## New Jersey Department of Environmental Protection Reason for Application

#### **Permit Being Modified**

**Permit Class:** Number: 0

**Description** Cooper is submitting this Preconstruction Permit Application (Application) for the **of Modifications:** following:

1. Cooper operates an existing Combined Heat and Power (CHP) unit consisting of a natural gas-fired turbine and duct burner which are permitted as E1 and E2, respectively, of emissions unit U1 under General Permit No. GEN170002 (General Permit). The General Permit is a GP-021 for CHP Combustion Turbine(s), which has been discontinued by the New Jersey Department of Environmental Protection (NJDEP) as of April 6, 2020. Cooper submitted an Application on 12/6/2022 in order to obtain an operating certificate for the CHP unit prior to the expiration of the General Permit on January 3, 2023. After receipt of the application, the permit was extended by the NJDEP for 6 months. Cooper received comments on the application on 12/27/2022, and is submitting this revised application to address those comments.

2. Cooper is proposing a federally enforceable annual fuel throughput limit of 521.74 million cubic feet per year (MMcf/yr) of natural gas for the CHP unit.

## LIST OF APPENDICES

Appendix A - PDF Copy of Submitted RADIUS File

Appendix B - CHP Unit Technical Specifications

Appendix C - Potential to Emit Calculations

## 1. INTRODUCTION

Cooper University Hospital (Cooper) is located at 1 Cooper Plaza in Camden, Camden County, New Jersey (Facility) and is affiliated with Cooper Medical School of Rowan University. Cooper is submitting this Preconstruction Permit (PCP) application (Application) to the New Jersey Department of Environmental Protection (NJDEP) to seek authorization to continue to operate its existing combined heat and power (CHP) unit in accordance with New Jersey Administrative Code (N.J.A.C.) Title 7, Chapter 27, Subchapter 8. Cooper has prepared this Application using NJDEP's RADIUS software application and has submitted and certified the required submittal file electronically through NJDEP's Online Business Portal. A copy of the RADIUS forms is included with this report as an Adobe PDF in Appendix A.

Cooper understands that, upon receipt of this Application, NJDEP will invoice Cooper for the applicable permitting fees pursuant to N.J.A.C. 7:27-8.6, Table A-2.

## 2. FACILITY AND PROJECT DESCRIPTION

The Facility is located at 1 Cooper Plaza, Camden, Camden County, New Jersey. The Facility is a teaching hospital and biomedical research facility and is categorized under the North American Industry Classification System (NAICS) code 622110 for general medical and surgical hospitals.

The Facility operates one natural gas-fired CHP unit, two dual-fuel boilers that fire primarily natural gas and No. 2 fuel oil only during periods of natural gas curtailment, four small natural gas fired boilers, and seven diesel-fired emergency generators to generate power for the Facility and supply steam for heating. The Facility is a minor source of air emissions and operates under various general permits and PCPs issued by NJDEP.

With this Application, Cooper is seeking a new PCP for the existing CHP unit. The existing CHP unit is currently permitted under General Permit No. GEN170002 (General Permit). The General Permit is a GP-021 for CHP Combustion Turbine(s), renewals of which were discontinued by NJDEP on April 6, 2020. Cooper is seeking to obtain an operating certificate for the CHP unit prior to the expiration of the General Permit on January 3, 2023.

The unit is an existing Solar Turbines Mercury 50-6400R CHP unit (General Permit emissions unit ID U1) consisting of a 44.25-million British thermal unit per hour (MMBtu/hr) natural gasfired turbine (General Permit equipment ID E1) and a 16.50-MMBtu/hr duct burner (General Permit equipment ID E2). Technical specifications for the CHP unit are provided in Appendix B. The CHP unit generates electricity for the Facility and produces steam for heating via an associated heat recovery steam generator (HRSG). In addition to transitioning the CHP unit from the General Permit to a PCP, Cooper is proposing a federally enforceable annual fuel throughput limit of 521.74 million cubic feet per year (MMcf/yr) of natural gas for the CHP unit.

## 3. EMISSIONS CALCULATIONS

Potential emissions from the CHP unit are calculated using manufacturer specifications, emissions factors from the NJDEP State of the Art (SOTA) Manual for Stationary Combustion Turbines (SOTA Manual), emissions factors from the U.S. Environmental Protection Agency (U.S. EPA) *AP-42: Compilation of Air Emissions Factors* (AP-42) Chapter 3.1 for natural gas-fired stationary combustion turbines, and emissions factors from 40 CFR Part 98, Subpart C. Potential annual emissions are calculated assuming a maximum annual natural gas throughput of 521.74 MMcf/yr for the CHP unit.

The calculated potential to emit (PTE) from proposed operations at the Facility is presented in Appendix C. The calculated PTE from the CHP unit is presented in Tables C-1 and C-2. A Facility-wide PTE summary is presented in Table C-2 to demonstrate that the Facility's total emissions from all sources remain below major facility permitting thresholds as defined in N.J.A.C. 7:27-8.1.

## 4. **REGULATORY REVIEW**

Cooper has reviewed the Federal and State of New Jersey air quality regulations to determine their applicability to the Facility.

