March 2018

ACKNOWLEDGMENTS

The New Jersey State Wildlife Action Plan (Plan) is a blueprint for the future conservation of our state's species of greatest conservation need. We wish to acknowledge the staff of the Endangered and Nongame Species Program (ENSP) within the NJ Department of the Environmental Protection's (NJDEP) Division of Fish and Wildlife, and the staff of the Conserve Wildlife Foundation of New Jersey whose dedicated work over many months shaped the Plan. ENSP staff include David Jenkins (Chief), Kris Schantz, Kathy Clark, John Heilferty, Jeanette Bowers-Altman, Christina Davis, Amanda Dey, Gretchen Fowles, MacKenzie Hall, Brian Henderson, Kim Korth, Sharon Petzinger, Patrick Woerner, Brian Zarate, Kerri Smith and Emily Melendez. Numerous programs and staff from the NJDEP and the various Bureaus within the Division of Fish and Wildlife provided valuable review and input, especially Shawn Crouse and Greg Hinks from Freshwater Fisheries and Marine Fisheries, respectively. Special thanks to Director Larry Herrighty, former Director David Chanda, and Assistant Director Dave Golden for their continued support and assistance during the development and review of the plan. We also appreciate significant input from Assistant Commissioner Rich Boornazian, as well as Kathleen Walz of the NJDEP's Office of Natural Lands Management.

A special debt of gratitude is owed to the New Jersey Endangered and Nongame Species Advisory Committee, and former and current chairs Barbara Brummer and Rick Lathrop. Their expertise and guidance over the years and during the development of the plan have helped New Jersey become a national leader in rare species conservation. The NJ Fish and Game Council also provided input.

We are also grateful to the Conserve Wildlife Foundation of New Jersey for their support of this project and thank Executive Director David Wheeler, and staff Liz Silvernail, Todd Pover, Ben Wurst, Larissa Smith, and Michael Davenport for assistance in reviewing, editing, and pursuing implementation of the plan. Special thanks to David VanLuven for his editorial work and oversight. Other agencies and New Jersey conservation organizations that were major contributors to the plan that deserve special recognition include the NJ Audubon Society, the NJ Conservation Foundation, The Nature Conservancy-NJ Chapter, the NJ Pinelands Commission, the D&R Greenway Land Trust, the U.S. Fish and Wildlife Service-NJ Field Office, the National Wildlife Refuges (NWR) [namely, Edwin B. Forsythe NWR, Cape May NWR, Supawna Meadows NWR, Great Swamp NWR, and Wallkill River NWR], the National Park Service (Gateway National Recreation Area–Sandy Hook Unit and Delaware Water Gap National Recreation Area–Milford, PA), the U.S. Department of Defense, the USDA Natural Resource Conservation Service, and the NJ State Forestry Service.

The inherent danger in writing an acknowledgment is not mentioning all the individuals and organizations that contributed. This is especially true for the New Jersey State Wildlife Action Plan since so many people and organizations played key roles in its development. We encourage readers to carefully review Appendix L within the plan that we hope includes all who participated in the development of this plan.

EXECUTIVE SUMMARY

A. Background

In 2000, Congress created the federal State Wildlife Grants program to help states conserve imperiled wildlife species, particularly those that were not traditionally hunted or fished. The program required states to develop Comprehensive Wildlife Conservation Strategies, later known as State Wildlife Action Plans, which identified Species of Greatest Conservation Need (SGCN), their habitats, threats, and conservation actions to protect them. In addition to providing a blueprint for conserving each state's rare and imperiled wildlife, the plans made states eligible for federal State Wildlife Grant funds for conservation action.

The New Jersey Division of Fish & Wildlife (DFW) released the first New Jersey State Wildlife Action Plan in 2006 and a slightly revised version of it in 2008. That plan embodied (and continues to embody) the collective judgment of the state's conservation professionals regarding which species and areas should receive special attention and what should be done. It identified tasks that could be accomplished by a variety of agencies, organizations, and landowners to keep common species common and to down-list or delist rare species.

This 2017 plan is the first complete revision of the initial plan. In essence, this plan is an assessment of the health of the state's wildlife and habitats, the problems they face, and actions that are needed to conserve them over the long term. With federal funding from the State Wildlife Grants program and state and private sources, the plan fosters cooperation between partners in the public and private sectors and enables effective conservation projects.

A fundamental underpinning of this plan is the recognition that certain species require new or additional conservation actions to ensure their long-term persistence. Because of changes in New Jersey's environment – both from past human activities and ongoing threats with local or distant origins – these wildlife species are unlikely to persist in the state without conservation action.

This plan is a dynamic tool for all landowners and land managers. Many components of the plan are useful to private property owners whether they manage a small backyard or a significantly larger property, and whether their property is actively used (such as for farming) or is left in a natural condition. These same plan components can also be applied by the managers who steward the state's many public and nonprofit-owned properties. Regardless of the property or the owner, this plan is designed to serve as a framework for directing the protection of Species of Greatest Conservation Need and the habitats required for their continued survival.

B. Core Underpinnings of the Plan

There are seven key considerations that permeate all aspects of this revised plan.

- ***Habitat Loss Is the Greatest Threat to New Jersey's Wildlife*** – Habitat loss, including both a) the complete loss of wildlife habitat, and b) the conversion of "suitable wildlife habitat" to conditions that no longer serve critical suitability needs of wildlife species, is a primary risk to wildlife, both directly and by disrupting essential life history and behavior patterns. Habitat and connectivity maps generated with the Landscape Project

and Connecting Habitat Across New Jersey (CHANJ) project are key tools for integrating wildlife considerations into planning and regulatory processes.

- ***Stewardship and Restoration Are Critical Actions*** – Managing for biodiversity management on public and private lands is necessary to ensure the persistence of New Jersey’s biological diversity. Key actions include research, monitoring, refining best management practices, maintaining properties with critical habitats, and restoring riparian buffers.
- ***Wildlife Management Must Control Overabundant Species*** – Control of overabundant species in and around critical habitats is vital for protecting New Jersey’s rare wildlife species. Some species, in particular white-tailed deer, when unchecked, can change habitats at a landscape scale and eliminate habitats on which rare wildlife depend. Other wildlife, like raccoons, foxes, and crows, fall in the category of “human-subsidized predators,” whose elevated populations can cause high rates of mortality for rare wildlife. Programs like Community-based Deer Management and targeted wildlife management can be effective, especially when implemented in collaboration with private landowners and public land stewards.
- ***Invasive Species Threaten Native Biodiversity*** – Invasive species, both plant and animal, often out-compete and crowd out native species, leaving behind less diverse ecosystems. Priority conservation actions include identifying routes through which invasive species are introduced, improving monitoring within and beyond New Jersey, and implementing management and eradication efforts.
- ***Recovery Plans Are Important for Effective Action*** – Ensuring the persistence of imperiled wildlife species in New Jersey typically requires a complex set of actions to be taken over many years. While this plan lays out threats and conservation actions for many species, more focused and more detailed recovery plans are an important tool, particularly for federally and state-listed species.
- ***Sound Science Must Be a Foundation for the Plan*** – The information and recommendations in this plan are built on rigorous research and expert interpretation of all available data. But more research and monitoring are needed to ensure that conservation actions are effective. For example, this plan calls for adaptive management procedures to use new information to inform and guide research and conservation actions throughout New Jersey.
- ***Urban & Suburban Environments Pose Distinctive Challenges*** – As the nation’s most densely populated state, New Jersey’s urban and suburban environments present unique challenges. Urban wildlife oases are still being identified, and strategies for maintaining them in the context of surrounding activities are still needed for many locations.

C. Past Successes Have Laid a Strong Foundation for Future Conservation

New Jersey’s State Wildlife Action Plan has been guiding conservation strategies to benefit wildlife and their habitats throughout the state since 2006. Important actions from the plan have been implemented by local, county, state, and federal agencies, non-profit organizations, and private landowners. Many examples are provided in the plan, including:

- ***Bringing Bald Eagles Back from the Brink*** – From 2005 to 2014, the number of bald eagles nesting in New Jersey increased from 42 pairs to 150 pairs, a 257% increase. This was accomplished by protecting nesting sites through cooperative relationships with

public and private landowners. Trained volunteer nest observers provide data on most of the nests statewide as well as assist with the DFW's outreach programs.

- ***Restoring Endangered Bog Turtles*** – In partnership with other agencies, the DFW is working to restore federally threatened bog turtle populations using cooperative agreements with landowners to restore and protect valuable wetlands habitats. One innovative program pioneered in New Jersey was the restoration of hundreds of acres of wetland habitat through prescribed grazing.
- ***Restoring Fish Habitats*** – Bureau of Freshwater Fisheries staff provide technical assistance on conservation, stream restoration, dam removal, and land use projects. The Musconetcong and Raritan Rivers both benefited from dam removals, and efforts are underway for additional removals on the Millstone and Paulins Kill Rivers.
- ***Managing Complex Wildlife Habitats*** – Excellent stewardship by New Jersey's conservation partners and individual landowners have benefitted wildlife and their habitats across more than 40,000 acres. Examples include the management of important agricultural grassland, early successional, wetland, and riparian habitats with periodic mowing, prescribed burning, and other techniques to benefit grassland birds and other wildlife. Partners also re-contoured and planted degraded lake and stream shorelines to enhance water quality and wildlife value. Further, forests on private and public lands were managed to increase their species diversity and understory vegetation.

D. Focusing on Species of Greatest Conservation Need

New Jersey is home to more than 3,700 wildlife species, from monarch butterflies to blue whales. Some species are stable or have growing populations. Others are rare, perhaps naturally because they live in unusual habitats, or perhaps due to changing or disappearing habitats.

A challenge for all wildlife managers is determining where and how to direct limited resources to best support the full range of wildlife diversity in New Jersey. This State Wildlife Action Plan is an important step to guiding conservation activities, whether they are implemented by state agencies, nonprofit organizations, or neighborhood groups.

Species of Greatest Conservation Need (SGCN) are the heart of all State Wildlife Action Plans. New Jersey's original 2006 Plan, along with the 2008 Revised Plan, addressed 289 SGCN. In preparation for this plan, the ENSP, with other wildlife experts and conservation partners, reassessed the state's wildlife species and created an updated list of 656 SGCN.

While comprehensive, at 656 species the SGCN list is too big for an effective State Wildlife Action Plan with achievable goals. With input from our conservation partners, the DFW therefore refined the list with taxonomic experts and conservation partners to identify 107 Focal SGCN. These species were selected based on their state and regional imperilment, the importance of New Jersey populations to each species' range-wide viability, and the feasibility of undertaking actions that would yield successful results.

While this revision of the State Wildlife Action Plan is focused on 107 species, it is not being suggested, nor should it be implied, that the state's conservation interests are limited to these species. The NJ State Wildlife Action Plan's Executive Committee, a group composed primarily of conservation partners, simply believed that this more focused approach to planning and

Executive Summary

conservation would yield greater conservation results not only for the Focal SGCN, but for the many other SGCN that are not formally addressed within the plan.

Recognizing that synergies exist between species with overlapping habitats, the 107 Focal SGCN were grouped by the expert taxonomic teams into guilds that reflected similarities in the species' taxonomies, ecological requirements, threats, and actions needed to conserve them. This assessment categorized 77 of the species into 18 groupings, while the remaining 30 species remained ungrouped.

Appendix D presents species characterization reports for each Focal SGCN (*Profiles of the Focal Species of Greatest Conservation Need*). These profiles include general information about the species (including its appearance, life history requirements, and distribution in New Jersey), conservation status, population abundance and trends, broad habitat types, and more.

E. Concentrating on Key Habitats and Conservation Focal Areas

Effective conservation of New Jersey's diverse wildlife requires planning at different scales. At the finer scale, Focal SGCN provide a discrete set of wildlife that are both in need of immediate protection *and* perceived to be responsive to known and feasible conservation actions.

Implementing targeted efforts towards Focal SGCN will also benefit many other species. That said, species-specific conservation is not enough, especially given the long-term shifts that are occurring now, and will continue to occur as New Jersey's landscape continues to change in response to human activities compounded by changing climate.

To address this broader scale need, the ENSP identified Conservation Focal Areas (CFAs). CFAs are specific areas of New Jersey that feature some of the state's highest value habitats and present important opportunities for effective conservation action. They allow for the consideration of threats and actions from a geographic perspective so will benefit key wildlife habitats generally and, in turn, virtually all SGCN. Further, CFAs include important opportunities for habitat connectivity, a critical factor in increasing resilience in a changing landscape.

CFAs reflect a wide variety of habitats throughout New Jersey based upon factors including quality, integrity, connectedness, and the likelihood of successfully implementing conservation actions within them. With their rich mix of important habitats and diverse species assemblages, CFAs represent some of the best opportunities for protecting, restoring, and sustaining New Jersey's wildlife diversity.

Through the two-pronged approach of Focal SGCN and Conservation Focal Areas, the 2017 Revised Plan is designed to better enable the DFW and conservation partners to focus their efforts and limited resources. The plan will help a variety of users – whether individual property owners or statewide organizations – advance their specific interests through actions and in habitats that will benefit all of New Jersey's wildlife diversity.

F. Recognizing Threats and Taking Actions to Address Them

New Jersey's wildlife and their habitats face hundreds, if not thousands, of threats to their persistence and well-being. Many of these threats, along with the conservation actions necessary to alleviate their impacts, have been identified in this plan with an emphasis on Focal SGCN.

This State Wildlife Action Plan is necessary because many of New Jersey's wildlife species face threats that could make them disappear from the state. At the same time, actions to address these threats could help many species recover to the point that they no longer need to be officially listed, or keep them from declining to the point where they need to be listed.

Using the 107 Focal SGCN as representatives of New Jersey's wildlife, DFW teams of taxonomic experts assessed threats related specifically to each. This assessment distilled the myriad of conservation actions needed to protect New Jersey's wildlife and their habitats into those actions that are most significant and will have the greatest impact on wildlife conservation in the next ten years.

Appendix J presents the *Threats and Conservation Actions for the Focal Species of Greatest Conservation Need* report that includes extensive and highly detailed lists of threats and the applicable conservation actions for each of the Focal SGCN. Plan users should consider this information when developing new or adapting on-going conservation projects.

Additional assessments delivered a wide-ranging list of actions, some of which were directed at overarching benefits to multiple SGCNs and their habitats, and some that applied only to individual species. The DFW grouped these actions when they addressed a particular threat, a suite of related threats, or a conservation need. These groups of actions – or projects – were then divided into jobs that would collectively help accomplish the project.

Appendix K contains the *Projects to Conserve New Jersey's Wildlife Populations of Concern* report. The report lists 32 projects which include 102 jobs; one project and its associated job are under development. For each job, the report describes the objective and purpose, benefits, Focal SGCN it would directly benefit, threats, and conservation actions.

G. Monitoring Effectiveness and Adapting Management for Greater Success

Monitoring comes in many forms and can serve many different conservation purposes. At the most basic level, monitoring can simply note whether or not a species continues to be present at a given location. At a more detailed level, monitoring can help managers determine the effectiveness of conservation actions and, in turn, adapt management activities to maximize their benefits.

Adaptive management is the process through which conservation actions are undertaken, assessed through careful monitoring, and then modified as necessary based on the monitoring results. Adaptive management is necessary because there is still so much we don't know about wildlife, their habitats, and the complex interactions of these with the surrounding world. In addition to gaining insights into wildlife management from conservation and monitoring efforts in New Jersey, the DFW is also committed to learning from, and contributing to, work on SGCN in other states.

Many of New Jersey's SGCN and habitats have active monitoring programs, some dating back more than 60 years. For example,

- The ENSP's ***Landscape Project*** maps critical wildlife habitat using species sighting data applied to suitable habitat types. Adopted by the NJ Department of the Environmental Protection (NJDEP) in 1993 to define habitats, it is a powerful tool for conservation planning and measuring habitat change over time.
- The ***Breeding Bird Survey*** in New Jersey is part of the national breeding bird survey that is used to detect bird population trends nationally and, to a lesser degree, within the state. Conducted largely by skilled volunteers, the data are considered each time the state reassesses bird species' conservation statuses and trends.
- Since 1968, the DFW's ***Trout Production Stream Monitoring Project*** has identified and classified New Jersey waters according to their suitability for trout. The classifications became part of the state's Surface Water Quality Standards in 1981, and trout-suitable waterways receive greater protection under state regulations.

H. Meeting Federal Requirements Now and in the Future

As with the 2006 Plan, the 2017 State Wildlife Action Plan must meet a suite of federal requirements overseen by the U.S. Fish & Wildlife Service. Specifically, every plan across the country must contain eight key elements:

1. Information on the distribution and abundance of wildlife species;
2. Descriptions of locations and relative condition of key habitats and community types;
3. Descriptions of problems and priority research and survey efforts;
4. Descriptions of conservation actions;
5. Proposed plans for monitoring;
6. Descriptions of procedures for reviewing the plan;
7. Provisions for coordinating the development and implementation of the plan with federal, state, and local agencies and representatives of organized New Jersey Native American groups; and
8. Provisions for broad public participation.

From 2018 to 2021, the DFW will continue revising the 2017 Plan to fill information gaps, provide additional clarity and guidance to plan users, and further prioritize conservation efforts.

ROADMAP TO THE EIGHT REQUIRED ELEMENTS

Federal guidelines require that all State Wildlife Plans address eight important elements. The intent of these elements is to help states ensure that their wildlife conservation efforts are strategic, carefully directed, and effective. In this section, we list each of the eight elements and briefly note how they are addressed within this revised plan.

1. Identify the distribution and abundance of Species of Greatest Conservation Need (SGCN)

The state's original 2006 Plan, along with the 2008 Revised Plan, addressed the conservation needs of the state's wildlife Species of Greatest Conservation Need (SGCN), with 289 SGCN identified. Since then, the ENSP modified the criteria for identifying SGCN and changed the status of some species as a result of this assessment. These changes led to the identification of 656 SGCN for the 2017 Revised Plan.

To better guide implementation, the DFW has focused the 2017 Revised Plan on a subset of the full SGCN list. This suite of Focal SGCN was selected through an assessment process that considered state and regional imperilment, the importance of New Jersey populations to each species' range-wide viability, and the feasibility of undertaking actions that would yield successful results.

It must be clearly stated that while this revision of the NJ State Wildlife Action Plan (Plan) is focused on 107 species, it is *not* being suggested, nor should it be implied, that the state's conservation interests are limited to these species. The Plan's Executive Committee, a group consisting primarily of conservation partners, simply believes that this more focused approach to planning and conservation will yield greater conservation results not only for the Focal SGCN, but for the many other SGCN that are not formally addressed within the plan.

Chapter 1 and its associated appendices and attachment provide a detailed discussion of SGCN, their distribution, and their abundance in New Jersey.

2. Describe the location and condition of key habitats essential to the SGCN

Locations of key habitats for SGCNs are described at multiple scales. Ranges of all Focal SGCNs are included in species profiles, while broad habitat categories identified for each Focal SGCN species allow a finer delineation of where habitats for these species are found in New Jersey. Additionally, for more than half of Focal SGCNs, New Jersey's Landscape Project maps provide an even finer resolution of habitat locations.

Pursuing the same efficiencies used for SGCN, the DFW also revised the 2017 Plan's list of habitats where conservation actions could be targeted. The 2006 Plan and the 2008 Revised Plan both recognized that many habitats throughout the state benefitted wildlife and that conservation actions undertaken anywhere would yield positive effects. While this approach provided useful information for every portion of the state, 10 years of plan implementation by numerous partners has led the DFW to conclude that even greater success could be achieved if conservation actions were focused not only on a smaller number of species, but also on more spatially refined areas of conservation interest.

Roadmap to the Eight Required Elements

Therefore, in another change from the 2006 Plan and the 2008 Revised Plan, the DFW undertook a second assessment to identify areas where habitat conservation efforts should be focused. The assessment used a relatively species-independent methodology (described in Chapter 2) that identified habitats with higher ecological integrity, larger sizes and core areas, and fewer negative influences like development and roads. The areas selected also ranked higher for biodiversity for both terrestrial and aquatic species richness. The resulting Conservation Focal Areas (CFAs) will help focus conservation efforts to better protect critical core areas and connecting corridors for Focal SGCN and other wildlife

Chapter 2 and its associated appendices and attachment describe the locations and conditions of key habitats for New Jersey's SGCN.

3. Describe the threats to and research needs for SGCN and their habitats

To categorize, assess, and track threats, the DFW utilized the common threats lexicon for the Northeastern states following the International Union for the Conservation of Nature's (IUCN) threats classification scheme and the "action drivers" lexicon used in U.S. Fish & Wildlife Service's Tracking and Reporting on Actions for Conservation of Species (TRACS) system. Working with conservation partners and wildlife experts, the DFW organized threats into 13 threat and action-driver categories based on these lexicons.

DFW teams of taxa experts assessed how each of the threat and action-driver categories related specifically to the 107 Focal SGCN. They used a qualitative, expert-opinion-based approach that considered six threat characteristics for each Focal SGCN: severity, reversibility, immediacy, spatial extent, certainty, and likelihood of impact in the next 10 years. These conditions were used to assign a summary impact rating for each of the Focal SGCN. These ratings were then used to identify the threats that required immediate or near-term conservation actions.

Chapter 3 and its associated appendices and attachments provide a detailed overview of threats and research needs for SGCN and their habitats.

4. Describe the conservation actions required to conserve the identified species and their habitats

For the 2006 Plan, the DFW and conservation partners identified hundreds of conservation actions needed to address the many threats facing SGCN. For this revision, the DFW determined which of these actions needed to be revised for clarification or specificity, could be removed because they were no longer applicable to current conditions, or could be combined or condensed. The goal in this effort was to make the plan easier to use. The DFW also identified additional actions that could address more recent challenges (such as new wildlife diseases and a growing understanding of climate change). All of these actions were categorized using the TRACS lexicon.

The DFW identified the specific conservation actions that applied to each of the threats and action drivers and for each Focal SGCN. The resulting list of actions, however, will benefit from additional, ongoing prioritization to more precisely identify a more limited set of feasible and effective actions on which the conservation community should focus over the next 5-10 years.

Roadmap to the Eight Required Elements

Chapter 3 and its associated appendices provide extensive and highly detailed lists of threats, action drivers, and conservation actions for each of the Focal SGCN.

5. Identify monitoring plans for SGCN, their habitats, and the proposed conservation actions

Monitoring is a vital component of this revised plan, both in the context of tracking the status of SGCN and their habitats, and in the context of guiding adaptive management decisions. To ensure that monitoring results are useful within the state and regionally, the DFW will continue to use the U.S. Fish & Wildlife Service's Tracking and Reporting on Actions for Conservation of Species (TRACS) system. This collaborative approach will allow managers to better target their SGCN management actions to achieve the greatest conservation benefits, both in New Jersey and throughout each species' range.

Chapter 4 and its associated appendices provide an overview of past, ongoing, and planned monitoring efforts for each of the Focal SGCN.

6. Describe the review process of the Plan at intervals not to exceed ten years

New Jersey's State Wildlife Plan is a dynamic, evolving document. This plan is the second revision since the plan was first completed in 2006, and additional revisions are planned in 2018 and beyond.

7. Coordinate the Plan with other federal, state, and local agencies' wildlife and land management plans

In 2013, the ENSP created a Plan's Executive Committee to help steer development of the plan. The committee was composed of a strong mix of wildlife experts from government agencies and nonprofit organizations: the U.S. Fish and Wildlife Service-NJ Field Office, the U.S. Department of Agriculture-Natural Resources Conservation Service, the Conserve Wildlife Foundation of New Jersey, the New Jersey Audubon Society, The Nature Conservancy, Ducks Unlimited, the National Wild Turkey Federation, Trout Unlimited, and staff from all bureaus of NJ Division of Fish and Wildlife.

Additional stakeholder input involved regular meetings with the Endangered and Nongame Species Advisory Committees and the Fish and Game Council. Appointed by the NJDEP's Commissioner and New Jersey governor, respectively, these committees are composed of experts from academia, nonprofit conservation organizations, and sportsmen and sportswomen. Members provided the ENSP with guidance on all aspects of the plan's development.

The ENSP also held three Action Development workshops in 2015 that focused on developing actions that were consistent with the TRACS lexicon. Participants in these workshops included municipal, county, state, and federal government agencies in addition to energy companies, academic researchers, and nonprofit organizations.

Three American Indian tribal groups are represented on the New Jersey Department of State's Commission on American Indian Affairs Despite multiple requests for meetings by the DFW, no replies were ever received.

Roadmap to the Eight Required Elements

Coordination with these varied stakeholders allows the DFW to consider content from existing New Jersey-specific wildlife management and/or habitat management plans, many of which are referenced in the Species Profiles, into the development of this plan.

8. Include a public involvement process in the development and implementation of the Plan

In 2015, the DFW deployed website pages that detailed plan development and progress, and included a drop-down menu for members of the public to easily use for submitting comments on each plan section and issue. The pages were prominently featured and labeled on both the DFW home page and the NJ Department of the Environmental Protection's main page. Further, whenever the web pages were updated, email notifications were sent to all members of the public who subscribed to the DFW listserv. Through the revision process, 67 public comments were submitted through the website.

In addition to the website, meetings of the Endangered and Nongame Species Advisory Committees and the Fish and Game Council were subject to the state Open Public Meetings Act so had their dates, times, and agenda items broadcast through public notices online, in listservs, and in newspapers.

The final version of the Plan was made available via the DFW's web site for a 40-day public comment period. The public comment period was announced via a Department press release, announcement on the DFW's State Wildlife Action Plan web page, via e-mail distributions to a variety of DFW email listservers (estimated to have reached over 2,400 persons), and posting on the DFW's Facebook page. Public announcements appeared in 7 newspapers of regional or local distribution. The DFW received over 150 comments from members of the public and/or members or representatives of 14 different groups, organizations or agencies.

After considering all comments received, the DFW found that many helped to improve the Plan by identifying text that was either incorrect, unclear, or required additional information. Some of the comments recommended revisions to, or additions or deletions of threats, actions or "Projects," or identified resources or perspectives that enhanced the DFW's understanding or assessment of pertinent issues. These comments all resulted in valuable contributions to the final Plan.

GUIDE TO NEW JERSEY'S STATE WILDLIFE ACTION PLAN

This revised State Wildlife Action Plan (Plan) is, due to the complexity of wildlife management and the wide range of species requiring conservation action, a long and complex document. This section provides a concise overview of the plan and its different sections to help readers navigate the plan and find the information they need.

A. Introduction

The introductory sections provide background information on the plan in the context of the original 2006 Plan and the 2008 Revised Plan. It also includes notes on seven key conservation issues and brief descriptions of the myriad conservation actions taken to conserve Species of Greatest Conservation Need (SGCN) between 2006 and 2016.

B. Chapter 1: New Jersey's Most Vulnerable Wildlife

This chapter walks through the process used to identify New Jersey's 656 SGCN and how additional selection criteria were employed to further refine that list to 107 Focal SGCN. The Focal SGCN are the centerpiece of this plan. Chapter 1 references the following appendices and attachment that provide additional detail related to these wildlife species.

Appendix A: *Criteria for Selecting SGCN*

Appendix B: *New Jersey's Species of Greatest Conservation Need and the Selection Criteria Each Fulfilled*

Appendix C: *Species of Greatest Conservation Need, their Distribution within New Jersey, and Habitat Associations*

Attachment I: *Northeast Lexicon Report* which provides the lexicon for categorizing and describing threats and actions used by most northeast states and adapted for use in this plan

Appendix D: *Profiles of the Focal Species of Greatest Conservation Need*, which provides basic information on the Focal SGCN

C. Chapter 2: Habitats of New Jersey

This chapter provides an overview of key areas important for the conservation of New Jersey's SGCN. Central to this chapter are descriptions of 49 Conservation Focal Areas (CFAs) which are located across the state's 6 landscape regions. For each landscape region, the chapter includes concise notes on its location, key habitats, and threats to these habitats and the SGCN using them. For each CFA, the chapter provides notes on its location, important habitat features, and the condition of habitats within it. Chapter 2 references the following appendices and attachment that provide additional detail related to habitats and CFAs.

Attachment II: *Landscape Project Report, v. 3.3* which provides a detailed description of New Jersey's Landscape Project habitat mapping methodology to identify habitats supporting rare wildlife

Appendix E: *Delineating Conservation Focal Areas*, which describes the CFA development and mapping process

Appendix F: *Habitat Crosswalks* that compare the various habitat classification systems used or referenced in this plan

Appendix G: *Conservation Focal Areas' Habitat Types*, which describes the general habitats found within each CFA

D. Chapter 3: Threats & Actions for Focal Wildlife & Habitats

This chapter is an overview of the diverse threats to New Jersey's wildlife and their habitats, including discussions of major threats such as pollution and climate change. Further, the chapter discusses conservation actions that are necessary to address these threats. Chapter 3 references the following appendices and attachments that provide additional detail related to threats and actions.

Appendix H: *List of Threats and Action Drivers*, including more detailed New Jersey-specific threats

Appendix I: *List of the Conservation Actions*, including more detailed New Jersey-specific actions

Appendix J: *Threats and Conservation Actions for Focal Species of Greatest Conservation Need*, which is a detailed report on threats and actions

Appendix K: *Projects to Conserve New Jersey's Wildlife Populations of Concern*, which is a selection of ready-to-implement projects that also serve as examples of how plan components can be assimilated to benefit Focal SGCN

Attachment III: *Climate Change Summary for Wildlife Action Plan*, which provides a detailed discussion of ongoing and expected climate change effects on SGCN and management considerations

Attachment IV: *Guidance for Integrating Plant Species of Conservation Concern into Wildlife Action Planning and Implementation*, which includes a report on four sites where integrated management was undertaken and tables summarizing the distribution of rare plant and natural communities in the state

E. Chapter 4: Monitoring

This chapter discusses the importance of monitoring not only to track the status of SGCN and key habitats, but also to assess the effectiveness of conservation actions and support adaptive management. It includes an extensive list of the different species and guild-level monitoring programs that have been underway in New Jersey – some started recently, others dating back more than 60 years. Further, the chapter includes model frameworks for monitoring and measuring the effectiveness of conservation actions for bog turtles and scrub-shrub and young forest habitats. Chapter 4 references the following appendix that provides additional detail related to monitoring.

Appendix M: The *USFWS TRACS Indicators for Measuring the Success of Conservation Actions*, which summarizes the metrics used to monitor the success of implemented actions

F. Chapter 5: State Wildlife Action Plan Revision Process

This chapter describes major efforts that the DFW will be undertaking in the coming years to further develop this revised State Wildlife Action Plan. It also discusses efforts that the DFW

has taken, and will continue to take, to coordinate conservation activities with various partners, and to fully involve interested members of the public in the decision-making process.

Appendix L: *Action Development Workshops' Invitees and Attendance*, which provides a summary of participants who helped develop the 2017 Revised Plan

G. Other Appendices

In addition to the appendices noted above, the plan includes a glossary and citations for references noted in the plan.

Appendix N: *Glossary*, which provides concise definitions of technical terms used in the plan

H. Other Plans

As noted above, the 2017 Wildlife Action Plan is an overarching strategy that identifies Species of Greatest Conservation Need (SGCN), their habitats, threats, and conservation actions to protect them. The Plan assists the Division of Fish and Wildlife in identifying and coordinating conservation efforts with other Divisions in the Department of Environmental Protection, as well as with other state and federal agencies, conservation organizations or non-profits, private landowners, and other states in the region. It is not, however, the *only* plan that provides guidance with respect to wildlife conservation or habitat management efforts in New Jersey. A wide array of other planning tools exist and should be consulted when contemplating conservation work in New Jersey. Many of these plans are identified on the “species profile” pages (Appendix D) for individual focal species addressed in this Plan, but even this listing is not exhaustive. Resources such as the New Jersey Forest Service’s “New Jersey Forest Action Plan” and the “Atlantic Flyway Shorebird Business Strategy” authored by the Manomet Center for Conservation Sciences and the US Fish and Wildlife Service, can facilitate advancing the actions identified in New Jersey’s Wildlife Action Plan based on species, habitat or management specific expertise.

INTRODUCTION

I. Background

In 2000, Congress created the federal State Wildlife Grants program to help states conserve imperiled wildlife species, particularly those that were not traditionally hunted or fished. The program required states to develop State Wildlife Action Plans that identified Species of Greatest Conservation Need, their habitats, threats, and conservation actions to protect them. In addition to providing a blueprint for conserving each state's rare and imperiled wildlife, the plans made states eligible for federal State Wildlife Grant funds for conservation action.

The New Jersey Division of Fish & Wildlife (DFW) released the first State Wildlife Action Plan in 2006. This plan was developed in close collaboration with wildlife experts, conservation organizations, and the general public.

Continued work on the plan resulted in the release of a slightly revised plan in 2008. That plan embodied (and continues to embody) the collective judgment of the state's conservation professionals regarding which species and areas should receive special attention and what should be done. It identified tasks that could be accomplished by a variety of agencies, organizations, and landowners to keep common species common, and to down-list or delist rare species.

This 2017 plan is the first complete revision of the initial plan. As with the previous plan, the 2017 State Wildlife Action Plan must contain eight key elements:

1. Information on the distribution and abundance of wildlife species;
2. Descriptions of locations and relative condition of key habitats and community types;
3. Descriptions of problems and priority research and survey efforts;
4. Descriptions of conservation actions;
5. Proposed plans for monitoring;
6. Descriptions of procedures to review the strategy;
7. Provisions for coordinating the development and implementation of the plan with federal, state, and local agencies and representatives of organized New Jersey Native American groups; and
8. Provisions for broad public participation.

In essence, New Jersey's State Wildlife Action Plan (Plan) is an assessment of the health of the state's wildlife and habitats, the problems they face, and actions that are needed to conserve them over the long term. With federal funding from the State Wildlife Grants program and state and private sources, the plan fosters cooperation between partners in the public and private sectors and enables effective conservation projects.

II. Purpose of the State Wildlife Action Plan

This plan is a dynamic tool for all landowners and land managers. Many components of the plan are useful to private property owners whether they manage a small backyard or a significantly larger property, and whether their property is actively used (such as for farming) or is left in a

natural condition. These same plan components can also be applied by the managers who steward the state's many public properties (and there are additional components specific to these lands). Regardless of the property or the owner, this plan is designed to serve as a framework for directing the protection of Species of Greatest Conservation Need (SGCN) and the habitats required for their continued survival.

A fundamental underpinning of this plan is the recognition that certain species require new or additional protection and management to ensure their long-term persistence. Because of changes in New Jersey's environment – both from past human activities and ongoing threats with local or distant origins – these wildlife species are unlikely to persist in the state without conservation action.

Further, there are seven key considerations that permeate all aspects of this revised plan.

A. Habitat Loss or Modification is the Greatest Threat to New Jersey's Wildlife

Habitat loss is a primary risk to wildlife in New Jersey, both directly and by disrupting essential life history and behavior patterns. Habitat maps generated with New Jersey's Landscape Project are a key tool for integrating wildlife considerations into planning and regulatory processes and thereby decreasing habitat loss. The maps are particularly effective when used to inform and guide land use and development decisions that could affect state-listed species. Similarly, the Connecting Habitat Across New Jersey (CHANJ) initiative is helping address habitat fragmentation and connectivity issues. It is also important to note that without proper stewardship, management, or restoration, habitat loss can also result from the gradual modification of conditions that are suitable for, and perhaps serving critical needs of SGCN species, to conditions no longer providing those important characteristics.

B. Stewardship and Restoration Are Critical Actions

Generally, managing for biodiversity on public and private lands is necessary to ensure the persistence of New Jersey's biological diversity. In addition, it is often necessary to implement species- or taxa-specific stewardship or restoration practices to address regional or species-specific needs. Best management practices focused on imperiled species and the ecological integrity of natural communities have only recently become the standard operating procedure on all public lands. This plan recommends continuing this standard regardless of the agency steward. Moreover, coordination and outreach opportunities should also be fostered in partnerships with private and nonprofit landowners. Key actions include research, monitoring, refining best management practices, maintaining properties with critical habitats, and restoring riparian buffers.

C. Wildlife Management Must Address Overabundant or Subsidized Species

Control of overabundant species in and around critical habitats is vital for protecting New Jersey's rare wildlife species. Species like white-tailed deer, when unchecked, can change habitats at a landscape scale and eliminate habitats on which rare wildlife depend. The deer population in parts of the state is so high that it is negatively affecting vegetation and, in turn, other wildlife habitats and populations. Programs like Community-based Deer Management Permits (which can be implemented in areas where traditional hunting is no longer feasible) and Hunters Helping the Hungry (which allows hunters to donate venison to food kitchens) can be

effective, especially when implemented in collaboration with private landowners and public land stewards. Human-subsidized predators, for example, raccoons, foxes, skunks, crows, and feral and free-roaming cats, are adaptable to human landscapes. Where they occur in unnaturally high densities, they can cause high mortality rates for rare wildlife in localized areas. Targeted management of overabundant species can alleviate the pressure they have on rare wildlife.

