A. Overview

MARAMA has awarded a contract to ICF Resources, L.L.C. (ICF), seeking ICF's services to evaluate the impact of EPA's CAIR Policy and the Mid-Atlantic/Northeast Visibility Union (MANE-VU) CAIR Plus proposal on the electric generating sector for the contiguous United States using the Integrated Planning Model (IPM®).

IPM is a dynamic linear optimization model that can be used to examine air pollution control policies for various pollutants throughout the contiguous U.S. for the entire electric power system. The dynamic nature of IPM enables the projection of the behavior of the power system over a specified future period. The optimization logic determines the least-cost means of meeting electric generation and capacity requirements while complying with specified constraints including air pollution regulations, transmission bottlenecks, and plant-specific operational constraints. The versatility of IPM allows users to specify which constraints to exercise and populate IPM with their own datasets.

This report summarizes the analysis that ICF has performed in evaluating the impact of the CAIR Plus proposal in the CAIR Plus region on the electricity generating sector by using IPM (hereafter, the analysis is referred to as the MARAMA analysis). As part of this analysis, ICF has also developed a Base Case that implements the EPA's CAIR, CAMR and CAVR policies. The model assumptions and data used in this analysis are presented in Section B. The results are presented in Section C and the analysis limitations are presented in Section D.

Since the modeling is based on analyses developed by U.S. EPA, VISTAS and LADCO, we have summarized only the incremental changes that were proposed by MARAMA as part of this analysis. The documentation for EPA's v2.19 and v3.0 base cases is available at <http://www.epa.gov/airmarkets/progsregs/epa-ipm>. The VISTAS and LADCO study assumptions are summarized in the Appendix.

B. Modeling Assumptions and Changes Made to VISTAS Run

The MARAMA analysis is based on the recent IPM based analysis performed for VISTAS and LADCO except for changes made by MARAMA. These runs are based on the VISTASII_PC_1f run that was developed for VISTAS in 2005. As per direction from MARAMA, the following assumptions for modeling the MARAMA Base Case-CAIR/CAMR/CAVR (MARAMA 5c) and MARAMA CAIR Plus Policy Case (MARAMA 4c) were implemented:

- a) Run year configuration: The run year configuration was updated to support the MARAMA analysis. The revised configuration is summarized in Table 1:

Table 1: Run Years in MARAMA Base Case and MARAMA CAIR Plus Policy Case

| Run Year | Calendar Years |
|----------|----------------|
| 2008 | 2007-2008 |
| 2009 | 2009-2009 |
| 2010 | 2010-2011 |
| 2012 | 2012-2012 |
| 2015 | 2013-2017 |
| 2018 | 2018-2018 |
| 2020 | 2019-2022 |
| 2026 | 2023-2030 |

b) Natural Gas Prices: As per direction from MARAMA, ICF implemented the EPA Base Case v3.0 natural gas supply curves as part of this analysis. These gas supply curves are documented in the EPA Base Case v3.0 documentation published on its website. The gas supply curves used in the VISTAS analysis were based on the EPA Base Case v2.1.9. The gas supply curves used in the MARAMA analysis result in higher gas prices as compared to the VISTAS analysis.

c) Fuel Oil Prices: The fuel oil price projections from AEO 2006 were implemented in the MARAMA analysis and are higher as compared to the VISTAS analysis. The fuel oil price projections used in the VISTAS analysis were based on AEO 2005. The AEO 2006 assumptions are documented in the EPA Base Case v3.0.

d) SCR and Scrubber Feasibility Limits: Table 2 summarizes the cumulative SCR and scrubber feasibility limits that were implemented (in the MARAMA analysis) in the years 2008, 2009 and 2010. These limits prevent the model from projecting a level of SCR and scrubber builds in the short-term that was higher than the industry's capability to deliver. The feasibility limits in 2008 and 2009 are based on actual planned SCR and scrubber installations. The 2010 limit for scrubbers is based on an internal analysis for installation of SO₂ scrubbers under CAIR. In the VISTAS study, feasibility limits for SCR and scrubbers were not applied in 2008, 2009 and 2010.

Note that in 2008, 2009 and 2010 run years, IPM will only build the most economic SCRs and scrubbers up to those limits.