## 4.1 FEDERAL REGULATIONS

For the purpose of this Application, potentially applicable Federal regulations include the following:

- New Source Review
- Standards of Performance for New Stationary Sources
- National Emission Standards for Hazardous Air Pollutants

A discussion of each potentially applicable Federal requirement is provided in the following subsections.

## 4.1.1 New Source Review

The New Source Review (NSR) program includes both the Nonattainment New Source Review (NNSR) regulations and Prevention of Significant Deterioration (PSD) regulations. The Facilitywide potential emissions of regulated NSR pollutants demonstrate that the Facility is not a major stationary source under either regulation. Therefore, PSD and NNSR permitting regulations do not apply.

## 4.1.2 Standards of Performance for New Stationary Sources

U.S. EPA has promulgated standards of performance for new, modified, or reconstructed sources of air pollution at 40 CFR Part 60, also known as the New Source Performance Standards (NSPS). Cooper has identified the following NSPS as being potentially applicable to the CHP unit:

- 40 CFR Part 60, Subpart GG (Standards of Performance for Stationary Gas Turbines)
- 40 CFR Part 60, Subpart KKKK (Standards of Performance for Stationary Combustion Turbines)

A discussion of each potentially applicable NSPS is provided in the following subsections.

## 4.1.2.1 40 CFR Part 60, Subpart GG

40 CFR Part 60, Subpart GG (Standards of Performance for Stationary Gas Turbines) applies to all stationary gas turbines with a heat input at peak load equal to or greater than 10 MMBtu/hr. The combustion turbine has a rated heat input of 44.25 MMBtu/hr. However, pursuant to 40 CFR §60.4305(b) of 40 CFR Part 60, Subpart KKKK, stationary combustion turbines regulated under 40 CFR Part 60, Subpart KKKK are exempt from the requirements of Subpart GG. The CHP unit is subject to Subpart KKKK; therefore, the requirements of Subpart GG do not apply.

## 4.1.2.2 40 CFR Part 60, Subpart KKKK

40 CFR Part 60, Subpart KKKK (Standards of Performance for Stationary Combustion Turbines) applies to stationary combustion turbines with a heat input at peak load equal to or greater than 10 MMBtu/hr which commenced construction, modification, or reconstruction after February 18, 2005. The combustion turbine has a rated heat input of 44.25 MMBtu/hr and was constructed in 2018. Therefore, the CHP unit is subject to Subpart KKKK.

The natural gas-fired CHP unit generates electricity. The peak load of the turbine is 44.25 MMBtu/hr. Per 40 CFR §60.4305(a), any additional heat input to associated heat recover steam generators (HRSG) or duct burners is not included when determining the peak heat input. Therefore, pursuant to 40 CFR §60.4320(a) and Table 1 to Subpart KKKK, NO<sub>X</sub> emissions from the CHP unit will be less than or equal to 42 parts per million by volume, dry (ppmvd), at 15% oxygen (O<sub>2</sub>). Pursuant to 40 CFR §60.4340(a) for units that do not use water or steam injection, Cooper will perform performance tests every two years in accordance with 40 CFR §60.4400 to demonstrate compliance with the NO<sub>X</sub> emissions limit. Pursuant to 40 CFR §60.4375(b), a written report of the results of each performance test will be submitted to U.S. EPA within 60 days of completion of each performance test.

Pursuant to 40 CFR §60.4330(a)(2), the CHP unit will comply with the SO<sub>2</sub> emissions limits of Subpart KKKK by firing fuel which contains total potential sulfur emissions less than or equal to 0.060 lb SO<sub>2</sub>/MMBtu, as demonstrated in Table C-2 of Appendix C. Pursuant to 40 CFR §60.4365, Cooper will demonstrate compliance with the sulfur emissions limit by maintaining fuel supplier records specifying that the total sulfur content for natural gas is less than or equal to 20 grains of sulfur per 100 standard cubic feet.

## 4.1.3 National Emission Standards for Hazardous Air Pollutants

U.S. EPA has promulgated National Emission Standards for Hazardous Air Pollutants (NESHAP) at 40 CFR Parts 61 and 63. The original NESHAP promulgated prior to the Clean Air Act Amendments (CAAA) of 1990, found in 40 CFR Part 61, apply to specific HAP. No standards in 40 CFR Part 61 have been identified as applicable to the CHP unit. NESHAP rules promulgated under 40 CFR Part 63, commonly referred to as Maximum Achievable Control Technology (MACT) standards, apply to source categories that are area or major sources of HAP. A major source of HAP is defined as a source with a facility-wide PTE of 10 tons per year (tpy) or more of any single HAP, or with a facility-wide PTE of 25 tpy of total HAP. Based on the PTE calculations included in Appendix C, the Facility is an area source of HAP. Cooper has identified the following NESHAP as being potentially applicable to the CHP unit:

• 40 CFR Part 63, Subpart YYYY (National Emission Standards for Hazardous Air Pollutants for Stationary Combustion Turbines)

A discussion of the potentially applicable NESHAP is provided in the following subsection.

## 4.1.3.1 40 CFR Part 63, Subpart YYYY

40 CFR Part 63, Subpart YYYY (National Emission Standards for Hazardous Air Pollutants for Stationary Combustion Turbines) applies to owners and operators of stationary combustion turbines located at major sources of HAP emissions. The Facility is an area source of HAP. Therefore, the CHP unit is not subject to Subpart YYYY.