D. Invasive Species Threaten Native Biodiversity

Invasive species, both plant and animal, often out-compete and crowd out native species, leaving behind less diverse ecosystems. This plan calls for concerted efforts to increase awareness of the risks posed by invasive species, identify new invasive species soon after their arrival, control established invasive species, and eliminate invasive species from key areas. Priority conservation actions include identifying routes through which invasive species are introduced, improving monitoring within and beyond New Jersey, and implementing management and eradication efforts.

E. Recovery Plans Are Important for Effective Action

Ensuring the persistence of imperiled wildlife species in New Jersey typically requires a complex set of actions to be taken over many years. While this plan lays out threats and conservation actions for many species, more focused and more detailed recovery plans are often needed for federal and state-listed species. The Endangered & Nongame Species Program (ENSP) has played, and will continue to play, a central role in the development of these plans.

F. Sound Science Must Be a Foundation for the Plan

The information and recommendations in this plan are built on rigorous research and expert interpretation of all available data. But more research and monitoring are needed to ensure that conservation actions are effective. Additional habitat mapping, species surveys, and scientific modeling are needed to identify the most critical habitats and the wildlife in greatest need of conservation attention. Regular monitoring to measure progress and refine approaches is also necessary for success.

G. Urban & Suburban Environments Pose Distinctive Challenges

As the nation's most densely populated state, New Jersey's urban and suburban environments present unique challenges. For example, bald eagles and peregrine falcons today nest in urban and suburban settings. Some individuals of these species have adapted to habitats with intensive human activity, but they are not completely unaffected by it. Further, some imperiled wildlife use urban environments on a seasonal basis, such as when migrating through the region. These urban wildlife oases are still being identified, and strategies for maintaining them in the context of surrounding activities is still needed for many locations. Urban and suburban environments also tend to have higher levels of toxins, some of which have accumulated over time, others which may be unintentionally released in large volumes (such as oil spills) with catastrophic implications for wildlife. Many of the threats and actions identified in the Plan address the concerns of urban and suburban wildlife. Plan users should note, however, that the Plan's identification of Conservation Focal Areas was *not* designed to capture urban or suburban habitats. Other resources are available (e.g., New Jersey's Landscape Project mapping), or could be developed, to serve this unique need.

III. NJ's State Wildlife Action Plan Planning Framework

The overarching goal of the New Jersey Wildlife Action Plan is to develop a set of implementable conservation actions and projects (sets of inter-related actions) that provide the best opportunity for producing significant conservation of the state's most vulnerable wildlife and thereby meaningfully contribute to the conservation of state, regional, and global wildlife diversity. The planning approach for achieving this goal is straightforward and follows a common conservation planning framework of: 1) identifying conservation targets (species of greatest conservation needs, focal species and their habitats, and conservation focal areas); 2) understanding the factors that are affecting the health and sustainability of the conservation targets (threats); 3) developing wide-ranging conservation actions and sets of inter-related actions that are designed to address the identified threats (actions and projects); 4) including performance monitoring aimed at assessing the progress towards conservation goals, improving the understanding of ongoing and emerging threats; and 5) improving the efficacy of actions by adapting management strategies to this changing information (monitoring / adaptive management).

The assumptions and processes we used to develop conservation targets (species and habitats) are described in greater detail in Chapters 1 and 2, but some key points bear emphasis here. Our approach identifies the state's species that are most in need of conservation and then further refines this list by considering New Jersey's role in regional- and continental-scale conservation. By further focusing on those species for which there is sufficient understanding of conservation needs to develop feasible and consequential conservation actions, we arrived at our focal species conservation targets. Habitat conservation targets include the habitats for focal species, and separately, conservation focal areas comprised of specific geographic areas and representative biological communities where conservation action stands to benefit a wide diversity of wildlife, including significant populations of all wildlife of greatest conservation need.

In this framework, the adverse impacts of human activities comprise threats, while human activities that benefit focal species and habitats are captured in actions. In identifying threats and developing actions, our approach attempts to be forward-looking and anticipatory, that is, the Plan is intended to not only address current threats but to also anticipate threats that may emerge or worsen over the next decade.

We acknowledge that conservation actions on behalf of at-risk species and habitats that are poorly understood must often rely on inadequate or incomplete understanding of threats (severity, risk, likelihood) and actions (feasibility, expected effectiveness, etc.). In this context of uncertainty, a precautionary approach to the conservation of wildlife diversity attempts to minimize risks to conservation targets (species and habitats) by avoiding serious or irreversible environmental harm in advance of scientific certainty of such harm. Implementing this precaution involves balancing the interests of biodiversity/resource conservation, and other countervailing pressures such as economic or livelihood interests. As we perform, with input from stakeholders and conservation partners, the further prioritization of actions that we have recognized as needed (see Chapter 5-I.), striking that balance will be an important goal. Prioritization and implementation of the Plan's actions must and will consider the relative benefits of specific actions and projects in a context that also considers costs (in the broadest

sense) and societal values, and attempt to achieve proportionality between level of risk that particular threats pose to conservation targets and the conservation actions proposed and performed.

Finally, the Plan is intended to be a “living plan” that adopts an adaptive management strategy wherein monitoring is designed to inform progress towards achieving conservation goals, and to inform a continuously improved understanding of threats and diminishing uncertainty, providing feedback necessary to amend and adjust actions and projects.

IV. 2017 Changes to NJ’s State Wildlife Action Plan

New Jersey’s first version of the State Wildlife Action Plan in 2006, as well as its 2008 revision, were developed by NJ Division of Fish and Wildlife (DFW) staff with assistance and input from the public, the state’s many conservation groups, and other stakeholders. As the DFW and its conservation partners (e.g., government agencies, academic institutions, nonprofit organizations, and private landowners) implemented the plan, it became clear that the plan was a powerful resource, but the unwieldy size and format made it difficult for partners to identify the actions they were best suited to undertake.

To address this difficulty, the DFW provided one-on-one guidance to many partners to help them identify, develop, and revise projects. In 2010, with the help of the Conserve Wildlife Foundation of New Jersey, the ENSP held ten meetings for conservation partners across the state to deliver additional guidance on how to navigate the plan, implement it in the context of their objectives, and identify potential funding sources. These efforts helped partners successfully implement many aspects of the plan, but also highlighted the need for the 2017 revision to be streamlined into a more user-friendly resource.

This revision of the State Wildlife Action Plan has been restructured to better focus conservation efforts throughout the state. Among the more apparent changes are:

- a. *Focal Species of Greatest Conservation Need*, which are the highest priority wildlife species;
- b. *Conservation Focal Areas*, which are specific areas identified for conservation action; and
- c. *New lexicons*, which use standardized language to assess threats and conservation actions within and beyond New Jersey’s borders.

A. Focal Species of Greatest Conservation Need

The state’s original 2006 Plan, along with the 2008 revised Plan, addressed the conservation needs of the state’s wildlife Species of Greatest Conservation Need (SGCN), with 289 SGCN identified. Since then, the ENSP modified the criteria for identifying SGCN (described in Appendix A) and changed the status of some species as a result of this assessment. These changes led to the identification of 656 SGCN for the 2017 revised Plan (see Appendices B and C for the complete list, their distribution within the state, habitats where they are found, and the SGCN criteria they fulfilled).

Introduction

The large increase in the number of SGCN for New Jersey was the result of several factors that together resulted in a considerably more inclusive approach to selecting SGCN than the methods used in 2005.

- The DFW *consulted newly published documents* that provided species conservation information for a broader array of taxonomic groups, such as the Xerces Society's Red List for species like bees, butterflies, moths, and aquatic invertebrates that are known to occur in New Jersey. This resulted in the inclusion of entire taxonomic groups, most notably bumblebees, which were not previously considered for inclusion in the 2006 Plan.
- The DFW *broadened the eligibility criteria* to be more inclusive than in 2005. This resulted in the addition of more species from "red" lists and regional and national taxonomic plans, including: (a) the IUCN Red List of Threatened Species; (b) Partners in Flight's National Landbird Conservation Plan; and (c) Northeast Partners in Amphibian and Reptile Conservation's Northeast Amphibian and Reptile Species of Regional Responsibility and Conservation Concern.
- The DFW *completed its own assessment* of species statuses in New Jersey using an adaptation of the Delphi Technique for taxonomic groups that had not been subject to review for the 2006 Plan (e.g., marine fish, fairy shrimp, crayfish). The results of these reviews expanded the number of species that met eligibility criteria for SGCN.
- Finally, the DFW added *species that were considered data deficient* (and that were not included in the 2006 Plan) to encourage research of these species.

On the contrary, 42 species were removed from the initial SGCN list as a result of changes to their statuses and the exclusion of game species that did not meet the revised SGCN criteria.

While the DFW remains committed to the conservation needs of all SGCN species, to better guide implementation of the 2017 Revised Plan the DFW has focused on a subset of the full SGCN list. This suite of Focal SGCN was selected through an assessment process that considered state and regional imperilment, the importance of New Jersey populations to each species' range-wide viability, and the feasibility of undertaking actions that would yield successful results. The process of filtering the full SGCN list to Focal SGCN is described more fully in Chapter 1 and Appendix B. The Plan's Executive Committee, a group consisting primarily of conservation partners, believes that this more focused approach to planning and conservation will yield greater conservation results not only for the Focal SGCN, but for the many other SGCN that are not formally addressed within the plan.

B. Conservation Focal Areas

Pursuing the same focus and efficiencies used for SGCN, the DFW also delineated habitats where conservation actions could most effectively be targeted and upon which threats and actions to wildlife habitats, generally, could be assessed. The 2006 Plan and the 2008 Revised Plan both recognized that many habitats throughout the state benefitted wildlife and that conservation actions undertaken anywhere would yield positive effects. While this approach provided useful information for every portion of the state, 10 years of plan implementation by numerous partners has led the DFW to conclude that even greater success could be achieved if conservation actions were focused on a more select group of areas of conservation interest where actions are likely to be more readily implemented and successful.

Introduction

The assessment used a relatively species-independent methodology (described in Chapter 2) that identified habitats with higher ecological integrity, larger sizes and core areas, and fewer negative influences like development and roads. The areas selected also ranked higher for biodiversity for both terrestrial and aquatic species richness.

Through this two-pronged approach of Focal SGCN and Conservation Focal Areas, the 2017 Revised Plan is designed to better enable the DFW and conservation partners to focus their efforts and limited resources. The plan will help a variety of users – whether individual property owners or statewide organizations – to advance their specific interests through actions and in habitats that will benefit all of New Jersey’s wildlife.

C. A New Lexicon for Conservation

A third meaningful change in the 2017 Revised Plan was the language used to characterize threats and conservation actions. As recommended by the Northeast Association of Fish & Wildlife Agencies, New Jersey’s revised plan follows the Northeast Lexicon System (Attachment I). Key elements of the system include:

- threats and action drivers are classified using the International Union for Conservation of Nature system; and
- conservation actions are classified using the U.S. Fish & Wildlife Service’s TRACS (Tracking & Reporting Actions for the Conservation of Species) system.

These new lexicons (which are described in more detail in Chapter 3) were instrumental for standardized analyses of threats, and corresponding conservation actions, for the Focal SGCN. They also facilitated assessments of threats and conservation actions that crossed state and national borders.

V. State Wildlife Action Plan Implementation (2006-2016)

New Jersey’s Plan has been guiding conservation strategies to benefit wildlife and their habitats throughout the state since 2006. Important actions from the plan have been implemented by local, county, state, and federal agencies, non-profit organizations, and private landowners. Below is a brief summary of some of the conservation efforts that have been accomplished.

A. Actions Led by the New Jersey Division of Fish and Wildlife

New Jersey’s Landscape Project: Mapping Critical Habitats

Over the past decade, the NJ Division of Fish and Wildlife’s Landscape Project has advanced in its Geographic Information Systems (GIS) approach and the scope of its applications. In 2008, the DFW released Versions 2.1 and 3.0 which reflected a transition in the mapping method. Version 2.1 retained a basic mapping approach that combined unique land-use/land-cover (LULC) classes into five general habitat types: forest, forested wetland, emergent wetland, grassland, and beach. Version 3.0 shifted away from these broad habitat categories by adopting a species-based habitat patch approach that associated each species with a unique set of LULC classes according to specific habitat needs. It was developed specifically for the Highlands Region for incorporation into the Highlands Regional Master Plan.

Introduction

In 2012, Version 3.1 applied this species-based method to the entire state. For the first time, a more precise method of delineating habitat based on species-specific associations was available throughout New Jersey. Version 3.1 also incorporated riparian corridor mapping that identified streams and riparian habitats that are essential to aquatic, semi-aquatic, and floodplain wildlife and that often serve as travel corridors for many species. In addition, the new maps included species not represented in previous statewide versions of the Landscape Project, including freshwater mussels, marine mammals, and marine turtles.

The Landscape Project is being used to help guide strategic wildlife habitat conservation in an ever-expanding variety of ways. At the state level, for example, landscape data have been incorporated into many initiatives including:

- the Highlands Regional Master Plan, which aims to protect natural and cultural resources;
- the Water Quality Management Planning program, as a major component in delineating Environmentally Sensitive Areas that shape where potential sewer service areas can occur and thus influence future development patterns;
- the NJ Department of the Environmental Protection's Green Acres program, to evaluate and prioritize properties under consideration for conservation acquisition; and
- implementation of regulations that contain provisions for protecting habitats that are critical to endangered and threatened wildlife [Coastal Permit Program (N.J.A.C. 7:7), Coastal Zone Management (N.J.A.C. 7:7E), Freshwater Wetlands Protection Act (N.J.A.C. 7:7A), Flood Hazard Area Control Act (N.J.A.C. 7:13), Highlands Water Protection & Planning Act (N.J.A.C. 7:38), and Water Quality Management Planning (N.J.A.C. 7:15)].

Landscape maps and overlays also provide a foundation for proactive land use planning, such as the development of local habitat protection ordinances, zoning to protect critical wildlife areas, management guidelines for imperiled-species conservation on public and private lands, and land conservation projects.

The most advanced version (Version 3.3, which is described in Attachment II), released in May 2017, reflects the updated status of many wildlife species, thousands of new species occurrence records, and the most recent LULC data from 2012. In addition to providing access to species lists for areas of interest defined by users, Version 3.3 provides detailed information about occurrences, including their type (e.g., colony, den, nest, foraging, etc.), and the last recorded observation year. Perhaps most importantly, Version 3.3 features easily accessible documentation including transparent descriptions of the methods used and references to supporting scientific literature. More information is available online at http://www.state.nj.us/dep/fgw/ensp/landscape/lp_report_3_3.pdf.

Biotics Database Management

The NJ Department of the Environmental Protection's Biotics database now houses 27,170 records of endangered, threatened, and special concern wildlife. The ENSP applied those species records to the latest version of the Landscape Project habitat mapping. Biotics records of rare wildlife – with information on both abundance and distribution – were also considered by experts in the course of species status reviews. The ENSP review of species status is an important part of keeping the lists of endangered, threatened, and special concern wildlife current, and a

Introduction

significant revision was adopted in early 2012. A major upgrade to a cloud-based version of the Biotics database, which took place in 2014, improved access, stability, and efficiency.

Technical Guidance for Department Regulatory Reviews and Conservation Planning

ENSP staff provided guidance for the conservation of rare wildlife habitat to agencies within the NJDEP and to many additional parties outside our agency. State Wildlife Grants funding was allocated to technical guidance, policy, and planning in 2008, and since then ENSP biologists have reviewed as many as 650 projects each year.

Initially triggered by a screening of the Landscape Project, many projects are reviewed at the request of the NJDEP's Division of Land Use Regulation. These reviews have included several large-scale linear roadway and utility line projects such as: major widening of the NJ Turnpike and Garden State Parkway; three separate gas pipeline expansions by the Tennessee Gas Pipeline Corp.; new pipeline proposals by the Penn East Pipeline Company and Pilgrim Pipeline Holdings; and a major overhead transmission line upgrade by PSE&G. In addition to performing detailed environmental reviews of the initial applications, these projects often required: (a) additional and ongoing monitoring during construction; (b) violation assessment and enforcement; and (c) assessments of post-construction condition compliance.

Additional technical assistance is regularly rendered to land managers inside and outside the agency. No less important are ENSP consultations with policy makers regarding issues such as mitigation requirements for habitat impacts, provisions for habitat considerations in regulations, species statuses, and standardized policies in land use.

ENSP staff further partnered with the NJDEP's Natural and Historic Resources section to create the "Natural Resources Land Management Policy," an internal review procedure that assesses state and public/private proposals for the use of state-owned lands (including certain recreational uses) for potential adverse effects on rare wildlife or their habitats as depicted in the Landscape Project. The new procedure has resulted in significantly improved inter-agency coordination regarding resource management projects, greatly minimizing the possibility of inadvertent habitat conflicts. It has also enabled the consistent, coordinated internal review of proposals by non-state entities on public lands, such as for "enduro" motorsport events.

Bald Eagles – Back from the Brink

From 2005 to 2014, the number of bald eagles nesting in New Jersey increased from 42 pairs to 150 pairs, a 257% increase. This was accomplished by protecting nesting sites through cooperative relationships with public and private landowners. Volunteer nest observers were recruited and trained, and they provide data on most of the nests statewide as well as assist with the DFW's outreach programs. The number of volunteers actively involved has grown from 54 to 85 since 2005. Nest sites have been mapped and included in the Landscape Project so they can be considered in land use decisions and land acquisition priorities.

Steady Recovery of Peregrine Falcons

ENSP biologists have increased the resident peregrine falcon population from 16 to 28 pairs by providing suitable nest structures and working with managers to accommodate these increasingly urban birds. In 2014, the ENSP began a partnership with Southern Illinois University's Zoology

Introduction

Department to analyze contaminants in archived, inviable peregrine falcon eggs. Of particular interest is accumulation by peregrines of flame retardant chemicals, as well as monitoring the accumulation of organochlorines and other environmental contaminants.

Least Terns –When Holding the Line Equals Success

New Jersey has some of most visited and heavily used beaches on the Atlantic seaboard. They also now rank among the most highly managed, with the vast majority of New Jersey's coast under beach replenishment or other stabilization efforts including sea walls, groins, and sheet piling. Despite the extent of these engineering efforts, New Jersey's seashore is home to birds that depend on barrier beaches to nest, such as the least tern. Through a combination of nesting area protection, cooperative agreements with municipalities, predation management, and public outreach over the last 10 years, we have kept the least tern population stable at approximately 1,600 individuals (average) with nesting occurring at approximately 15-25 sites. Similar efforts in neighboring Northeast and Mid-Atlantic states have almost certainly kept least terns from needing the protection of the federal Endangered Species Act (unlike least terns in other areas of the county, e.g., California interior populations where they are listed as federally endangered).

Secretive Marsh Birds

Secretive marsh birds (such as rails and bitterns) are among the most under studied birds in New Jersey, owing in large part to the inaccessibility of their habitat and their enigmatic nature, which makes them difficult to detect. However, changing marsh ecosystems (especially from human development, stabilization programs, and increased rates of sea-level rise) also makes them among the most at risk for endangered and threatened status designations. For this reason, the ENSP has focused its efforts on better understanding the distributions and populations of these species. In 2011 and 2012, the ENSP participated in the region-wide efforts of the Saltmarsh Habitat and Avian Research Program (SHARP) by conducting call playback and acoustic recording surveys. The data gathered have helped fill information gaps in the northeast coastal region of the United States for this species group, has encouraged the southeast coastal region to undertake a similar survey, and are the basis of the Eastern Saltmarsh Bird Business Plan. In 2015 and 2016, the ENSP conducted call playback and acoustic recording surveys that focused on black rails, the most critically imperiled species of this group (and in all of North America). These data have informed the in-progress status assessment and related tasks supporting a finding for federal listing.

Aerial Surveys for Wading Birds, Terns, and Gulls

Surveys of wading birds (herons and egrets), terns, and gulls took place in 2007-2008, 2010-2011, and 2013-2016, adding to a long-term dataset that New Jersey has maintained since the 1970s. These surveys highlight the response of these species to changes in their environment, particularly those related to sea-level rise and marsh subsidence. Some marsh islands have disappeared completely while others have been abandoned by the birds – likely in part because of flooding and storm tide conditions that have worsened over the last few decades. These surveys have helped New Jersey researchers and conservation agencies understand how the spatial distribution of these species has changed and highlights where to focus efforts to help these species adapt to the current and future changes in habitat.

Introduction

Responsibility for International Bird Migrations

The Delaware Bay migration stopover hosts hemispheric populations of six arctic-nesting shorebirds including the federally-threatened red knot. New Jersey, Delaware, the New Jersey Natural Lands Trust, and the Conserve Wildlife Foundation of New Jersey have partnered on research, protection, and habitat restoration efforts since 1997. Our work identified horseshoe crabs and their eggs as the principal food resource for migrant shorebirds, and documented the decline in the red knot population following horseshoe crab overharvest. Our research, which contributed to the 2007 Red Knot Status Assessment, helped stem declines of red knots (stable at 25,000) and contributes to biological models that set less damaging horseshoe crab harvest quotas. The ENSP further collaborated on international geolocator and nanotag telemetry projects that identified migration routes, stopovers, and wintering sites for red knots and ruddy turnstones in the Western Atlantic Flyway. These data inform the Atlantic Flyway Shorebird Initiative and international conservation actions.

Bog Turtles – Restoring an Endangered Species

In partnership with other agencies such as the U.S. Fish & Wildlife Service (USFWS) and the U.S. Department of Agriculture's Natural Resources Conservation Service, the DFW is working to restore federally threatened bog turtle populations through a program that uses cooperative agreements with landowners to restore and protect valuable wetlands habitats. One innovative program pioneered and perfected in New Jersey was the restoration of wetland habitat through prescribed grazing. Hundreds of acres have been restored or enhanced through these cooperative programs. Targeted land protection directed by the DFW's mapping and habitat assessment work has also significantly aided the recovery of this species.

Working with Experts to Track Rare Butterflies and Moths

ENSP biologists conducted targeted surveys to find new and assess the persistence of known rare butterfly populations. Frosted elfin, arogos skipper, and other species were documented in surveys conducted with assistance from the North American Butterfly Club-North Jersey Chapter and the South Jersey Butterfly B/Log contributors. The ENSP has promoted habitat management for these site-specific butterflies on more than 1,000 acres of state and federal lands with good success. Also, ENSP biologists created the Rare Moth Species of New Jersey list with assistance from moth experts. New Jersey is home to at least 56 species of rare and endangered moths that are of conservation concern, and this list is the first step to conservation planning.

Mapping Freshwater Mussels

Freshwater mussels have been on New Jersey's radar for many years as they are one of the most endangered taxa in the country. ENSP biologists have mapped the highest quality streams and documented suitable habitat for the state's endangered, threatened, and special concern mussels using the Landscape Project. Secretive and sensitive species can be our most vulnerable wildlife, so identifying their locations and monitoring populations are the first steps to conservation actions. The ENSP's work has helped to classify streams as Category 1, which gets the highest level of regulatory protection. We also completed an analysis of more than 10 years of habitat data that will be used to identify critical mussel areas suitable for stream restoration efforts.

Introduction

American Kestrel

American kestrel populations have declined precipitously over the past several decades for many reasons. In 2004, the ENSP surveyed suitable habitats and the findings were alarming: only nine of the 100 routes surveyed for kestrels were positive. It is believed one of the greatest limiting factors for kestrels is the lack of suitable nesting locations; they are secondary cavity nesters, which means that they make their nests in naturally occurring cavities or in ones left behind by woodpeckers. In 2006, the ENSP began a nest box program in which much of the monitoring is conducted by volunteers. At the peak of the project close to 300 boxes were monitored, but since 2010 the ENSP has monitored a subset of about 150 of the most productive boxes, many of which are hosted by private landowners and nonprofit partners. Over the course of the project, 1,048 fledglings were banded, and 248 adults were captured for banding and identification. The ENSP also led a geolocator study in which 15 geotags were deployed in 2013 (with five recovered in 2014) and five more were deployed in 2015 (with two recovered in 2016). Six of the seven recovered tags were from live captured birds, and of these birds, three had migrated to Florida for the winter while three remained in the Northeast.

Cessation of Trout Stocking to Restore Native Brook Trout Populations

The DFW discontinued stocking trout in eight small trout production streams between 2005 and 2010. This management action was taken to protect New Jersey's wild trout resources, particularly brook trout (the only salmonid native to New Jersey), and to better utilize hatchery trout in waters not having self-sustaining trout populations. In 2013, these eight streams were surveyed at sites where surveys had been conducted prior to 2002 to obtain comparative data. Two of the streams surveyed in 2013 no longer had wild brook trout and the populations in two other streams were considered fragile due to low abundance. Restoration (both translocation of wild fish and habitat enhancement) was recommended for these four streams. Of the four remaining streams, either no action or consideration of special trout fishing regulations was recommended.

Conservation and Restoration of Fish Habitat

In order to protect New Jersey's critical aquatic resources, fisheries biologists participate in or provide input on a variety of projects each year. Bureau of Freshwater Fisheries staff provide technical assistance related to conservation, stream restoration, dam removal projects, and land use projects. Rivers that have recently benefited from dam removals include the Musconetcong and Raritan Rivers, while efforts are underway for additional removals on the Millstone and Paulins Kill Rivers. Land use projects are coordinated through the DFW's Environmental Review Program. This input is directed towards minimizing land use change impacts to the state's fisheries resources. This is typically accomplished through the use of timing restrictions during critical fish spawning periods, protection of riparian buffers, and project modifications that ensure best use practices are implemented at all times. In addition, more in-depth reviews and comments are provided for selected projects.

Fish Index of Biotic Integrity for New Jersey's Lower Delaware River Drainage

From 2000 through 2006, the Bureau of Freshwater Fisheries developed and validated a fish Index of Biotic Integrity (IBI) for wadeable streams in New Jersey's Lower Delaware River Drainage. An IBI is a tool that utilizes the empirical response of fish assemblages to anthropogenic stressors to get an indication of stream health and biological condition. This is

Introduction

important for protecting water quality and water-dependent species that do not fulfill Category 1 requirements (as the Category 1 designation is most often based on the presence of reproducing trout). The new IBI is composed of 10 metrics accounting for species richness and composition, indicator species, trophic composition, and fish abundance. Data were analyzed from 148 electrofishing surveys conducted during the summers of 2000 through 2006. The NJDEP's Bureau of Freshwater and Biological Monitoring also developed and implemented two other IBIs specific to northern New Jersey streams and headwater streams. The NJDEP uses IBIs to assess cumulative impacts on streams and to communicate the condition of stream ecosystems to citizens and policymakers, thus helping all concerned communities to contribute to sound environmental policies.

Freshwater Permits

The Bureau of Freshwater Fisheries annually reviews and issues more than 400 permits to ensure the effective management and protection of the state's aquatic resources. These permits encompass nine specific permit types including commercial harvest of aquatic species, water level management (for the protection of aquatic species), the introduction of aquatic species, collection of aquatic species for scientific purposes, and special use permits. The permit process not only helps protect freshwater fish, but also other aquatic species such as frogs and turtles during critical spawning and hibernating periods.

Mapping Native Fish Species

The Bureau of Freshwater Fisheries created the state's first comprehensive fish species distribution maps utilizing more than 50 years of fisheries data (managed within FishTrack, a computerized freshwater fisheries database) and compiling data from 2000-2012. This was particularly useful when using the Delphi Technique for species status reviews.

Minimum Size on Trout Increased

The statewide minimum size limit for brook, brown, and rainbow trout was increased from 7 to 9 inches in 2008. The minimum size was adjusted to afford naturally reproducing trout populations in small streams a greater level of protection, as many of these populations have small numbers of spawning adults that seldom exceed 9 inches.

Potentially Dangerous Fish

Dangerous species are those that are not native to an ecosystem and whose introduction would likely cause economic or environmental harm or harm to human health. New Jersey statutes prohibit the possession or release of live, potentially dangerous animals, but no fish species were listed prior to 2010. This was addressed when the DFW and Fish and Game Council listed 10 fishes under the term "Potentially dangerous exotic fish" in N.J.A.C. 7:25-6.2. The species are: Asian swamp eel, bighead carp, brook stickleback, flathead catfish, grass carp (diploid), green sunfish, snakeheads, Oriental weatherfish, silver carp, and warmouth. The possession of these species is now prohibited under N.J.A.C. 7:25-6.1(g). The regulation states that anglers must destroy these species if encountered while fishing and are directed to submit specimens or photographs to the Bureau of Freshwater Fisheries. This requirement is intended to raise invasive species awareness, alert fisheries staff to new occurrences, and help curtail the spread of invasive species before they become established. The Bureau of Freshwater Fisheries has several ongoing surveillance and removal efforts for many of these species.

Introduction

Prohibition of the Possession of Acid Tolerant Sunfish

In 2008, the DFW and the Fish and Game Council implemented a regulation to prohibit the possession of four sunfish species (mud sunfish, blackbanded sunfish, bluespotted sunfish, and banded sunfish) under N.J.A.C. 7:25-6.13(u). These species are in decline throughout their native ranges and New Jersey's Pinelands are currently a stronghold for them. Threats to these species include land use changes that increase pH and nutrient loads in waterbodies, loss of native aquatic vegetation, and competition and predation by non-native fishes. Prior to this regulation, there was no creel or size limit restrictions for these attractive species that are targeted by aquarium hobbyists.

Status Evaluation of Native Freshwater Fishes

A formal review process that applied the Delphi Technique was led by the ENSP in 2014 and 2015 to determine the status of New Jersey's native freshwater fishes. The Delphi Technique is a systematic method for reaching consensus among experts in which absolute, quantitative answers are either unknown or unattainable. By structuring the communication process, the Delphi Technique helps the group reach a consensus of opinion by incorporating all available data and disseminating those data among all participants. The results of this review process, in conjunction with recommendations by Bureau of Freshwater Fisheries staff on non-consensus species, were approved by the Endangered and Nongame Species Advisory Committee and are as follows:

- Endangered – bridle and ironcolor shiners;
- Threatened – slimy sculpin; and
- Special Concern – American brook lamprey, blackbanded sunfish, brook trout, comely shiner, mud sunfish, northern hog sucker, and shield darter.

The next step will be to formally adopt the recommended statuses of each native freshwater fish into the New Jersey Administrative Code (N.J.A.C.).

Stream Temperature Monitoring

In 2013, the Bureau of Freshwater Fisheries established an ambient stream temperature monitoring network on streams having coldwater fisheries that are of conservation interest, specifically those with Focal SGCN (brook trout and slimy sculpin) or of recreational importance. The data collected will be used to assess current temperature conditions, evaluate long-term trends, determine if ambient water quality is consistent with the NJDEP's Surface Water Quality Standards, and aid in the management of coldwater fisheries. Integral to the establishment of this monitoring network was the development of a Quality Assurance Project Plan that complied with the NJDEP's regulations concerning the certification of laboratories and environmental measurements under N.J.A.C. 7:18-1 et seq., which was approved by the NJDEP's Office of Quality Assurance in July 2013. By 2015, ongoing monitoring was occurring at 39 sites. Five of these sites had wild brook trout populations and complemented the Eastern Brook Trout Joint Venture initiative to assess climate change using paired water/air thermographs.

Surface Water Classification Assessments

Trout are useful bioindicators of stream health as excellent water quality and habitat are necessary for their survival and successful reproduction. In 1968, the Bureau of Freshwater Fisheries initiated the process of identifying and classifying New Jersey waters according to their suitability to support trout. Five years later, a classification system for New Jersey waters was

Introduction

developed. The Bureau of Freshwater Fisheries' classification system, although already in use by various programs within the DFW was formally recognized in 1981 under the state's newly adopted Surface Water Quality Standards. The NJDEP's Land Use Regulation Program, through stream encroachment, freshwater wetlands, and stormwater rules, acknowledges the fragile nature of these ecosystems and provides additional protective measures. The classification of New Jersey's rivers and streams is updated by the NJDEP using the DFW field data on their trout supporting capabilities.

Targeted Surveys of Rare Fishes

The Bureau of Freshwater Fisheries annually conducts approximately 200 fisheries surveys for a variety of projects throughout the state. These data are valuable in the understanding the status and distribution of our native species. In addition, the Bureau of Freshwater Fisheries has focused on several rare fish species in recent years to determine the extent of their current range, primarily focusing on historical locations in which they occurred. Since 2005, the Bureau has conducted more than 140 fisheries surveys looking specifically for rare species such as bridled and ironcolor shiners, along with several species primarily restricted to the Pinelands such as the blackbanded sunfish. This information is critical for other projects such as the statewide mapping of native species, using the Delphi Technique for species status reviews, and State Wildlife Action Plan updates.

Wild Trout Stream Regulation Assessment

The DFW has documented reproducing trout populations in nearly 200 streams (or stream segments) statewide, but only 36 are currently designated as Wild Trout Streams. These streams are not stocked with hatchery trout, but rather rely upon their wild, naturally reproducing trout populations to provide a recreational fishery. The Wild Trout Streams regulation is more stringent than the statewide general trout regulation and has changed little since it was adopted in 1990. Currently, the regulation provides for a limited harvest of only two trout daily, from the Opening Day of the trout season in April through September 15. The minimum size limit on trout is 9 inches in most of these streams. Fishing gear restrictions also apply (artificial lures only, no bait or bait scent allowed). In 2014 a multi-year assessment was initiated to review the Wild Trout Streams regulation, collect and analyze data, and develop regulations that will better address recreational fishing opportunities for, and conservation needs of, the state's wild trout fisheries, with anticipated regulation changes in 2018.

Shortnose and Atlantic Sturgeon

In 2010, New Jersey, Delaware, and Connecticut, along with academic and private collaborators, partnered to develop a multi-year effort entitled "Sturgeons in the Mid-Atlantic Region: A Multi-State Collaboration of Research and Conservation" directed at providing state, federal, and regional management authorities with information necessary to conserve and ultimately restore populations of federally endangered Atlantic and shortnose sturgeons in the mid-Atlantic region. The project focus was to conduct targeted activities that would not only benefit regional managers but would provide infrastructure and data management capabilities for sturgeon researchers and managers on a coastwide basis. Bureau of Marine Fisheries staff, along with the ENSP and contractors, deployed and maintained acoustic telemetry receivers in the Delaware Bay and river, allowing biologists to develop a more detailed picture of sturgeon movement and habitat use throughout the Delaware River estuary. In addition, we confirmed a shortnose

Introduction

sturgeon spawning area using an early life stage collection and adult tracking effort. Data from the sturgeon project were entered into the Biotics database and applied to the latest version of the Landscape Project to inform management, regulatory, and permitting decisions. Receiver data were also provided to the Atlantic Cooperative Tagging Network and Atlantic States Marine Fisheries Commission's Sturgeon Technical Committee for stock assessments.

Allegheny Woodrat

Since 1987, ENSP biologists have monitored the last remaining Allegheny woodrat population in the state. With the population index remaining low since 2007 and a genetic assessment completed in 2014 indicating that the population was showing significant signs of genetic isolation, the ENSP, with the endorsement of a team of woodrat experts from New York, Pennsylvania, and Indiana, collaborated with the Pennsylvania Game Commission on two translocation efforts in 2015 and 2016 to serve as a "genetic rescue." An updated genetic assessment planned in early 2017 will enable us to assess the effectiveness of these efforts. In 2015, the ENSP, with the help of Montclair State University, AmeriCorps members, and the Palisades Interstate Park Commission, also implemented a spatially extensive, year-round anthelmintic bait deployment as a mitigation strategy to try to keep raccoon roundworm infection, a serious mortality factor for woodrats, at bay. The population index in 2016 was the highest it has been since the peak in the early 2000s, so we are hopeful that these efforts are helping the population. In 2016, Montclair State University started supporting two graduate students who are focusing their thesis work on helping the ENSP with Allegheny woodrat research and management in the Palisades as well as investigating historic woodrat sites in New Jersey. Also in 2016, the ENSP and Montclair State University began collaborating on research to assess the habitat in both active and extirpated Allegheny woodrat sites in New Jersey, Maryland, and Pennsylvania, as well as assess the prevalence of raccoon roundworm at those sites.