Table 2: Cumulative SCR and FGD Feasibility Limits in MARAMA Base Case and MARAMA CAIR Plus Policy Case Runs

| Year | SCR (GW) | Scrubbers (GW) |
|------|----------|----------------|
| 2008 | 98 | 133 |
| 2009 | 104 | 153 |
| 2010 | No Limit | 172 |

e) CAVR (Clean Air Visibility Rule): Consistent with U.S. EPA's implementation of the CAVR rule, MARAMA has implemented the CAVR rule beginning in the run year 2015 within the MARAMA Base Case and MARAMA CAIR Plus Policy Case runs.

CAVR SO₂ Requirements: All CAVR eligible, unscrubbed, non CAIR and non WRAP affected sources larger than 200 MW are required to meet an output emission rate of

0.15 lbs/MMBtu of SO₂ or achieve 95% removal. Based on the results of an internal analysis, only the option to meet the 0.15 lbs/MMBtu of SO₂ was provided in IPM.

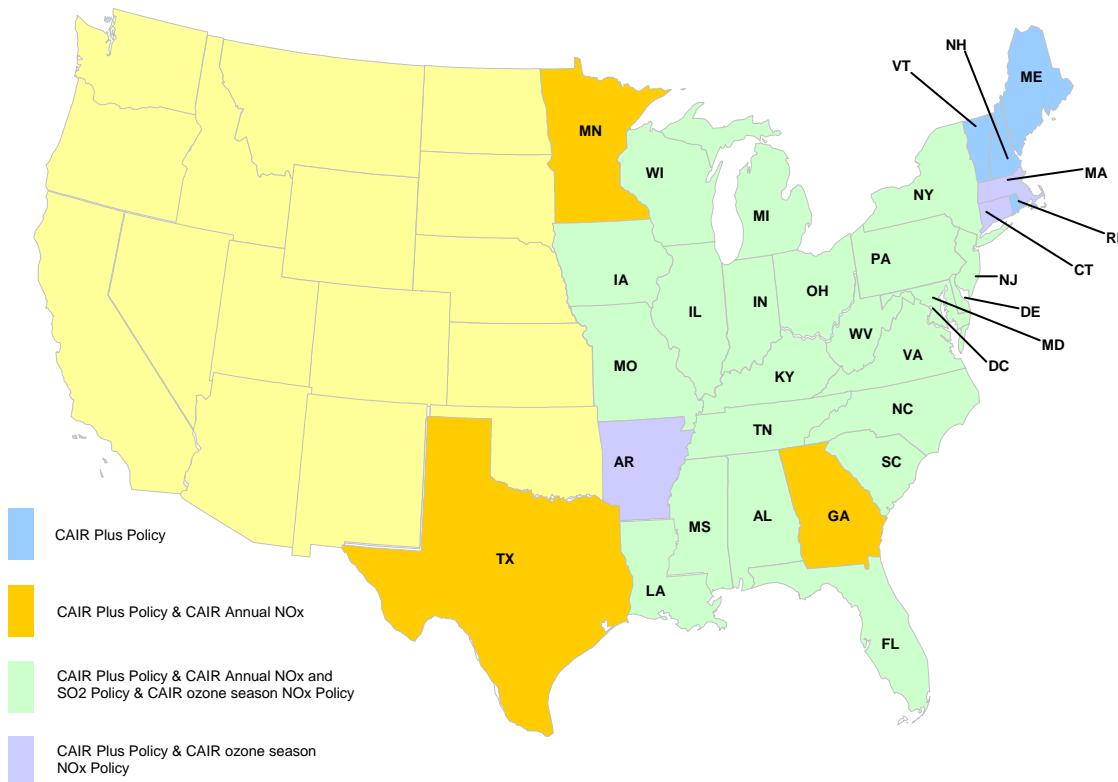

CAVR NO_x Requirements: All CAVR eligible, non CAIR affected sources larger than 200 MW are required to install combustion controls. SCRs are also required if the affected units are cyclone fired. All existing SCRs are required to operate annually.

Note that CAVR eligible sources in the above discussion imply the list of CAVR affected sources that U.S. EPA had modeled in their CAVR analysis using IPM.

f) Title IV SO₂ Bank: The IPM modeling time period in the MARAMA analysis is 2007-2030. In order to capture the dynamics of the SO₂ allowance market pre 2007, MARAMA has implemented a Title IV SO₂ allowance bank of 6.43 million tons, going into the year 2007. This assumption is based on an internal ICF analysis of the current market conditions.

g) Applicable States for Programs: The MARAMA CAIR Plus Policy Case run is based on the MARAMA Base Case run with the MARAMA CAIR Plus proposal implemented as a replacement of the CAIR policy. Figure 1 shows a U.S. map with states affected by CAIR and CAIR Plus policies highlighted.