## 4.2 NEW JERSEY REGULATIONS

For the purpose of this Application, potentially applicable State of New Jersey regulations include the following:

- N.J.A.C. 7:27-3 (Control and Prohibition of Smoke from Combustion of Fuel)
- N.J.A.C. 7:27-4 (Control and Prohibition of Particles from Combustion of Fuel)
- N.J.A.C. 7:27-7 (Sulfur)
- N.J.A.C. 7:27-8 (Permits and Certificates for Minor Facilities)
- N.J.A.C. 7:27-16 (Control and Prohibition of Air Pollution by Volatile Organic Compounds)
- N.J.A.C. 7:27-18 [Control and Prohibition of Air Pollution from New or Altered Sources Affecting Ambient Air Quality (Emission Offset Rules)]
- N.J.A.C. 7:27-19 (Control and Prohibition of Air Pollution from Oxides of Nitrogen)
- N.J.A.C. 7:27-22 (Operating Permits)

A discussion of each potentially applicable State of New Jersey air quality regulation is provided in the following subsections.

## 4.2.1 N.J.A.C. 7:27-3

N.J.A.C. 7:27-3.5 regulates smoke emissions from stationary turbine engines. Visible smoke darker than number 1 on the Ringelmann smoke chart or greater than 20% opacity will not be emitted from the CHP unit for a period of more than 10 consecutive seconds.

## 4.2.2 N.J.A.C. 7:27-4

N.J.A.C. 7:27-4.2(a) sets standards for PM emissions from combustion of fuel. As demonstrated in Table C-2 of Appendix C, the CHP unit will meet this standard of less than 12 pounds per hour.

## 4.2.3 N.J.A.C. 7:27-7

N.J.A.C. 7:27-7.2 regulates air pollution from sulfur compounds. Pursuant to N.J.A.C. 7:27-7.2(k), this subchapter does not apply to sulfur compound emissions resulting from the combustion of commercial fuel. Therefore, the CHP unit is not subject to N.J.A.C. 7:27-7.

## 4.2.4 N.J.A.C. 7:27-8

N.J.A.C. 7:27-8.2(c)(1) establishes the CHP unit as requiring a PCP because it is commercial fuelburning equipment with maximum heat input of 1 MMBtu/hr or greater and, therefore, a significant source. Therefore, Cooper is submitting this Application in accordance with N.J.A.C. 7:27-8.2 and 8.4.

N.J.A.C. 7:27-8.12 establishes SOTA control requirements. The CHP unit emissions are over the SOTA threshold for NOx and CO and therefore must meet the SOTA requirements for those pollutants. Cooper complies with the SOTA requirements per N.J.A.C. 7:27-8.12(e)(5)(i). The SOTA Manual for Stationary Combustion Turbines documents that SOTA for a combined cycle turbine is 12 ppmvd for NOx and 50 ppmvd for CO, which the unit complies with.

## 4.2.5 N.J.A.C. 7:27-16

N.J.A.C. 7:27-16.9 regulates VOC emissions from stationary combustion turbines subject to the provisions of N.J.A.C. 7:27-19. The CHP unit is not subject to N.J.A.C. 7:27-19; therefore, it is not subject to N.J.A.C. 7:27-16.9.

#### 4.2.6 N.J.A.C. 7:27-18

As demonstrated in Table C-2 of Appendix C, the Facility does not exceed the PTE threshold for any of the air contaminants listed in N.J.A.C. 7:27-18.2(a)(1). Therefore, the CHP unit is not subject to N.J.A.C. 7:27-18.

## 4.2.7 N.J.A.C. 7:27-19

Pursuant to N.J.A.C. 7:27-19.2(b)(3) and (c)(2), N.J.A.C. 7:27-19 applies to stationary combustion turbines that have a maximum gross heat input of at least 25 MMBtu/hr located at a major NO<sub>X</sub> facility. The Facility is not a major source of NO<sub>X</sub>. Therefore, the CHP unit is not subject to N.J.A.C. 7:27-19.

## 4.2.8 N.J.A.C. 7:27-22

As demonstrated in Table C-2 of Appendix C, the Facility does not exceed the applicability thresholds listed in N.J.A.C. 7:27-22.2(a). Therefore, the Facility is not subject to major source air permitting under N.J.A.C. 7:27-22.

APPENDIX A -PDF COPY OF SUBMITTED RADIUS FILE

### New Jersey Department of Environmental Protection Reason for Application

#### **Permit Being Modified**

#### Permit Class: Number: 0

**Description** Cooper is submitting this Preconstruction Permit Application (Application) for the **of Modifications:** following:

1. Cooper operates an existing Combined Heat and Power (CHP) unit consisting of a natural gas-fired turbine and duct burner which are permitted as E1 and E2, respectively, of emissions unit U1 under General Permit No. GEN170002 (General Permit). The General Permit is a GP-021 for CHP Combustion Turbine(s), which has been discontinued by the New Jersey Department of Environmental Protection (NJDEP) as of April 6, 2020. Cooper submitted an Application on 12/6/2022 in order to obtain an operating certificate for the CHP unit prior to the expiration of the General Permit on January 3, 2023. After receipt of the application, the permit was extended by the NJDEP for 6 months. Cooper received comments on the application on 12/27/2022, and is submitting this revised application to address those comments.