Habitat Change Analysis

Habitat loss and fragmentation continue to be the two most serious threats to wildlife populations. To effectively protect endangered and threatened species populations and to evaluate protection and management efforts, wildlife agencies need to identify and monitor habitat for each listed species. With this in mind, the DFW adopted a habitat change analysis approach to track wildlife habitat transition and fragmentation trends over time. The analysis uses GIS to identify potential habitat from available land use and land cover data based on species habitat associations and range extents. The analysis spans four time periods between 1986 and 2012. Products from the analysis include up-to-date, multi-level, species-specific habitat change information to support agency initiatives. Resulting maps and data serve as a guide to help prioritize work for particular species and their habitats, and provide baseline information for the development of species status assessments and recovery plans. Outputs also provide a basis for additional analyses such as evaluating habitat change in regulated versus unregulated areas, evaluating habitat conservation planning efforts, and other land-use planning, land management, and preservation efforts.

Connecting Habitat Across New Jersey (CHANJ)

In response to the significant threat posed by increasing habitat loss and fragmentation, the state's dense road network, and a changing climate, the DFW formed a multi-partner, multi-

Introduction

disciplinary working group in 2012 called Connecting Habitat Across New Jersey, or CHANJ. CHANJ is made up of representatives from more than 40 agencies across the state, including the New Jersey Department of Transportation (DOT) and other state, federal, local, academic, and nonprofit organizations. The group has been informing the ENSP's development of a strategic plan for wildlife conservation that will identify key areas and the actions needed for preserving and restoring habitat connectivity for terrestrial wildlife in New Jersey. Core teams (Mapping, Guidance Document, and Communication) have been meeting and communicating regularly to develop the project and its capstone tools – a mapping system and a guidance document. Now in their final stages of development, these products will allow land-use, conservation, and transportation planners to operate in a more collaborative way to increase road safety, streamline permit efficiency, and ultimately improve the prospects for the long-term sustainability of New Jersey's terrestrial wildlife.

The ENSP has also been organizing regular meetings of a Roads and Wildlife Working Group made up of CHANJ partners from the New Jersey DOT, the USFWS, and the NJDEP's Land Use Regulation Program since 2009. This group has focused on developing and implementing strategies to reduce the impact of roads on wildlife. The group has been developing a Roads/Wildlife Toolkit that will consist of: (a) CHANJ maps that incorporate road segments intersecting habitat cores and corridors; (b) road segment assessments; (c) culvert inventory data; (d) road/wildlife best management practices; and (e) a Road/Wildlife Mitigation Projects database. Once completed, the toolkit can be used by counties and municipalities, Metropolitan Planning Organizations, and the New Jersey DOT to help plan and implement road and wildlife work as part of CHANJ.

Species Status Reviews

In addition to the recent status assessment of freshwater fishes (described above), ENSP biologists coordinated status reviews of freshwater mussels, crayfish and fairy shrimp, dragonflies and damselflies, reptiles and amphibians, birds, and terrestrial and marine mammals. The state adopted changes to legal listings that were recommended prior to 2011. The legal list changes included:

- adding five species to the endangered list (black rail, golden-winged warbler, red knot, Indiana bat, gray petaltail dragonfly);
- adding nine species as threatened (banner clubtail, brook snaketail, harpoon clubtail, Kennedy's emerald, robust baskettail, superb jewelwing, American kestrel, cattle egret, horned lark);
- adding 34 species as special concern (one mussel, 33 dragonflies/damselflies and butterflies); and
- upgrading eight species, including Cooper's hawk, from threatened or endangered to special concern or stable.

Changes to species statuses that were evaluated since 2011 will be made following the 2016-17 review of birds due to the lengthy rulemaking procedure that was completed in February 2012.

B. Accomplishments by Conservation Groups and Agency Partnerships

Habitat Management

Thousands of acres of land were in some way positively affected by the hard work of New Jersey's conservation partners and individual landowners. Management activities occurred on

Introduction

more than 40,000 acres, benefitting not only the forests, grasslands, aquatic systems, and other habitats, but the wildlife that depend upon these landscapes, including songbirds, raptors, reptiles, amphibians, fish, mammals of all sizes, and more. Their efforts included the following projects:

- Restoring and managing grassland, early successional, wetland, and riparian habitats to benefit grassland birds, other bird species, and various wildlife species through periodic mowing, prescribed burns, and other techniques.
- Integrating conservation practices on agricultural lands to increase grassland habitat for grassland birds and other wildlife, with support from federal and state incentive programs.
- Controlling invasive species to improve native growth by removing vegetation such as Phragmites and managing woody vegetation.
- Managing and planting native vegetation on rights-of-ways.
- Re-contouring, planting, and modifying degraded lake and stream shorelines to enhance water quality and wildlife habitats.
- Restoring a freshwater tributary and surrounding woodlands.
- Restoring salt marsh habitat.
- Improving habitat for rare turtles and snakes through habitat management and, where it was appropriate, drainage improvements.
- Creating a 1,000 sq. ft. rain garden to serve as an outdoor classroom for programs about wildlife habitat and water filtration systems.
- Conducting nonpoint source pollution control and stormwater management.
- Managing resident Canada goose populations on 2,700 acres to preserve lakeshore habitat and biodiversity.
- Construction of an under-road turtle passage to reconnect two pieces of protected land for state-threatened wood turtles.
- Installing wildlife crossing structures under the Atlantic City Expressway with the South Jersey Transportation Authority, conducting monitoring, and having data analyzed by the ENSP and Montclair State University to increase the effectiveness of structures for passing wildlife.
- Managing forests to increase the diversity and understory vegetation on private and public lands to benefit a suite of species that depend on interior forests with diverse age classes.
- Advancing the Eastern Brook Trout Joint Venture partnership by:
 - identifying key threats to brook trout and their habitats;
 - developing conservation strategies to protect, enhance and restore brook trout;
 - refining subwatershed status maps to the catchment scale; and
 - conducting surveys to assess the status of brook trout and their habitats, and sharing the data between agencies and partners.

Research

Some partners conducted wildlife research across almost 90,000 acres to help provide a better understanding of species statuses, ranges, and habitat needs including, but not limited to:

- Acoustic surveys to determine bat presence, species, and important roost sites;
- Breeding songbird surveys to monitor population trends and identify critical habitats;

Introduction

- Monitoring semipalmated sandpipers as they make their spring stopover on the Delaware Bayshore to track the health and status of this international migrant;
- Inventories of reptiles and amphibians;
- Identification and certification of important vernal pool habitats critical to the persistence of many of New Jersey's amphibian species;
- Identification of roadkill hot-spots and mitigation strategies for reptiles and amphibians;
- Raptor surveys and monitoring including radio-tracking bald eagles to identify important roost sites;
- Banding ospreys to continue long-term monitoring of the state's population;
- Surveys to monitor lake trout health;
- Breeding songbird surveys to evaluate management of forested landscapes to increase the diversity and understory vegetation on private and public lands; and
- Research on northern pine snake baseline populations, genetics, habitat use, den population dispersals, and overwintering and nesting successes conducted by academics and private researchers with support from the DFW – this information will help the DFW map habitats and population corridors to secure this species in New Jersey's unique Pine Barrens, an Eastern U.S. stronghold for pine snakes.

Research: Wildlife disease

- The devastating bat disease white-nose syndrome emerged in North America in 2006 as the result of a foreign-borne fungus (*Pseudogymnoascus destructans*). It was discovered in New Jersey's most important bat hibernacula in January 2009. The DFW and partners have since been monitoring the impacts of the disease on the state's cave-hibernating bat species, some of which have suffered declines of more than 95%. Research on bat survivorship, winter body condition, reproduction, and summer distribution of understudied species like the northern myotis have been underway and will continue into the foreseeable future.
- The ENSP funded Montclair State University through a small grant to sample amphibians for Bd (*Batrachochytrium dendrobatidis*) in 2009, and two out of 27 samples tested positive. An additional 399 samples were collected by ENSP and Conserve Wildlife Foundation of New Jersey staff in 2011 and 2012 and analyzed by Montclair with no additional positive detections.
- Through a Regional Conservation Need grant, the ENSP contracted with the Conserve Wildlife Foundation of NJ to sample wood frogs for Ranavirus in 2013 and 2014. During the study period, Ranavirus was detected in eight populations of wood frogs across four counties. Including a documented Ranavirus occurrence from 2011 by Montclair State University, the ENSP is aware of nine positive Ranavirus detections in the state.
- The DFW partnered with the Wildlife Conservation Society and later participated in a multi-state, multi-organization research effort to determine the distribution of Snake Fungal Disease (SFD) and the affected species. Over three seasons of surveys, SFD was confirmed in timber rattlesnake, corn snake, northern pine snake, black rat snake, coastal plain milk snake, and eastern milk snake, and was suspected in northern copperhead. These findings confirmed SFD presence in Bergen, Passaic, Warren, Burlington, and Ocean Counties, and symptomatic snakes were observed in Sussex County.

Introduction

- Year-round anthelmintic bait was deployed around the last remaining active Allegheny woodrat site in an effort to keep raccoon roundworm (a serious mortality factor for woodrats) at bay.

Research: Marine Fisheries

- The New Jersey Marine Fisheries Administration, in cooperation with Rutgers and Stockton universities, initiated a study in 2016 with the goal of collecting biological data on various life stages of commercially and recreationally important species of fish managed by the NJDEP and the Atlantic States Marine Fisheries Commission. Participants are actively collecting biological and environmental data through the use of seine-net, fyke-net, plankton-net, fish-trap, trawl, and gill-net surveys.
- In 2016, the New Jersey Marine Fisheries Administration and Rutgers University began a pilot study to characterize the seasonal and spatial variation in the composition and abundance of structure-associated species of marine fish and invertebrates present on the Sea Girt and Little Egg artificial reefs. The study uses fish traps to collect biological data that can be used by fisheries managers to assist them in stock assessments for black sea bass, tautog, and American lobster.
- Since 2012, the New Jersey Marine Fisheries Administration has deployed acoustic receivers in Delaware Bay to track migration patterns of Atlantic sturgeon. As part of a multi-state collaborative effort, the DFW has partnered with several states to develop a multi-year effort directed at providing state, federal, and regional management authorities with information necessary to successfully conserve and ultimately restore the population of sturgeon in the mid-Atlantic region.
- The Delaware River Basin Fish and Wildlife Management Cooperative (New York, New Jersey, Delaware, Pennsylvania, the U.S. Fish and Wildlife Service, and the National Marine Fisheries Service) monitors the American shad population in support of its sustainable fishery plan through a variety of fishery dependent and independent surveys conducted by the states both individually and together. New Jersey contributes American shad young of the year data from the tidal portion of the Delaware River, records commercial harvest of American shad in the Delaware Bay, and participates in the Wildlife Management Cooperative's young of the year seine survey in the non-tidal portion of the Delaware River. The data collected from New Jersey's surveys are combined with those of the other member states to determine trends in fish abundance and allow fishery managers to develop appropriate management measures.

Education and Outreach

The ENSP and its many partners undertook a vast array of educational efforts to advance conservation, including:

- Creating and coordinating environmental workshops and outdoor-classroom programs;
- Educating the public about responses to emergency marine mammal and sea turtle strandings;
- Using volunteerism, field programs, online story maps, and social media to rally support for solutions to road-wildlife conflicts, such as crossing structures for migratory amphibians and turtles; and
- Educating homeowners and Nuisance Wildlife Control Operators about the proper handling of bats in buildings by offering training programs, providing New Jersey-

specific online resources, and providing free bat boxes; and teaching citizens and students how backyard habitat management, even in schoolyards, can benefit wildlife and local ecosystems.

Introduction

CHAPTER 1: NEW JERSEY'S MOST VULNERABLE WILDLIFE

I. Process for Selecting SGCN and Focal SGCN

New Jersey is home to more than 3,700 wildlife species, from monarch butterflies to blue whales. Some species are stable or have growing populations. Others are rare, perhaps naturally because they live in unusual habitats, or perhaps due to changing or disappearing habitats.

A challenge for all wildlife managers is determining where and how to direct limited resources to best support the full range of wildlife diversity in New Jersey. This State Wildlife Action Plan is an important step to guiding conservation activities, whether they are implemented by state agencies, nonprofit organizations, neighborhood groups or private landowners.

The following subsection explains the review and assessment processes that were used to identify Species of Greatest Conservation Need (SGCN) from the full list of New Jersey's wildlife species. Subsequent subsections outline how the SGCN list was further refined into Priority SGCN, then "Upper Tier" SGCN, and finally Focal SGCN. A graphic depiction of the selection process is included as Figure 1, below.

A. Selecting Species of Greatest Conservation Need (SGCN)

An early step in the planning process was identifying Species of Greatest Conservation Need (SGCN). This list was first developed in 2005 as part of New Jersey's initial State Wildlife Action Plan. SGCN are wildlife most in need of active support to ensure that they remain part of the state's biological heritage. These at-risk birds, mammals, reptiles, amphibians, fish, and invertebrates were acknowledged as SGCN due to their low or declining populations and vulnerability to threats. Without actions to conserve them, SGCNs are likely to decline further over the next 10 years, possibly moving them closer to endangerment or extirpation.

The SGCN list was first developed by evaluating all of New Jersey's native, indigenous wildlife species using the best available assessments of their conservation statuses and trends within the state, the Northeastern U.S., and beyond. The assessment for each taxonomic group was tailored using the best available data for that specific group. In general, the assessments drew on state and federal listing statuses, status assignments by the International Union for the Conservation of Nature (IUCN), published evaluations by taxonomic expert groups, and taxonomic conservation plans that listed or ranked at-risk species based on a variety of vulnerability factors. The criteria used to select SGCN are presented in detail in Appendix A.

A species meeting any one or more of the assessment criteria for their taxonomic group was included on New Jersey's SGCN list. For example, any species that was state or federally listed, or that was on the IUCN Red List as "Near Threatened" through "Critically Endangered" was identified as an SGCN. At the taxonomic level, any bird on the Partners in Flight "Watch List" and any insect on the Xerces Society "Red List" was included.

Figure 1: Process for selecting SGCN and Focal SGCN.

- were listed as endangered, threatened, or candidate species in New Jersey or federally;
- were included on the Regional Species of Greatest Conservation Need list for the USFWS Northeast Region; or
- could be advanced through a fatal-flaw assessment that took into account practical knowledge of the species and New Jersey's importance to its regional and global status.

The initial SGCN list in the 2006 Plan (and in the 2008 Revised Plan) included 289 species. After using new criteria to review all species for this revised plan, the DFW identified 656 species as SGCN. The full SGCN list is provided in Appendices B and C, and a brief discussion of the changes between the two lists is presented in Section III of the Introduction, "2017 Changes to the State Wildlife Action Plan."

While comprehensive, at 656 species the SGCN list is too big for an effective State Wildlife Action Plan with achievable goals. The ENSP therefore refined the list using the SGCN as the foundation for a 2-tiered filtering process to identify Focal SGCN. For each tier, a team of taxonomic experts assessed each species' conservation need and the feasibility of successful conservation actions.

B. Selecting Priority SGCNs

The DFW conducted the first filtering tier which refined the SGCN list down to Priority SGCN. These species included wildlife that:

Chapter 1: New Jersey's Most Vulnerable Wildlife

Through this filtering process, the full list of SGCN was refined to 351 Priority SGCN that were in clear and immediate need of conservation action. These species are distinguished from the initial 656 SGCN in Appendix B.

C. Selecting “Upper Tier” Priority SGCN and Focal SGCN

The DFW next conducted the second filtering tier which refined the Priority SGCN list down to “Upper Tier” Priority SGCN. This process looked more closely at conservation needs and the feasibility of actions to address the threats faced by each Priority SGCN.

Conservation need was assessed by considering (1) the level of concern for the species across its range in the Northeastern U.S., and (2) New Jersey’s responsibility for the species’ persistence range wide. For most species, the northeast regional scores followed the Northeast Regional Conservation Synthesis ranking by Terwilliger Consulting. This ranking ranged from “Very High” to “Low” based on the percentage of northeastern states within the species’ range where it was of conservation concern. For species that were not ranked in the Synthesis (most notably insects), scores were based on population trends and the risk of extirpation from New Jersey. New Jersey’s responsibility scores were based on the percentage of the species’ North American range that occurred in the Northeastern U.S. and/or the risk of regional extirpation or extinction if the species were lost from the state.

The feasibility of actions was measured by (1) assessing whether potential actions had been shown to benefit the species elsewhere and (2) projecting the likelihood that the actions would succeed if applied in New Jersey. A high likelihood of success assumed that the tools, work force, ability, funding, and collective will to act were present.

Next, the review teams assigned each of the initial “Upper Tier” SGCN to a taxonomic sub-class (e.g., birds were divided into landbirds and waterbirds, invertebrates to insects and non-insects, etc.). Then, they indicated in which of the state’s six Landscape Regions and nine broad habitat types each species occurred.

Finally, the remaining SGCN list underwent a fatal-flaw analysis to ensure that scores for conservation need emphasized need in New Jersey. This final review by the State Wildlife Action Plan executive committee and the DFW SGCN team focused the final list on species that would most benefit from concerted conservation action in New Jersey.

The outcome of this filtering process was a final Focal SGCN list with 107 species:

- a. that were state and regional priorities;
- b. for which there was a notable capacity to positively affect their long-term persistence; and
- c. that represented the broad taxonomic groups, habitat types, and landscapes across New Jersey.

Species profiles for the 107 Focal SGCN can be found in Appendix D. The profiles include information regarding each species’ distribution, abundance, and population trend within New Jersey. They also note additional plans that have valuable conservation information, and note the primary and supporting habitats that are important for the Focal SGCN’s survival. Although the

Chapter 1: New Jersey's Most Vulnerable Wildlife

NJDEP's Land Use/Land Cover data layer includes finer-scale habitat information, the DFW used broader categories for this 2017 Plan to characterize each species' habitat use. These categories were:

- *Forest* (including deciduous and coniferous forests)
- *Grassland* (including natural grasslands and agricultural lands)
- *Shrub*
- *Wetlands* (including freshwater emergent marshes, forested wetlands, and tidal wetlands)
- *Barren and Exposed Rock*
- *Cold Water Stream* (including cold water rivers and oligotrophic lakes)
- *Warm Water Stream* (including warm water rivers and most ponds and lakes)
- *Beach and Dune* (including intertidal beach areas down to mean low water)
- *Tidal Flat* (including intertidal areas of mud or sand exposed during low tide)
- *Marine Near Shore Zone* (including subtidal waters seaward from the mean low water line to well beyond the breaker zone, and landward into subtidal waters of back-bays, coastal bays, lagoons, etc.)
- *Marine Off Shore Zone*, meaning (for the purposes of this plan) the zone extending seaward from the Marine Near Shore Zone.

New Jersey's wildlife habitat types are further discussed in Chapter 2.

D. Individual Focal SGCN and Guilds of Focal SGCN

Recognizing that synergies exist between species with overlapping habitats, the 107 Focal SGCN were grouped by the expert taxonomic teams into guilds that reflected similarities in the species' taxonomies, ecological requirements, threats, and actions needed to conserve them. This assessment categorized 77 of the species into 18 groupings, while the remaining 30 species remained ungrouped.

This final categorization produced a list of 48 individual Focal SGCN and guilds of Focal SGCN provided in Table 1.

E. Profiles of the Focal Species of Greatest Conservation Need

Profiles for each of the species that comprise our Focal SGCN have been developed to help users of the plan better understand data known or available concerning these species. Appendix D presents summary information for each individual Focal SGCN, and includes:

- General information on appearance, life history requirements, and geographic distribution within New Jersey;
- State Wildlife Action Plan classification of taxonomic and guild group, and conservation targets;
- Conservation status at the federal, regional, and state levels (including breeding versus nonbreeding for birds), and their ranks within the NatureServe international database;
- Status of the species' population abundance and trend;
- Broad habitat categories;
- Landscape Region(s) where the species occur in New Jersey;
- A statement indicating whether species habitat mapping is available through the New Jersey Landscape Project maps (details on the Landscape Project map are provided in Attachment II); and
- References to additional information on abundance and population trends, as well as other conservation plans that might be available.

Chapter 1: New Jersey's Most Vulnerable Wildlife

This page intentionally left blank

CHAPTER 2: HABITATS of NEW JERSEY

Effective conservation of New Jersey’s diverse wildlife requires planning at different scales. At the finer scale, Focal SGCN provide a discrete set of wildlife that are both in need of immediate protection *and* perceived to be responsive to known and feasible conservation actions. Implementing targeted efforts towards their conservation will benefit many other species. But species-specific conservation is not enough, especially given the long-term shifts that are occurring now, and will continue to occur, due to climate change and many other changes to New Jersey’s landscape.

I. Mapping SGCN Habitat

New Jersey’s Landscape Project mapping (Attachment II) continues to be the principal means by which the DFW documents the locations of habitats that support state listed (Endangered, Threatened, and Special Concern) wildlife species. New Jersey’s Landscape Project maps are used by the NJDEP to guide implementation of land use regulations that provide protections to imperiled wildlife species habitats, for internal review of habitat management and other habitat altering projects undertaken by the NJDEP, and as an important factor in land protection efforts overseen by the NJDEP’s Green Acres Program. New Jersey’s Landscape Project mapping uses the state’s land use / land cover GIS data and Biotics species occurrence data to model species habitat locations in the state. The mapping is updated periodically to reflect changes in land use / land cover data mapping and/or updated Biotics species occurrence data. Attachment II provides a more detailed description of New Jersey’s Landscape Project habitat mapping methodology and links to online mapping available through the NJDEP’s GIS servers.

New Jersey’s Landscape Project mapping currently provides presumptive habitat mapping, based upon 2012 LU / LC habitat conditions and 2016 species occurrence data, for more than half (61 of 107) of the Focal Species of Conservation Need identified in this plan (species for which New Jersey’s Landscape Project mapping exists are identified in the “Species Profiles” found in Appendix D). This includes habitats in urban areas, provided they meet the standard minimum mapping criteria. In the case of the 46 Focal Species of Conservation Need *not* currently mapped, the “Species Profiles” do provide information on broad habitat categories used by each species, as well as a general map depicting each species range in New Jersey. Together this information can be used to roughly delineate the areas of the state that provide habitat. In the DFW’s future development of the Landscape Project mapping consideration will be given to developing and implementing habitat mapping protocols for at least some of the FSGCNs not currently mapped with this methodology.

II. Identifying Conservation Focal Areas

To address broader scale planning needs, the DFW, with input from partners, identified Conservation Focal Areas (CFAs). CFAs are specific areas of New Jersey’s geography that feature some of the state’s highest value habitats and present important opportunities for effective conservation action. They will allow for the consideration of threats and actions from a geographic perspective so will benefit key wildlife habitats generally and, in turn, virtually all SGCN. Further, CFAs include important opportunities for habitat connectivity, a critical factor

Chapter 2: Habitats of New Jersey

in increasing resilience in a changing landscape. Note that identifying important *urban* wildlife habitats was not a goal of the CFA mapping, and will require a separate, dedicated mapping effort.

With their rich mix of important habitats and diverse species assemblages, CFAs are designed to represent some of the best opportunities for protecting, restoring, and sustaining New Jersey's wildlife diversity.

A. Delineating CFAs

Conservation Focal Areas are intended to reflect a wide variety of habitats throughout New Jersey's landscape regions based upon factors including quality, integrity, connectedness, and the likelihood of successfully implementing conservation actions within them. CFAs were identified using a broad spectrum of conservation-relevant metrics, each related to one of the following broad categories:

- landscape condition/ecological integrity;
- wildlife habitats;
- biological diversity;
- existing conservation infrastructure; and
- negative human influences.

Some metrics helped emphasize riparian corridors that serve to connect larger tracts of habitat in an otherwise fragmented landscape. Other metrics from the recently developed Regional Conservation Opportunity Areas (ROCA) mapping effort helped add a regional perspective to the CFAs in order to address ecosystems of importance not only to New Jersey, but to the Northeast.

The DFW designed the CFA mapping initiative to be separate but complementary to the identification of Focal SGCN. As such, it did not explicitly use information on the distribution of Focal SGCN. However, some species occurrence data layers that included SGCN were used to help identify habitats supporting biodiversity assemblages.

In all, the DFW used more than 40 datasets from state and regional sources with information about habitats within terrestrial, freshwater aquatic, and marine environments to delineate CFAs. Each dataset was weighted relative to its importance, and the DFW then conducted a co-occurrence analysis to identify areas where several different qualities were present. The raw values generated from the weighted co-occurrence analysis were then rescaled at the landscape region level by calculating percentile ranks relative to each region in order to evenly distribute CFAs across the state's six landscape regions. The DFW highlighted places within each landscape region that scored within or greater than the 70th percentile, and then ran a GIS analysis to identify CFA habitats based on key connections between high value areas and protective buffers. Details on selection, weighting, and analysis of CFA data can be found in Appendix E. As a final step, Division staff reviewed the final CFA outputs for each region, and, based on their knowledge of the areas, determined how they could either group or divide the CFA valued habitats in a manner that captured some unique regional, geographic and/or habitat relevance for that area. Staff biologist then assigned a unique Conservation Focal Area name; characterized each in terms of habitat location, scope or scale; predominant habitats and their condition; potential relevance to specific SGCN; and significant threats noted. This resulted in as few as six unique CFAs in several landscape regions, and up to 13 CFAs in the diverse and

Chapter 2: Habitats of New Jersey

highly fragmented Piedmont and Inner Coastal Plain landscape region. Descriptions and mapping for each unique CFA are provided for within each landscape region.

B. Use and Future Development of CFAs

As noted above, the DFW will use CFAs to further identify geographically-based threats to New Jersey's wildlife habitats and develop actions that will address those threats. In addition, the DFW will regularly review and improve CFA maps as new data become available and as new insights are shared by the public and conservation partners. For example, consideration is being given to incorporate established Important Bird Areas identified by Birdlife International and the National Audubon Society, as well as areas that have been mapped as critical migratory bird stopover habitat in the lower Cape May peninsula.

Advancing SGCN conservation at the regional level also remains a priority. To this end, the DFW will continue to work with the North Atlantic Land Conservation Cooperative and the Northeast Association of Fish and Wildlife Agencies to assess how new RCOA mapping products can best be incorporated into future versions of the New Jersey's CFAs.

The Connecting Habitat Across New Jersey (CHANJ) project is another initiative that will contribute to further improvements to CFAs and conservation actions within them, particularly in the context of habitat loss and fragmentation. CHANJ is a multi-partner, multi-disciplinary project led by the DFW that identifies key areas and actions needed to preserve and restore habitat connectivity for terrestrial wildlife at the local, landscape region, and statewide levels.

The initiative is designed to help:

- prioritize land protection;
- inform habitat restoration and management; and
- guide mitigation of road impacts on wildlife/habitats.

CHANJ products include a statewide map of core habitat areas and corridors between them, a guidance document, and a road/wildlife toolkit that provides recommendations on protecting, managing, and restoring the functional connectivity within the core habitat areas and corridors.

III. New Jersey's Landscape Regions & Conservation Focal Areas (CFAs)

New Jersey divides into six landscape regions: Atlantic Coast, Delaware Bay, Piedmont/Inner Coastal Plain, Pinelands, Skylands, and Marine (which is exclusively aquatic). The first five landscapes are each characterized by similar landforms, soils, vegetation, and hydrological regimes that collectively support distinctive habitat and species mixes.

Within these landscape regions, the ENSP and its conservation partners have identified Conservation Focal Areas (CFAs). These are the portions of the landscape regions that are of particular conservation interest because they have important habitats and species assemblages, and represent the best opportunities for protecting, restoring, and sustaining the state's wildlife diversity. They also include important opportunities for habitat connectivity, a critical factor in increasing resilience in a changing landscape. The CFAs were delineated as described above and in Appendix E using available data and expert knowledge of wildlife and their habitats. Figure 2

Chapter 2: Habitats of New Jersey

depicts a map of New Jersey's six landscape regions, as well as the CFA habitats delineated therein.

While research is underway to assess the condition of habitats within state lands, the sheer extent of Conservation Focal Areas precludes detailed assessments of the conditions of the many different wildlife habitats within them. Lacking such an assessment, the ENSP has described the habitats of the CFAs based on an evaluation of 18 land-use and land-cover based habitat categorizations (see Appendix F for a habitat characterization crosswalk) and the knowledge and experience of NJDEP staff.

In the following sections, we briefly describe each of the landscape regions and the CFAs within them. For each CFA, we note its location, important habitats, and the condition of these habitats.

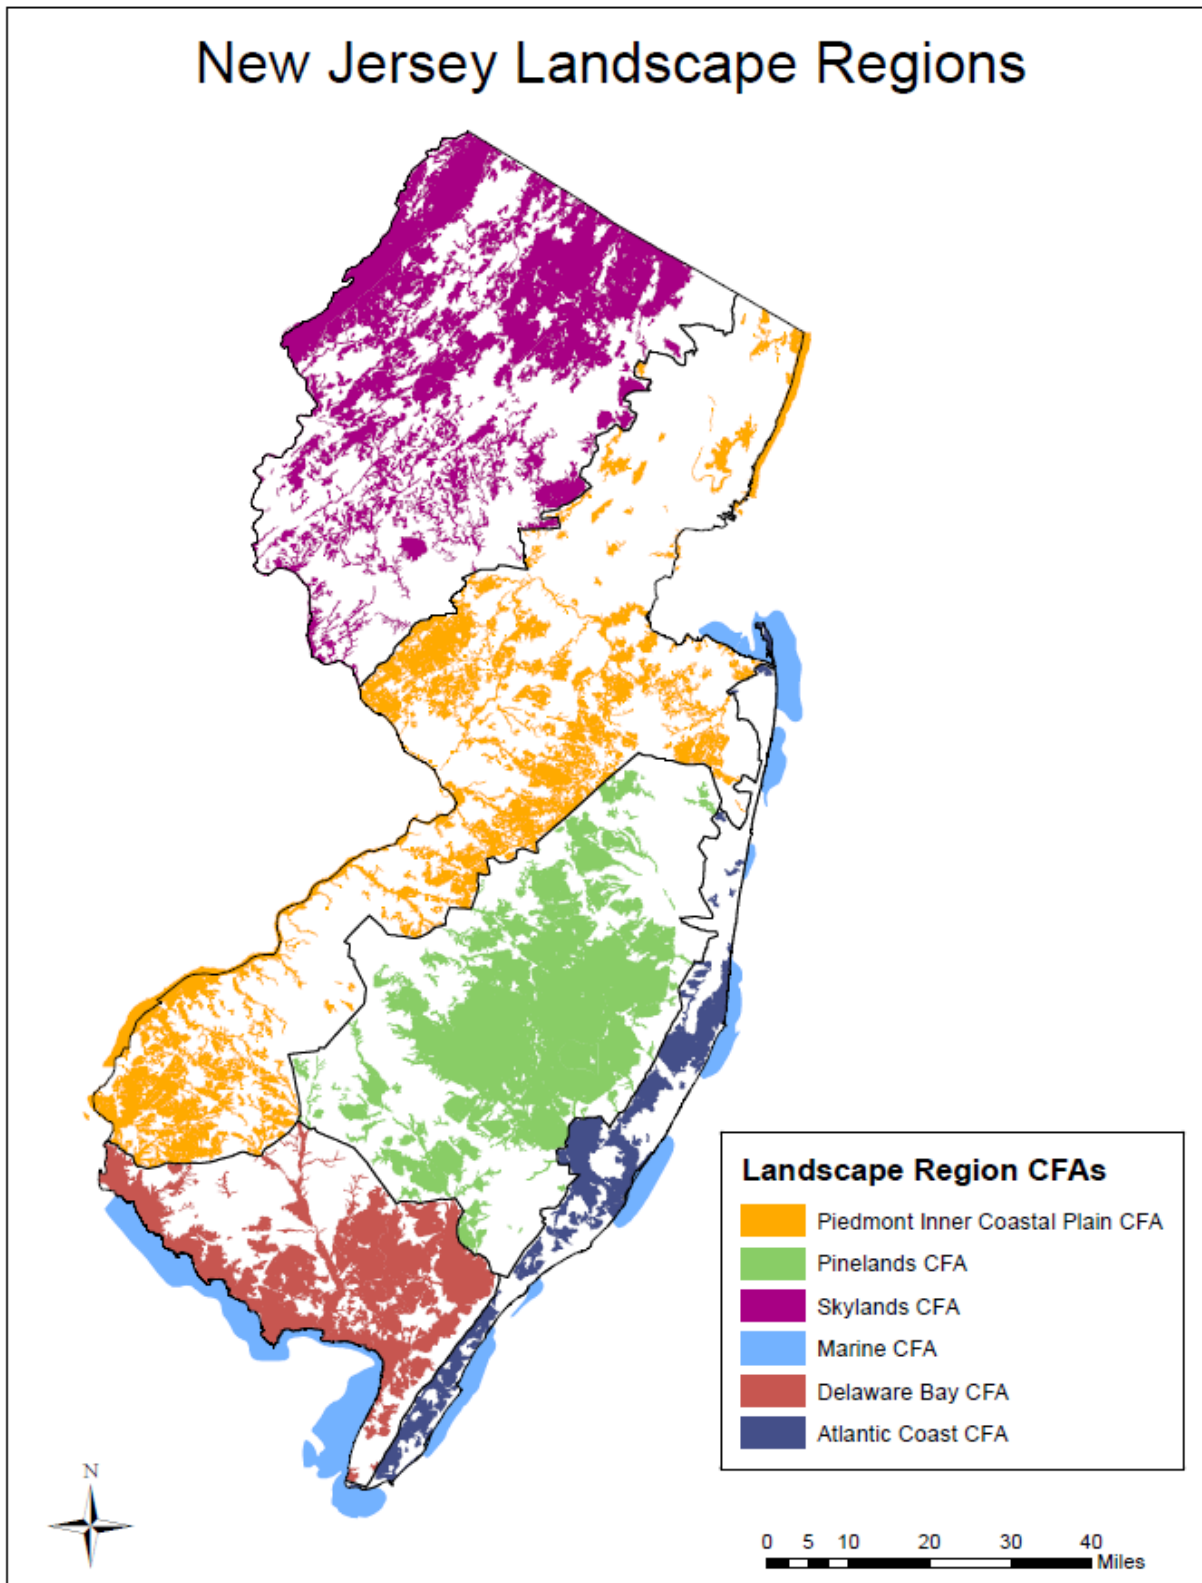

Figure 2. Statewide mapping of Conservation Focal Areas, by Landscape Region.

