**Subject:** [EXTERNAL] pfas in sludge

**Categories:** [REDACTED]

PFAS are becoming ubiquitous in our environment and now we have to be concerned about their land application via contaminated sludge. Rather than resigning ourselves to their presence because they are so prevalent, we must resist even more entry points into our air, water and land. I urge you to consider the urgency of using every means possible to prevent more exposure to these deadly chemicals and use whatever means you have to dissuade those who would propagate them further.

Thank you,  
Stephanie Scanlon