2. Cooper is proposing a federally enforceable annual fuel throughput limit of 521.74 million cubic feet per year (MMcf/yr) of natural gas for the CHP unit.

## New Jersey Department of Environmental Protection Facility Profile (Permitting)

1. Is this facility classified as a small business by the USEPA?	No
2. Is this facility subject to N.J.A.C. 7:27-22?	No
3. Are you voluntarily subjecting this facility to the requirements of Subchapter 22?	No
4. Has a copy of this application been sent to the USEPA?	No
5. If not, has the EPA waived the requirement?	No
6. Are you claiming any portion of this application to be confidential?	No
7. Is the facility an existing major facility?	No
8. Have you submitted a netting analysis?	No
9. Are emissions of any pollutant above the SOTA threshold?	Yes
10. Have you submitted a SOTA analysis?	Yes
11. If you answered "Yes" to Question 9 and "No" to Question 10, explain why a SOTA analysis was not required	

12. Have you provided, or are you planning to provide air contaminant modeling? Yes

Air Contaminant(s)	
Name	CAS Number
Formaldehyde	00050-00-0
Polynuclear aromatic hydrocarbons (PAHs)

## 2.2 HEAT RECOVERY STEAM GENERATOR DESCRIPTION

The recommended Heat Recovery Steam Generator is an offering from Rentech, per the data sheet and technical information below.

## A. Heat Recovery Steam Generator

No.	Item Description	Supplier: Rentech Boiler Systems
1.0	Base Bid	
1.1	Model	Rentech Crossflow HRSG
1.2	Design Pressure (PSIG)	200
1.3	Operating Pressure (PSIG)	130
1.4	Drum Pressure (PSIG)	132
1.5	Steam Flow (lb/hr)	13,098 - expected
1.6	Exhaust Gas Flow (lb/hr)	139,882
1.7	Turbine Exhaust Temperature (F)	692
1.8	Heat Loss (%)	1.3
1.9	Evap1 Temp In (F)	692
1.10	Evap2 Temp Out (F)	369
1.11	Economizer Temp In (F)	369
1.12	Economizer Temp Out (F)	327
1.13	Steam Temperature (F)	Saturated
1.14	Steam Flow (lb/hr)	13,098 - expected
1.15	Feed Water Temperature Pre Economizer (F)	240
1.16	Feed Water Temperature Post Economizer (F)	346
1.17	Blow Down (%)	2
1.18	Exhaust Gas Pressure Drop (in WC)	7.6
1.19	Total Duty (MMBTU/HR	13.11
1.20	Duty Screen (MMBTU/HR)	0.78
1.21	Duty Evap1 (MMBTU/HR)	10.85
1.22	Duty Evap 2 (MMBTU/HR)	N/A
1.23	Duty Economizer (MMBTU/HR)	1.48
2.0	Alternate 1 – Duct Fired	
2.1	Model	Rentech Crossflow HRSG
2.2	Design Pressure (PSIG)	200
2.3	Operating Pressure (PSIG)	130
2.4	Drum Pressure (PSIG)	138
2.5	Steam Flow (lb/hr) with CT and Duct Firing, Limit to a maximum of 28,000 lbs/hr	28,000
2.6	Exhaust Gas Flow (lb/hr)	139,882
2.7	Turbine Exhaust Temperature (F)	692

#### **Power Generation**

## Mercury 50 Generator Set

2.8	Heat Loss (%)	1.3
2.9	Firing Temperature (F)	1,069
2.10	LHV (BTU/SCF) from Combustion Turbine Form	922.3
2.11	Gas Input (MMBTU/HR)	14.8
2.12	Evap1 Temp In (F)	1,069
2.13	Evap2 Temp Out (F)	385
2.14	Economizer Temp In (F)	385
2.15	Economizer Temp Out (F)	318
2.16	Steam Temperature (F)	Saturated
2.17	Feed Water Temperature Pre Economizer (F)	240
2.18	Feed Water Temperature Post Economizer (F)	320
2.19	Blow Down (%)	2
2.20	Exhaust Gas Pressure Drop (in WC)	8.2
2.21	Total Duty (MMBTU/HR	28.05
2.22	Duty Screen (MMBTU/HR)	1.86
2.23	Duty Evap1 (MMBTU/HR)	23.81
2.24	Duty Evap 2 (MMBTU/HR)	N/A
2.25	Duty Economizer (MMBTU/HR)	2.38
2.26	NO <sub>x</sub> : ppmv; lb <sub>m</sub> /hr in	5.0
2.27	NO <sub>x</sub> : ppmv; lb <sub>m</sub> /hr out	9.5

2.30	CH <sub>2</sub> O (formaldehyde): lb <sub>m</sub> /hr in	Supplied after order
2.31	$CH_2O$ (formaldehyde): $lb_m/hr$ out	Supplied after order
2.32	PM <sub>10</sub> : lb <sub>m</sub> /hr in	Supplied after order
2.33	PM <sub>10</sub> : lb <sub>m</sub> /hr out	Supplied after order

## **Power Generation**

## J. Main Stack

The main stack will be provided as follows. Stack will be supported from the top of the economizer without any requirement for external support structure.