Atlantic Coast Landscape Region and Its CFAs

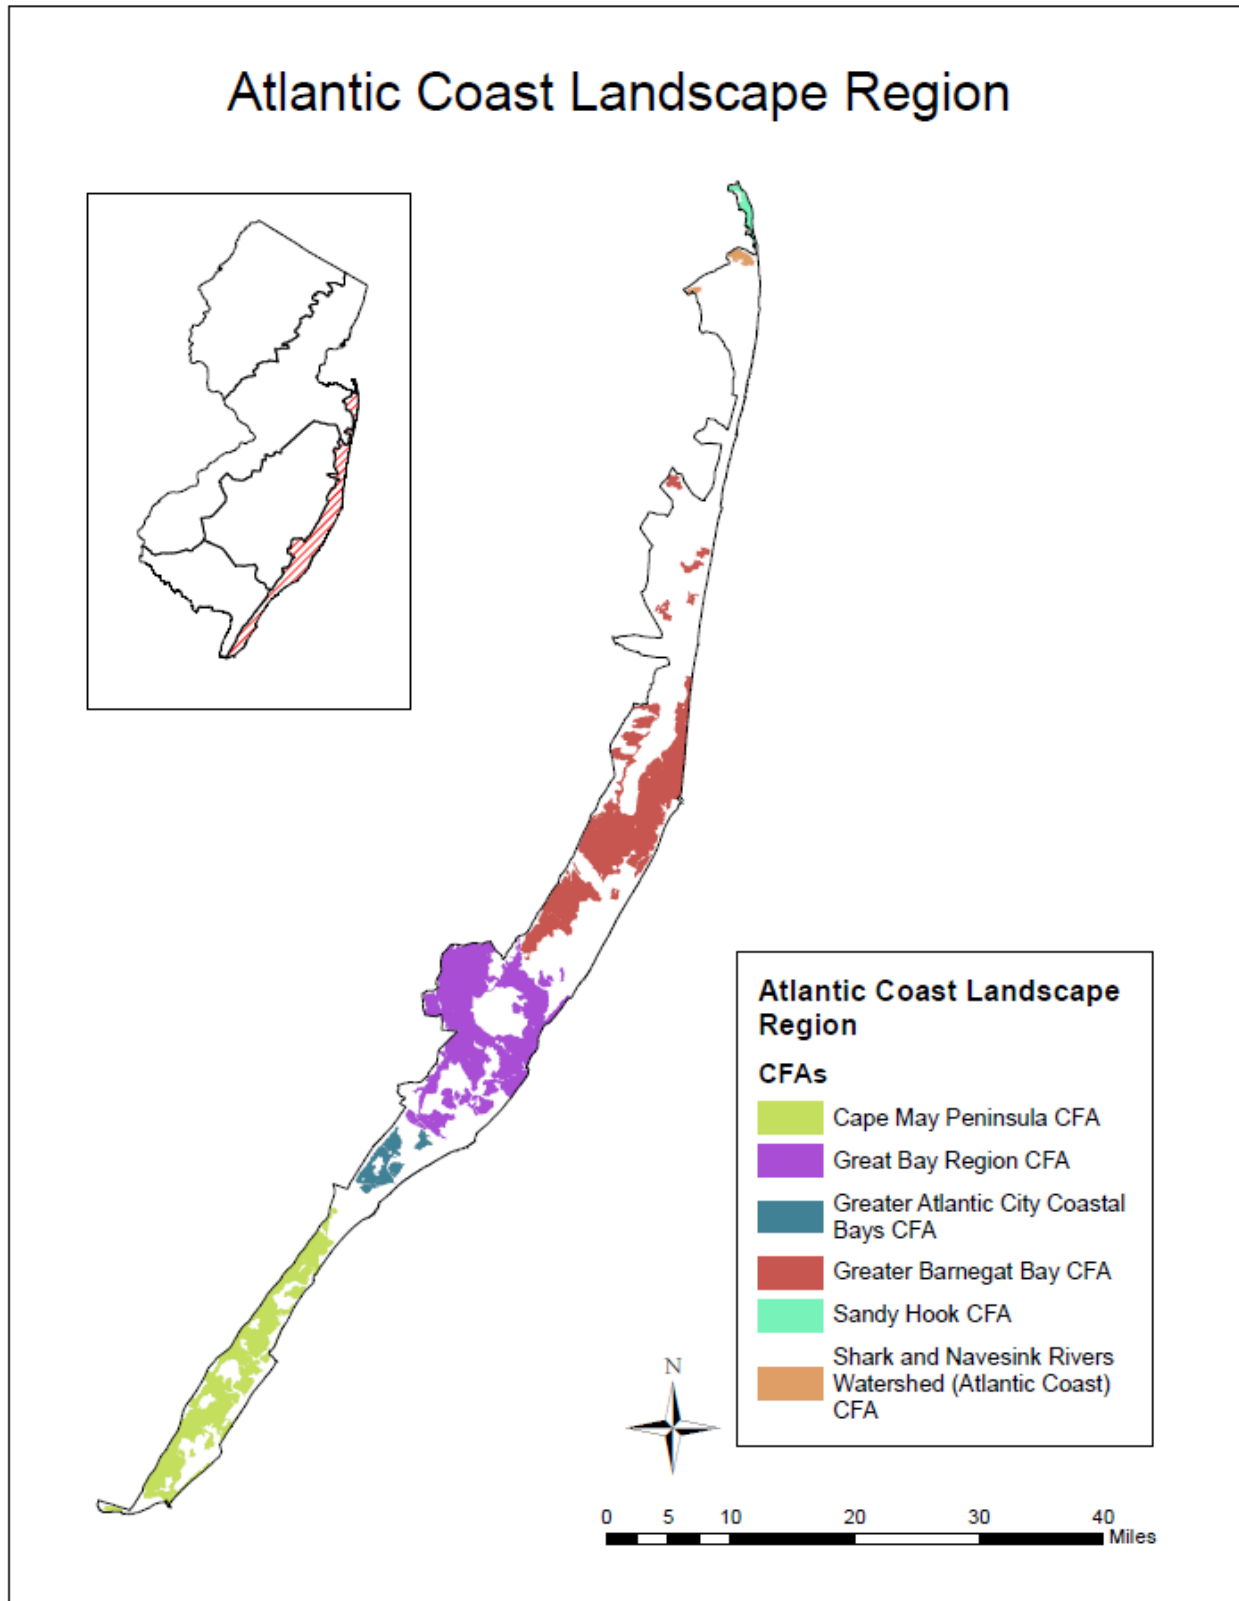

Figure 3. Mapping of Atlantic Coast Landscape Region CFAs.

Chapter 2: Habitats of New Jersey

This landscape region encompasses parts of Monmouth, Ocean, Cape May, and Atlantic counties and consists of barrier islands and beaches, tidal salt marshes, rivers, shallow bays, and lagoons along New Jersey's coastline (Figure 3). New Jersey's Atlantic coast beaches and marshes are among the most productive coastal habitats in the country. That said, the region also includes extensively degraded locales with few natural areas.

Threats to the region's habitats are led by development that impairs the ability of the coastal system to function normally. Upland portions of the barrier islands are almost entirely developed, and to protect these areas, the islands have been stabilized through extensive use of groins, seawalls, jetties, and intense beach replenishment programs. These engineering efforts preclude the normal, dynamic functions of coastal systems and thereby reduce the suitability of habitats for wildlife. Their effects are intensified by sea level rise and marsh subsidence, both of which have affected and will continue to impact the marshes and barrier islands.

A. Sandy Hook CFA

This CFA is composed of habitat within the Gateway National Recreation Area, Sandy Hook Unit which is National Park Service property. Although the park is heavily used for recreation, there are portions of it that remain highly suitable for wildlife. As a largely undeveloped barrier island, it offers some of the most mature maritime forest habitat left in the state. It plays an important role for endangered wildlife species, such as piping plover (where in some years more than half the state's population resides) as well as endangered plant species such as sea-beach amaranth. The habitat provides excellent stopover habitat for migrating passerines and shorebirds as evidenced by its designation as a globally significant Important Bird Area.

Although Sandy Hook receives some of the most intense recreational use in the state, the habitats in this CFA are generally intact, which leads to both greater quality and more availability than the fragmented beaches and marshes found elsewhere in the coastal zone. Its wide diversity of habitats (including beaches, secondary dunes, maritime forests, and bayside shoreline) provides important opportunities for wildlife in the northern portion of New Jersey's coast.

This CFA encompasses 0.5% of the Atlantic Coast Landscape Region at 605 hectares, including approximately 602 hectares of terrestrial and wetland habitats and 3 hectares of aquatic habitats. Approximately 500 hectares, or 83% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

B. Greater Barnegat Bay CFA

This CFA includes lands around the Manasquan River, Barnegat Bay, Manahawkin Bay, and Little Egg Harbor Bay. Island Beach State Park, one of the longest expanses of undeveloped barrier islands in the state, is an important stopover habitat for migrating passerines. The marsh and bay habitats in this CFA provide some of the most important areas for nesting ospreys, terns, and gulls, and many aquatic species use this area for early life stages. The bay habitats also hold the majority of the state's eelgrass beds, which provide vitally important

Chapter 2: Habitats of New Jersey

fish nursery habitat. Important Bird Areas of state significance are designated within this CFA.

Similar to the Sandy Hook CFA, the habitats in this CFA experience intensive recreational use, but there is less development than elsewhere along the Atlantic coast. Because of this, the CFA's habitats (including marsh islands, maritime forests, and beaches) are still highly suitable for wildlife.

This CFA encompasses 14% of the Atlantic Coast Landscape Region at 18,103 hectares, including approximately 10,166 hectares of terrestrial and wetland habitats and 7,937 hectares of aquatic habitats. Approximately 6,976 hectares, or 39% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

C. Great Bay Region CFA

This CFA is dominated by the most critical coastal habitat remaining in the state, most of which is owned by the NJ Division of Fish & Wildlife or the U.S. Fish & Wildlife Service. Unlike other CFAs in the coastal landscape, the habitats here are both largely undeveloped and subject to stricter regulations regarding human disturbance. A large portion of the CFA falls within the Edwin B. Forsythe National Wildlife Refuge, some of which is designated Wilderness Area. This protection has allowed the area to flourish under primarily nature-based forces (versus the human generated stabilization efforts that are commonplace elsewhere along the coast). Holgate, Little Beach, and North Brigantine Natural Areas compose a trifecta of exemplary habitats for barrier island species such as piping plovers, least terns, and diamondback terrapins. The marsh islands in this CFA provide nesting habitat for long-legged wading birds, ospreys, terns, skimmers, and gulls. Migratory shorebirds find refuge on the beaches and marsh mudflats during both spring and fall migrations. In addition to having multiple state-significant Important Bird Areas, one in the Mullica River Corridor is continentally significant while another in Holgate is globally significant.

This CFA contains the best coastal habitats in the Atlantic Coast Landscape Region. Its undeveloped barrier islands and extensive marsh islands provide some of the most expansive natural areas left on New Jersey's coast.

This CFA encompasses 15% of the Atlantic Coast Landscape Region at 19,203 hectares, including approximately 14,113 hectares of terrestrial and wetland habitats and 5,091 hectares of aquatic habitats. Approximately 13,923 hectares, or 73% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

D. Greater Atlantic City Coastal Bays CFA

The habitats in this CFA are characterized by a transition from northern areas (which are dominated by open water dotted with small islands) to southern areas in which large expanses of marsh divide the open water into smaller bodies. It includes habitats from the lands around Lakes Bay, Shelter Island Bay, Scull Island, Great Egg Bay, and Pecks Bay.

This CFA contains some of the most developed coastline in the state and counts Atlantic City, Ventnor, and Ocean City among the municipalities within its boundaries. Nonetheless, long-standing and important habitats exist – primarily on the marsh islands – for long-legged wading birds, ospreys, terns, and skimmers. It also includes some beachfront areas that provide habitat for species like piping plover and American oystercatcher, though these areas are under heavy pressure from human development and disturbance.

The habitat conditions of this CFA are poorer than other CFAs in the Atlantic Coast Landscape Region due to extensive development and modifications (such as extensive ditching of the marshes). That said, some intact habitats do exist in the CFA, especially on smaller marsh islands (which were not ditched) where species concentrate.

This CFA encompasses 2% of the Atlantic Coast Landscape Region at 2,355 hectares, including approximately 1,843 hectares of terrestrial and wetland habitats and 512 hectares of aquatic habitats. Approximately 587 hectares, or 25% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

E. Cape May Peninsula CFA

The habitats in this CFA are similar to the Greater Atlantic Coastal Bays CFA in that there are wide expanses of marsh with smaller areas of open water in the back bays (although much of these habitats have been ditched and now provide limited benefit to wildlife). However, the scale of development is slightly less and the area features inlet systems that are either not stabilized with jetties (notably Corson's and Hereford Inlets) or are adjacent to habitat largely protected by federal agencies (particularly the Cape May Inlet). These unestablished inlets are the foundation for the most suitable habitat that occurs in the coastal landscape for beach nesting birds and migratory shorebirds. The area's proximity to Delaware Bay further enhances its importance to migratory shorebirds and long-legged wading birds, as they are known to cross the landmass to use both coastal sides of the peninsula. In addition, the funneling effect of the peninsula means that migratory bird species of many genera (including those in the waterbird, passerine, and raptor groups) utilize the area for migratory and stopover purposes.

The habitats in this CFA are, on the whole, in better condition than most of the areas in the Atlantic Coast Landscape Region though not as good as those in other CFAs, such as in the Great Bay Region CFA. The larger bays allow for increased isolation of the marsh islands, which decreases the effects of human disturbance and development, and its geographical positioning makes it particularly important for coastal wildlife. However, intense human development has reduced it from functioning at peak potential.

This CFA encompasses 10% of the Atlantic Coast Landscape Region at 12,875 hectares, including approximately 10,026 hectares of terrestrial and wetland habitats and 2,849 hectares of aquatic habitats. Approximately 8,002 hectares, or 62% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

F. Shark and Navesink Rivers Watershed (Atlantic Coast) CFA

This CFA area includes lower portions of the Navesink River watershed, including Monmouth County's Hartshorne Woods Park. While this CFA has been mapped within the Atlantic Coast Landscape Region, it is functionally equivalent to, and an appendix of, the Piedmont/Inner Coastal Plain Landscape Region's Shark and Navesink Rivers Watershed (Piedmont and Inner Coastal Plain) CFA. Please refer to that section for a description of the CFA's habitat types, conditions, and values.

This CFA encompasses 0.4% of the Atlantic Coast Landscape Region at 467 hectares, including approximately 358 hectares of terrestrial and wetland habitats and 109 hectares of aquatic habitats. Approximately 302 hectares, or 65% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

Delaware Bay Landscape Region and Its CFAs

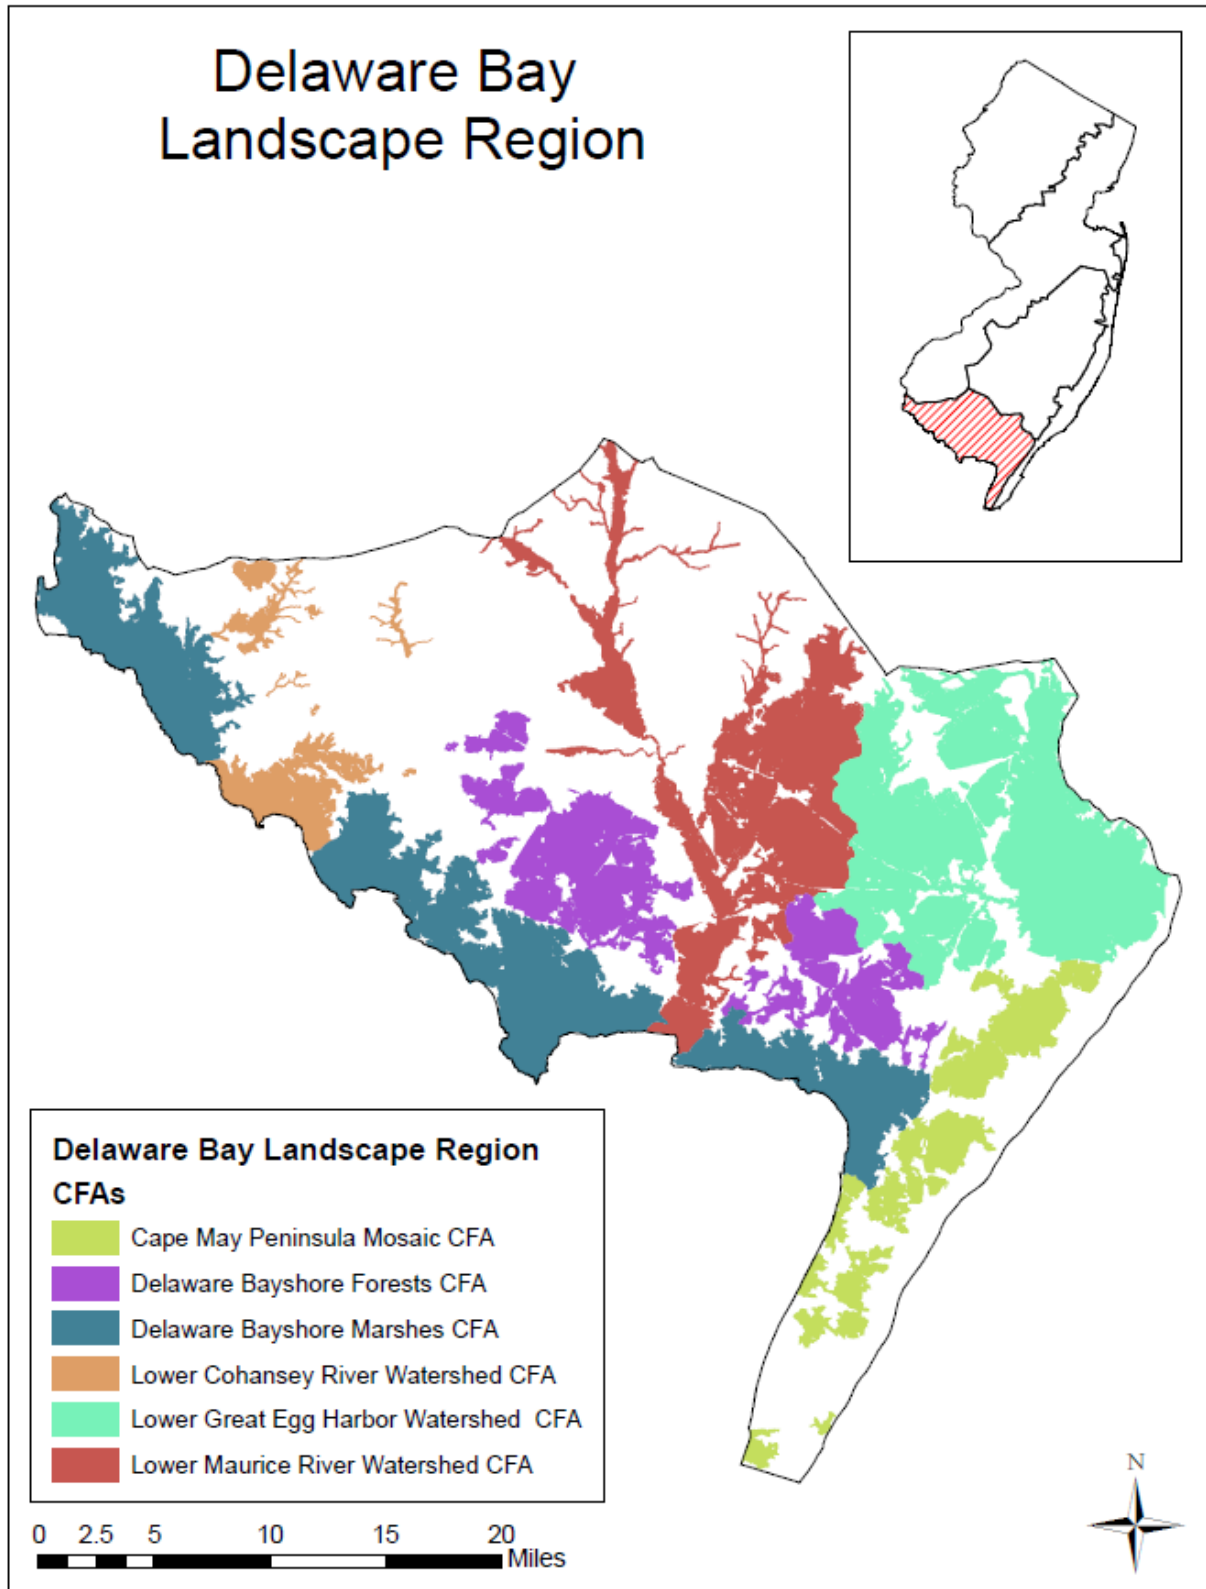

Figure 4. Mapping of Delaware Bay Landscape Region CFAs.

Chapter 2: Habitats of New Jersey

This landscape region encompasses all or parts of Cape May, Atlantic, and Cumberland counties (Figure 4). The region still contains vast woodland tracts that are among the largest in the state and are critical to migratory neotropical birds and raptors. The region's expansive habitat mosaic of rivers and streams flowing into the tidal Delaware Bay supports concentrations of rare wildlife and wintering waterfowl. Extensive salt marsh and sandy overwash beaches support a significant horseshoe crab breeding area and important stopover areas for migrating shorebirds, including the red knot, a federally threatened species of worldwide significance.

These important habitats remain in good condition for most species and the Cape May Peninsula remains one of the country's most important migratory stopovers for hundreds of bird and insect species. That said, the region is vulnerable. All of the region's habitats are threatened by development that fragments natural landscapes and invasive species that outcompete native species. The loss of peninsula habitat is a particular threat to migratory birds and to other species that reside permanently in this limited area. The vast tidal marshes of Delaware Bay are vulnerable to sea level rise and shoreline erosion, as are interior wetlands that could be affected by storm surge. Natural subsidence of marshes and alteration for salt hay farms could continue to significantly reduce high salt marsh habitat which is important for species like black rail and northern harrier. Inappropriate silvicultural practices could also degrade the habitat value of forests for many interior-dependent forest wildlife species.

A. Cape May Peninsula Mosaic CFA

The Cape May Peninsula Mosaic CFA extends the length of Cape May from the western portion of peninsula up to the north and northwestern boundaries of the Cape May National Wildlife Refuge. It is bounded on the west by the Delaware Bay shoreline between Cape May Canal and Bidwell Creek. The CFA's habitats are mostly forest, but include shrub, field, and marsh edge. This CFA is particularly important for southbound migratory birds that are funneled into it by prevailing winds. It also supports the majority of the state's eastern tiger salamander and southern gray treefrog populations.

Habitats on the peninsula are quite fragmented by development and roads, although blocks of land are conserved under state and federal ownership. Many habitats are impaired by invasive plant species that have crowded out native food and cover plants. Saltwater intrusion has also caused some of the forest edge to die off, affecting Atlantic white cedar and mixed forest types. Conversion of habitat to development threatens the viability of the peninsula as a migratory bird stopover, making beneficial management of remaining parcels important.

This CFA encompasses 4% of the Delaware Bay Landscape Region at 10,393 hectares, including approximately 10,097 hectares of terrestrial and wetland habitats and 296 hectares of aquatic habitats. Approximately 5,075 hectares, or 49% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

B. Delaware Bayshore Marshes CFA

The Delaware Bayshore Marshes CFA's southern boundary is Bidwell Creek, north of which it extends north and west to the Delaware Bay Landscape Region's northwestern edge. This

CFA includes several disjunct sections, broken at the mouth of the Cohansey River to recognize the contiguous Cohansey River delta and Lower Cohansey River Watershed CFA's characteristic agricultural-woodland-marsh delta. It is also interrupted to recognize the contiguous Maurice River from its mouth to its upper reaches in the Maurice River Watershed CFA. The Delaware Bayshore Marshes CFA consists primarily of a mixture of low salt marshes and high salt marshes with mudflats and muddy tidal creek shores that are significant for breeding and wintering bald eagles, northern harriers, ospreys, and nesting and wintering waterfowl.

In general, the habitat condition is good, but this system is still recovering from decades of alteration for salt hay production. Formerly impounded salt marshes exhibit land subsidence that can make the marsh more vulnerable to sea level rise. The combination of past human activities, storm effects, and eroding shorelines have resulted in high salt marshes becoming low salt marshes, and the system is vulnerable to accelerated tidal flooding.

This CFA encompasses 13% of the Delaware Bay Landscape Region at 30,267 hectares, including approximately 25,736 hectares of terrestrial and wetland habitats and 4,531 hectares of aquatic habitats. Approximately 17,951 hectares, or 59% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

C. Delaware Bayshore Forests CFA

The Delaware Bayshore Forests CFA includes the many tracts of wetlands and upland forests that are immediately inland of the Delaware Bayshore Marshes CFA. This CFA is disjunct, interrupted by the Maurice River Watershed CFA, and contains a significant amount of protected land and some of the largest contiguous forest tracts outside of the Pinelands. These forests are the stronghold for many forest-dependent species, including barred owls and red-shouldered hawks.

In general, the condition of forests in this CFA is good, providing a mixture of forest ages and structure, and a variety of types, from Atlantic white cedar and red maple wetlands to mixed pine-hardwood uplands. Forest management has been very limited, and the primary silviculture focus has been reacting to forest pests like gypsy moth (in the 1990s) and southern pine beetle (in the 2000s). In addition, saltwater intrusion has caused some of the forest edge to die off, affecting Atlantic white cedar and mixed forest types. Fragmentation is a threat to this CFA's important core forests, but to a lesser degree than in some other CFAs.

This CFA encompasses 7% of the Delaware Bay Landscape Region at 16,986 hectares, including approximately 16,325 hectares of terrestrial and wetland habitats and 661 hectares of aquatic habitats. Approximately 11,208 hectares, or 66% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

D. Lower Great Egg Harbor Watershed CFA

The Lower Great Egg Harbor Watershed CFA is within the harbor's watershed boundary except for the southern portion, where the Cape May National Wildlife Refuge is part of the Cape May Peninsula Mosaic CFA. This CFA is a mixture of tidal rivers and forests along the tributaries of the Great Egg Harbor, Middle, and Tuckahoe rivers. Beyond the marshes and marsh-forest boundaries, the woodlands are mostly fragmented with the exception of those on state lands. These habitats are significant for breeding and wintering bald eagles, ospreys, and nesting and migrating landbirds and waterbirds.

While the forests in this area are very fragmented, the overarching mosaic of woodlands, marshes, and tidal waterways is a generally healthy system. Water quality is good (the Great Egg Harbor River is a National Wild and Scenic River), but the salt marshes reflect a high degree of grid-ditching as a result of mosquito control activities in the 1950s. Low salt marsh dominates this system, and the limited remaining areas of high salt marsh are threatened by sea level rise and marsh subsidence.

This CFA encompasses 12% of the Delaware Bay Landscape Region at 29,210 hectares, including approximately 26,985 hectares of terrestrial and wetland habitats and 2,225 hectares of aquatic habitats. Approximately 18,682 hectares, or 64% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

E. Lower Maurice River Watershed CFA

The Lower Maurice River Watershed CFA includes the Maurice River from most of the upper headwaters in northern Cumberland County, the Menantico and Manumuskin tributary rivers, and the Maurice itself. This CFA interrupts the Delaware Bayshore Marshes CFA to recognize the importance of the continuous Maurice River from bay to headwaters. It is characterized by the tidal and brackish waters of multiple tributaries, wide adjacent marshes, and woodlands. It is significant for breeding and wintering bald eagles, nesting ospreys, nesting and wintering waterfowl and waterbirds, and fish populations that support a wide variety of wildlife.

The Maurice River below Willow Grove Lake has excellent water quality (which helped it gain National Scenic and Recreational River status). Wetland habitats are dominated by Phragmites mainly in the brackish portion near Mauricetown. Woodlands along the river are generally in good condition, though fragmented intermittently by development (associated with towns of Millville and Laurel Lake) and pockets of sand mining.

Other portions of the upper watershed are mapped as CFAs within the Pinelands Landscape Region's Upper Maurice River Watershed (Pinelands) and the Piedmont/Inner Coastal Plain Landscape Regions' Upper Maurice River Watershed (Piedmont/Inner Coastal Plain). These CFAs share many similarities with the Lower Maurice River Watershed CFA.

This CFA encompasses 10% of the Delaware Bay Landscape Region at 22,750 hectares, including approximately 20,449 hectares of terrestrial and wetland habitats and 2,301 hectares of aquatic habitats. Approximately 14,171 hectares, or 62% of the CFA, are

classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

F. Lower Cohansey River Watershed CFA

The Lower Cohansey River Watershed CFA is bounded by the Maurice River watershed to the east, and the boundary around the river's mouth near Bayshore is defined by local roads running from the uplands and bisecting the marsh. The Cohansey River is characterized by the wide tidal estuary and an adjacent marsh-woodlot-agricultural habitat matrix that is exceptional habitat for nesting and wintering bald eagles, northern harriers, ospreys, waterbirds, and wintering waterfowl. Disjunct from the lower river, the CFA includes upper watershed streams that are the Cohansey's headwaters.

The habitats in the lower Cohansey River are shaped by agricultural use that has reduced structural diversity and degraded water quality. Agriculture dominates both the upper and lower portions of the watershed, covering 60% to 70% of the landscape. As a result, water quality is compromised with elevated phosphorus, bacteria, and high turbidity. Structurally, the marsh-upland ecotone is limited to a narrow woodland separating marshes from planted fields in most of the river below Bridgeton. Phragmites is found in pockets, especially upstream toward Bridgeton.

This CFA encompasses 2% of the Delaware Bay Landscape Region at 5,717 hectares, including approximately 4,934 hectares of terrestrial and wetland habitats and 783 hectares of aquatic habitats. Approximately 1,923 hectares, or 34% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

Piedmont and Inner Coastal Plain Landscape Region and Its CFAs

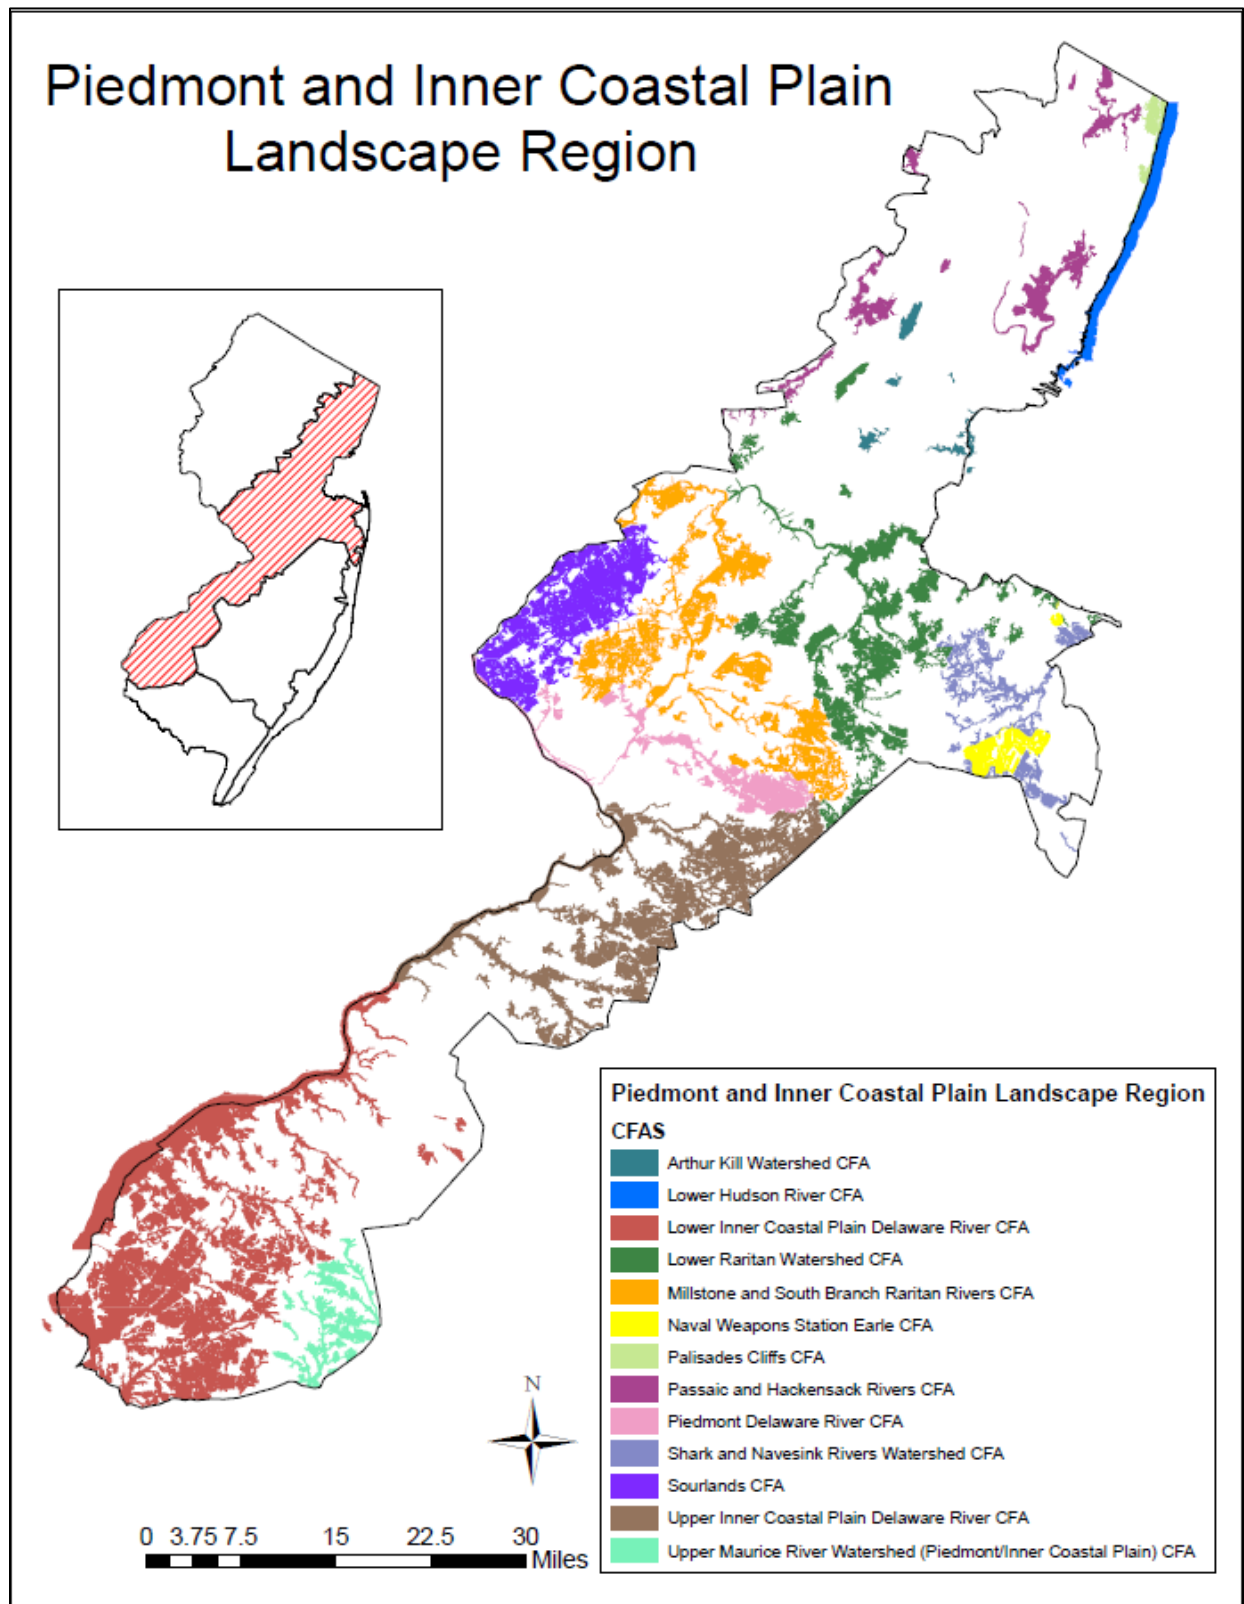

Figure 5. Piedmont and Inner Coastal Plain Landscape Region CFAs.

Chapter 2: Habitats of New Jersey

This landscape region combines two of New Jersey's physiographic regions, the Piedmont and the Inner Coastal Plain. It encompasses all or parts of Burlington, Gloucester, Salem, Mercer, Middlesex, Monmouth, Hunterdon, Somerset, Union, Essex, Hudson, Passaic, and Bergen counties (Figure 5). It is a network of waterways drained by the Delaware and Raritan Rivers and is characterized by farmed areas, extensive grasslands, fragmented woodlands, and some of the world's most productive tidal freshwater marshes.

The conditions of the region's habitats vary, but all have been influenced by human settlement as most of this region has been logged, farmed, and developed. Because habitat values were assessed by percentile rank *within a landscape region* as opposed to being ranked statewide (see Appendix E), CFA mapping in the Piedmont and Inner Coastal Plain region captured more anthropogenically influenced wildlife habitats than did other regions. While this "best of the region" approach ensured that CFA mapping captured habitats in this region that might have been overshadowed if compared on a statewide scale, it should be noted that there was no attempt to capture truly "urban" wildlife habitats. Threats today and in the future include invasive species, continued development, and over-browsing by white-tailed deer. Sea level rise may also impact the freshwater tidal marshes as the saltwater moves farther up into the freshwater tidal areas of the Delaware, Raritan, and Hudson Rivers and their tributaries.

A. Arthur Kill Watershed CFA

This CFA consists of five distinct locations within the Arthur Kill Watershed. The CFA includes streams, lakes, tidal rivers, and their associated wetlands and forests. Each location is relatively unfragmented by development but separated from each other by at least two miles of developed lands. Three of the areas are a part of an Important Bird Area that is known to be habitat for breeding populations of many endangered and threatened bird species, and significant congregations of breeding wading birds, and wintering waterfowl. The majority of this CFA consists of parcels owned by Union, Essex, and Middlesex counties.

Habitat quality in this CFA is generally poor. The streams are moderately to severely impaired and have poor habitat quality. Phragmites is encroaching on the CFA's tidal marshes, which are further contaminated with mercury, sewage, and other pollutants. Very little high salt marsh habitat remains in this CFA because of Phragmites, development, and sea level rise. A few areas, such as South Mountain, have large enough mosaics of upland and wetland forests to buffer some of the effects of fragmentation from the surrounding roads and development, but they are isolated from one another.