Figure 1: States affected by CAIR and MARAMA CAIR Plus Policies

h) NO_x and SO₂ Budgets. Table 3 summarizes the NO_x budgets implemented in the MARAMA Base Case and MARAMA CAIR Plus Policy runs, and Table 4 summarizes SO₂ allowance retirement ratios implemented in the MARAMA Base Case and MARAMA CAIR Plus Policy Case runs. In IPM, emissions budgets are modeled as a cap that all affected sources together are required to comply with. These sources can buy or sell emission allowances among themselves and bank for future use under favorable economics.

The SO₂ allowance retirement ratio is the number of Title IV SO₂ allowances that need to be surrendered for each ton of SO₂ emissions in the CAIR/CAIR Plus region. In IPM, a CAIR/CAIR Plus policy affected source is required to surrender the applicable number of Title IV SO₂ allowances determined by the SO₂ retirement ratio for every ton of SO₂ emission. A non CAIR/CAIR Plus policy affected source surrenders one Title IV SO₂ allowance for every ton of SO₂ emissions.

Table 3: NO_x Budgets in the CAIR/CAIR Plus Region (Thousand Tons)

| Year | NO _x Ozone Season Budget | | NO _x Annual Budget | |
|------|-------------------------------------|------------------------------|-------------------------------|------------------------------|
| | MARAMA Base Case | MARAMA CAIR Plus Policy Case | MARAMA Base Case | MARAMA CAIR Plus Policy Case |
| 2009 | 568 | 623 | 1,722* | 1,553* |
| 2010 | 568 | 623 | 1,522 | 1,353 |
| 2012 | 568 | 415 | 1,522 | 902 |
| 2015 | 518 | 395 | 1,370 | 858 |
| 2018 | 485 | 382 | 1,268 | 829 |

* Includes NO_x Compliance Supplement Pool of 199,997 tons included in 2009.

Table 4: SO₂ Allowance Retirement Ratios in the CAIR/CAIR Plus Region

| Year | SO ₂ Allowance Retirement Ratio | |
|------|--------------------------------------------|------------------------------|
| | MARAMA Base Case | MARAMA CAIR Plus Policy Case |
| 2009 | 1.00 | 1.00 |
| 2010 | 2.00 | 2.50 |
| 2012 | 2.00 | 2.94 |
| 2015 | 2.52 | 3.32 |
| 2018 | 2.86 | 4.16 |

Note: The 2015 budgets and retirement ratios in Tables 3 and 4 are the average of the budgets and retirement ratios over the period 2013-2017.

i) SO₂ and NO_x emission allowances were allowed to be banked in any year and then withdrawn from the bank in a future year under the CAIR program in the base case and the CAIR Plus programs.

C. Results

In this section, ICF has presented the costs, retrofit control installations, emissions, allowance market impacts, delivered fuel prices, generation, power plant retirements and new builds from the MARAMA Base Case and then compared these results with those from the MARAMA CAIR Plus Policy Case

run. The Appendix summarizes the SO₂ and NO_x emission results and production cost components on a state and RPO level. The following paragraphs discuss the results from the two runs.

1. Projected Costs

IPM projects the production cost of the U.S. power sector for each of the modeled run years. The production cost includes the annualized capital costs of new investment decisions (includes control equipments costs and new build costs), fuel costs and the total variable and fixed operation and maintenance (O&M) costs of power plants. The annualized incremental cost¹ of the MARAMA CAIR Plus Policy as compared to MARAMA Base Case is summarized in Table 5. The analysis projects a total cost of \$4.4 billion in 2009 & \$2.6 billion in 2018 respectively. Note that the cost of the policy is highest in 2009 and comes down starting 2010 because in 2009 there are limitations to the number of units that can install SCRs. In order to comply with the NO_x regulations the power sector increases the natural gas based generation resulting in an increase in fuel cost. Note that these costs are for the entire US power sector and the policy could affect states that are within and outside the CAIR Plus region.