Stack Height Above Grade	70'-0"	
 Stack Shell Diameter	48″	I
Material	1/4" Thick	CS Material
Exterior Surface Coating	SSPC-SP1	) Surface Prep with Inorganic Zinc Primer and
	Top Coat	
Test Ports	(4) - 4" x 1	50# Test Ports

## K. Ladders / Platforms

Will be provided at the following locations.

- Along length of the steam drum.
- Steam drum ends.
- Economizer
- Main Stack

## L. Trim and Instrumentation

Feedwater Water Side				
Feedwater Inlet Temperature	°F	240	240	
Gas Turbine Performance				
Gas Turbine Flow	Lbs/Hr	139,882	139,882	
Gas Turbine Temperature	۴F	692	692	
Combustion Turbine Exhaust Analysis				
CO2	(% volume)	2.39	2.39	
H2O	(% volume)	5.66	5.66	
N2	(% volume)	75.49	75.49	
02	(% volume)	15.55	15.55	
Ar	(% volume)	0.90	0.90	
Gas Side Pressure Drop *	(inches W.C.)	10	10	
Duct Burner Heat Input *	MMBtu/hr LHV	16.5		

#### Notes:

1. The blowdown rate is 2%.

- 2. Performance is calculated at site ambient pressure for guarantee point.
- 3. Feedwater analysis based on suggested Water Quality Limits per latest edition of ASME.
- 4. The steam conditions are at the RENTECH terminal points.
- 5. The RENTECH Guarantees are marked with an asterisk (\*).
- 6. Performance Tests By Others

HRSG performance will be measured by a performance test based upon the principles of ASME PTC 4.4 for Heat Recovery Steam Generators. Final test procedures will need to be mutually agreed upon by both parties.

7. Steam purity based ASEM boiler water requirements.

## 5.4 EMISSIONS OUTPUT (GAS FUEL)

The following turbine output emissions are warranted:

#### Gas Fuel Operation (per the Gas Fuel Component Analysis):

		With Duct Burner
NOx	5 ppmv	9.5 ppmv
CO	10 ppmv	17.0 ppmv
UHC	10 ppmv	8.3 ppmv

Operating Conditions for the above emissions are as follows:

Ambient Temperature range:	0 - 120°F ( -17 -48° C	)
Operating Range:	50-100%	

(Emissions rates in ppmv; measured at steady state operation; and corrected to ISO conditions -- 15%  $O_2$  dry, 59°F, 14.696 psia, 60% relative humidity)

#### Notes/Clarifications:

The emissions cited above are applicable only for steady-state conditions and does not apply during start-up, shutdown, malfunction, or during transient events.

1.2	Overall Turbine Generator Set Dimensions (L x W x H) (ft)	36.5 x 10.5 x 12.3
1.3	Power Generator Operating Weight (lb)	105,100
2.0	Power Generator Performance Data (provide data for 0F, 59F & 90F ambient air temperatures at 13-ft elev) (Used 20 fasl to match Section 2.03 of Specification)	
2.1	Ambient Air Conditions:	0/59/90
2.2	Site Elevation above Sea Level (ft):	20
2.3	Turbine Inlet Pressure Loss (in.wg):	5
2.4	Turbine Outlet Pressure Loss (in.wg):	10
2.5	Net Electrical Output Power (kWe) (1): (Measured at the generator terminals)	5299/4417/3709
2.6	Manufacturers ratings based on LHV of (BTU / Cu. Ft.)	922.3
2.7	Natural Gas Fuel Flow at LHV (mmbtu/hr)	44.25/39.92/35.71
2.8	Heat Rate (btu/kW-hr)	8351/9039/9630
2.9	CT Thermal Efficiency (%)	40.859/37.751/35.433
2.10	CT Thermal Recovery (mmbtu/hr) (Available Exhaust Heat)	13.092
2.11	Turbine Inlet Air Flow for Combustion (Ib <sub>m</sub> /hr)	149626/137811/126915
2.12	Turbine Exhaust Gas Mass Flow (Lb <sub>m</sub> /hr)	151460/139460/128319
2.13	Turbine Exhaust Gas Volumetric Flow (Scfm)	33449/30920/28679
2.14	Turbine Exhaust Gas Temperature (°F)	620/692/719
2.15	Ventilation (Scfm) (Inlet Opening/Exhaust Opening)	34,000/34,000
2.16	Required minimum ventilation temperature (°F) (Standard operating range of package)	-4 to 120
3.0	Emissions Data (at 0F ambient air, 13-ft elevation)	
3.1	NO <sub>x</sub> : ppmv; lb <sub>m</sub> /hr	5/.89
3.2	CO: ppmv; lb <sub>m</sub> /hr	10/1.1
3.4	CH <sub>2</sub> O (formaldehyde): lb <sub>m</sub> /hr	0.14
3.5	PM10: lbm/hr	0.5
4.0	Natural Gas Criteria	
	Natural Gas Pressure required at CT Entrance to the Valve Train: PSI	See Skid Edge Pressure Curve
	Natural Gas Temperature: °F	See ES 9-98
	Oil Carryover (Fuel Gas Compressor)	0.5 ppmw

<sup>(a)</sup> Emissions factors from manufacturer specifications for a Solar Turbines Mercury 50-6400R natural gas-fired combustion turbine

(b) Emissions factor from manufacturer specifications for a Solar Turbines Mercury 50-6400R natural gas-fired combustion turbine. Manufacturer documentation indicates that VOC emissions are 20% of the UHC emission factor.