This CFA encompasses 0.3% of the Piedmont and Inner Coastal Plain Landscape Region at 1,729 hectares, including approximately 1,339 hectares of terrestrial and wetland habitats and 390 hectares of aquatic habitats. Approximately 1,021 hectares, or 59% of the CFA is classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

Chapter 2: Habitats of New Jersey

B. Naval Weapons Station Earle CFA

The entire CFA is a U.S. Navy base that houses ammunition and explosives. It is mostly composed of wetlands and upland forests with scattered clearings and roads, and it contains some of the headwaters for the Manasquan, Navesink, and Shark Rivers.

This CFA contains large patches of deciduous wooded wetlands and upland coniferous/mixed forests, which serve as a relatively unfragmented forested oasis in an area surrounded by development and some agriculture. Forested areas near the roads, depots, and rights-of-way are affected by fragmentation. This relatively pristine CFA borders the northern edge of the Pinelands Landscape Region, contains high-quality acid waters, and is the only location in the Piedmont and Inner Coastal Plain Landscape Region that contains habitat for the Pine Barrens bluet.

This CFA encompasses 1% of the Piedmont and Inner Coastal Plain Landscape Region at 3,447 hectares, including approximately 3,428 hectares of terrestrial and wetland habitats and 20 hectares of aquatic habitats. None of the CFA is classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

C. Lower Hudson River CFA

This CFA consists of the Hudson River from the New York state line down to Jersey City. It is a tidal estuary consisting almost entirely of brackish water that is crossed by the Tappan Zee and George Washington Bridges, the Lincoln and Holland Tunnels, and the PATH and Pennsylvania railroads. The estuary is heavily traveled by ferries and boats, including barges. With the exception of the Palisades CFA, the Lower Hudson River CFA is isolated from other natural habitats as it is bounded on the east and west by heavy development. That said, the Hudson River serves as a critical corridor for anadromous fish, including Atlantic sturgeon, traveling to spawning grounds upstream.

Runoff from impervious surfaces and sewage overflows are now the main sources of pollution on this stretch of the Hudson River, though it is still contaminated with mercury, PCBs, and other pollutants from activities that occurred decades ago. However, the water quality of the Hudson River has improved, particularly in the northern part of the CFA, and supports aquatic flora and fauna as well as the terrestrial wildlife that depend on it as a food source.

This CFA encompasses 0.3% of the Piedmont and Inner Coastal Plain Landscape Region at 5,276 hectares, including approximately 102 hectares of terrestrial and wetland habitats and 5,174 hectares of aquatic habitats. Approximately 361 hectares, or 7% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

D. Lower Inner Coastal Plain Delaware River CFA

This CFA consists of riparian networks of streams and rivers and their associated tidal and fresh wetlands, forests, and farms, which drain into the Delaware River. It includes the Alloway/Hope Creek Watershed at the southern end of the Piedmont and Inner Coastal Plain

Landscape Region north to the Cooper River Watershed. The majority of this CFA is tidal marsh along the Delaware River with an agriculture matrix farther east and a developed matrix farther north. This CFA is also part of eight Important Bird Areas that collectively support breeding bald eagles, northern harriers, marshbirds of regional priority, and an exceptional diversity of breeding landbirds.

This CFA is distinct because it contains the tidal portion of Delaware River, brackish water, and a mixture of salt and freshwater tidal marshes. Towards the northern boundary of this CFA, which is just south of Pennsauken Creek in Camden, water quality is severely impaired as development and impervious surfaces encroach on the small slivers of forest and shrubs that border the tributaries. The lack of vegetated buffer between development and the stream results in higher water temperatures and pollutants from runoff, resulting in degraded water quality. Further, dams and road crossings in some areas serve as pinch points for tidal flow, depriving many upriver marshes of sediments and nutrients, and also keeping out natural flooding during tidal extremes. Farther downstream along the Delaware River, water quality is moderately impaired as the matrix of development is broken up by large patches of agricultural lands, resulting in higher quality habitat overall. Depending on what is being grown, these areas can attract many area-sensitive species that need grasslands to breed, but they can also contribute to nutrient loading of streams from runoff.

This CFA encompasses 8% of the Piedmont and Inner Coastal Plain Landscape Region at 56,570 hectares, including approximately 42,679 hectares of terrestrial and wetland habitats and 13,891 hectares of aquatic habitats. Approximately 5,155 hectares, or 9% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

E. Lower Raritan Watershed CFA

This CFA is an interconnected riparian network of streams and rivers and their associated freshwater wetlands, low salt marshes, forests, and farms. It follows the boundary of Union and Somerset Counties south through the center of Middlesex County into northern Monmouth County. Large patches of upland and wetland forests mixed with development surround most of the headwaters in the southern portion of this CFA. The headwaters in the northern portion of the CFA occur on the southeastern portion of First and Second Watchung Mountain, which support some small but intact patches of upland forest surrounded by many residential areas. Two small, isolated forests also occur in Middletown Township. Some of the salt marshes in northern Monmouth County are part of the large Raritan Bay Important Bird Area, known for breeding black skimmers, wading birds, and salt marsh/wetland birds of regional priority as well as a significant congregation of wintering waterfowl, particularly greater scaup. The majority of this CFA is owned by federal, state, county, and municipal governments, and also nonprofit organizations.

The salt marshes near the mouth of the Raritan River and tributaries to the north are riddled with Phragmites and surrounded by development and impervious surfaces, creating low quality habitats contaminated by runoff. A few patches of freshwater tidal marshes that are not overrun with Phragmites can be found farther upstream, but their water quality is still moderately to severely impaired. Isolated forest patches are large enough to buffer

Chapter 2: Habitats of New Jersey

fragmentation effects from surrounding development, but they contain many invasive plant species and an overabundant deer population that keeps understory vegetation from growing, leaving forested habitats of generally fair quality.

This CFA encompasses 3% of the Piedmont and Inner Coastal Plain Landscape Region at 21,257 hectares, including approximately 19,197 hectares of terrestrial and wetland habitats and 2,061 hectares of aquatic habitats. Approximately 7,428 hectares, or 35% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

F. Millstone and South Branch Raritan Rivers CFA

This CFA is an interconnected riparian network of streams and rivers and their associated wetlands, forests, and farms set within a matrix of development. It spans across most of Somerset County and follows the border of Mercer and Middlesex Counties into northern Monmouth County. Many of the brooks in this CFA are a stronghold for several rare minnow species and currently do not contain any non-native fish species. This CFA also is a part of three Important Bird Areas that are known for breeding bald eagles, kestrels, endangered and threatened grassland birds, and a plethora of forest and shrub birds of regional priority. The CFA also has a significant stopover site for migrating landbirds in both the spring and fall, and significant congregations of wintering waterfowl and fall migrating raptors. The Millstone River and the Delaware & Raritan Canal are mostly owned by the state, serve as continuous corridors connecting the northern and southern ends of this CFA, and are central to the importance of this area.

Although the waterways in this CFA are extremely important for rare freshwater fishes, water quality along the Millstone River and its tributaries is impaired and considered to be of poor to moderate quality due to nutrient and/or bacteria loads, sedimentation, and runoff due to the increasing presence of impervious cover as farms and forests along the waterways are converted into developments. Patches of forest, agriculture, and grasslands occur at the headwaters, but they are heavily fragmented by development. Overabundant deer and invasive plants keep the diversity of shrubs at a minimum. Few patches of forest within this CFA are large enough to buffer the effects of fragmentation from the surrounding development and agriculture, resulting in poor to low quality of wildlife habitats.

This CFA encompasses 3% of the Piedmont and Inner Coastal Plain Landscape Region at 21,647 hectares, including approximately 20,746 hectares of terrestrial and wetland habitats and 900 hectares of aquatic habitats. Approximately 6,942 hectares, or 32% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

G. Palisades Cliffs CFA

This CFA consists of one contiguous patch of forest and cliffs bordered on the east by the Hudson River and New York City, and on the west by a heavily developed portion of Bergen County. The cliffs are home to the last known New Jersey population of the endangered Allegheny woodrat as well as natural cliff-nesting peregrine falcons. The forests at these cliffs are also an Important Bird Area that serves as a significant fall migratory stopover for

Chapter 2: Habitats of New Jersey

raptors and landbirds. Most of this CFA is owned by the county or the Palisades Interstate Park Commission.

This CFA is a forested and rocky haven with excellent water quality in an otherwise heavily urbanized area, though it is far from pristine. The habitat is generally of fair quality as the forest patches are narrow, separated from other forest patches by the Palisades Parkway and development, and riddled with many different invasive and exotic plant species.

This CFA encompasses 0.2% of the Piedmont and Inner Coastal Plain Landscape Region at 1,403 hectares, including approximately 1,397 hectares of terrestrial and wetland habitats and 5 hectares of aquatic habitats. Approximately 1,313 hectares, or 94% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

H. Passaic and Hackensack Rivers CFA

This CFA consists of seven distinct locations containing streams, lakes, and tidal rivers that are a part of or drain into the Passaic and Hackensack Rivers and their associated wetlands and forests. Each location is relatively unfragmented by development, but is separated from others by at least 1.5 miles of developed lands. Two of the areas are a part of three Important Bird Areas that have known breeding habitats for many endangered, threatened, and regional priority bird species, as well as significant congregations of breeding wading birds, wintering waterfowl, spring and fall migrating landbirds, fall migrating waterfowl, gulls, and terns. Almost the entire CFA is owned by a variety of government bodies and nonprofits.

The largest part of this CFA is the Hackensack Meadowlands and the tidal waters and low salt marshes downstream. Much of this is poor quality habitat, contaminated with high levels of mercury, dominated by Phragmites, and surrounded by highways, development, and landfills. The Meadowlands has a history of degradation and contamination. A significant recovery has been made, as evidenced by water quality testing showing improved dissolved oxygen levels, among other metrics. Improvement in habitat conditions has also been documented via the long-term monitoring of biota. Approximately 800 acres in the Meadowlands have been significantly enhanced to provide better quality wetland habitat to a diverse and sustained plant and wildlife community. Some remnant areas with desirable wetland vegetation still exist here. Hundreds of acres of tidally exposed mudflat is inhabited by a valuable benthic invertebrate community that supports many thousands of waterfowl, shorebirds, and wading birds. Populations of iconic wetland species, including bald eagle, osprey, and diamondback terrapin, continue to grow in the Meadowlands.

A forested part of this CFA - occurring on and around the Passaic River near the Long Hill and Riker Hill portions of Third Watchung Mountain - is narrow, surrounded by development, and prone to the effects of fragmentation, isolation, and an overabundant deer population. However, in a heavily urbanized environment, even degraded forests and marshes serve as critical refuges for wildlife. Most of the Meadowlands is brackish tidal habitat, but there are forested areas around Teterboro Airport and Losen Slote Park. Smaller areas of isolated freshwater wooded habitat also exist in the Meadowlands.

Chapter 2: Habitats of New Jersey

This CFA encompasses 1% of the Piedmont and Inner Coastal Plain Landscape Region at 7,963 hectares, including approximately 5,033 hectares of terrestrial and wetland habitats and 2,931 hectares of aquatic habitats. Approximately 2,363 hectares, or 30% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

I. Piedmont Delaware River CFA

This CFA is the portion of the Delaware River from Trenton north to the northern boundary of the Piedmont and Inner Coastal Plain Landscape Region. Its extensive riparian network and associated wetlands, forests, and farms drain into the only section of the Delaware River within the Piedmont physiographic region. The land cover in this CFA varies from a mix of agriculture and development in the eastern half and northwestern corner to mostly development in the middle. The Piedmont Delaware River CFA is New Jersey's only known spawning and nursery area for the endangered shortnose sturgeon and is part of three different Important Bird Areas that are known for a plethora of breeding forest and shrub birds of regional priority, an exceptional diversity of breeding landbirds, particularly forest and shrub birds of regional priority, and significant congregations of spring migrating and wintering waterfowl. The majority of this CFA, other than the Delaware River, is along Assunpink Creek and is owned by state, county, and municipal governments or nonprofits.

The waterways in the middle portion of the CFA are surrounded by development and impervious surfaces and as such are generally of poor quality as they are degraded from runoff of nutrients and sediments. Forests, agriculture, and grasslands are in the eastern portion and although they are less fragmented by development, few patches of forest within this CFA are large enough to buffer the effects of fragmentation from surrounding agriculture, resulting in poor to low quality wildlife habitats. Overabundant deer and invasive plants keep the diversity of shrubs at a minimum. Large hay farms can provide suitable habitat that attracts many area-sensitive species that need grasslands to breed, but they can also contribute to nutrient loading of streams from runoff.

This CFA encompasses 1% of the Piedmont and Inner Coastal Plain Landscape Region at 7,618 hectares, including approximately 6,556 hectares of terrestrial and wetland habitats and 1,063 hectares of aquatic habitats. Approximately 4,144 hectares, or 54% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

J. Shark and Navesink Rivers Watershed (Piedmont and Inner Coastal Plain) CFA

This CFA is adjacent to the Naval Weapons Station Earle CFA in Monmouth County, and is bordered to the east by the Atlantic Coast Landscape Region's Shark and Navesink Rivers Watershed (Atlantic Coast) CFA. It consists of three riparian networks of streams and rivers, and their associated wetlands, forests, and farms, within a primarily developed matrix. Parts of this CFA are within two different Important Bird Areas that are known for significant congregations of wintering waterfowl, particularly brant, greater scaup, American black ducks, and canvasbacks. The mouth of the Navesink River is tidal and contains some salt marsh and freshwater tidal marsh, a part of which is owned by the state. Very little of the Shark River in this CFA is tidal, and the forests, shrubs, and wetlands surrounding this river

are partially owned by the county. The other portions of this CFA are narrow slivers of wetlands and forests with pockets of agriculture adjacent to rivers and lakes, all of which are surrounded by development.

Water quality in this CFA is moderately to severely impaired due to pollution from runoff. The majority of the high and low salt marshes at the mouth of the Navesink River are dominated by Phragmites, creating a monoculture of poor habitat. The Swimming River portion of the Navesink is mostly surrounded by development and impervious surfaces, with the exception of some county parks. Because of the extensive development in this CFA, most areas are of poor quality and are affected by fragmentation.

This CFA encompasses 1% of the Piedmont and Inner Coastal Plain Landscape Region at 6,270 hectares, including approximately 5,827 hectares of terrestrial and wetland habitats and 443 hectares of aquatic habitats. Approximately 1,732 hectares, or 28% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

K. Sourlands CFA

This CFA lies at the boundary of Hunterdon, Mercer, and Somerset Counties and supports large forests fragmented by development and large, relatively unfragmented farms on the forest peripheries. The forests are the largest in the region and contain both Sourland and Baldpate Mountains, parts of which are owned by the state, county, municipalities, and nonprofits. The forests and farms in this CFA also contain the headwaters for the Stony Brook, Millstone, and Neshanic Rivers. The Sourlands CFA is also an Important Bird Area with breeding habitat for an exceptional diversity of landbirds, including regional priority forest and shrub species, and is a significant spring migration stopover for landbirds.

Roads and residential areas crisscross the forests, which are bordered by agricultural lands and development, while overabundant deer, invasive plants, and lack of disturbances (natural or manmade) keep the diversity of the forest understory at a minimum. Water quality in this CFA is mostly moderately impaired with a few unimpaired areas. While the overall habitat quality is moderate, it is the highest quality forest in the region. Large hay farms can provide suitable habitat for that attracts many area-sensitive species that need grasslands to breed, but they can also contribute to nutrient loading of streams from runoff.

This CFA encompasses 3% of the Piedmont and Inner Coastal Plain Landscape Region at 17,270 hectares, including approximately 17,137 hectares of terrestrial and wetland habitats and 133 hectares of aquatic habitats. Approximately 5,408 hectares, or 31% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

L. Upper Inner Coastal Plain Delaware River CFA

This CFA consists of four riparian networks of streams and rivers, and their associated wetlands, forests, and farms, which are part of or drain into the Delaware River. It includes the Pennsauken Creek Watershed north to the northern border of the Piedmont and Inner Coastal Plain Landscape Region. The majority of this CFA is developed along the Delaware

River but is more of a mix of developed and agriculture matrix farther east. It includes parts of six Important Bird Areas that are known for breeding threatened and endangered birds like peregrine falcons and grasshopper sparrows, forested wetland birds of regional priority, and significant stopovers for spring and fall migrating waterfowl and landbirds.

Tidal waters and freshwater tidal wetlands occur along the Rancocas Creek and part of Assicunk Creek, but the largest area of high quality freshwater tidal wetlands in the Piedmont Region that is not dominated by Phragmites occurs at the mouth of Crosswicks Creek. The locations with non-tidal waters are narrow riparian corridors surrounded by development, and are degraded due to pollution from runoff. At the headwaters, large patches of agriculture are buffered by small patches of forest that help maintain higher water quality. Two very small headwater areas associated with this CFA are mapped within the Pinelands Landscape Region's Upper Inner Coastal Plain Delaware River (Pinelands) CFA, but are functionally equivalent to the headwater habitats described here.

This CFA encompasses 4% of the Piedmont and Inner Coastal Plain Landscape Region at 29,772 hectares, including approximately 25,728 hectares of terrestrial and wetland habitats and 4,033 hectares of aquatic habitats. Approximately 4,929 hectares, or 17% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

M. Upper Maurice River Watershed (Piedmont and Inner Coastal Plain) CFA

This CFA consists of a riparian network and its associated wetlands, forests, and farms in a predominately agricultural matrix. It includes the western parts of the Still/Little Ease Run and Muddy Run watersheds that drain into the Maurice River.

The CFA's upland and wetland riparian forest patches are mostly narrow and fragmented by surrounding agriculture and some development making them of poor quality and limited use to wildlife. Water quality is also moderately impaired. Large hay farms can provide suitable habitat for that attracts many area-sensitive species that need grasslands to breed, but they can also contribute to nutrient loading of streams from runoff. This CFA drains to the Delaware Bay Landscape Region's Lower Maurice River Watershed CFA. Please refer to that section for additional information on habitats and their condition.

This CFA encompasses 1% of the Piedmont and Inner Coastal Plain Landscape Region at 5,755 hectares, including approximately 5,577 hectares of terrestrial and wetland habitats and 178 hectares of aquatic habitats. Approximately 170 hectares, or 3% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

Pinelands Landscape Region and Its CFAs

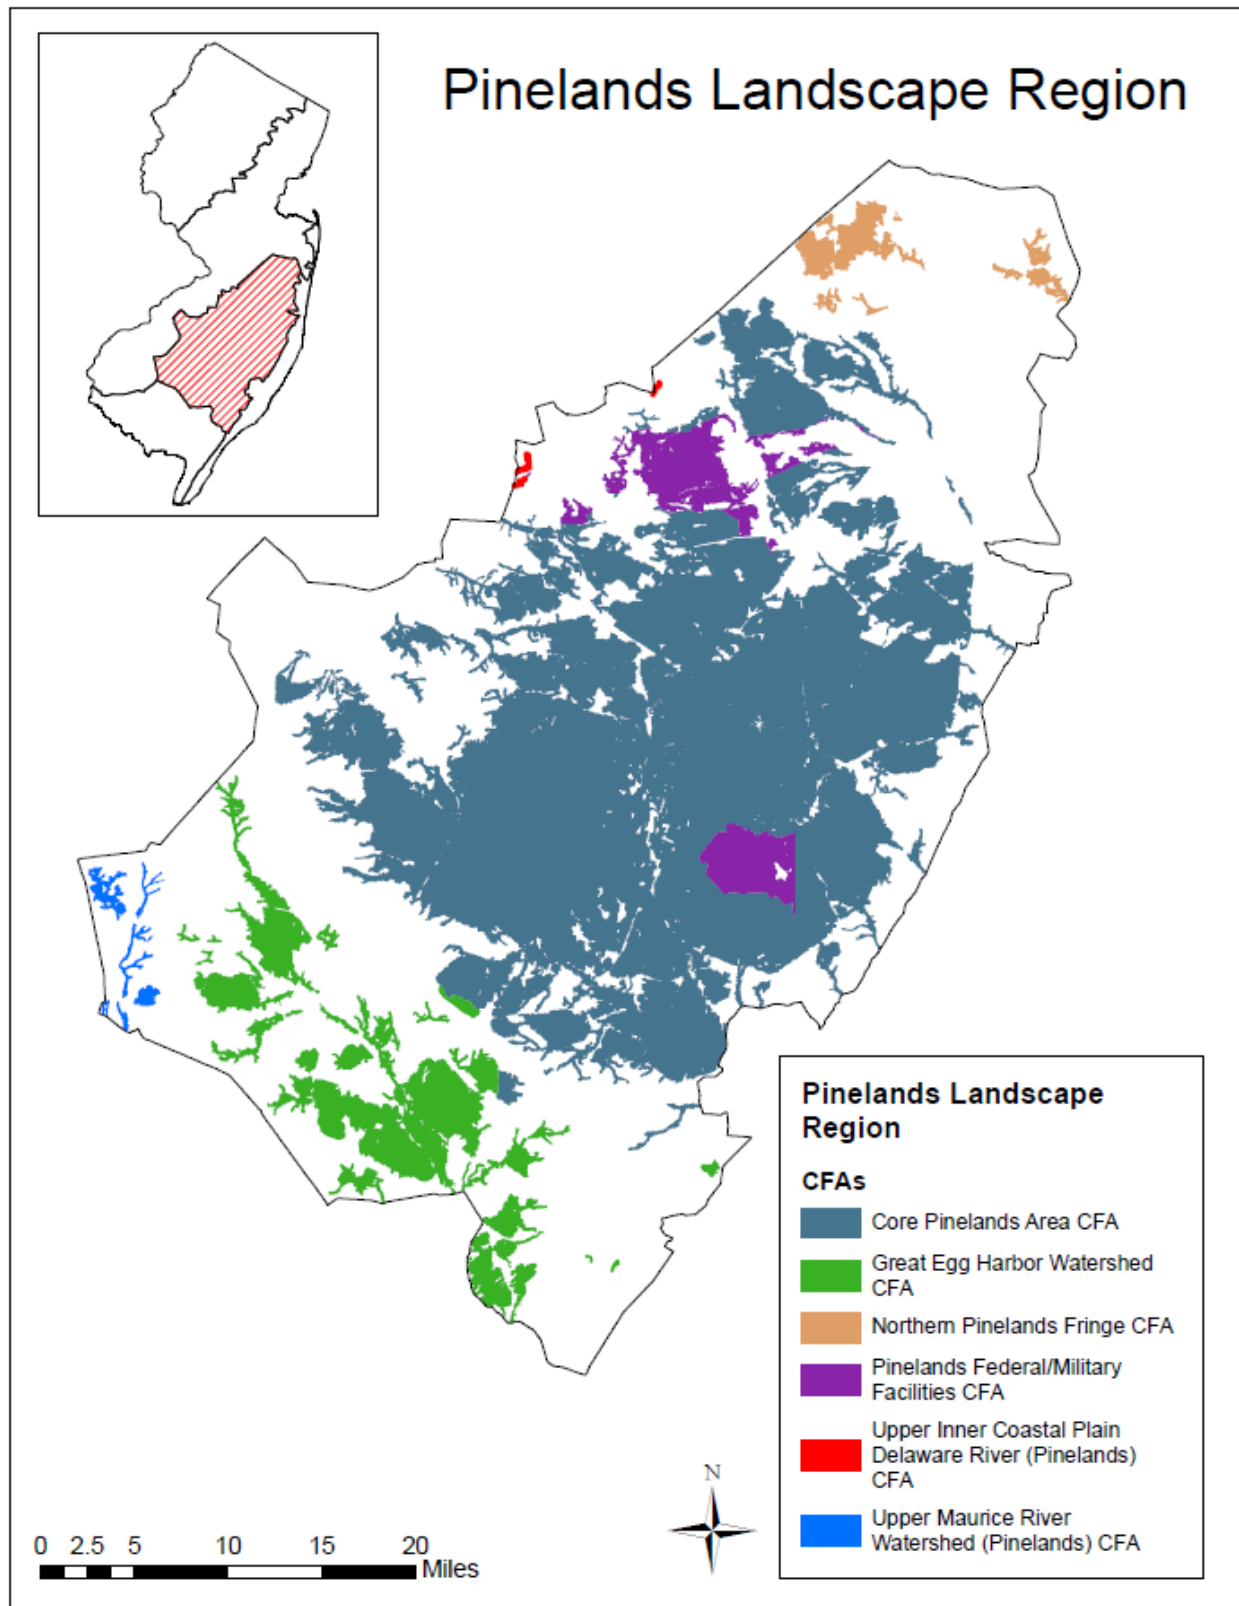

Figure 6. Pinelands Landscape Region CFAs.

Chapter 2: Habitats of New Jersey

This landscape encompasses all or parts of Atlantic, Ocean, Burlington, Camden, and Gloucester counties (Figure 6). New Jersey's Pinelands (or Pine Barrens) are an internationally recognized ecosystem consisting predominantly of pine and pine-oak mesic upland forests, pitch pine lowlands, and cedar swamps supporting extremely diverse reptile, amphibian, and invertebrate populations (including interior forest and area-sensitive species). Extensive cedar swamps and wetland systems contain numerous insect species, as well as sustainable populations of many neotropical birds. Its waterways support aquatic communities unique among the mid-Atlantic states, and its aquifers provide drinking water to a vast portion of the surrounding region.

Overall, the conditions of the region's habitats are very high, with vast forest and wetlands ecosystems preserved and intact, thanks not only to abundant state park and forest holdings but also to the federal designation of the more than one-million acre "Pinelands National Reserve." This designation carries strong stewardship and regulatory protections that are implemented by the New Jersey Pinelands Commission.

Notwithstanding these protections, certain habitats remain at risk. The region's scant topographic diversity makes it particularly susceptible to impacts from climate change, a current example being the region-wide introduction of southern pine beetle. Other impacts are associated with the illegal recreational use of off-road vehicles in wetlands and sensitive forest habitats, the effects of regional groundwater withdrawals, and the slow conversion of the climax forest structure. This forest structure was historically maintained by wildfires and more recently by human activities such as logging and charcoal production which maintained re-occurring openings in the canopy and sustained a pine-dominated composition. Combined with restrictions and market-driven reductions in logging or forestry activities, the changes in wildfire patterns are converting the forest to a consistently closed canopy condition, and the species composition is slowly changing to include more deciduous hardwoods.

A. Northern Pinelands Fringe CFA

The Northern Pinelands Fringe CFA is composed of wetland and upland forest and wetland corridors associated with the Manasquan River and Metedeconk River drainages. While the forest structure tends to be more deciduous in nature than the core Pinelands, the area does share many similarities with the true Pine Barrens to the south. Significant portions of the CFA are preserved in Allaire State Park, Turkey Swamp Park, and other county and municipal holdings. However, some properties in the southern section of this CFA are privately held and may face imminent development. The CFA continues to support the northernmost occurrences of some important Pinelands or coastal plain species such as northern pine snake, pine barrens treefrog, and swamp pink. It also represents important core areas at risk of fragmentation from remaining Pinelands ecosystems to the south.

The habitats in this CFA are generally smaller in size and more amorphous in shape than others in the Pinelands Landscape Region. As a result, these habitats tend to have smaller core areas that are more susceptible to adverse impacts from adjacent edge effect influences. While many of the habitats within this CFA are preserved under state and county ownership and benefit from associated management efforts, there are also privately-owned areas that receive no direct state or county stewardship.

Chapter 2: Habitats of New Jersey

This CFA encompasses 1% of the Pinelands Landscape Region at 4,053 hectares, including approximately 4,021 hectares of terrestrial and wetland habitats and 33 hectares of aquatic habitats. Approximately 2,930 hectares, or 72% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

B. Core Pinelands Area CFA

The Core Pinelands Area CFA consists of the expansive pine and pine/oak forests, forested wetlands, and largely intact stream corridors that make up the Pinelands Protection Area. Extensive tracts are preserved as state parks, forests, wildlife management areas, or in county, municipal, and nonprofit preserves. Development in most remaining lands is carefully planned by the Pinelands Commission. As such, the area remains the state's largest, most intact forest ecosystem. The Core Pinelands Area CFA encompasses the majority of the Mullica River watershed, making the watershed one of the most pristine and best protected in the state. Portions of the Barnegat and Rancocas Watersheds are also represented. The area's ecology is driven primarily by the sandy, highly permeable, and nutrient poor coastal plain soils. Fire ecology has been a historically significant driver of plant and animal communities in the CFA, though with development and the associated need for fire suppression and management, this critical factor is likely forever altered. The Core Pinelands Area CFA is well known for its unique and diverse faunal communities, including many Pine Barrens specialists that warranted specific grouping as Focal SGCN, such as the "Pine Barrens Snakes" and the "Pine Barrens Moths."

Habitats within this CFA are generally considered to be of high quality in comparison to other areas of the state. Very large core areas of forest, extensive public ownership, management, and limited adjacent development have maintained highly functioning natural communities. While the CFA experiences very little development pressure, the sandy soils and generally high water table make many areas susceptible to disturbance from agriculture, groundwater withdrawal, sand and gravel mining, and impacts from controlled or uncontrolled fire and illegal on- and off-road vehicular recreation. The slow conversion of forest types due to the past few decades of fire suppression and wildfire management is a long-term concern regarding habitat quality within this CFA.

This CFA encompasses 36% of the Pinelands Landscape Region at 164,798 hectares, including approximately 160,794 hectares of terrestrial and wetland habitats and 4,004 hectares of aquatic habitats. Approximately 115,738 hectares, or 70% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

C. Federal/Military Facilities CFA

This CFA consists of largely undisturbed forests, wetland forests, and riparian corridors that exist on the federal properties comprising the Joint Base McGuire-Dix-Lakehurst and the Warren Grove Gunnery Range. The large intact ecosystems on these installations, historically sheltered from traditional residential, recreational, and commercial development pressures, receive additional benefit from site-specific Integrated Natural Resource Management Plans. While management under these plans only applies to federally listed

Chapter 2: Habitats of New Jersey

species, state species of concern often receive umbrella protection or thrive under the routine management of anthropogenic conditions on the installations.

The habitats are generally of very high quality within the natural communities and ecosystems. While facility site improvements and expansions do sometimes occur, the habitats within this CFA are largely protected from the rampant development that might otherwise occur and the illegal intrusion of vehicles and collectors. They are also managed to protect federally listed species.

This CFA encompasses 2% of the Pinelands Landscape Region at 10,729 hectares, including approximately 10,570 hectares of terrestrial and wetland habitats and 159 hectares of aquatic habitats. None of the CFA is classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

D. Great Egg Harbor Watershed CFA

Draining to the Great Egg Harbor, this CFA area is of great importance to the maintenance of water quality for the abundant fishery resources throughout the watershed, as well as the fauna that forage and nest in it. The area has an active watershed association, and nonprofit involvement and stewardship could offer meaningful opportunities for action implementation throughout the CFA. This CFA is a mix of preserved and private lands, though it appears that even the private lands are largely built out or are likely constrained by wetlands and floodplains.

The habitats in this CFA are generally of high quality as there is a good core of abundant wetlands and watercourses that are protected and buffered by state regulations. It is also difficult for the public to enter this core area. The edges of the CFA abut many developed areas and experience typical edge effects including nonpoint pollution, the use of off-road vehicles, and the introduction of invasive plant species.

This CFA encompasses 5% of the Pinelands Landscape Region at 22,351 hectares, including approximately 21,777 hectares of terrestrial and wetland habitats and 574 hectares of aquatic habitats. Approximately 13,019 hectares, or 58% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

E. Upper Inner Coastal Plain Delaware River (Pinelands) CFA

Several very small headwater tributaries to the Delaware River originate in this CFA but immediately enter the Piedmont and Inner Coastal Plain Landscape Region's Upper Inner Coastal Plain Delaware River CFA. As the habitats within these CFA's are functionally equivalent, please see the habitat description and condition information in the Piedmont and Inner Coastal Plain Landscape Region's Upper Inner Coastal Plain Delaware River CFA.

This CFA encompasses 0.02% of the Pinelands Landscape Region at 74 hectares, including approximately 73 hectares of terrestrial and wetland habitats and 1 hectares of aquatic habitats. Approximately 9 hectares, or 12% of the CFA, are classified as federal, state, or

county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

F. Upper Maurice River Watershed (Pinelands) CFA

This CFA consists of the northeastern headwaters of the Maurice River watershed. It includes a riparian network made up by Little Ease Run and Scotland Run, along with their associated wetlands and forests. A significant portion of the CFA is preserved in the Glassboro Wildlife Management Area and Gloucester County's Scotland Run Park. There are also portions of the CFA that are privately held and susceptible to development. The CFA is in many ways functionally equivalent to the Delaware Bay Landscape Region's Lower Maurice River Watershed CFA. Please refer to that section for additional information on the CFA's habitat types, conditions, and values.

This CFA encompasses 0.3% of the Pinelands Landscape Region at 1,519 hectares, including approximately 1,446 hectares of terrestrial and wetland habitats and 74 hectares of aquatic habitats. Approximately 679 hectares, or 45% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

Skylands Landscape Region and Its CFAs

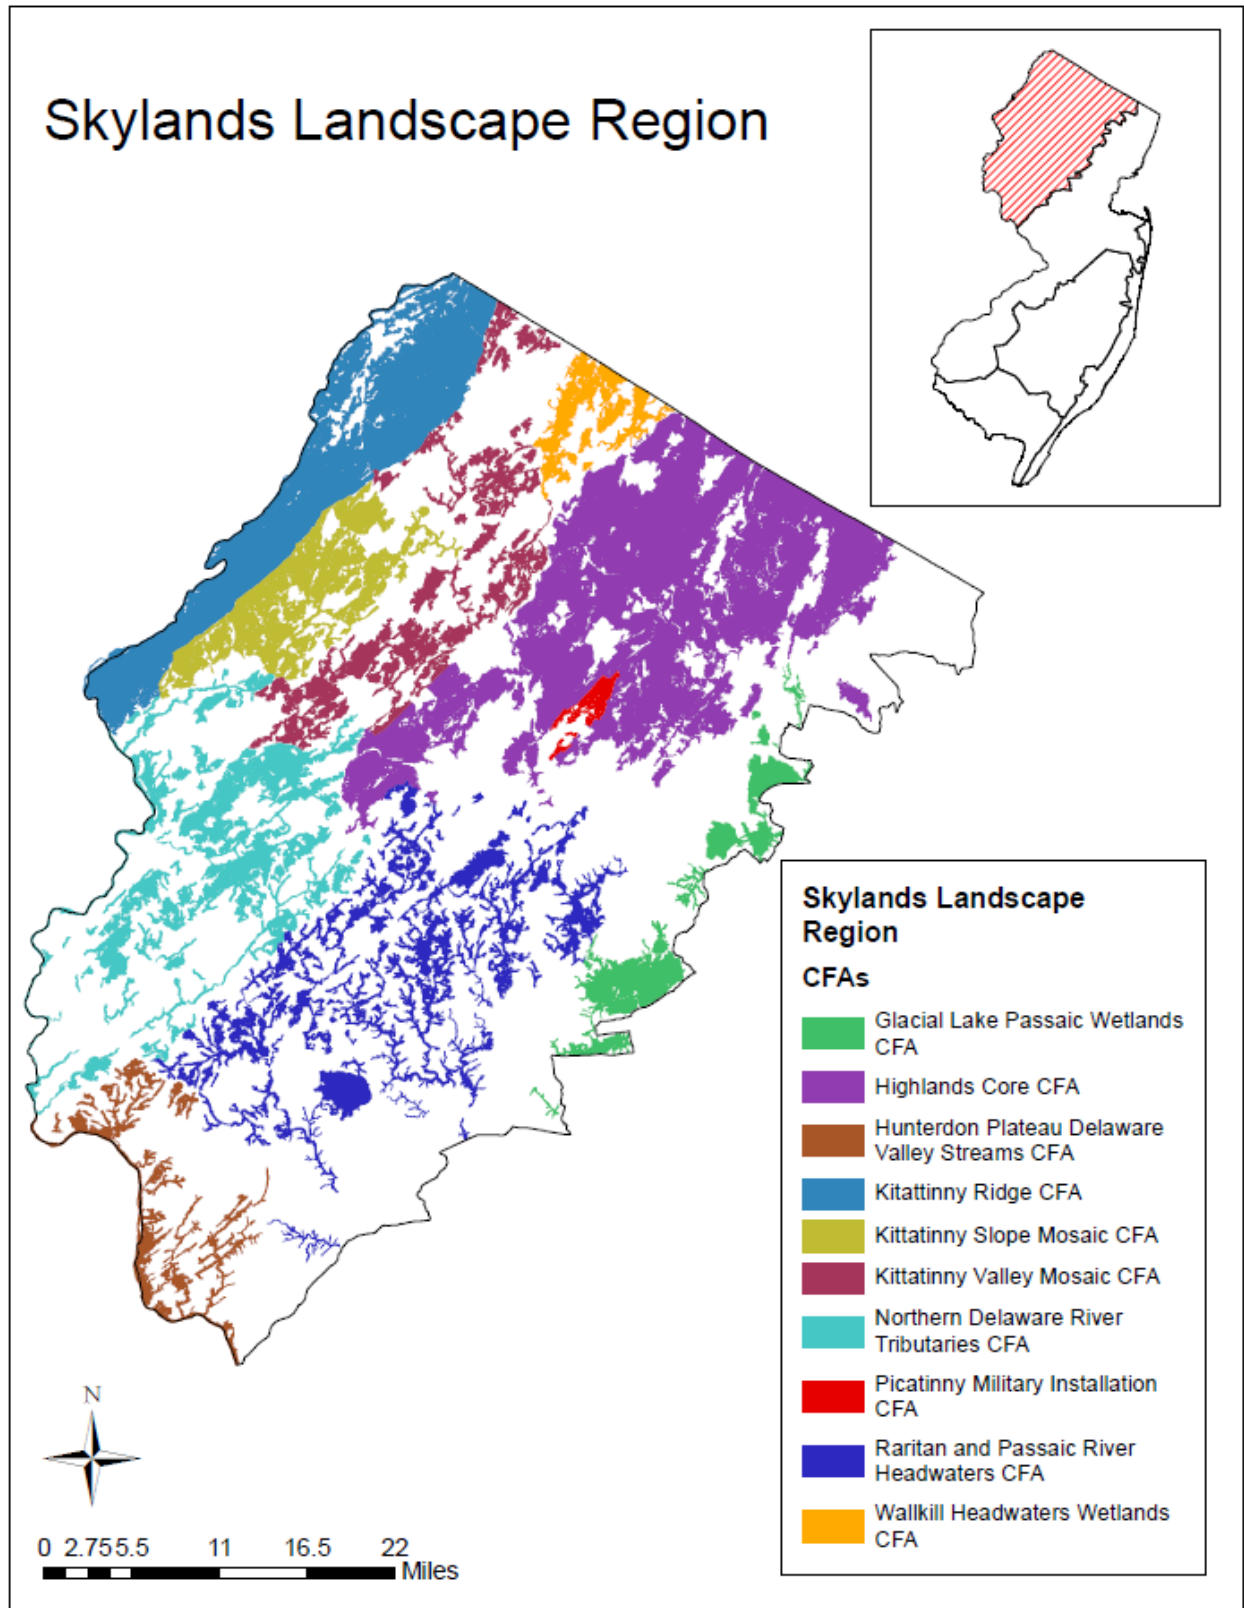

Figure 7. Skylands Landscape Region CFAs.