Table 5: Cost of the MARAMA CAIR Plus Policy to the US Power Sector (1999 Billion Dollars)

| | 2008 | 2009 | 2010 | 2012 | 2015 | 2018 |
|-------------------------|------|-------|------|-------|------|------|
| Variable O&M Cost | 0.05 | 0.02 | 0.34 | 0.52 | 0.42 | 0.29 |
| Fixed O&M Cost | 0.00 | -0.02 | 0.11 | 0.28 | 0.18 | 0.12 |
| Fuel Cost | 0.26 | 4.17 | 0.18 | -0.89 | 0.05 | 0.24 |
| Annualized Capital Cost | 0.11 | 0.21 | 1.55 | 2.41 | 2.07 | 1.91 |
| Total Production Cost | 0.41 | 4.38 | 2.18 | 2.32 | 2.72 | 2.57 |

Note: To convert year 1999 dollars to year 2006 dollars, use a conversion factor of 1.1856

The marginal costs² of emission reductions as manifested in the projected allowance prices in the MARAMA Base Case and the MARAMA CAIR Plus policy case are shown in Table 6. The SO₂ and NO_x allowance prices in the CAIR Plus region in the MARAMA CAIR Plus Policy Case run are high starting in 2009 due to the relatively tighter policies applied to the CAIR Plus region as compared to the SO₂ and NO_x policies in the MARAMA Base Case. Tighter policies result in more expensive compliance options being chosen resulting in higher allowance prices. The NO_x allowance prices are high in 2009 and drop in 2010 because the SCR feasibility limits are relaxed starting in 2010. In 2009, due to limitations on SCR installations, a significant increase in natural gas fired generation occurs, driving up the annual NO_x allowance prices. Starting in 2010, SCRs are installed resulting in a reduction in the use of more expensive NO_x reduction options such as natural gas generation, driving down the annual NO_x allowance prices.

The compliance options available to power plants to reduce both annual NO_x emissions and the ozone season NO_x emissions are same. In addition the plants affected by the ozone season NO_x policy and the annual NO_x policy in the MARAMA CAIR Plus Policy Case are identical. Hence, it appears that complying with the annual NO_x policy results in an automatic compliance with the ozone season NO_x policy. This is highlighted by the zero ozone season NO_x allowance price starting 2010.

¹ Annual Incremental Production Cost = Annualized Production Cost of MARAMA CAIR Plus Policy Case – Annualized Production Cost of MARAMA Base Case

² Marginal cost is defined as the cost of reducing one additional ton of emissions.

Table 6: Allowance prices (Marginal Costs) of Emission Reductions in MARAMA Base Case and MARAMA CAIR Plus Policy Case (1999 \$/ton)

| CAIR/CAIR Plus Policy | MARAMA Base Case | | | | | MARAMA CAIR Plus Policy Case | | | | |
|--------------------------|------------------|-------|-------|------|-------|------------------------------|-------|-------|------|-------|
| | 2009 | 2010 | 2012 | 2015 | 2018 | 2009 | 2010 | 2012 | 2015 | 2018 |
| SO ₂ | 692 | 748 | 809 | 943 | 1,105 | 870 | 940 | 1,017 | 1186 | 1,390 |
| NO _x – Ozone | 15,270 | 0 | 0 | 0 | 0 | 9,153 | 0 | 0 | 0 | 0 |
| NO _x - Annual | 2,489 | 1,155 | 1,155 | 1346 | 1,577 | 14,280 | 4,240 | 4,586 | 5346 | 6,266 |

Note: To convert year 1999 dollars to year 2006 dollars, use a conversion factor of 1.1856

2. Projected Control Technology Retrofits

Installation of controls is one of the strategies that the power sector opts for complying with the CAIR Plus proposal requirements. This strategy is in addition to other compliance strategies such as changes to plant retirements, plant dispatch and new builds. Under the MARAMA CAIR Plus Policy Case, an additional 19 GW of SO₂ scrubbers and 78 GW of selective catalytic reduction (SCRs) are installed by 2012 (see Table 7). In the MARAMA CAIR Plus Policy Case, the SCR feasibility limits in 2008 and 2009 run years and the SO₂ scrubber limits in 2008 and 2010 run years are achieved.

Table 7: Incremental Pollution Control Installations by Technology in the MARAMA CAIR Plus Policy Case with the MARAMA Base Case (GW)

| Technology | 2009 | 2010 | 2012 | 2015 | 2018 |
|------------|------|------|------|------|------|
| Scrubber | 9 | 10 | 19 | 18 | 16 |
| SCR | 0 | 77 | 78 | 66 | 65 |

3. Emissions

Tables 8 and 9 summarize the SO₂ and NO_x emissions from all units in the MARAMA Base Case and the MARAMA CAIR Plus Policy Case in the 2008, 2009, 2010, 2012, 2015 and 2018 run years. Total projected state-level emissions for SO₂ and NO_x for the MARAMA CAIR Plus Policy Case and the MARAMA Base Case are presented in Tables A1-A3 in the Appendix.