<sup>(c)</sup> Emissions factors from U.S. EPA AP-42 Chapter 3.1, Tables 3.1-2a and 3.1-3 for natural gas-fired turbines.

(d) Emissions factor from manufacturer specifications for a Solar Turbines Mercury 50-6400R natural gas-fired combustion turbine. Manufacturer documentation indicates that methane emissions are 90% of the UHC emission factor.

<sup>(e)</sup> Emissions are calculated according to the following:

Parameter
Turbine Heat Input
Duct Burner Heat Input
Proposed Annual Throughput Limit
Annual Operating Hours
Natural Gas Heating Value
Pound to Kilogram Conversion
Pound to Ton Conversion

Value	Units
44.25	MMBtu/hr
16.50	MMBtu/hr
521.74	MMcf/yr
8,760	hr/yr
1,020	Btu/cf
2.20	lb/kg
2,000	lb/ton

## **Greenhouse Gas Emission Estimates**

Leslie Witherspoon and Anthony Pocengal

## PURPOSE

This Product Information Letter (PIL) summarizes emission factors commonly utilized to estimate greenhouse gas (GHG) emissions of carbon dioxide ( $CO_2$ ), methane ( $CH_4$ ), and nitrous oxide ( $N_2O$ ) from gas turbines.

## INTRODUCTION

PIL 291 addresses combustion related GHG emissions. The emission estimates in this PIL are assumed valid at ambient temperatures >-4°F (-20°C) and for natural gas from 50-100% load (40-100% for the Titan<sup>™</sup> 250 and 80-100% load for the Saturn<sup>®</sup> 20) or for liquid fuel from 65-100% load (80-100% for the Saturn 20 and Centaur<sup>®</sup> 40).

For methane emissions estimates from centrifugal gas compressor seal systems see PIL 251 (Emissions from Centrifugal Compressor Dry Gas Seal System). Control options for these emissions are discussed in PIL 279 (Primary Vent Dry Gas Seal Recompression). Methane emissions associated with venting from start-up purging are estimated in PIL 219 (Pneumatic Start System). Recovery options for blowdown emissions are discussed in PIL 280 (Process Gas Vent Recompression).

## Carbon Dioxide

Carbon dioxide represents ~99% of total CO2e for a natural gas fired turbine at full load. CO<sub>2</sub> emission estimates are available as an output from Solar's engine performance program. Please contact your Solar Account Manager or Environmental Programs for a CO<sub>2</sub> estimate. Alternatively, generic CO<sub>2</sub> emissions can be estimated by multiplying fuel flow in MMBtu/hr (HHV) by 117 lb CO<sub>2</sub>/MMBtu (HHV) [50.3 kg/GJ] for natural gas fuel or by 163 lb CO<sub>2</sub>/MMBtu (HHV) [70.1 kg/GJ] for liquid fuel (diesel #2).

Blending hydrogen with natural gas is a method of carbon reduction under consideration by gas turbine users, policy makers, and governments around the world. Table 1 summarizes the percent decrease in  $CO_2$  emissions and the impact on the  $CO_2$  emission factor estimated on Solar's products at various hydrogen blend concentrations. For project specific estimates submit a fuel gas analysis request. Because the molecular weight of the fuel decreases with the increase of H<sub>2</sub> in an H<sub>2</sub>-NG fuel blend, the reduction of  $CO_2$  on a fuel mass basis (lbm of fuel, kg of fuel) is less than the  $CO_2$  reduction on a mole basis. Table 1 shows the reduction on a mass basis.

	0% H2	5% H2	10% H2	15% H2	20% H2	30% H2	40% H2	50% H2	60% H2	70% H2	80% H2	90% H2	100% H2
CO2 % Reduction Estimate		1-2%	3%	5%	7%	11%	16%	22%	30%	41%	54%	72%	100%
CO2 Emission Factor Ib/MMBtu (HHV) (kg/GJ)	117.2 (50.3)	115.3 (49.6)	113.3 (48.7)	111.1 (47.8)	108.7 (46.7)	103.4 (44.4)	97.1 (41.7)	89.4 (38.4)	79.9 (34.3)	67.9 (29.2)	52.2 (22.4)	30.8 (13.2)	

Table 1. Hydrogen Blended Fuels Impact on CO<sub>2</sub> Emissions Estimates – Simple Cycle Applications

Assumptions: Full load, 59F, 60% RH, no losses, minimum performance, blended with San Diego natural gas.

## Methane

Natural Gas Fired Turbines – Methane exists in the exhaust in very small quantities representing ~0.4% of total CO2e emissions at full load. Emissions of volatile organic compounds (VOC) may comprise up to 10-20% of Unburned Hydrocarbons (UHC). For a very conservative estimate of methane emissions from natural gas fired turbines, assume 90% of the UHC estimated/warranty value as methane. For a 25 ppm UHC warranty this is ~0.028 lb methane /MMBtu (HHV) [12g/GJ]. For a 15 ppm UHC warranty, methane is ~0.017 lb/MMBtu (HHV) [7 g/GJ].