Chapter 2: Habitats of New Jersey

This landscape region combines two of New Jersey's physiographic regions, the Ridge & Valley and the Highlands. It encompasses all or parts of Sussex, Warren, Hunterdon, Somerset, Passaic, Essex, Bergen, and Morris Counties (Figure 7). The region is a mosaic of habitat types including forest, forested wetland, and scrub-shrub habitats that are vital to a variety of species.

The conditions of the region's habitats vary significantly between both types and places. Some of the highest quality habitats can be found on conserved properties where there are extensive tracts of interior forest habitat for area-sensitive species. Threats to forests in the region, however, include a lack of long-term management that has reduced structural diversity, deer browse and a lack of sunlight that have left the understory barren in many places, and an abundance of invasive species. Scrub-shrub habitat is uncommon due to succession to closed-canopy forest, and remaining patches are threatened by development and over-browsing by deer.

A. Kittatinny Ridge CFA

The Kittatinny Ridge CFA features significant topography and ridgeline associated with the Appalachian Mountains, vast mature contiguous forests, and small to medium sized watersheds of remarkable water quality. Topography and geologic aspect have created a variety of unique habitats such as talus slopes and bare rock outcrop found nowhere else in the state, and the westerly slopes and lower elevations extending to the Delaware River contribute distinctive habitats including seeps, limestone fens, and hemlock ravines. Much of the Kittatinny Ridge is protected state and federal land. While the Flatbrook and other watercourses of medium drainage areas provide abundant aquatic resources, numerous additional watercourses of extremely small drainage areas flow directly to the Delaware River and support salamander assemblages found nowhere else in the state. Forest management that focuses on eliminating invasive plants and creating a habitat mosaic while retaining older forest stands could improve diversity in mid- and lower elevation habitats and benefit rare species.

The ridgetop features xeric communities such as pitch pine and chestnut oak that are generally of high quality and consist mostly of native vegetation. The ridgetop's harsher conditions (e.g., wind exposure and thin soils) stunt some plant communities, creating a mosaic of habitats and species diversity. These communities could be in jeopardy due to fire suppression, as without fire they will be replaced by oak forest over time. Such a shift would shade out currently sun-exposed areas that are critical to rare reptiles and barren ground-nesting birds, and cause vegetative changes that could alter food resources for wildlife. The westerly slopes and lower elevations have been greatly impacted by the agriculture of early settlers, leaving behind nutrient poor soil with a plethora of invasive plants; however, these areas still include a diverse suite of habitats, including hemlock forests, springs, fens, ravines, and ephemeral wetlands, important to a variety of wildlife.

This CFA encompasses 7% of the Skylands Landscape Region at 36,446 hectares, including approximately 34,600 hectares of terrestrial and wetland habitats and 1,846 hectares of aquatic habitats. Approximately 29,176 hectares, or 80% of the CFA, are classified as federal, state, or county classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

B. Kittatinny Slope Mosaic CFA

The Kittatinny Slope Mosaic CFA showcases broad forest patches mixed with agriculture and grasslands in the shadow of the Kittatinny Ridge. The CFA is the bridge between the Kittatinny Valley Mosaic CFA and the Kittatinny Ridge CFA with distinctive geology and management needs. Bobcats travel along the slopes, and the bottomlands include the key Paulins Kill drainage tributaries that feature one of the most significant populations of a federally listed mussel species in the state along with wood turtles and trout streams. The higher elevations of the slopes feature xeric communities such as pitch pine and chestnut oak while the lower elevations are more representative of the overall Skylands Regional Landscape.

Fire suppression has been and continues to alter the mid- and higher elevation vegetation over time, converting the landscape to an oak forest that shades out the slopes and alters the thermal characteristics critical for rare reptiles and barren ground-nesting birds.

This CFA encompasses 3% of the Skylands Landscape Region at 15,700 hectares, including approximately 14,715 hectares of terrestrial and wetland habitats and 985 hectares of aquatic habitats. Approximately 5,371 hectares, or 34% of the CFA, are classified as federal, state, or county classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

C. Kittatinny Valley Mosaic CFA

The Kittatinny Valley Mosaic CFA supports many of the remaining undeveloped natural communities that are home to some of the state's rarest terrestrial wildlife, such as the bog turtle. The value of this CFA is not only in what remains, but in its potential to link the largely protected Kittatinny Ridge and Highlands Core CFAs. The valley is characterized by expansive agriculture and grasslands among rolling forested hillsides and distinctive groundwater fed wetland complexes. The valley contains a mosaic of habitats ranging from small forest tracts to scrub-shrub habitats and agricultural grasslands.

Habitat conditions within the valley are representative of the overall Skylands Regional Landscape. While the wildlife habitat within this area is not considered poor quality, as a patchwork of natural lands among a more human-modified landscape, this area would benefit from restored connectivity to best provide live-in and corridor habitats for wildlife. Increasing forest management and broad restoration of inactive agricultural lands could increase overall biodiversity in this CFA.

This CFA encompasses 3% of the Skylands Landscape Region at 17,050 hectares, including approximately 16,107 hectares of terrestrial and wetland habitats and 943 hectares of aquatic habitats. Approximately 4,188 hectares, or 25% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

Chapter 2: Habitats of New Jersey

D. Wallkill Headwaters Wetlands CFA

The Wallkill Wetlands CFA is primarily protected federal and state land featuring lower gradient floodplain wetlands and connecting uplands between New Jersey's portion of the lower Wallkill River Valley and Vernon Valley. These areas represent the largest intact river floodplains in the northern part of the state and are valuable for migrating passerines and resident species like Indiana bats, bronze copper butterflies, wood turtles, and blue-spotted salamanders. Breeding grassland birds and raptors thrive here as well. This majority lowland wetland CFA is also a key bridge to the more mountainous, adjacent Highlands Core CFA.

Habitats within this CFA are generally of good to moderate quality, although management of invasive plants and maintaining or increasing native plant community diversity along riparian floodplains would strengthen the overall resilience of this CFA. Portions of the critically important wetlands, invaded by non-native plants, within this CFA have unique restoration needs compared to those within the larger region and such restoration would benefit aquatic and semi-aquatic species. Agricultural practices threaten habitats and wildlife by contributing sediment, phosphorus, and fecal coliform to waterways.

This CFA encompasses 1% of the Skylands Landscape Region at 5,451 hectares, including approximately 5,272 hectares of terrestrial and wetland habitats and 179 hectares of aquatic habitats. Approximately 1,565 hectares, or 29% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

E. Highlands Core CFA

The Highlands Core CFA is composed of mostly protected contiguous high elevation forest. Timber rattlesnakes, bobcats, barred owls, and red-shouldered hawks all depend on these lands to sustain their populations. These are also key recovery areas for golden-winged warblers and other declining songbirds. A large portion of the Highlands Preservation Area is within the boundary of this CFA.

The habitats and conditions in this CFA are similar to those described for the Skylands Regional Landscape. They are generally of high quality but have fewer invasive plants than are found in the lower elevations of the Kittatinny Ridge CFA. However, diversifying forest age class and reducing forest-floor invasive plants would help secure wildlife populations and support colonization by additional animal species.

This CFA encompasses 14% of the Skylands Landscape Region at 75,140 hectares, including approximately 69,626 hectares of terrestrial and wetland habitats and 5,515 hectares of aquatic habitats. Approximately 40,213 hectares, or 54% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

F. Glacial Lake Passaic Wetlands CFA

The Glacial Lake Passaic Wetland CFA features bottomland hardwood floodplain complexes that remain in good condition. These wetlands are all within the Passaic River watershed and

include vernal pool complexes that support blue-spotted salamander populations. There are few remaining undeveloped areas in this region.

Invasive plants and a lack of forest management imperil the persistence of wildlife diversity within this CFA. As such, habitat management including the treatment of invasive plants and selective forest management would greatly benefit the species diversity. In addition, streambank and riparian restoration may be beneficial in more flood-prone sections to reduce stream siltation and channelization.

This CFA encompasses 2% of the Skylands Landscape Region at 9,655 hectares, including approximately 9,309 hectares of terrestrial and wetland habitats and 346 hectares of aquatic habitats. Approximately 6,832 hectares, or 71% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

G. Raritan and Passaic River Headwaters CFA

The Raritan and Passaic River Headwaters CFA includes important aquatic areas in the North Branch Raritan River, South Branch Raritan River, and Passaic River watersheds. The Passaic River headwaters were included with the North and South Branches of the Raritan River in this CFA to distinguish the Passaic headwater areas from the lower gradient, floodplain dominated Glacial Lake Passaic Wetlands CFA. Both the Passaic headwaters and the expansive North and South Branch Raritan River headwaters feature moderate gradient streams of high water quality, narrow floodplains mixed with agriculture, and wooded hillsides.

The conditions within this CFA vary by area and watershed. Agricultural practices in headwater regions threaten aquatic habitats and wildlife by increasing sediment, phosphorus, and fecal coliform in waterways, and the lack of riparian buffers contributes to erosion and water quality degradation. Aquatic, semi-aquatic, and riparian species and their habitats are also threatened by point and nonpoint source pollution and flooding that erodes banks and scours stream bottoms. Streambank and riparian restoration may be beneficial in more flood-prone sections to reduce stream siltation and channelization.

This CFA encompasses 5% of the Skylands Landscape Region at 27,191 hectares, including approximately 24,829 hectares of terrestrial and wetland habitats and 2,362 hectares of aquatic habitats. Approximately 11,372 hectares, or 42% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

H. Northern Delaware River Tributaries CFA

The Northern Delaware River Tributaries CFA highlights predominantly aquatic and riparian corridors of the Musconetcong River, Pequest River, and Paulins Kill watersheds from their headwaters to confluences with the Delaware River. These watercourses feature extremely large drainage basins with broad floodplains that are often closely associated with agriculture. The CFA captures both aquatic areas and undeveloped buffer uplands. Dwarf wedgemussels, triangle floaters, longtail salamanders, and wood turtles are dispersed throughout these basins.

The conditions within this CFA vary by area and watershed. The Category 1 classification of many stream stretches indicates that these waterways are of high quality. There are dams scattered throughout the waterways, and much effort has been expended on dam removal projects (particularly along the Musconetcong River) to enhance fish migration, improve water quality, and help to eliminate flood hazards. Aquatic, semi-aquatic, and riparian species and their habitats are also threatened by point and nonpoint source pollution and flooding that erodes banks and scours stream bottoms. Streambank and riparian restoration may be beneficial in more flood-prone sections to reduce stream siltation and channelization.

This CFA encompasses 4% of the Skylands Landscape Region at 24,115 hectares, including approximately 22,430 hectares of terrestrial and wetland habitats and 1,683 hectares of aquatic habitats. Approximately 7,156 hectares, or 30% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

I. Hunterdon Plateau Delaware Valley Streams CFA

The Hunterdon Plateau Delaware Valley Streams CFA is focused on aquatic areas that largely consist of small drainages and moderate gradient streams that drain directly to the Delaware River. In otherwise highly developed areas, these riparian corridors often represent the best dispersal pathways for local wildlife. Longtail salamanders inhabit stretches of streams while breeding bobolinks, eastern meadowlarks, and grasshopper sparrows are present in adjacent grasslands.

The habitat conditions within this CFA vary by area and watershed. Much of the area is designated Category 1, indicating that these waterways are of high quality. Changing land use practices, the loss of stream buffers, and the addition of impervious surfaces continue to impact natural habitats and wildlife by increasing the likelihood of point and nonpoint source pollution into waterways. Also, flooding from extreme storms could erode banks and scour stream bottoms. The spread of the highly invasive Chinese pond mussels remains a serious threat to native freshwater mussels in Wickecheoke Creek and tributaries, and possibly the Delaware River.

This CFA encompasses 1% of the Skylands Landscape Region at 7,633 hectares, including approximately 6,480 hectares of terrestrial and wetland habitats and 1,152 hectares of aquatic habitats. Approximately 1,633 hectares, or 21% of the CFA, are classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

J. Picatinny Military Installation CFA

The Picatinny Military Installation CFA lies within the Highlands physiographic region. It is characterized by the bedrock features of Green Pond Mountain and includes Lake Denmark and Picatinny Lake. This federally managed military installation is home to rare reptiles, raptors, and songbirds, with bobcats also traversing the elevated terrain. Containing nearly 6,000 acres of ridgeline, slopes, and valley floor, approximately 70% of the installation is forested with only 19% developed.

Although much of the natural landscape is used for military training and ordinance testing, the habitats within this CFA are generally healthy forests that are largely protected from outside commercial and residential development. Habitat restoration for federal species is a management priority and restricted access to the installation protects against illegal intrusion by vehicles and wildlife poachers. However, as with many areas within New Jersey, diversifying forest age class and eliminating forest floor invasive plant species would help secure wildlife populations and support colonization by additional animal species.

This CFA encompasses 0.2% of the Skylands Landscape Region at 1,357 hectares, including approximately 1,201 hectares of terrestrial and wetland habitats and 156 hectares of aquatic habitats. None of this CFA is classified as federal, state, or county open space. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

Marine Landscape Region and Its CFAs

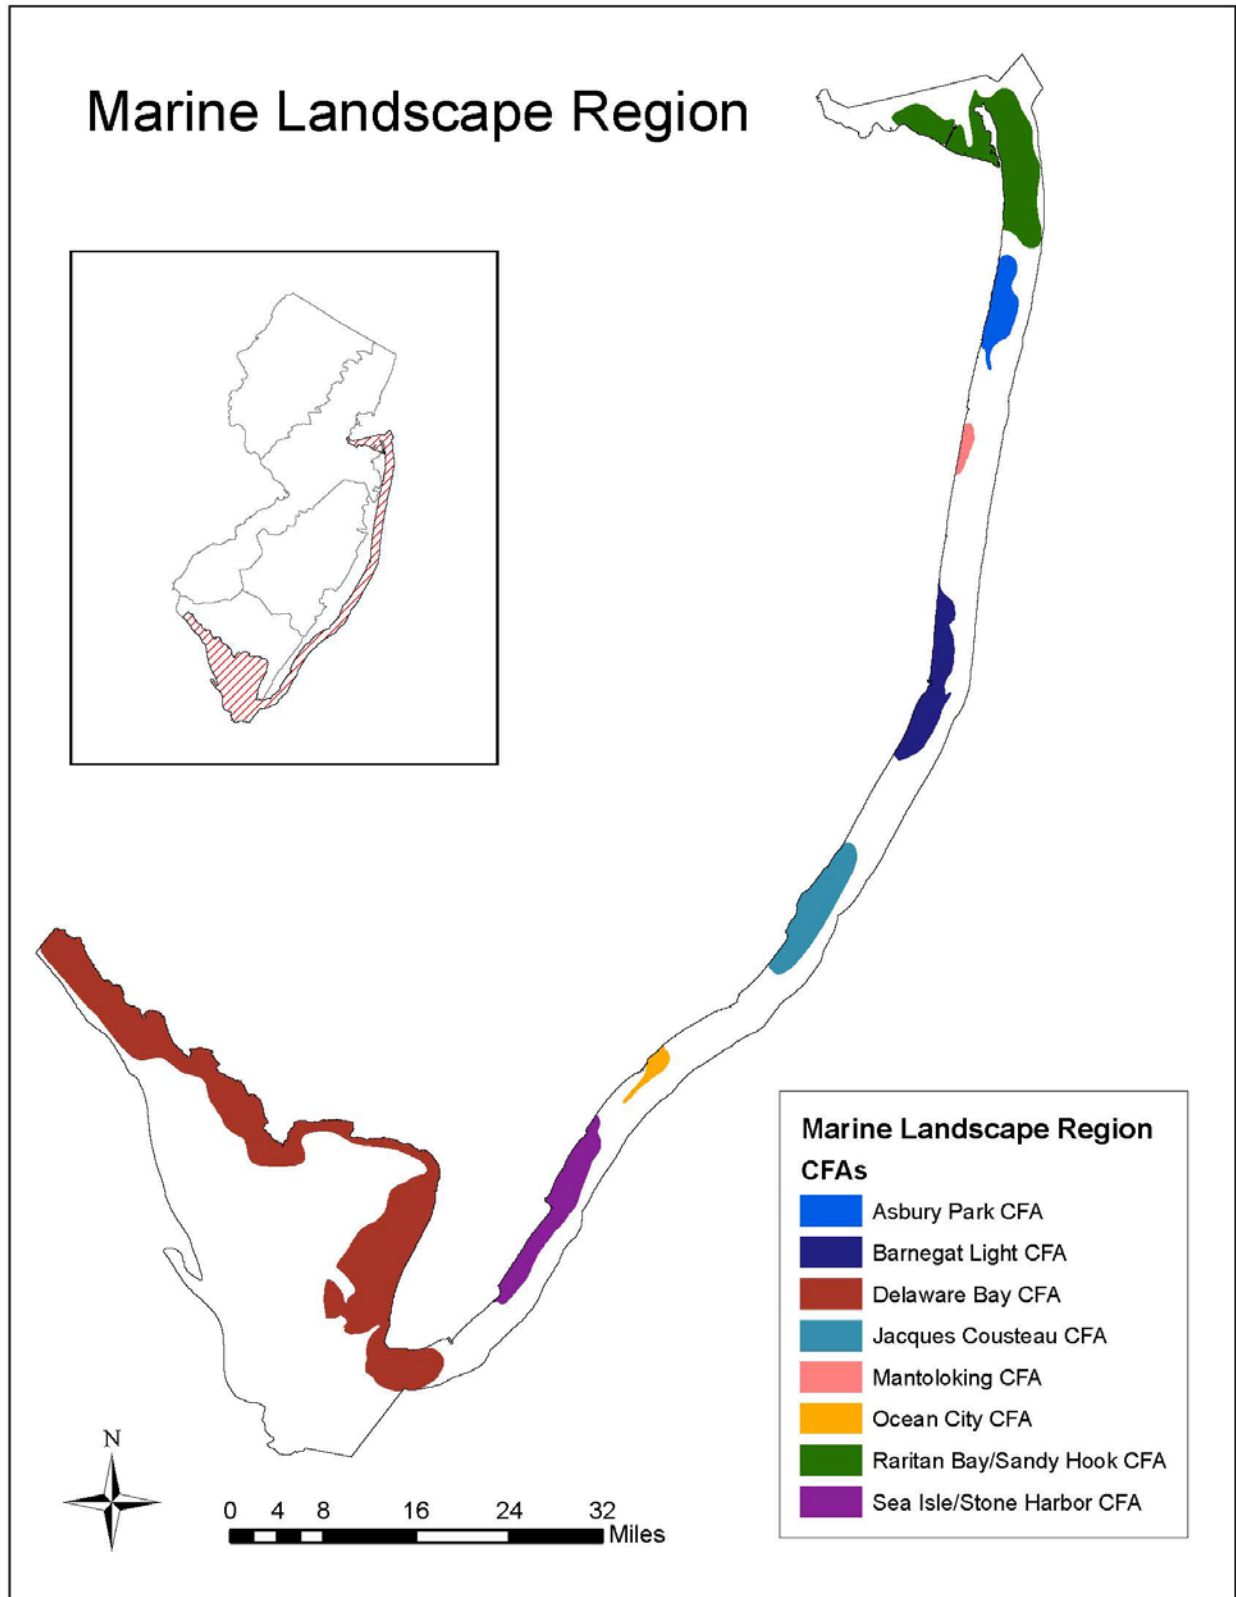

Figure 8. Marine Landscape Region CFAs.

Chapter 2: Habitats of New Jersey

This region is exclusively aquatic and includes the New Jersey portion of the Delaware and Raritan Bays (Figure 8). It also includes the Atlantic Ocean within the state's jurisdiction, which is defined as the area within 3-nautical miles of the New Jersey shoreline. This region supports fish and shellfish of commercial and recreational importance. More than half of New Jersey's federally listed species are found exclusively within this region, including several species of whales and sea turtles, as well as Atlantic sturgeon. The waters of the Delaware Bay are critical habitat to one of the largest populations of horseshoe crabs in the world. During the summer, near-shore Atlantic Ocean waters are calving and nursery grounds for bottlenose dolphins, while many additional species utilize these waters as a migratory corridor.

The condition of the Marine Landscape Region's water is highly variable. Overall water quality has shown continuing improvements over the last few decades including all ocean beaches fully supporting their designated uses and shellfish harvesting allowable at over 95% of Raritan Bay, Delaware Bay, and ocean waters. However, these areas continue to be degraded by point and nonpoint source pollution from a variety of sources. Low dissolved oxygen levels have been reported in the ocean along the entire New Jersey coast; efforts are now underway by the NJDEP to determine impacts and if low dissolved oxygen events are natural occurrences. Excessive nutrient loading may lead to harmful algal blooms that can kill other marine organisms or transfer toxins up through the food chain. Expansion of aquaculture, particularly shellfish aquaculture, may have unintended and unanticipated adverse impacts on marine wildlife.

Increases in water temperature due to climate change are altering marine ecosystems, impacting species such as surf clams (which are moving into deeper, cooler waters), and finfish (some of which are redistributing northward). Additionally, higher levels of carbon dioxide are causing ocean water to become more acidic, potentially inhibiting the ability of clams, sea urchins, and other species to produce calcium shells and exoskeletons. Sea level rise and the movement of highly saline water into estuarine areas threaten the breeding and nursery habitats of numerous fish species, and could eliminate important haul outs for seals. Native marine wildlife are threatened by invasive species including the Asian shore crab, Chinese mitten crab, and European periwinkle, as well as persistent marine debris (such as plastic bags, fishing line, and other derelict fishing gear). Marine wildlife are also vulnerable to ship strikes, especially in high use areas of Raritan and Delaware Bays, and to entanglement or entrapment in commercial and recreational fishing gear.

A. Raritan Bay/Sandy Hook CFA

The Raritan Bay/Sandy Hook CFA encompasses portions of Raritan and Sandy Hook Bays, and the surrounding Gateway National Recreation Area. It extends from estuarine waters off Union Beach Borough to Middletown Township and south along the coast to the marine waters just off Monmouth Beach. The area is part of an important travel corridor between the ocean and Raritan Bay/River, which is critical to the life history of a multitude of fish species for spawning and migration. The CFA serves as a critical overwintering area for seals and is migratory habitat for humpback, fin, and right whales and three species of sea turtles. It is also a migrating shorebird concentration site. An artificial reef within the CFA provides shelter, nursery, and feeding habitat for numerous marine fish and macroinvertebrate species. Varying substrate types and depths are present in this CFA.

Chapter 2: Habitats of New Jersey

The area is threatened by a myriad of anthropogenic sources, including point and nonpoint source pollution. Nutrient loading may lead to algal blooms within the bays, which can be harmful to marine organisms or transfer toxins up through the food chain, and regional industrial development has led to elevated PCB levels in fish. Sea level rise may impact islands serving as seal haul out sites.

This CFA encompasses 5% of the Marine Region with 15,417 hectares of estuarine and marine habitats. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

B. Asbury Park CFA

The Asbury Park CFA extends from the shoreline into marine waters off Long Branch City south to Spring Lake Borough. It is an important feeding area for species such as great blue herons and black crown night herons, and is migratory habitat for humpback, fin, and right whales. Varying substrate types and depths are present in this CFA. As noted in the overview for the Marine Landscape Region, habitat conditions are highly variable.

This CFA encompasses 1% of the Marine Region with 4,074 hectares of estuarine and marine habitats. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

C. Mantoloking CFA

The Mantoloking CFA is located below Manasquan Inlet, from the marine waters off Point Pleasant Beach to just off Brick Township. The area serves as critical feeding habitat for ospreys, black crowned night herons, and snowy egrets. It also serves as a migratory area for humpback, fin, and right whales, harbor porpoises, and bottlenose dolphins. Numerous shipwrecks within the CFA area provide shelter and feeding opportunities for a variety of marine fish and macroinvertebrate species. This CFA includes a variety of habitats and depths. As noted in the overview for the Marine Landscape Region, habitat conditions are highly variable.

This CFA encompasses 0.01% of the Marine Region with 888 hectares of estuarine and marine habitats. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

D. Barnegat Light CFA

The Barnegat Light CFA extends from the shoreline into the marine waters off Berkeley Township to Long Beach Township. The CFA provides important feeding habitat for bird species such as roseate tern, black skimmer, little blue heron, and snowy egret. It also serves as a migratory corridor for leatherback and loggerhead sea turtles, humpback, fin, and right whales, and overwintering seals that haul out on shore near the mouth of the Barnegat Inlet. The area is part of an important travel corridor between the ocean and Barnegat Bay, which is critical to the life history of a multitude of fish species for spawning and migration. Varying substrate types and depths are present in this CFA. As noted in the overview for the Marine Landscape Region, habitat conditions are highly variable. Sea haul out sites may be inundated as sea level rises.

Chapter 2: Habitats of New Jersey

This CFA encompasses 2% of the Marine Region with 6,698 hectares of estuarine and marine habitats. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

E. Jacques Cousteau CFA

The Jacques Cousteau CFA extends from the shoreline into marine waters off Beach Haven Borough to Little Egg Inlet and south to Brigantine City. It serves as an important feeding area for bird species such as osprey, little blue heron, and Caspian tern. It is a migratory corridor for leatherback and loggerhead sea turtles, humpback, fin, and right whales, and bottlenose dolphins and harbor porpoises. The CFA is part of an important travel corridor between the ocean and the estuarine waters of Great Bay, which are critical to the life history of a multitude of fish species for spawning and migration. It is also an important corridor for overwintering seals that feed in deep channels and haul out on the sandy beaches of bay islands. Varying substrate types and depths are present in this CFA.

This CFA encompasses 3% of the Marine Region with 7,212 hectares of estuarine and marine habitats. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

F. Ocean City CFA

The Ocean City CFA is located from the shoreline into marine waters off Longport Borough and extends south to Ocean City. The area is part of an important travel corridor between the Atlantic Ocean and the Great Egg Harbor estuary and river, which are critical to the life history of a numerous fish species for spawning and migration. It is an important feeding area for black crowned night herons and black skimmers. It is also serves as important habitat for migrating leatherback and loggerhead sea turtles, humpback, fin, and right whales, and harbor porpoises and bottlenose dolphins. Varying substrate types and depths are present in this CFA.

This CFA encompasses 0.01% of the Marine Region with 1,172 hectares of estuarine and marine habitats. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

G. Sea Isle/Stone Harbor CFA

The Sea Isle/Stone Harbor CFA extends from the shoreline into marine waters off Ocean City south to North Wildwood, and includes Townsends Inlet and Hereford Inlet. It serves as an important feeding area for bird species such as osprey, black skimmer, and great blue heron. Coastal waters of the CFA provide migratory habitat for humpback, fin, and right whales, bottlenose dolphin, harbor porpoise, leatherback and loggerhead sea turtles, and Atlantic sturgeon. Varying substrate types and depths are present in this CFA.

This CFA encompasses 3% of the Marine Region with 7,667 hectares of estuarine and marine habitats. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

H. Delaware Bay CFA

The Delaware Bay CFA is the largest in the Marine Landscape Region, extending from the shoreline into saline waters off Cape May City, surrounding Cape May point, and continuing northwest to the Heislerville Wildlife Management Area in Lower Alloway Creek Township. The area serves as an important habitat and travel corridor for migrating fish species such as striped bass, Atlantic and shortnose sturgeon, and alewife and blueback herring that spawn in the freshwater reaches of the Delaware River. Estuarine waters provide feeding areas for four species of migrating sea turtles. In addition, the CFA lies within a known migrating shorebird concentration area, providing critical stopover habitat to species such as red knot. Humpback and fin whales, along with other marine mammals, have also been documented within the CFA. A variety of depths and fluctuations in salinity and other factors create highly variable and ever-changing habitat conditions in this CFA.

As in the Atlantic Coast Landscape Region's Sandy Hook CFA, offshore and on-land human activities threaten this CFA. For example, excessive nutrient loading from both point and nonpoint source pollution can lead to harmful algal blooms, which can kill other marine organisms and/or transfer toxins up through the food chain. Aquaculture practices imperil wildlife within a portion of the intertidal zone by disturbing feeding shorebirds and blocking horseshoe crabs from reaching beach habitat to lay eggs. Ghost crab pots can inflict long-term harm to wildlife, such as diamondback terrapins, by continuously entrapping organisms. Boat strikes remain a serious threat to Atlantic sturgeons, sea turtles, and other marine wildlife. Since the Delaware Bay and River serve as the largest oil transfer port on the East Coast, the potential for catastrophic oil spills is an ever-present threat to aquatic habitats and wildlife.

This CFA encompasses 16% of the Marine Region with 46,418 hectares of estuarine and marine habitats. Details regarding the habitat types that comprise this CFA are presented in Appendix G.

IV. Notes Regarding Habitat Classifications Used or Referenced in this Plan

The NJDEP began Geographic Information Systems (GIS) mapping of New Jersey's land use/land cover in the late 1980s. These maps, which followed a modified Anderson¹ classification scheme, were based on the hand digitization of color infrared photography into polygons representing distinct land use/land cover types, which were then converted into a land use/land cover GIS digital file. This mapping is now in its fifth iteration based on 2012 aerial photo imagery. The DFW began using this GIS resource to assess and depict occurrences and

¹ Anderson *et al.*, 2013

Chapter 2: Habitats of New Jersey

distribution of wildlife species habitats in 1994, when it created the first version of the New Jersey Landscape Project. The Landscape Project maps depict areas of contiguous habitat known to be used by or necessary to sustain state endangered and threatened species and other priority wildlife. Updated in early 2017, Landscape Project mapping continues to rely upon New Jersey's land use / land cover data as a base layer, and remains the principal basis for the DFW's mapping of habitats for endangered, threatened, and special concern wildlife species.

Following the first development of State Wildlife Action Plans in 2005, Northeast states collaborated on the development of a shared system for habitat classification and mapping: the Northeast Terrestrial Wildlife Habitat Classification System (NETWHCS). This system is a flexible framework for characterizing wildlife habitats by integrating two approaches – habitat systems and structural modifiers. The basic layer is the habitat systems which correspond to the Ecological Systems developed by NatureServe², with additional systems for altered habitats and land-use types. Ecological Systems are “recurring groups of biological communities that are found in similar physical environments and are influenced by similar dynamic ecological processes”³ and are based on biogeographic region, landscape scale, dominant cover type, and disturbance regime. Because most habitat systems can incorporate substantial variation in vegetative species dominance, structure, successional stage, and other characteristics that are relevant to wildlife use, the classification superimposes a set of structural modifiers. A companion set of terrestrial and aquatic habitat maps were created for the Northeast⁴.

Because the NETWHCS does not capture small-patch habitat systems, because the NJDEP maps are to a finer scale and are more spatially accurate, and to make New Jersey's State Wildlife Action Plan relevant and accessible to New Jersey's users, the DFW decided to continue using the New Jersey land use/land cover mapping to describe and depict wildlife habitats for this plan. To facilitate use of this plan at multi-state and regional levels, the DFW created a crosswalk between these two habitat classification/mapping schemes (Appendix F). Appendix F also includes a crosswalk between the New Jersey land use/land cover categories and the broad habitat categories used to identify the habitats used by Species of Greatest Conservation Need (Appendix C) and those used for the characterization of Conservation Focal Areas (Appendix G).

CHAPTER 3: THREATS AND ACTIONS FOR FOCAL WILDLIFE & HABITATS

This State Wildlife Action Plan is made necessary and relevant by the number of New Jersey's wildlife species that face threats that could jeopardize their continued existence in the state and beyond. At the same time, actions to address these threats are directed at aiding species recovery to the point that they no longer need to be officially listed or keeping them from declining to the point where they would need to be listed. The following sections provide an overview of the wide-ranging threats facing New Jersey's wildlife and their habitats, needed research and outreach to guide conservation efforts, referred to as "action drivers," and conservation actions to ameliorate the threats and address the action drivers.

In this plan, information on threats and related actions is presented in three formats to help users of the plan develop and implement conservation projects that also fulfill their agency's or organization's mission. First, detailed lists of threats and action drivers (hereafter simply called threats) and conservation actions are provided in Appendices H and I, respectively. These lists provide the base information needed to develop projects focused on the conservation of SGCN and their habitats. In addition, the DFW has prepared two reports that present threats and associated conservation actions as they apply to the 48 individual Focal SGCN and Focal SGCN guilds (Appendix J: *Threats to and Conservation Actions for the Focal Species of Greatest Conservation Need*) and broader conservation issues (Appendix K: *Projects to Conserve New Jersey's Wildlife Populations of Concern*). Both are described below and should assist conservation partners in tailoring their conservation efforts to achieve the greatest benefits for New Jersey's imperiled wildlife.

I. Overview of Threats to Wildlife and Their Habitats

A. Building a Common Lexicon to Characterize Regional and Statewide Threats

Like the ranges of wildlife species themselves, the threats affecting SGCN commonly go well beyond the borders of individual states. As such, the actions needed to address these threats may be best accomplished through coordinated regional efforts. In the past, disparities in the language that individual states used to characterize threats to their SGCN impeded regional collaboration. Therefore, for this round of State Wildlife Planning, New Jersey and other Northeastern states agreed to use common lexicons for describing threats and developing actions to address them. The use of a common lexicon will enable the creation of a regional threats database that can help identify the most severe, pervasive or ubiquitous threats in the northeast. Such a database will foster efforts to address regional conservation needs and collaboration among states, which can pool their resources and expertise to maximize conservation gain.

The common threats lexicon for the Northeastern states follows the International Union for the Conservation of Nature's (IUCN) threats classification scheme. The IUCN lexicon consists of 11 primary categories of threats, which are then subdivided into secondary and tertiary sub-categories of increasing detail. In using the IUCN lexicon to identify threats in its Wildlife Action Plan, New Jersey will derive all the benefits discussed above. Users of the plan should note, however, that in deferring to a standard (and - in this case - "international") lexicon as the

Chapter 3: Threats and Actions for Focal Wildlife & Habitats

standard framework within which to categorize threats, there will be some inherent shortcomings. For example, the DFW decided not to use the IUCN's "Geological Events" category because they were highly unlikely to affect the state's wildlife (it included, for example earthquakes, tsunamis, avalanches, and landslides). In addition, many second or third level IUCN threat categories were retained, despite perhaps having only minor relevance to New Jersey's SGCN. Certain "scale" modifiers contained in the IUCN lexicon were also poorly defined or perhaps not applicable in New Jersey. These factors need to be understood and considered when reviewing the threats identified in this Plan.

