Monmouth Battlefield State Park discharges sanitary wastewater generated by public restrooms associated with the operation of the State Park. The Park also discharges backwash from the potable water treatment plant which serves the State Park. The Water Treatment Plant uses potassium permanganate for iron removal in green sand filters. Two potable wells supply water and are located approximately 390 feet from the spray irrigation field and the subsurface disposal system. Sanitary wastewater is collected and undergoes flow equalization, primary settling, biological treatment utilizing RBCs, denitrification and UV disinfection prior to spray irrigation or subsurface disposal.

The conventional wastewater design flow volume of sanitary wastewater from the school is approximately 15,000 gpd, however, the school has a wastewater recycling and treatment system which recycles the majority of the treated wastewater through the school's toilets. Because the majority of the wastewater is recycled, the treatment system has been designed to discharge 3,000 gpd of effluent to ground water via four subsurface disposal beds totaling 6,000 square feet. The wastewater is treated to Ground Water Quality Standards for all parameters of concern except fecal coliform bacteria prior to discharge. Although ultraviolet disinfection is provided, final treatment to Ground Water Quality Standards is provided by unsaturated soils within the disposal bed. The maintenance of an adequate unsaturated soil zone is assessed through required water level measurements in four monitor wells. All residuals generated by the treatment and disposal system are managed at an approved residuals management facility.