An alternative to estimate methane emissions is to reference the U.S. Environmental Protection Agency (EPA) or Intergovernmental Panel on Climate Change (IPCC) default emission factor for methane of 0.0022 lb/MMBtu (HHV) [1 g/GJ]. However, please note that the default emission factor for natural gas is quite a bit lower than the Solar's recommend emission factor for permitting. The default EPA/IPCC emission factor is more representative of an expected "actual" emissions level.

Liquid Fuel Fired Turbines (Diesel #2) – To estimate methane emissions for #2 diesel fuel Solar recommends using the EPA/IPCC default methane emission factor of 0.0066 lb/MMBtu (HHV) [2.9 g/GJ].

For CO2e calculations the current Global Warming Potential (GWP) of methane value is 25.

#### Nitrous Oxide

Nitrous oxide (N<sub>2</sub>O) can be produced in the combustion process in very small quantities representing ~0.6% of total CO2e emissions from a natural gas fired turbine at full load. Solar Turbines has limited test data for N<sub>2</sub>O on natural gas. Based on the test data a conservative emission factor for N<sub>2</sub>O emissions is 0.0023 lb/MMBtu (HHV) [1 g/GJ] from 50-100% load.

An alternative is to reference the EPA/IPCC default emission factors for N<sub>2</sub>O. However, please note that the default emission factor for natural gas is an order of magnitude lower than the Solar estimate. The EPA/IPCC values originate in the 1996 IPCC Guidelines and are restated in the 2006 IPCC Guidelines and state, "...Since not many measurements of these types of emission factors are available, the uncertainty ranges are set at plus or minus a factor of three." For natural gas the EPA/IPCC emission factor is 0.00022 lb/MMBtu (HHV) [0.1g/GJ]. For #2 diesel the EPA/IPCC emission factor is 0.0014 lb/MMBtu (HHV) [0.6 g/GJ].

For CO2e calculations the current GWP of  $N_2O$  is 298.

## Volatile Organic Compound, Sulfur Dioxide, and Formaldehyde Emission Estimates

Leslie Witherspoon

## PURPOSE

This Product Information Letter (PIL) summarizes emission factors commonly utilized to estimate emissions of volatile organic compounds (VOC), sulfur dioxide (SO<sub>2</sub>), and formaldehyde from gas turbines.

## Volatile Organic Compounds

Many permitting agencies require gas turbine users to include emissions of VOC, a subpart of the unburned hydrocarbon (UHC) emissions, during the air permitting process. Volatile organic compounds, non-methane hydrocarbons (NMHC), and reactive organic gases (ROG) are different ways of referring to the non-methane (and non-ethane) portion of an "unburned hydrocarbon" emission estimate.

For natural gas fuel, Solar's customers often use 10-20% of the UHC emission rate to conservatively estimate VOC emissions. Solar can offer a 5 ppm VOC warranty level upon request. For liquid fuel, it is appropriate to estimate that 100% of the UHC estimate is VOC. The emissions estimates are assumed valid for natural gas at ambient temperatures >-4°F (-20C) from 50-100% load (80-100% load for the Saturn<sup>®</sup> 20 and >-20°F (-29C) and 40-100% for the Titan<sup>™</sup> 250) and for liquid fuel from 65-100% load (80-100% for the Saturn 20 and Centaur<sup>®</sup> 40).

Environmental Protection Agency (EPA's) AP-42<sup>1</sup> document and WebFIRE<sup>2</sup> database also contain VOC emission estimates for gas turbines. These sources are not commonly used by Solar's customers.

## Sulfur Dioxide

Sulfur dioxide emissions are produced by conversion of any sulfur in the fuel to  $SO_2$ . Solar customers usually either use a mass balance calculation or reference AP-42 to estimate  $SO_2$  emissions. Because Solar does not control the amount of sulfur in the fuel, no  $SO_2$  emissions warranty is available.

The mass balance method assumes that any sulfur in the fuel converts to  $SO_2$ . For reference, the typical mass balance equation is shown below.

$$\frac{\text{lb SO2}}{\text{hr}} = \left(\frac{\text{wt\% Sulfur}}{100}\right) \left(\frac{\text{lb fuel}}{\text{Btu}}\right) \left(\frac{10^6 \text{ Btu}}{\text{MMBtu}}\right) \left(\frac{\text{MMBtu fuel}}{\text{hr}}\right) \left(\frac{\text{MW SO2}}{\text{MW Sulfur}}\right)$$

Variables: wt% of sulfur in fuel Btu/lb fuel (LHV) MMBtu/hr fuel flow (LHV)

As an alternative to the mass balance calculation, EPA's AP-42 document can be used. AP-42 (Table 3.1-2a, April 2000) suggests emission factors of 0.94S lb/MMBtu (HHV) (where S=Sulfur % in fuel) or 0.0034 lb/MMBtu (HHV) for gas fuel and 1.01S lb/MMBtu (HHV) (where S=Sulfur% in fuel) or 0.33 lb/MMBtu (HHV) for liquid fuel.

<sup>&</sup>lt;sup>1</sup>AP-42 is an EPA document containing a compilation of air pollutant emission factors by source category.

<sup>&</sup>lt;sup>2</sup> WebFIRE is an EPA electronic based repository and retrieval tool for emission factors.