Threats can also be viewed as factors that drive the need for conservation action. Therefore, the Northeastern states also considered the "action drivers" identified by the U.S. Fish & Wildlife Service in their Tracking and Reporting on Actions for Conservation of Species (TRACS) database as a meaningful way to expand the IUCN threat categories. Through this assessment, the DFW added three TRACS action-driver categories to the 10 IUCN primary threats categories: "Resource Management Needs" and "Education & Outreach Needs." The 13 resulting threat and action driver categories are summarized in Table 2, and throughout the remainder of the plan are simply referred to as "threats."

Table 2. Major Threats & Action-Driver Categories

The numbers below relate to those in the IUCN and TRACS lexicons, so are not sequential. Categories 1-9 and 11 are threats based on the IUCN Lexicon, while categories 12, 14, and 15 are action drivers based on the TRACS Lexicon.

Category	Threat/Action Driver
1	Residential & Commercial Development
2	Agriculture & Aquaculture
3	Energy Production & Mining
4	Transportation & Service Corridors
5	Biological Resource Use
6	Human Intrusions and Disturbance
7	Natural Systems Modifications
8	Invasive & Other Problematic Species, Genes, & Diseases
9	Pollution
11	Climate Change & Severe Weather
12	Resource Management Needs
14	Education & Outreach Needs
15	Administrative Needs

The DFW worked with conservation partners and wildlife experts to organize finer scale threats into each of the 13 major categories. The resulting hierarchy organizes threats into four tiered levels of increasing detail, with level 4 containing New Jersey-specific threats to further clarify how the IUCN and TRACS categories apply specifically to New Jersey's wildlife and habitats.

A final note about “threats”: The primary purpose of New Jersey’s state Wildlife Action Plan is to identify the *actions* that must be taken to conserve *any one* of the 107 focal species or species groups addressed in the Plan. In order to identify such actions, it is necessary to identify the *specific threats* to each of these individual species or species groups. Threats to any single wildlife species vary greatly, and it is important to understand that activities, events or conditions that serve as a “threat” to one species or species group could benefit, or serve as a “conservation action,” for another. For example, “forestry activities” may be listed as a threat when considered in the context of potential impacts associated with poorly timed or implemented forestry practices, or in regard to retention of certain forest structure or condition necessary for an individual focal species. However, forestry activities are more often a critically important *action* necessary to ensure that a broad array of other focal species or species groups are supported by a healthy and diverse age class of forest habitats, have specific vegetative species available, or experience specific conditions in the sub-canopy or forest floor that are critical for their survival. To arrive at all meaningful actions, it is important that all activities, events or conditions that can adversely impact certain wildlife species be recognized as threats. But it is equally important that users of the plan understand these characterizations are relative to some specific combination of species/habitats/conservation issues. Switching the focus to a separate species, habitat context, or conservation issue may, in turn, *completely* alter an activity, event or condition’s characterization as a “threat.”

In a similar vein, certain activities, events or conditions perceived as being beneficial or necessary for *society* may also be characterized in the Wildlife Action Plan as a “threat.” For example, “agriculture and aquaculture” are identified as an IUCN threat category. Here, the plan merely recognizes that – *for specific species or species groups, and perhaps even limited to particular habitats or regions of the State* – these activities, conditions or associated side effects, do in fact result in adverse impacts for that specific species, their habitats or life history needs. Designation as a “threat” does *not* imply that these activities are universally adverse to all wildlife, nor that they are bad for humankind. Designation of activities, events or conditions as “threats” has no derogatory intent -- it merely reflects some factual association with impacts to certain wildlife species or habitats. Again, “threats” (and “actions”) must be considered and understood in the context of specific species or species groups, and/or a specific habitat, and/or a specific conservation concern.

B. Evaluation of Threats

Using the 107 Focal SGCN as representatives of New Jersey’s wildlife, DFW teams of taxa experts assessed how each of the threats related specifically to each species. They used a qualitative, expert-opinion-based approach that considered six threat characteristics⁵ for each Focal SGCN: severity, reversibility, immediacy, spatial extent, certainty, and likelihood of impact in the next 10 years. These characteristics were used to assign a summary impact rating for each of the

⁵ Crisfield, E. and the Northeast Fish and Wildlife Diversity Technical Committee (NEFWDTTC). 2013

Focal SGCN: “high (3),” “moderate (2),” or “low (1).” A rating of “not applicable (0)” was given if the category posed no or an insignificant threat to the species. These ratings were then used to identify the threats that required immediate or near-term conservation actions. This information was used to generate the report, *Threats to and Conservation Actions for the Focal Species of Greatest Conservation Need* (which is further described in Section III of this chapter and is presented in Appendix J). The ratings were further used to identify the conservation actions that will have the greatest impact on wildlife in the next 10 years, as described in Section II below.

C. Threats Summary

After rating the threats to each Focal SGCN, the DFW grouped the Focal SGCN into three categories: marine (with 10 species), non-marine aquatic (with 25 species), and terrestrial (with 72 species). Then, for each level-3 threat category, the DFW determined the “threat frequency” (percentage of species within each of the three groups for which the threat category applied) and “threat severity” (the average impact rating for those species to which the threat category applied). A set of parameters were used for each group to refine the list of threats to those of greatest concern.⁶ This distillation resulted in the 68 threat categories presented in Table 3.

6

- Marine Group: Threat frequency $\geq 90\%$ of species with average threat severity ≥ 1.5 or average Threat severity score ≥ 2.5
- Non-marine aquatic group: Threat frequency $\geq 90\%$ of species with average threat severity ≥ 1.5 or average Threat severity score ≥ 2.5
- Terrestrial group: Threat frequency $\geq 80\%^*$ of species with average threat severity ≥ 1.5 or average Threat severity score ≥ 2.5

*A lower threat frequency value was applied to the terrestrial group as the group contains multiple species guilds with more varied life history requirements and consequently more varied threats and action drivers.

Chapter 3: Threats and Actions for Focal Wildlife & Habitats

Table 3. Summary of the most ubiquitous and severe threats to New Jersey’s wildlife and their habitats.

IUCN Level3 ID	IUCN Level 3 Category	IUCN Level 3 Category Definition/Description	Actions: TRACS Level3 ID
1.1.1	Land conversion from natural habitat to urban and other residential areas (large and small scale)	Habitat loss, fragmentation, and degradation (including wildlife travel corridors) associated with habitat conversion to housing and associated infrastructure and traffic.	1.2.1, 2.9.2, 2.10.0, 2.11.0, 2.12.1, 2.12.2, 2.12.3, 2.12.7, 3.0.0, 3.2.0, 3.2.3, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 4.1.0, 6.0.0, 6.1.1, 6.3.0, 7.1.4, 8.1.0, 8.3.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 11.2.1, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.3.2, 100.4.0
1.2.1	Land conversion from natural habitat to commercial or industrial areas (large and small scale)	Habitat loss, fragmentation, and degradation (including wildlife travel corridors) resulting from habitat conversion to commercial or industrial use and associated infrastructure and traffic (Note: The conversion of natural landscapes to structures and infrastructure within military bases are included within this category).	1.2.1, 2.9.2, 2.10.0, 2.11.0, 2.12.1, 2.12.2, 2.12.3, 2.12.7, 3.0.0, 3.2.0, 3.2.3, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 4.1.0, 6.0.0, 6.1.1, 6.3.0, 7.1.4, 8.1.0, 8.3.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 11.2.1, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.3.2, 100.4.0
2.1.1	Shifting Agriculture	Changing the agricultural use of a land from one that can be beneficial to animals (e.g., hay fields, pastureland) if managed for target species to one of lesser or no use (e.g., intensive tree/shrub nurseries).	1.2.1, 2.1.1, 2.3.3, 2.9.1, 2.10.0, 2.11.0, 2.12.1, 2.12.2, 2.12.3, 2.12.7, 3.0.0, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 4.1.0, 6.0.0, 6.3.0, 6.4.0, 7.1.2, 7.1.4, 8.1.0, 8.3.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 11.2.1, 100.1.2, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.4.0
2.1.3	Agro-industry	Industrial-scale agriculture, including new or expansion of existing facilities that causes habitat loss, degradation and/or fragmentation.	1.2.1, 2.3.3, 2.9.1, 2.10.0, 2.11.0, 2.12.1, 2.12.2, 2.12.3, 2.12.7, 3.0.0, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 6.0.0, 6.3.0, 6.4.0, 7.1.2, 7.1.4, 8.1.0, 8.3.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 11.2.2, 100.1.2, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.4.0
3.1.1	Distribution processes of petroleum and other liquid hydrocarbons	Placement of new facilities and pipelines or expansion of existing facilities and pipeline to develop, produce and/or distribute petroleum and other liquid hydrocarbons that causes habitat loss, degradation, and/or fragmentation.	1.2.1, 2.2.1, 2.10.0, 2.11.0, 2.12.1, 2.12.3, 3.0.0, 3.2.0, 3.2.3, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 6.0.0, 6.3.0, 7.1.2, 7.1.4, 8.1.0, 8.3.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 11.2.1, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.4.0
3.1.2	Natural gas distribution processes	Placement of new facilities and pipelines or expansion of existing facilities and pipelines to develop, produce and/or distribute natural gas that causes habitat loss, degradation, and/or fragmentation.	1.2.1, 2.10.0, 2.11.0, 2.12.1, 2.12.3, 3.0.0, 3.2.0, 3.2.3, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 6.0.0, 6.3.0, 7.1.2, 7.1.4, 8.1.0, 8.3.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 11.2.1, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.4.0
3.3.1	Wind Power	Placement of new facilities or expansion of existing facilities that causes habitat loss, degradation, and/or fragmentation and/or that leads to increased bird and bat fatalities within their movement corridors and foraging areas.	1.2.1, 2.10.0, 2.11.0, 2.12.1, 2.12.3, 3.0.0, 3.2.0, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 6.0.0, 6.3.0, 7.1.2, 7.1.4, 8.1.0, 8.3.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 11.2.1, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.4.0
3.4.0	Conventional Power Plants	Placement of new facilities or expansion of existing facilities that causes impacts to groundwater hydrology and/or alters the water temperature and/or pH of aquatic systems.	1.2.1, 2.10.0, 2.10.1, 2.11.0, 2.12.1, 2.12.2, 2.12.3, 2.12.6, 3.0.0, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 6.0.0, 6.3.0, 7.1.2, 7.1.4, 8.1.0, 8.3.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.2.0, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.4.0
4.1.2	Movement of cars and other vehicles on roads and railroads (large and small scale)	Vehicular traffic densities that increase wildlife mortality and disrupt movement corridors.	1.2.1, 2.2.1, 2.10.0, 2.11.0, 2.12.1, 2.12.3, 2.12.7, 3.0.0, 3.2.0, 3.2.3, 3.3.1, 3.5.3, 3.5.4, 6.0.0, 8.1.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 100.1.4, 100.3.0, 100.4.0

Chapter 3: Threats and Actions for Focal Wildlife & Habitats

Table 3 (threats/action drivers) continued

IUCN Level3 ID	IUCN Level 3 Category	IUCN Level 3 Category Definition/Description	Actions: TRACS Level3 ID
4.2.2	Management of rights-of-way or communication tower facilities and/or their associated access roads	Managing the vegetation within and adjacent to the rights-of-way, communication tower facilities and/or their associated access roads in a manner that results in direct mortality of wildlife (e.g., mowing during ground-nesting birds' or reptiles nesting season) or the creation of unsuitable habitat or conditions (e.g., herbiciding important food plants for invertebrates).	1.2.1, 2.10.0, 2.11.0, 2.12.1, 2.12.2, 2.12.3, 2.13.0, 3.3.2, 3.5.3, 3.5.4, 6.0.0, 7.1.2, 8.1.0, 8.3.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 11.2.1, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.4.0
4.3.1	Movement of large ships in shipping lanes	Ship traffic densities that increase marine and freshwater species' mortality and/or disrupt movement corridors or migratory patterns.	1.2.1, 3.0.0, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 6.0.0, 6.3.0, 7.1.2, 7.1.3, 7.1.4, 8.1.0, 8.3.0, 9.3.1, 9.3.3, 11.1.1, 11.2.0, 100.1.3, 100.1.4, 100.3.0, 100.4.0
5.1.1	Intentional Use	Excessive or illegal collection of butterflies and other insects, the illegal collection of reptiles and amphibians and localized excessive beaver trapping.	1.2.1, 7.1.2, 7.1.3, 7.1.4, 8.1.0, 8.3.0, 9.3.1, 9.3.3, 100.3.0
5.1.3	Persecution/Control	Harming, killing or controlling the presence of species considered undesirable (e.g., snakes, bats, invertebrates) and similar-looking species (i.e., those species misidentified as an undesirable species).	1.2.1, 7.1.2, 7.1.3, 7.1.4, 8.1.0, 8.3.0, 9.3.1, 9.3.3, 100.3.0
5.4.2	Fishing and Harvesting of Aquatic Resources: Intentional Use (large scale)	Excessive harvest of aquatic animals or plants from public or private "lands" (i.e., aquatic systems) at a large-scale for commercial markets that leads to the loss or degradation of aquatic habitats and/or decline of aquatic species (e.g., excessive horseshoe crab harvest).	1.2.1, 2.2.5, 2.8.0, 2.10.0, 2.10.1, 2.11.0, 2.12.1, 2.12.2, 2.12.3, 2.12.6, 3.0.0, 3.2.0, 3.2.3, 3.3.1, 3.3.2, 3.5.1, 3.5.3, 3.5.4, 4.1.1, 6.3.0, 7.1.2, 7.1.3, 7.1.4, 8.1.0, 8.3.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.4.0
5.4.3	Fishing and Harvesting of Aquatic Resources: Unintentional effects (subsistence/small scale)	Includes unintended impacts to aquatic animals and/or vegetation as a result of small-scale/subsistence fishing/harvesting practices (e.g., diamond-backed terrapin by-catch within crab traps without excluder devices), the introduction of fishing-gear (e.g., line and hooks) into aquatic systems in which animals become entangled, injured or killed, the disruption of substrate/benthic habitat during trawling activities conducted as a result of product harvesting and/or scientific research.	1.2.1, 2.2.5, 2.8.0, 2.10.0, 2.10.1, 2.11.0, 2.12.1, 2.12.2, 2.12.3, 2.12.6, 3.0.0, 3.2.0, 3.2.3, 3.3.1, 3.3.2, 3.5.1, 3.5.3, 3.5.4, 4.1.1, 6.3.0, 7.1.2, 7.1.3, 7.1.4, 8.1.0, 8.3.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.4.0
5.4.4	Fishing and Harvesting of Aquatic Resources: Unintentional effects (large scale)	Includes unintended impacts to aquatic animals and/or vegetation as a result of large-scale/commercial fishing/harvesting practices (e.g., diamond-backed terrapin by-catch within crab traps without excluder devices), the introduction of fishing-gear (e.g., abandoned long lines, nets and hooks) into aquatic systems in which animals become entangled, injured or killed, the disruption of substrate/benthic habitat during commercial trawling activities.	1.2.1, 2.2.5, 2.8.0, 2.10.0, 2.10.1, 2.11.0, 2.12.1, 2.12.2, 2.12.3, 2.12.6, 3.0.0, 3.2.0, 3.2.3, 3.3.1, 3.3.2, 3.5.1, 3.5.3, 3.5.4, 4.1.1, 6.3.0, 7.1.2, 7.1.3, 7.1.4, 8.1.0, 8.3.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.4.0

Chapter 3: Threats and Actions for Focal Wildlife & Habitats

Table 3 (threats/action drivers) continued

IUCN Level3 ID	IUCN Level 3 Category	IUCN Level 3 Category Definition/Description	Actions: TRACS Level3 ID
6.1.1	Off-road vehicles (motorized and non-motorized)	Vehicle use in natural landscapes that leads to the loss or degradation of habitat and/or aquatic systems and the decline of associated terrestrial and aquatic wildlife through habitat degradation and/or direct mortality (e.g., vehicles driving over dunes or through streams increase erosion and sediment threats degrading the habitat for beach nesting birds and aquatic wildlife, respectively, increase the spread of invasive plants which can alter the natural ecosystem, etc.).	1.2.1, 2.9.1, 2.9.3, 2.10.0, 3.2.0, 3.3.1, 3.5.3, 3.5.4, 5.15.6, 7.1.2, 7.1.3, 7.1.4, 8.1.0, 8.3.0, 9.2.1, 9.3.1, 9.3.3, 11.1.1, 11.2.0, 100.1.4, 100.3.0
6.1.2	Boating	Recreational boating within sensitive wildlife areas that cause the disruption of waterbird colonies, other nesting habitats, or roosting areas.	1.2.1, 2.9.1, 2.9.3, 3.2.0, 3.3.1, 3.5.3, 3.5.4, 7.1.2, 7.1.3, 7.1.4, 8.1.0, 8.3.0, 9.3.1, 9.3.3, 11.1.1, 100.3.0, 100.4.0
6.1.3	Use of beaches	Pedestrian and dog activities within sensitive beach habitats that cause the disruption of nesting, roosting, foraging birds on beaches.	1.2.1, 2.9.1, 2.9.3, 3.3.1, 3.5.3, 3.5.4, 7.1.2, 7.1.3, 7.1.4, 8.1.0, 8.3.0, 9.3.1, 9.3.3, 11.1.1, 11.2.0, 11.2.1, 100.1.4, 100.3.0
6.3.2	Authorized research projects at significant habitats	Includes excessive trampling impacts of rare natural communities, ground-nesting wildlife (birds, reptiles), and aquatic breeders such as amphibians, fish and mussels, and also the impacts of sonar use on marine wildlife.	1.2.1, 3.0.0, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 6.3.0, 7.1.2, 7.1.3, 7.1.4, 8.1.0, 8.3.0, 9.3.1, 9.3.3, 11.1.1, 11.2.0, 100.1.3, 100.1.5, 100.3.0
6.3.3	Other "work" unrelated to research	Includes maintenance and construction activities of structures such as bridges and dams that disturb or otherwise impact wildlife species using the structure to fulfill part of their life history requirements (e.g., breeding, roosting, etc.).	1.2.1, 3.0.0, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 6.3.0, 7.1.2, 7.1.3, 7.1.4, 8.1.0, 8.3.0, 9.3.1, 9.3.3, 11.1.1, 11.2.0, 11.2.1, 100.1.3, 100.1.5, 100.3.0, 100.4.0
7.1.2	Suppression of Fire Frequency/Intensity	Lack of fire in fire-dependent habitats resulting in the degradation or loss of native landscapes and associated wildlife.	1.2.1, 2.3.3, 2.10.0, 2.11.0, 3.0.0, 3.2.0, 3.3.2, 3.5.3, 3.5.4, 6.4.0, 7.1.2, 7.1.4, 8.1.0, 8.3.0, 9.3.1, 9.3.3, 11.1.1, 11.2.0, 11.2.1, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.4.0
7.2.1	Abstraction of Surface Water (domestic use)	Includes water diversion for domestic use; ditching, impounding, and stream channelization.	1.2.1, 2.9.1, 2.9.2, 2.10.0, 2.11.0, 2.12.1, 2.12.2, 2.12.3, 2.12.6, 2.12.7, 2.12.8, 2.13.0, 3.0.0, 3.2.0, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 6.4.0, 8.1.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.4.0
7.2.2	Abstraction of Surface Water (commercial use)	Includes water diversion for commercial use; ditching, impounding, stream channelization.	1.2.1, 2.9.1, 2.9.2, 2.10.0, 2.11.0, 2.12.1, 2.12.2, 2.12.3, 2.12.6, 2.12.7, 2.12.8, 2.13.0, 3.0.0, 3.2.0, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 8.1.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.4.0
7.2.3	Abstraction of Surface Water (agricultural use)	Includes water diversion for agricultural use; ditching, impounding, stream channelization.	1.2.1, 2.9.1, 2.9.2, 2.10.0, 2.11.0, 2.12.1, 2.12.2, 2.12.3, 2.12.6, 2.12.7, 2.12.8, 2.13.0, 3.0.0, 3.2.0, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 8.1.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.4.0
7.2.5	Abstraction of Ground Water (domestic use)	Disrupting and/or permanently altering groundwater hydrology in support of the construction of residential developments.	1.2.1, 2.9.2, 2.10.0, 2.11.0, 2.12.1, 2.12.2, 2.12.3, 2.12.5, 2.12.6, 2.12.7, 8.1.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 100.1.3, 100.1.4, 100.1.5, 100.3.0

Chapter 3: Threats and Actions for Focal Wildlife & Habitats

Table 3 (threats/action drivers) continued

IUCN Level3 ID	IUCN Level 3 Category	IUCN Level 3 Category Definition/Description	Actions: TRACS Level3 ID
7.2.6	Abstraction of Ground Water (commercial use)	Disrupting and/or permanently altering groundwater hydrology in support of mining operations, hydrofracturing or other commercial activities (excluding development).	1.2.1, 2.9.2, 2.10.0, 2.11.0, 2.12.1, 2.12.2, 2.12.3, 2.12.5, 2.12.6, 2.12.7, 8.1.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 100.1.3, 100.1.4, 100.1.5, 100.3.0
7.2.7	Abstraction of Ground Water (agricultural use)	Disrupting and/or permanently altering groundwater hydrology as a result of pumping water for irrigation.	1.2.1, 2.9.2, 2.10.0, 2.11.0, 2.12.1, 2.12.2, 2.12.3, 2.12.5, 2.12.6, 2.12.7, 8.1.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 100.1.3, 100.1.4, 100.1.5, 100.3.0
7.2.9	Small Dams	Altering the physical, biological and chemical environment of streams and rivers as a result of installing small dams and/or conducting periodic dam-associated draw downs. For the purposes of NJ's SWAP, a "small dam" is considered to be any dam similarly defined in New Jersey's Dam Safety Standards, N.J.A.C. 7:20, June 16, 2008, i.e., any dam that impounds <15 acre-feet of water to the top of the dam, has less than 15 ft height of dam, and has a drainage area above the dam of 150 acres or less.	1.2.1, 2.2.5, 3.0.0, 8.1.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 100.3.0
7.2.10	Large Dams	Altering the physical, biological and chemical environment of streams and rivers as a result of installing large dams and/or conducting periodic dam-associated draw downs. For the purpose of NJ's SWAP, a "large" dam" is considered to be any dam greater in structure size, volume of water retention or size drainage area above the dam than would otherwise meet the definition of a "small dam" used herein (and as is similarly defined at N.J.A.C. 7:20, Dam Safety Standards, June 16, 2008).	1.2.1, 2.2.5, 3.0.0, 8.1.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 100.3.0
7.2.11	Dams (size unknown)	Altering the physical, biological and chemical environment of streams and rivers as a result of installing dams (of a size that does not qualify as "small" or "large") and/or conducting periodic dam-associated draw downs.	1.2.1, 2.2.5, 3.0.0, 8.1.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 100.3.0
7.2.12	Culverts	Placement or improper management of culverts that create barriers to terrestrial and/or aquatic organisms rather than assist their safe dispersal.	1.2.1, 2.2.1, 2.2.5, 2.9.2, 3.0.0, 8.1.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.4.0
7.2.13	Stream Burial	Loss of headwater and/or intermittent streams as a result of stream burial.	1.2.1, 8.1.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 100.1.3, 100.1.4, 100.1.5, 100.3.0
7.3.1	Shoreline Stabilization	Installation of rip-rap, jetties, bulkheads, groins, etc. that alters the behavior of or otherwise impacts beach and marine wildlife. Installation of rip-rap, gabion and bulkheads on freshwater lakes and streams impacting freshwater aquatic and semi-aquatic species.	1.2.1, 2.1.1, 2.6.6, 2.9.1, 2.9.2, 2.9.3, 2.12.2, 3.3.1, 3.3.2, 4.1.1, 7.1.2, 8.1.0, 8.3.0, 9.3.1, 9.3.3, 11.1.1, 11.2.0, 11.2.1, 100.3.0
7.3.2	Inappropriate timing of mowing	Managing roadsides, rights-of-way, hay and other fields, etc. through mowing at times that increase the risk of disturbance and/or direct mortality to ground nesting/breeding birds, reptiles, small mammals and invertebrates.	1.2.1, 2.10.0, 2.11.0, 3.3.2, 3.5.3, 4.1.0, 6.0.0, 6.3.0, 7.1.2, 8.1.0, 8.3.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 11.2.1, 11.2.2, 100.1.2, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.4.0

Chapter 3: Threats and Actions for Focal Wildlife & Habitats

Table 3 (threats/action drivers) continued

IUCN Level3 ID	IUCN Level 3 Category	IUCN Level 3 Category Definition/Description	Actions: TRACS Level3 ID
7.3.3	Removal of coarse woody debris (streams, forests, scrub-shrub habitats)	Removing woody debris that could otherwise provide shelter, nesting and foraging habitat for birds, reptiles and amphibians, and small mammals.	1.2.1, 2.3.2, 2.10.0, 2.11.0, 3.2.0, 3.3.2, 3.5.3, 4.1.0, 6.0.0, 6.3.0, 6.4.0, 8.1.0, 8.3.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 11.2.1, 11.2.2, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.4.0
7.3.5	Poor habitat management	Managing habitats and aquatic systems in a manner that is not beneficial to, and may cause harm and/decline of, the wildlife inhabitants and/or native plant communities.	1.2.1, 2.1.1, 2.3.2, 2.3.3, 2.8.0, 2.9.1, 2.9.3, 2.10.0, 2.10.1, 2.11.0, 2.12.1, 2.12.2, 2.12.3, 2.12.5, 2.12.6, 2.12.7, 2.12.8, 3.0.0, 3.2.0, 3.2.3, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 4.1.0, 6.0.0, 6.3.0, 6.4.0, 8.1.0, 8.3.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 11.2.1, 11.2.2, 100.1.2, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.4.0
8.1.4	Invasive non-native terrestrial/wetland animals	Non-native, terrestrial and/or wetland-associated animals that have a detrimental impact on the natural ecosystem by damaging or causing change in the native vegetation (and potential food source), hydrology and/or a decline of native aquatic animals. Examples include feral cats, gypsy moth, Asian long-horned beetle (<i>Anoplophora glabripennis</i>), emerald ash borer (<i>Agrilus planipennis</i>), and hemlock wooly adelgid (<i>Adelges tsugae</i>), European starlings (<i>Sturnus vulgaris</i>) and house wrens.	1.2.1, 2.8.0, 2.13.0, 3.2.0, 3.3.1, 3.3.2, 3.5.4, 7.1.4, 8.1.0, 8.3.0, 9.3.1, 9.3.3, 11.1.1, 11.2.0, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.4.0
8.1.6	Invasive non-native fungal/bacterial diseases	Non-native fungal and bacterial diseases that infect and have a detrimental impact on native wildlife and/or their habitats. Examples of such diseases include chytrid fungus (<i>Batrachochytrium dendrobatidis</i>) and <i>Pseudogymnoascus destructans</i> which causes white-nose syndrome in bats, and Sudden Oak Death fungus (<i>Phytophthora ramorum</i>).	1.2.1, 2.8.0, 2.13.0, 2.14.0, 3.2.0, 3.3.1, 3.5.3, 3.5.4, 8.1.0, 8.3.0, 9.3.1, 9.3.3, 11.1.1, 100.1.3, 100.1.5, 100.3.0, 100.4.0
8.3.0	Introduced Genetic Material	Human-induced hybridization or genetic dilution through direct introduction of species from another region or indirect introduction from habitat modification creating habitat connectivity that naturally would not have occurred otherwise.	1.2.1, 2.13.0, 3.0.0, 3.2.0, 3.2.3, 3.2.5, 3.5.4, 8.1.0, 9.3.1, 9.3.3, 100.1.5, 100.3.0, 100.4.0
8.5.2	Named Species (Disease)	Includes West Nile Virus, arenavirus, sudden oak death, Avian Influenza.	1.2.1, 2.8.0, 2.13.0, 2.14.0, 3.2.0, 3.3.1, 3.5.3, 3.5.4, 8.1.0, 9.3.1, 9.3.3, 11.1.1, 100.1.3, 100.1.5, 100.3.0, 100.4.0
9.1.1	Sewage	Habitat is degraded and/or animals are harmed or killed as a result of leaking septic systems, discharge from municipal wastewater treatment plants, untreated sewage.	1.2.1, 2.10.0, 2.11.0, 3.0.0, 3.2.0, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 7.1.4, 8.1.0, 9.3.1, 9.3.3, 11.2.0, 100.1.3, 100.1.4, 100.3.0, 100.4.0
9.1.2	Run-off	Habitat is degraded and/or animals are harmed or killed as a result of runoff of oil and sediment from roads, chemicals from roads and lawns, road salt, golf course chemicals, etc. into adjacent aquatic and terrestrial habitats.	1.2.1, 2.8.0, 2.10.0, 2.11.0, 3.0.0, 3.2.0, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 7.1.4, 8.1.0, 8.3.0, 9.1.0, 9.3.1, 9.3.3, 11.2.0, 100.1.3, 100.1.4, 100.3.0, 100.4.0

Chapter 3: Threats and Actions for Focal Wildlife & Habitats

Table 3 (threats/action drivers) continued

IUCN Level3 ID	IUCN Level 3 Category	IUCN Level 3 Category Definition/Description	Actions: TRACS Level3 ID
9.2.1	Oil Spills	Habitat is degraded and/or animals are harmed or killed as a result of terrestrial and aquatic leakage from fuel tanks and spills from pipelines, and from PCBs in river sediments and the subsequent impacts of bioaccumulation of PCBs in the food web.	1.2.1, 2.10.0, 2.11.0, 3.3.2, 3.5.3, 8.1.0, 9.1.0, 9.3.1, 9.3.3, 11.1.1, 100.3.0, 100.4.0
9.2.2	Seepage from Mining	Includes acid mine drainage, mine tailings.	1.2.1, 2.10.0, 2.11.0, 3.0.0, 3.2.0, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 7.1.4, 8.1.0, 9.3.1, 9.3.3, 100.1.3, 100.3.0
9.2.3	Industrial and Military Effluents: Other	Other industrial pollutants impacting habitat and/or animals which are not specifically captured under the classification scheme such as toxic chemicals from factories, illegal dumping of chemicals, other industrial effluent, ship waste discharge, etc.	1.2.1, 2.10.0, 2.11.0, 3.0.0, 3.2.0, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 7.1.4, 8.1.0, 9.3.1, 9.3.3, 100.1.3, 100.3.0
9.3.1	Nutrient Loads	Aquatic and terrestrial environments become degraded or destroyed and/or animals are harmed as a result of nutrient loading from fertilizer run-off, manure from feedlots, nutrients from aquaculture, etc.	1.2.1, 2.10.0, 2.11.0, 3.0.0, 3.2.0, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 7.1.4, 8.1.0, 8.3.0, 9.1.0, 9.3.1, 9.3.3, 11.1.2, 11.2.0, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.4.0
9.3.2	Soil Erosion and Sedimentation	Aquatic and terrestrial environments become degraded or destroyed and/or animals are harmed as a result of soil erosion from overgrazing, increased run-off and hence sedimentation due to the conversion of forests (or other natural landscapes) to agricultural lands, etc.	1.2.1, 2.9.2, 2.10.0, 2.11.0, 2.12.1, 2.12.3, 2.12.7, 3.0.0, 3.2.0, 3.3.2, 3.5.1, 3.5.3, 3.5.4, 8.1.0, 8.3.0, 9.1.0, 9.3.1, 9.3.3, 11.2.0, 100.1.4, 100.3.0, 100.4.0
9.3.3	Herbicides and Pesticides	Herbicide, pesticides and fertilizer run-off from agricultural fields degrade or destroy adjacent aquatic and terrestrial habitats and/or cause harm to non-target species (plants and animals).	1.2.1, 2.8.0, 2.10.0, 2.11.0, 2.12.1, 2.12.3, 2.12.7, 3.0.0, 3.2.0, 3.3.2, 3.5.1, 3.5.3, 3.5.4, 8.1.0, 8.3.0, 9.1.0, 9.3.1, 9.3.3, 11.2.0, 100.1.4, 100.3.0, 100.4.0
9.3.4	Agricultural and Forestry Effluents: Other	Other agricultural and/or forestry management-related pollutants impacting habitat and/or animals which are not specifically captured under the classification scheme; identify type/source.	1.2.1, 2.10.0, 2.11.0, 2.12.1, 2.12.3, 2.12.7, 3.0.0, 3.2.0, 3.3.2, 3.5.1, 3.5.3, 3.5.4, 8.1.0, 8.3.0, 9.1.0, 9.3.1, 9.3.3, 11.2.0, 100.1.4, 100.3.0, 100.4.0
9.3.5	Control of insect pests and plants leading to mortality of non-target species not associated with agriculture	Herbicide and pesticides applied in environments through directional application (i.e., not aerial spraying) that lead to the harm of non-target species (plants and animals) such as the use of larvicides and adulticides for mosquito control that may harm amphibians and beneficial invertebrates.	1.2.1, 2.8.0, 2.11.0, 2.13.0, 3.2.0, 3.3.2, 3.5.3, 8.1.0, 8.3.0, 9.1.0, 9.3.1, 9.3.3, 11.2.0, 100.1.4, 100.3.0, 100.4.0
9.4.1	Direct hazards to wildlife	Includes waste that can harm or kill wildlife by entangling or strangling animals leading to their predation, starvation or fatal injury, causing fatal blockages in their digestive systems when waste is mistakenly eaten, etc., including but not limited to municipal solid waste, litter from cars and boats, waste that entangles or strangles wildlife, construction debris, etc.	1.2.1, 8.1.0, 8.3.0, 9.3.1, 9.3.3, 11.2.0, 100.1.4, 100.3.0, 100.4.0

Chapter 3: Threats and Actions for Focal Wildlife & Habitats

Table 3 (threats/action drivers) continued

IUCN Level3 ID	IUCN Level 3 Category	IUCN Level 3 Category Definition/Description	Actions: TRACS Level3 ID
9.5.1	Acid Rain	Habitat and water quality degradation and/or the acidification of ocean water as a result of acid rain, excess nitrogen deposition, wind dispersion of pollutants or sediments, radioactive fallout, smoke from forest fires, etc.	1.2.1, 8.1.0, 9.3.1, 9.3.3, 100.3.0
9.5.6	Herbicides and Pesticides	Herbicide and pesticides applied to environments through aerial application that lead to the harm of non-target species (plants and animals) such as the aerial application of chemicals to control pests, such as gypsy moths, mosquitos.	1.2.1, 2.8.0, 3.0.0, 3.3.2, 3.5.3, 8.1.0, 9.3.1, 9.3.3, 100.3.0
9.6.3	Noise Pollution	Noise that causes changes in animal behavior that may result in injury, death, failed reproduction, or detrimental shifts in migratory patterns such as noise from highways or airplanes, sonar from submarines that disturb whales, the construction activities associated with offshore wind and other energy development, etc.	1.2.1, 3.2.0, 3.3.1, 3.5.3, 3.5.4, 5.15.6, 7.1.2, 7.1.3, 7.1.4, 8.1.0, 8.3.0, 9.2.1, 9.3.1, 9.3.3, 11.1.1, 11.2.0, 11.2.1, 100.1.4, 100.3.0
11.1.0	Macro- and Micro-Climate Alterations	Permanent changes in macro- and micro-habitat conditions that reduce habitat suitability for habitat specialist or niche species.	1.2.1, 2.1.1, 2.9.1, 2.9.3, 2.10.0, 2.11.0, 2.12.1, 2.12.2, 2.12.3, 2.12.6, 2.12.7, 3.0.0, 3.2.0, 3.3.1, 3.5.3, 4.1.1, 6.0.0, 8.1.0, 9.3.1, 9.3.3, 100.3.0
11.2.1	Droughts	Increased periods and/or frequency of droughts leading to changes in the hydrology of aquatic systems and ground water and subsequent loss/alteration of aquatic and terrestrial habitats, the elimination of small wetlands and streams, etc., and subsequent impacts or loss of animals dependent on such habitat such as freshwater mussels.	1.2.1, 2.10.0, 2.11.0, 2.12.1, 2.12.2, 2.12.3, 2.12.5, 2.12.6, 2.12.7, 3.0.0, 3.3.1, 3.5.3, 3.5.4, 4.1.1, 6.0.0, 6.3.0, 7.1.4, 8.1.0, 9.3.1, 9.3.3, 11.2.0, 100.1.4, 100.3.0
11.3.1	Temperature extremes	Periods of extreme temperature ranges (high or low) that lead to the loss of habitats, disrupts migratory patterns of both marine and terrestrial wildlife, reduces water flow in streams/rivers, increases water temperature and/or changes water pH which impacts aquatic animals, lowers the water level of wetlands, riverine, lacustrine and vernal pool habitats, and causes premature drying of vernal habitats.	1.2.1, 2.10.0, 2.11.0, 2.12.1, 2.12.2, 2.12.3, 2.12.5, 2.12.6, 2.12.7, 3.0.0, 3.3.1, 3.5.3, 3.5.4, 4.1.1, 6.0.0, 6.3.0, 7.1.4, 8.1.0, 9.3.1, 9.3.3, 11.2.0, 100.1.4, 100.3.0
11.4.1	Storms and flooding	Extreme flooding alters the hydrology of aquatic habitats and causes water quality degradation as a result of increased silt loads, stream bottom shifting and increased turbidity of streams and rivers. It also disrupts migratory patterns of both marine and terrestrial wildlife, and coastal flooding breaches existing natural sand berms along shores that normally limit tidal flooding events and cause conversion of "barrier wetlands" to open water or other natural communities.	1.2.1, 2.9.1, 2.9.2, 2.9.3, 2.10.0, 2.11.0, 2.12.1, 2.12.2, 2.12.3, 2.12.5, 2.12.6, 2.12.7, 3.0.0, 3.3.1, 3.5.3, 3.5.4, 4.1.1, 6.0.0, 6.1.1, 6.3.0, 7.1.4, 8.1.0, 8.3.0, 9.1.0, 9.3.1, 9.3.3, 11.2.0, 100.1.4, 100.3.0, 100.3.2