Note, that the CAIR/CAIR Plus policies are not applied to the WRAP region in the MARAMA Base Case and MARAMA CAIR Plus Policy Case runs and hence the SO₂ and NO_x emissions in the two runs in the WRAP region are similar. The CAIR/CAIR Plus SO₂ programs start in 2010 and the NO_x programs start in 2009. Hence, the SO₂ and NO_x emissions are lower starting in 2010 and 2009 respectively.

Table 8: SO₂ Emissions from the U.S. Electric Power Sector (Thousand Tons)

| | 2008 | 2009 | 2010 | 2012 | 2015 | 2018 |

4. Allowance Market

Tables 10a and 10b summarize the CAIR/CAIR Plus SO₂ and NO_x allowance market as implemented in the CAIR/CAIR Plus region in the MARAMA Base Case and the MARAMA CAIR Plus Policy Case.

SO₂ emission allowances are banked in 2008 and 2009 and withdrawn in subsequent years. Allowances are not banked in later years as the CAIR/CAIR Plus policy starts in 2010 resulting in reduced opportunities for over complying. Annual NO_x emission allowances are banked in 2010 and not in 2009 in the MARAMA CAIR Plus Policy Case because restrictions on SCR installations prevent over compliance of the NO_x cap in 2009.

No ozone season NO_x emission allowances are banked in both the CAIR/CAIR Plus policies because the allowance price is zero starting 2009. A zero allowance price does not provide any incentive for banking of allowances. On a separate note, the allowances banked in the SIP Call budget program are allowed to be banked and used in the ozone season NO_x program starting in 2009.

Table 10a: Summary of SO₂ and NO_x Allowance Market in MARAMA Base Case (Thousands Tons)

| Run Year | 2008 | 2009 | 2010 | 2012 | 2015 | 2018 | 2020 |

5. Fuel Prices

Table 11 summarizes the delivered coal and natural gas prices solved by IPM in the MARAMA Base Case and MARAMA CAIR Plus Policy Case runs in the 2008, 2009, 2010, 2012, 2015 and 2018 run years.

The gas prices are higher in the MARAMA CAIR Plus Policy Case, in comparison to the MARAMA Base Case. This is a result of a small increase in gas consumption as shifting from coal to gas is a compliance option leading to higher gas prices. In 2009 and 2010, the gas prices are higher by 0.02 and 0.07 \$/MMBtu respectively. This shift in fuel consumption from coal to gas, results in a drop in coal prices by approximately 0.01 \$/MMBtu.

Table 11: Delivered Fuel Prices in MARAMA Base Case and MARAMA CAIR Plus Policy Case (1999 \$/MMBtu)

| Fuel | MARAMA Base Case | | | | | | MARAMA CAIR Plus Policy Case | | | | | |
|-------------|------------------|------|------|------|------|------|------------------------------|------|------|------|------|------|
| | 2008 | 2009 | 2010 | 2012 | 2015 | 2018 | 2008 | 2009 | 2010 | 2012 | 2015 | 2018 |
| Coal | 1.09 | 1.07 | 1.07 | 1.05 | 1.03 | 1.00 | 1.09 | 1.06 | 1.06 | 1.04 | 1.02 | 0.99 |
| Natural Gas | 7.39 | 6.62 | 4.81 | 4.75 | 4.15 | 4.01 | 7.39 | 6.64 | 4.88 | 4.75 | 4.19 | 4.04 |

6. Power Plant Retirements

A tighter environmental policy increases a power plant's cost of compliance and hence could make an economic plant uneconomic. Table 12 summarizes the increase in power plant retirements in the MARAMA CAIR Plus Policy Case as compared to the MARAMA Base Case.