## Formaldehyde

For gas turbines, formaldehyde emissions are a result of incomplete combustion and are unstable in the exhaust stream. In this section, regulatory background, recommended emission factors, and testing considerations are discussed.

#### Regulatory Background and Emissions Factors – U.S. and EU

In 2004 the U.S. EPA published a Maximum Achievable Control Technology (MACT) standard (40 CFR 63 Subpart YYYY) for natural gas fired combustion turbines with a formaldehyde limit of 91 ppb (15% O2). The standard was stayed a few months later for the natural gas subcategories essentially rendering the regulation "on hold". The stay was lifted on March 9, 2022. After ~18 years of not having to comply with the MACT standard, natural gas fired combustion turbines located **at major sources of hazardous air pollutants** need to comply with the standard. The initial compliance date is September 4, 2022. With the lifting of the stay, four of the eight subcategories outlined in the Subpart YYYY must comply with the MACT standard. They are:

- stationary lean premix combustion turbines when firing gas and when firing oil at sites where all turbines fire oil no more than an aggregate total of 1,000 hours annually
- stationary lean premix combustion turbines when firing oil at sites where all turbines fire oil more than an aggregate total of 1,000 hours annually
- stationary diffusion flame combustion turbines when firing gas and when firing oil at sites where all turbines fire oil no more than an aggregate total of 1,000 hours annually
- stationary diffusion flame combustion turbines when firing oil at sites where all turbines fire oil more than an aggregate total of 1,000 hours annually

For U.S. customers with a combustion turbine that must comply with Subpart YYYY, an emission factor of 91 ppb @ 15% O2 (~0.00021 lb/MMBtu HHV) is recommended.

The formaldehyde emissions estimate of 91 ppb @15%O2 (~0.00021 lb/MMbtu HHV) can be used for all new, current production, SoLoNOx models and ratings when firing pipeline quality natural gas or ultra-low sulfur (ULSD) diesel fuel. The emissions estimate is valid for natural gas from 50-100% load (40-100% load for Titan 250) or for liquid fuel from 65-100% load (80-100% load for the Centaur 40) and at ambient temperatures >-4°F (-20C) [> -20 °F (-29C) for Titan 250].

Alternative emission factors for combustion turbines **not** affected by Subpart YYYY (or non-U.S. based combustion turbines) are from U.S. EPA's AP-42 document and are 0.00071 lb/MMBtu (HHV) for natural gas and 0.00028 lb/MMBtu (HHV) for distillate oil<sup>3</sup>. Note that both of the aforementioned formaldehyde emission factors are higher than the MACT standard. Since ~2003 many gas turbine users have used the emission factors found in an EPA memo <u>Revised HAP Emission Factors for Stationary Combustion Turbines<sup>4</sup></u> for estimating hazardous air pollutant emissions. The memo presents hazardous air pollutant emission factor data in several categories. While the memo presents several formaldehyde emissions factors, the most common formaldehyde emission factor used to estimate emissions from gas turbines from this document is 0.00288 lb/MMBtu HHV (Table 16). Note that this emission factor is an order of magnitude higher than the MACT standard.

In the EU, Germany has established a formaldehyde limit of 5 mg/Nm3 for combustion turbines (13.BlmSchV Section 33). This limit applies for operation at 70-100% load and it is anticipated that something similar will be adopted in other EU member states. The 5 mg/Nm3 limit is equivalent to ~0.0038 kg/GJ or ~3.7 ppm.

#### Formaldehyde Emissions Testing Considerations

Actual emissions of formaldehyde from Solar's gas turbines, in the SoLoNOx operating range, are predicted to be less than 91 ppb @15%O2. However, **the 91 ppb level can only be verified if the proper testing equipment is utilized.** To properly measure formaldehyde emissions, Fourier Transform Infrared (FTIR) instrumentation with limits of detection well below the standard must be utilized. Most "traditional" FTIR systems have formaldehyde

<sup>&</sup>lt;sup>3</sup> AP-42, Table 3.1-3 for Natural Gas and Table 3.1-4 for Distillate Oil, 4/00.

<sup>&</sup>lt;sup>4</sup> Revised HAP Emission Factors for Stationary Combustion Turbines, OAR-2002-0060, IV-B-09,8/22/03.

limits of detection in the 120-150 ppb range and are not suitable to measure formaldehyde from combustion turbines.

## Solar recommends the MKS Multi Gas 2030 FTIR with StarBoost<sup>™</sup> System, the Spectrum WaveRunIR-EXT or an equivalent system with similar path lengths and detection levels.

EPA Method 320 (or equivalent method for non-U.S. testing) should be used to measure formaldehyde. Testing should include three – 120-minute test runs. To ensure accurate formaldehyde measurements, the testing company, in addition to following the requirements of Method 320 (or equivalent method), should take necessary steps to optimize signal-to-noise, verify the FTIR is fully temperature stabilized and purged, ensure the FTIR signal is optimized before testing by maximizing alignment and cleanliness of optics, minimize sampling line bias by using clean sample lines at 250°F to prevent off-gassing and minimize contamination with other compounds, verify absence of sampling system bias via system zero measurements, measure a source specific moisture spectrum while at the test site using a water/N2 delivery systems at +/-10% of turbine moisture content, and use the source specific water spectrum as an interferent in the analysis.