Table 12: Incremental Power Plant retirements in MARAMA CAIR Plus Policy Case with the MARAMA Base Case (MW)

| Plant Type | 2008 | 2009 | 2010 | 2012 | 2015 | 2018 |
|----------------|-------|-------|-------|-------|-------|-------|
| Coal Steam | 75 | 2,071 | 2,491 | 2,491 | 2,491 | 2,491 |
| Oil/Gas Steam | 2,428 | 2,428 | 2,279 | 2,279 | 2,184 | 2,184 |
| Combined Cycle | -73 | -73 | 208 | 208 | 86 | 86 |

7. Power Plant Generation

Power plant dispatch is one of the compliance strategies for meeting a tighter environmental policy. In the MARAMA CAIR Plus Policy Case as compared to the MARAMA Base Case, the generation mix changes towards lower emission intensive fuel and plant types. Table 13 summarizes the generation mix in the MARAMA CAIR Plus Policy Case and the MARAMA Base Case. Note that there is an increase in natural gas fired generation and a reduction in coal generation in all years except 2012. This occurs because 2012 is the first year when the SCR and scrubber feasibility limits are no longer applicable resulting in increased control installation and an increase in coal generation. In years after 2012, the SO₂ and NO_x policies in the MARAMA CAIR Plus Policy case continue to become tighter resulting in an increase in gas based generation.

Table 13: Generation by Fuel Type in the U.S. Electric Power Sector (GWh)

| | 2008 | 2009 | 2010 | 2012 | 2015 | 2018 |

8. Power Plant New Builds

Table 14 summarizes the new power plant builds in the MARAMA Base Case and the MARAMA CAIR Plus Policy Case. Note, that in the MARAMA CAIR Plus policy case, new build penetration is higher than in the MARAMA Base Case. A reason for this increase is the need to compensate for increased power plant retirements as presented in Table 12.

Table 14: New Power Plant Builds by Plant Type in the United States (MW)

| | 2008 | 2009 | 2010 | 2012 | 2015 | 2018 |

D. Limitations of Analysis

MARAMA modeling using IPM is based on various economic and engineering input assumptions that are inherently uncertain, such as assumptions for future fuel prices, electricity demand growth and the cost and performance of control technologies. As configured, IPM does not take into account demand response (i.e., consumer reaction to changes in electricity prices).

Appendix

1. Summary of Changes to EPA Base Case v2.1.9 by Vistas

The EPA Base Case v.2.1.9 was developed by ICF under the direction of the U.S. Environmental Protection Agency (EPA). It serves as the starting point for the analysis presented in this report. Subsequent to its release the VISTAS Regional Planning Organization initiated a two-phase study using IPM. Starting with the EPA 2.1.9 as a base, VISTAS, along with study participants from CENRAP and LADCO RPOs, made several changes to the underlying datasets and modeling assumptions. The starting point for the MARAMA analyses discussed in this report was work from the VISTAS study as modeled in the run VISTASII_PC_1f.

VISTAS and its workgroup initiated a review of NEEDS and recommended a large number of changes to the data. This occurred in two phases. In addition to unit level changes, VISTAS and its workgroup made a number of global changes that are reflected in this case. These are briefly described below:

- Demand forecast were changed to reflect unadjusted EIA AEO 2005 national electricity and peak demand values.
- AEO 2005 data was used for all assumptions regarding new builds of conventional technologies. The cost and performance assumptions for these units were as per the AEO 2005 documentation, while assumptions for renewable capacity were the same as those used in the EPA Base Case 2004 v.2.1.9.
- For nuclear units, the cost of continued operation was updated to approximately \$27 per kilowatt-year based on AEO 2005.
- Fuel oil price projections from AEO 2005 were used.
- Hardwired Duke Power and Progress Energy control technology investment strategies for complying with the North Carolina Clean Smoke Stacks rule.
- The renewable portfolio standards (RPS) is modeled based on the most recent RGGI documentation using a single RPS region for Massachusetts (MA), Rhode Island (RI), New York (NY), New Jersey (NJ), Maryland (MD) and Connecticut (CT). The RPS requirements within these states can be met by renewable generation from New England, New York and PJM. EPA Base Case 2004 v.2.1.9 methodology and EIA AEO 2004 projected renewable builds were used for the rest of the regions.

2. Emission and Cost Results

Tables A1- A3 present SO₂ and NO_x emissions from the MARAMA Base Case and MARAMA CAIR Plus Policy Case runs by state in 2008, 2009, 2012, 2015 and 2018 run years.

Tables A4- A7 present variable O&M costs, fixed O&M costs, annualized capital costs and fuel costs from the MARAMA Base Case and MARAMA CAIR Plus Policy Case runs by state in 2008, 2009, 2012, 2015 and 2018 run years.