Chapter 3: Threats and Actions for Focal Wildlife & Habitats

Table 3 (threats/action drivers) continued

IUCN Level3 ID	IUCN Level 3 Category	IUCN Level 3 Category Definition/Description	Actions: TRACS Level3 ID
11.6.3	Phenology shifts related to species redistribution	Changes in species distribution driven by climate-caused changes in species' ranges and/or competition.	1.2.1, 2.8.0, 2.13.0, 3.0.0, 3.2.0, 3.2.3, 3.2.5, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 4.1.1, 8.1.0, 8.3.0, 9.3.1, 9.3.3, 11.2.0, 100.1.5, 100.3.0, 100.4.0
12.1.1	Resource information collection needs: Lack of initial baseline inventory	Need to gather baseline data regarding fish, wildlife populations and/or habitat status, availability and condition as part of long-term trend analysis.	1.2.1, 2.8.0, 2.13.0, 3.0.0, 3.2.0, 3.2.3, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 8.1.0, 9.3.1, 9.3.3, 100.1.3, 100.3.0, 100.4.0
12.1.2	Resource information collection needs: Lack of up-to-date existing information	Need to conduct (routine, regular, ongoing) surveys/assessments to provide the up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.	1.2.1, 2.8.0, 2.14.0, 3.0.0, 3.2.0, 3.2.1, 3.2.2, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 8.1.0, 9.3.1, 9.3.3, 100.3.0, 100.4.0
12.1.3	Resource information collection needs: Need to answer research question	Need to address unanswered or unresolved conservation question(s) regarding fish/wildlife species, species suites and/or their habitats that will inform future conservation efforts and management decisions.	1.2.1, 2.4.2, 2.8.0, 2.13.0, 2.14.0, 3.0.0, 3.2.0, 3.2.3, 3.2.4, 3.2.5, 3.2.7, 3.3.1, 3.3.2, 3.5.1, 3.5.3, 3.5.4, 6.3.0, 8.1.0, 9.3.1, 9.3.3, 100.1.3, 100.3.0, 100.4.0
12.1.4	Resource information collection needs: Need to develop new technique	Need to develop and evaluate new species or habitat survey methods or techniques because current survey/assessment efforts fail to obtain the necessary data. Need to develop and evaluate new (species or habitat) management techniques.	1.2.1, 3.2.0, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 8.1.0, 9.3.1, 100.3.0
12.3.0	State Regulatory Reforms		1.2.1, 2.2.1, 2.10.0, 3.2.0, 3.3.1, 3.3.2, 3.5.3, 3.5.4, 6.0.0, 6.1.1, 6.3.0, 6.4.0, 7.1.2, 7.1.3, 7.1.4, 8.1.0, 9.1.0, 9.2.1, 9.3.1, 9.3.3, 11.1.1, 11.1.2, 11.2.0, 100.1.2, 100.1.3, 100.1.4, 100.1.5, 100.3.0, 100.3.2, 100.4.0
14.1.1	Education needs: Need for improved knowledge of fish and wildlife and their habitats	Lack of general knowledge or understanding (ecological literacy) of fish and wildlife and habitat conservation.	1.2.1, 3.3.1, 4.1.0, 4.1.1, 5.15.6, 8.1.0, 8.3.0, 9.2.1, 9.3.1, 11.2.0, 11.2.1, 11.2.2, 100.1.5, 100.3.0, 100.4.0
14.2.1	Outreach needs: Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions	Need to develop greater understanding of and support for agency's/organization's conservation work among general public and constituent groups (i.e., conservation partners, government agencies, the general public, farmers, business, homeowners, recreationists).	1.2.1, 3.3.1, 3.5.4, 4.1.0, 4.1.1, 5.15.6, 8.1.0, 8.2.3, 8.3.0, 9.1.0, 9.2.1, 9.3.1, 9.3.3, 11.2.0, 11.2.1, 11.2.2, 100.1.5, 100.3.0, 100.4.0
15.2.3	Need for multi-state, regional and landscape scale planning	Needs that can only be achieved via coordination or action among states or regional conservation partners/stakeholders.	9.3.1

D. Future Evaluation and Ranking of Threats

The DFW intends to work with conservation partners to further evaluate threats from 2018 to 2020, so as new information and perspectives are assessed, these values, and consequently the lists, may change. Future evaluations of threats will consider the six threat characteristics independently (such as their severity, spatial extent, and tractability) with the goal of generating rankings that even more accurately represent the potential risk to Focal SGCN. The results of this intensive evaluation will be integrated into a revised report, *Threats and Actions of Focal Species of Greatest Conservation Need*, as part of a future revision to this plan.

E. The Compounding Threat of Climate Change

Consideration of the implications of climate change for SGCN is a requirement that the USFWS places on all State Wildlife Action Plan submittals. Further, climate change – perhaps more than any other threat – exacerbates the consequences of many other threats in addition to posing direct problems of its own. This section therefore discusses the current state and projections of climate change in New Jersey.

The current state of climate change in New Jersey

- In New Jersey, the average annual temperature has continued to rise over the past century. Climate data for a 122-year period between 1895 and 2016, published by the State Climatologist Office, Rutgers University, demonstrates a clear statewide warming trend. Notably, the five of the coldest average annual temperatures were recorded before 1941, while the five warmest were recorded after 1997.⁷
- While precipitation has been variable over the past century, New Jersey's average annual precipitation in the past four decades has exceeded that of the early 20th century.⁸
- Complex modeling led by Rutgers University indicates that sea level rise in the 20th century has been three times faster than at any time in the past 2,700 years.⁹
- Over the last 15 years, sea level rose, on average, 2" globally and 4" in New Jersey. Over the next 15 years, sea level is predicted to rise 3"-4" globally and 7"-12" in New Jersey. If greenhouse gas emissions remain the same, sea level could rise 24"-36" globally over the next century and 29"-54" along the New Jersey coast. If emissions are cut drastically, the century prediction could be reduced by 12" or so – meaning that New Jersey will have to contend with significant sea level rise even if changes were made immediately.¹⁰
- New Jersey's marshes are relatively flat, so 12" of sea level rise translates to the marsh moving 1,000' back. The Delaware Bay coast of New Jersey is especially vulnerable. At current rates, New Jersey will lose almost 3% of its landmass over the course of the next century to advancing waters.¹¹
- The sea level rise trend for New Jersey is almost twice the global rate.¹²
- Increasing rates of carbon dioxide emissions (and the subsequent absorption of the carbon dioxide into the water) is leading to ocean acidification. The average pH has gone down by 0.1 since the Industrial Revolution. This represents a 25% change, and an even larger change is predicted in the next 10-50 years.¹³

Future effects of climate change if climate change continues to accelerate

- Decreased air and water quality.¹⁴
- More severe “heat island” effects in New Jersey’s urbanized landscapes.¹⁵
- Changes in forest species composition, with resulting shifts or losses of bird and wildlife habitat, migratory corridors and breeding areas.¹⁶
- More severe storms separated by increased periods of drought. This flashier storm cycle will result in more severe flooding, but also in less recharge of aquifers as storm water quickly runs off the hardened soils. These changes will increase stress on both natural and managed ecosystems across the state.¹⁷
- Substantial increases in the extent and frequency of storm surge, coastal flooding, erosion, property damage, and loss of wetlands along New Jersey’s densely populated coasts. Sea level rise will exacerbate these problems.¹⁸
- Increased salt-water inundation into coastal aquifers that residents rely on for fresh water.¹⁹

Implications of climate change for New Jersey’s wildlife and their habitats

- Loss of habitat as marshes and beaches disappear due to sea-level rise. If storms occur during breeding seasons, productivity could be reduced by more flooding and damaging winds. Conversely, overwash habitat can be created by major storms like hurricanes, but then compromised when humans attempt to re-stabilize an area, thus eliminating the positive benefit it would have had for some wildlife.²⁰
- Diminished water recharge within watersheds could lead to decreased water availability for native vegetation, with consequent impacts on habitats and wildlife.²¹
- Shifts in the timing of migration and hibernation could put these critical life history events out of synch with the availability of important food resources, leading to mistimed reproduction and reduced population success.²² For example, warmer springs have led to earlier nesting for 28 migrating bird species on the East Coast.²³

²³ Butler, 2003

- Increased periods of drought will lower water tables, altering wetlands that are critical for many of New Jersey's wildlife species that rely on them year-round or seasonally for resting, breeding, and feeding.²⁴
- Warmer winter temperatures may result in an increase of invasive pathogens and insects that threaten the state's natural systems as many of these organisms are limited by cold winters. There are many cases where climate change has already affected or will affect forest-insect species' range and abundance.²⁵ Warming temperatures are expected to result in an expansion of suitable range and increase the probability of spruce beetle outbreaks.²⁶ Climate change also appears to be encouraging the expansion of other non-native insects, including hemlock wooly adelgid, gypsy moth, and southern pine beetle.²⁷ Research has also demonstrated the spread of two protozoan parasites from the Gulf of Mexico to Delaware Bay and farther north, resulting in mass mortalities of oysters.²⁸
- Warming trends lead to changes in species compositions. In the ocean, for example, hake was once one of the most common fish species off New Jersey's coast. It has been replaced by black sea bass, which used to be most common off Virginia's coast.²⁹
- Increasing amounts of carbon dioxide absorbed in the water leads to ocean acidification (lower pH) which changes nutrient availability, decreases oxygen levels, and impedes the ability of shellfish to thrive and grow strong shells.³⁰

II. Conservation Actions for Wildlife and Their Habitats

A. Building a Common Lexicon to Enhance Local and Regional Actions

For the 2006 Plan, the DFW and conservation partners identified hundreds of conservation actions needed to address the many threats facing SGCN. For this revision, the DFW determined which of these actions needed to be revised for clarification or specificity, could be removed because they were no longer applicable to current conditions, or could be combined or condensed. The goal in this effort was to make the plan easier to use. The DFW also identified additional actions that could address more recent challenges, such as new wildlife diseases and a growing understanding of climate change.

All of these actions were categorized using the TRACS lexicon and are presented in Appendix I. To better address New Jersey's specific needs and SGCN priorities, the DFW removed some TRACS categories and created new ones. TRACS categories removed included those that were

Chapter 3: Threats and Actions for Focal Wildlife & Habitats

not applicable in the state, did not focus on SGCN conservation, or were adequately addressed in other TRACS action categories. New categories were added to address voids in the lexicon.

The TRACS lexicon organizes actions into three tiered levels of increasing detail. As was done with threats and action drivers, the DFW introduced a fourth level containing even more detailed conservation actions specific to New Jersey.

B. Identifying the Actions Associated with the Most Important Threats

Action Development Workshops

In order to reflect on past successes and future needs as a conservation community, the DFW collaborated with the Conserve Wildlife Foundation of New Jersey to host three expert stakeholder workshops in July 2015. The workshops brought together participants to collaboratively identify the broad suite of actions that will guide conservation of New Jersey's SGCN for the next ten years.

An invitee list was generated by the ENSP, the NJ Plan's Executive Committee, and the Conserve Wildlife Foundation of New Jersey. It included more than 460 professionals from state and federal agencies, private organizations, research institutions, land trusts, and universities (all of whom are listed in Appendix L). Because of the wide breadth of knowledge and ground to cover (both topically and geographically), the DWF organized three separate professionally facilitated workshops that each centered on a focal theme or landscape that reflected the unique expertise and interests of the participants.

The first workshop focused on Policy & Planning actions with more than 50 people from 22 agencies and organizations. Discussions explored actions related to the ten IUCN primary threats categories.

The second workshop focused on Habitat Management and Land Protection actions with more than 65 people from 32 agencies and organizations. At this workshop, participants considered actions relating to general habitat types, such as forests, grasslands, and freshwater systems.

The third workshop focused on actions in the Marine Environment and involved more than 30 people from 15 agencies and organizations. Their discussions helped identify actions necessary for addressing threats to marine wildlife and habitats.

The actions presented at the workshops ranged from species- and habitat-specific issues to broader, more comprehensive conservation needs. Ultimately, they lent themselves to the creation of conservation projects that are described in section IV, *Projects to Conserve New Jersey's Wildlife Populations of Concern Report*, below. The participation of this wide array of conservation partners not only made this plan stronger and more comprehensive, it will also help focus limited resources on the actions that will yield the greatest benefits for New Jersey's SGCN.

Actions Distillation

In an effort to identify the conservation actions that would have the greatest impact on wildlife conservation over the next ten years, the DFW filtered the actions (which use the TRACS

Chapter 3: Threats and Actions for Focal Wildlife & Habitats

lexicon) by identifying those associated with the distilled threats described and presented in section I.C of this chapter. This method, however, resulted in the selection of virtually all of the “level 3” action categories (Table 4).

While inclusive, the list shows the breadth of actions needed to conserve New Jersey’s diverse wildlife. More specific species-focused guidance regarding conservation actions is presented in the report, *Threats and Conservation Actions for the Focal Species of Greatest Conservation Need* (Appendix J) and, in the context of broader conservation issues in the report, *Projects to Conserve New Jersey’s Wildlife Populations of Concern* (Appendix K).

Table 4. Summary of conservation actions to address the most ubiquitous and severe threats to New Jersey’s wildlife and their habitats.

TRACS Level3 ID	TRACS Level 3 Category	TRACS Level 3 Category Definition/Description
1.2.1	Incentives	Development and delivery of economic incentives to private landowners to influence responsible stewardship of land/water and specific species.
2.1.1	Habitat conversion	Conversion of one type of habitat into another (e.g., creating bottomland forest from agricultural land, wetland creation).
2.2.1	Culvert work	Replacement or repair of road culverts (e.g., installing larger culvert, eliminating perching).
2.2.5	Obstruction removal	Removal of other obstructions (e.g., beaver dams).
2.3.2	Fuel reduction	Application of treatments to reduce the risk of high-severity wildfires and to manage changes in the ecological functions of forests (e.g., mechanical thinning).
2.3.3	Prescribed burning	Application of fire in a knowledgeable manner to forest fuels on a specific land under selected weather conditions to accomplish predetermined, well-defined management objectives (e.g., burning an established native grass community to reduce or eliminate invading brush or exotic species).
2.4.2	Hibernacula	Creation or improvement of overwintering sites.
2.6.6	Shoreline armoring removal	Removal of shoreline armoring to improve aquatic habitats (e.g., jetties, riprap).
2.8.0	Invasive species control strategies and implementation	Control of invasive animal and plant species to maintain native species populations and restore ecological functions.
2.9.1	Beach renourishment	Placement of sand onto beaches and employing other techniques for their renourishment.
2.9.2	Erosion control structures	Installation of hard structures (e.g., seawall bulkhead) or living structures (e.g., greenwall systems) to control erosion.
2.9.3	Sand dune restoration	Application of techniques to restore sand dunes (e.g., fencing off sea-grass areas).
2.10.0	Planting/seeding strategies for terrestrial or aquatic habitat	Planting or seeding to maintain fish and wildlife habitats and/or restore ecological functions.

Chapter 3: Threats and Actions for Focal Wildlife & Habitats

Table 4 (conservation actions) continued

TRACS Level3 ID	TRACS Level 3 Category	TRACS Level 3 Category Definition/Description
2.10.1	Coral	Application of techniques to reestablish coral reefs.
2.11.0	Vegetation management strategies for terrestrial or aquatic habitat	Physical manipulation of vegetation to maintain fish and wildlife habitats and/or restore ecological functions.
2.12.1	Water management: Ditch plugs	Installation of earthen plugs into drainage ditches to restore wetlands.
2.12.2	Water management: Diversion/headgate	Installation or maintenance of structures to divert water.
2.12.3	Water management: Drainage	Removal of tile drains or drainage ditches to restore wetland hydrology.
2.12.5	Water management: Spring development	Application of techniques to improve the flow, quantity and yield of water from a natural spring.
2.12.6	Water management: Tide gate	Installation or maintenance of structures to increase the hydro-period and water depth of a wetland.
2.12.7	Water management: Waterfowl impoundment maintenance	Maintenance of impoundments for waterfowl habitat (e.g., renovation of impoundment dikes).
2.12.8	Water management: Watering facilities	Installation or maintenance of structures to collect and store water for the benefit of wildlife (e.g., water holes, guzzlers, wells).
2.13.0	Nuisance fish and wildlife damage	Assessment and management of damage from nuisance native fish and wildlife, including the effects of predator control via biological, chemical or mechanical means.
2.14.0	Wildlife disease strategy development and investigation	Assessment and management of wildlife disease situations, including control or treatment of diseased animals to maintain populations of species at risk and restore ecological functions.
3.0.0	Research, survey or monitoring - general fish and wildlife needs	Research, survey or monitoring efforts to collect and analyze data regarding long-term or emerging needs of native fish or wildlife species and their habitats.
3.2.0	Research, survey or monitoring - fish and wildlife populations: Data deficiency	Collection and analysis of data as part of research, survey or monitoring primarily focused on fish and wildlife populations.
3.2.1	Research, survey or monitoring - fish and wildlife populations: Abundance determination	Determination of relative abundance or estimation of size of fish and wildlife populations (e.g., adult population estimate, juvenile relative abundance).
3.2.2	Research, survey or monitoring - fish and wildlife populations: Age, size and sex structure	Determination of age, size or sex structure of fish and wildlife populations (e.g., age and growth, length frequency, sex ratio).
3.2.3	Research, survey or monitoring - fish and wildlife populations: Baseline inventory	Baseline survey and inventory to understand distribution of fish and wildlife populations.
3.2.4	Research, survey or monitoring - fish and wildlife populations: Food habits	Studies on food habits of fish and wildlife species or their utilization as prey.

Chapter 3: Threats and Actions for Focal Wildlife & Habitats

Table 4 (conservation actions) continued

TRACS Level3 ID	TRACS Level 3 Category	TRACS Level 3 Category Definition/Description
3.2.5	Research, survey or monitoring - fish and wildlife populations: Genetics	Genetics studies of fish and wildlife populations (e.g., population connectivity, hybridization).
3.2.7	Research, survey or monitoring - fish and wildlife populations: Population assessment	Assessments of biological information to determine status of fish and wildlife populations (e.g., population viability analysis, fisheries stock assessment).
3.3.1	Research, survey or monitoring - habitat: Baseline inventory	Baseline survey and inventory to understand distribution of fish and wildlife habitat quality and quantity (e.g., wetland mapping).
3.3.2	Research, survey or monitoring - habitat: Monitoring	On-going monitoring of fish and wildlife habitat quality and quantity (e.g., annual early successional habitat survey, artificial reef condition).
3.5.1	Artificial propagation studies	Research on artificial propagation of fish and wildlife (e.g., nutrition studies, culture methods).
3.5.3	Habitat restoration methods	Development or improvement of methods to restore habitats and natural processes (e.g., evaluations of water level fluctuations).
3.5.4	Fish and wildlife research, survey and management techniques	Development or improvement of research techniques or management tools (e.g., tag retention studies, sampling device improvements, testing of animal control devices).
4.1.0	Public education	Provide educational resources and training programs to private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.
4.1.1	Aquatic resource education	Training of new instructors and teachers in aquatic resource education who will teach others. Note: This includes teachers, nature center staff and camp counselors who attend ARE workshops, teachers who help the agency write curriculum, etc.
5.15.6	Wildlife Management Areas: Roads	Clearly post vehicular access restrictions of roads and trails on wildlife management areas.
6.0.0	Land and Water Rights Acquisition and Protection: Combined acquisition and protection strategies	Enhance and increase the effective size of fish and wildlife habitats by securing habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
6.1.1	Land and Water Rights Acquisition and Protection: Fee title	Acquisition of lands through fee title acquisition.
6.3.0	Land and Water Rights Acquisition and Protection: Conservation area designation strategies	Designation of a site or landscape as having unique and important value to fish and wildlife with or without legal protections (e.g., waterfowl breeding area, Marine Protected Area).
6.4.0	Land and Water Rights Acquisition and Protection: Private land agreement strategies	Enter into private lands agreements to expand control burns on private lands, in particular those adjacent to conserved lands to improve SGCN habitats.
7.1.2	Law Enforcement: National Level	Enforcement of federal laws and regulations related to the protection of fish and wildlife or their habitats.
7.1.3	Law Enforcement: Sub-national Level	Enforcement of state or municipal laws and regulations related to the protection of fish and wildlife or their habitats.

Chapter 3: Threats and Actions for Focal Wildlife & Habitats

Table 4 (conservation actions) continued

TRACS Level3 ID	TRACS Level 3 Category	TRACS Level 3 Category Definition/Description
7.1.4	Law Enforcement: Scale Unspecified	Enforcement of unspecified laws and regulations related to the protection of fish and wildlife or their habitats.
8.1.0	Partner/stakeholder engagement strategies	Engagement of partners to achieve shared objectives and broader coordination across overlapping areas.
8.2.3	Recruitment and retention activities: Wildlife watching	Participation in programs intended to recruit and retain wildlife watchers Note: this activity has limited eligibility for funding through WSFR grant programs.
8.3.0	WSFR program/subprogram outreach strategies	Provision of educational information on WSFR grants and grant programs to target audiences.
9.1.0	Land use planning strategies	Leading or participating in land use planning for rural, urban or agricultural lands.
9.2.1	Organizational strategic and operational planning	Development of agency strategic and operational plans Note: Does not include actions to implement plans.
9.3.1	Species management planning	Development of management plans for fish and wildlife species (e.g., interjurisdictional fisheries management planning).
9.3.3	Habitat management planning	Development of management plans for habitats and natural processes (e.g., management planning for longleaf pine habitat; Habitat Conservation Plan development).
11.1.1	Environmental review: Review of proposed projects	Review of proposed development projects to help ensure that impacts to fish and wildlife are minimized and resource benefits are maximized.
11.1.2	Environmental review: Review of proposed policies and plans	Review of non-conservation oriented policies and plans to help ensure that impacts to fish and wildlife are minimized and resource benefits are maximized (e.g., review of harbor dredging plan, review of state highway plans).
11.2.0	Assorted technical assistance strategies	Provision of professional training and technical assistance to others on fish and wildlife assessment and management.
11.2.1	Technical assistance: With individuals and groups involved in resource management decision making	Provision of professional training and technical assistance on fish and wildlife assessment and management to individuals and groups involved in resource management decision-making (e.g., provide agency-collected data to other governmental officials, train non-governmental organizations on new trapping methods, review of conservation-oriented policies and plans).
11.2.2	Technical assistance: Private landowners	Provision of technical assistance on fish and wildlife management practices to private landowners Note: Could Include development and delivery of economic incentives to private landowners to influence responsible stewardship of land/water and specific species.
100.1.2	Legislation: National Level	A directive proposed by a legislative body (bills, laws, acts, statutes) within the federal government.
100.1.3	Legislation: Sub-national Level	A directive proposed by a legislative body (bills, laws, acts, statutes) within a state or sub-national legislative body.
100.1.4	Legislation: County and Local	A directive proposed by a legislative body (bills, laws, acts, statutes) within County or local government.
100.1.5	Legislation: Scale Unspecified	A directive proposed by a legislative body (bills, laws, acts, statutes) at an unspecified level of government.
100.3.0	State regulations: Regulatory initiatives for species and habitat	Specific regulatory initiatives directed at the protection of fish and wildlife and/or their habitats.

Table 4 (conservation actions) continued

TRACS Level3 ID	TRACS Level 3 Category	TRACS Level 3 Category Definition/Description
100.3.2	State regulations: State Land Acquisition Programs	Increase opportunities for habitat restoration by making any necessary policy changes to state land acquisition programs to facilitate acquisition of desirable fish and/or wildlife habitats.
100.4.0	State Agency Policy Integration: Policy initiatives for species and habitat protection	Specific policy initiatives directed at the protection of fish and wildlife and/or their habitats.

C. Future Prioritization of Conservation Actions

The extensive list of conservation actions addresses the highest priority threats discussed in section I.B and presented in Table 3. However, the DFW intends to work closely with conservation partners from 2018 to 2020 to further prioritize conservation actions using a more refined and detailed assessment that considers feasibility, cost, potential effectiveness, and other criteria. The results of this intensive evaluation will be integrated into a revised report, *Threats and Actions of Focal Species of Greatest Conservation Need*, as part of a future revision to this plan.

D. Addressing the Impacts of Climate Change on New Jersey's Wildlife and Their Habitats

The USFWS requires State Wildlife Action Plans to carefully consider the threats created and exacerbated by climate change and to assess actions that can be taken to address those threats. This section explores the approaches and actions that the NJDEP and conservation partners can take locally to address a global challenge.

The consequences of a changing climate, including sea level rise, are forecasted to pose significant threats to New Jersey's natural ecosystems and wildlife. Most climate change impacts will occur by influencing or intensifying many other existing unrelated threats.³⁰ Not knowing how and the degree to which these impacts will affect wildlife poses major challenges with respect to planning adaptive measures to address those effects. Making the challenge even greater, climate change is a global issue, so the steps needed to address its root causes (e.g., greenhouse gas emissions) are well beyond the purview of this state wildlife plan.

Fortunately, there is still work that can be completed on the state level to address the *effects* of climate change or to at least facilitate possible adaptations to those effects. Many of the strategies that will help reduce the effects of climate change on New Jersey's wildlife will improve the conditions for wildlife in general and improve their resiliency to a changing landscape. For example, habitat connectivity in coastal areas is a serious concern. Actions that address connectivity – whether in response to development or sea level rise – can yield real benefits to coastal species.

The NJDEP's Bureau of Energy & Sustainability has worked on several fronts to help address statewide climate change mitigation and adaptation concerns in collaboration with other NJDEP programs, other government agencies, and a variety of organizations across New Jersey. These efforts connect to on-going state, regional, and federal adaptation initiatives such as:

Chapter 3: Threats and Actions for Focal Wildlife & Habitats

- piloting a coastal-community vulnerability assessment protocol;
- testing models of transportation infrastructure vulnerability (with support from the Federal Highways Administration); and
- developing adaptation planning and implementation tools for local governments (though a Sustainable Jersey Climate Adaptation Task Force co-chaired by the NJDEP).

In addition, New Jersey participates in on-going regional and federal adaptation initiatives such as the:

- Mid-Atlantic Ocean Council's identification of regional transportation infrastructure vulnerability to sea level rise and increased flood hazards;
- Northeastern States for Coordinated Air Use Management's adaptation workgroup, which is collaborating on region-wide adaptation issues (e.g., data collection and storage, shared frameworks, and communications);
- National Oceanic & Atmospheric Administration's Climate Ready Estuaries Program to address climate change in coastal areas and watersheds; and
- U.S. Environmental Protection Agency's State and Tribal Climate Change Council to address climate change adaptation issues relating to water.

At the state level, the NJDEP continues to be a strong leader in managing air and water pollution through reasonable and appropriate regulations, including regulations to protect water quality in important waterways that support sensitive species. Of particular note is the NJDEP's participation in the NJ Climate Adaptation Alliance, a Rutgers University-led effort that brings together diverse stakeholders to address climate change preparedness for public health; watersheds, rivers, and coastal communities; built infrastructure; agriculture; and natural resources. In addition, the Alliance is a clearinghouse for guides (such as *Resilience: Preparing NJ for Climate Change*) and tools, such as NJADAPT's Flood Mapper. The Flood Mapper allows users, whether government officials or interested citizens, to visualize coastal flood hazards and sea level rise. The Alliance also lists policy recommendations for the state.

New Jersey's conservation community acknowledges that long-term research and monitoring are required to better understand the effects of climate change on the state's wildlife and their habitats. Therefore, when appropriate, future research will address climate change threats and effects such as increased water temperatures, rising sea level, vegetation changes, changes in food source emergence (e.g., insects, seeds and fruits), changes in migratory routes and timing, and the appearance and disappearance of climate-sensitive species.

This 2017 Revised Plan addresses threats associated with climate change by accepting that there will be inevitable impacts (however difficult they are to precisely predict) and maximizing the ability of New Jersey's habitats and wildlife to adapt to them. To provide a foundation for climate-related actions in the revised plan, the DFW had VanLoven Environmental review, synthesize, and summarize scientific articles and analyses on climate change specifically related to New Jersey's wildlife. This review, entitled *Climate Change Summary for Wildlife Action Plan*, can be found in its entirety in Attachment III.

There are two broad approaches to adaptation. The first is to implement changes that *address and overcome the challenges of climate change*. Strategies include increasing connectivity between protected areas and other refugia, and sustaining ecological processes and functions.³¹ This approach recognizes that while there will be major changes across the state, the emphasis is on protecting the species and the habitats that are in New Jersey now. The second approach, developed by Anderson and Ferree (2010), is to *protect the places with geophysical features that are most likely to support species richness regardless of climate change*. This approach can be more difficult for people to accept since it may mean letting go of certain high-risk species, possibly with the result of local extinctions.

The overarching threats at the landscape region scale include temperature changes (shifting temperatures may shuffle species compositions), precipitation and flooding (more intense precipitation can lead to more flooding and erosion in streams and rivers), drought and low stream flows (lower water levels could impede fish access), and sea-level rise (rising waters will lead to the inundation of beaches and marshes).³²

Although the consequences of climate change and sea level rise are not yet fully understood, it is clear that New Jersey's wildlife populations and the habitats that support them are, and will continue to be, undergoing fundamental changes due to these threats. Stakeholders with a vested interest in protecting the state's wildlife may not be able to influence large-scale policy, such as limiting greenhouse gas emissions in other countries, but there are actions that can be taken to adapt to the impacts of climate change. At the same time, these strategies will help relieve other challenges that wildlife are facing, such as habitat fragmentation and pollution. A comprehensive, holistic approach to wildlife protection may represent the best opportunity for addressing both individual threats and their additive impacts.

E. Collaboration beyond New Jersey's Borders

Many, if not most, of the threats to wildlife and wildlife habitats are not local or unique to New Jersey, and many of the approaches to addressing these threats benefit greatly from collaboration at regional and landscape scales that result in more unified, consistent and effective actions and projects. The close proximity of many northeastern states has engendered a culture of cooperative and/or complementary management approaches. The Northeast Association of Fish and Wildlife Agencies traditionally has supported a strong technical committee structure to further wildlife conservation. Technical committees are species or habitat-focused groups that exchange ideas and develop common approaches to wildlife issues. Typically, these conservation actions are implemented by individual states using their own funds; however, in some cases additional funding has been made available through the Northeast Directors.

³¹ Staudinger *et al*, 2015

³² VanLuven, 2015

The Regional Conservation Needs (RCN) program formalizes a cooperative approach to address SGCN needs across multiple states. The purpose of the RCN program is to develop, coordinate, and implement conservation actions that are regional/sub-regional in scope, and build upon the many regional initiatives that already exist. The RCN program utilizes a funding mechanism that is equitable to all Northeast states and the District of Columbia, creating a base of funding for regional projects. Since 2007, thirty-seven different projects have been supported through this program. The resulting reports and products can be found at RCNgrants.org. New Jersey will continue to participate in this and other regional-, watershed- and landscape- scale cooperative approaches to addressing SGCN and habitat conservation needs.

III. Threats and Conservation Actions for the Focal Species of Greatest Conservation Need Report

As described above, New Jersey's wildlife and their habitats face hundreds, if not thousands, of threats to their persistence and well-being. Many of these threats, along with the conservation actions necessary to alleviate their impacts, have been identified in this plan with an emphasis on Focal SGCN.

In this section, we briefly describe the report, *Threats and Conservation Actions for the Focal Species of Greatest Conservation Need* (Appendix J). This report provides extensive and highly detailed lists of threats and the applicable conservation actions for each of the 48 individual Focal SGCN and Focal SGCN guilds, referred to as "conservation targets." Plan users should consider this information when developing new or adapting on-going conservation projects. Additionally, if other species-based plans exist, they are cited within the *Profiles of the Focal Species of Greatest Conservation Need* (Appendix D), and such plans may provide additional management guidance.

This report was generated from a complex database developed and managed by the DFW. The DFW continues to work on the development and deployment of the database with an ultimate intent to make it publicly available and, perhaps, web-enabled. This greater accessibility would enable plan users to query for species, habitats, threats, actions, and geographic areas of interest.

The report identifies the conservation target, the Focal SGCN included within the target (if more than one), the associated threats, and applicable conservation actions. For the threats, the level 1-3 categories and New Jersey-specific statements (level 4) are presented in chronological order of their identification number. Each level 3 category is followed by the average impact rating of the Focal SGCN to help readers identify the issues of greatest concern (threat impact ratings are described in section I.B above, *Evaluation of Threats*). Similarly, applicable conservation actions are presented in chronological order of their identification number.

Excerpts from one conservation target (Allegheny woodrat) within the report, *Threats and Conservation Actions for the Focal Species of Greatest Conservation Need*, have been provided below to illustrate how this information is presented in the report; i.e., the taxonomic group, conservation target, the Focal SGCN within that conservation target (if more than one), the

Chapter 3: Threats and Actions for Focal Wildlife & Habitats

threats and action drivers associated with the conservation target, and the conservation actions to address those threats and action drivers. Please see Appendix J for the *complete* report on Allegheny woodrat and the other 47 conservation targets.

Mammals

Allegheny Woodrat

Focal species that comprise this Conservation Target:

Allegheny Woodrat

Threats and Action Drivers associated with this Conservation Target:

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale) (Avg. Score: 2.00)

NJ Specific Threats: 1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
1.1.1.2 Loss, alteration and/or degradation of habitat.
1.1.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale) (Avg. Score: 2.00)

NJ Specific Threats: 1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
1.2.1.2 Loss, alteration and/or degradation of habitat.
1.2.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale) (Avg. Score: 1.00)

NJ Specific Threats: 1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

3 Energy Production and Mining

3.1 Oil and Gas Facilities and Pipelines

3.1.1 Distribution processes of petroleum and other liquid hydrocarbons (Avg. Score: 1.00)

NJ Specific Threats: 3.1.1.1 Fragments terrestrial and aquatic habitats.
3.1.1.2 Loss, alteration and/or degradation of habitat.
3.1.1.3 Increased risk of oil spills.
3.1.1.4 Increased noise pollution.
3.1.1.5 Increased vehicular and ship traffic associated with construction and operations, and therefore an increased risk of wildlife mortality from strikes.

3.1.2 Natural gas distribution processes (Avg. Score: 1.00)

NJ Specific Threats: 3.1.2.1 Fragments terrestrial and aquatic habitats.
3.1.2.2 Loss, alteration and/or degradation of habitat.

14.2 Outreach needs

14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions (Avg. Score: 2.00)

NJ Specific Threats: 14.2.1.1 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various forest management practices.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning (Avg. Score: 3.00)

NJ Specific Threats: 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Actions to address the Threats and Action Drivers associated with this Conservation Target:

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.2 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to increase the effective size of SGCN habitats by protecting/restoring adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats.
- 1.2.1.4 Secure and promote the protection, restoration, and/or development of old-growth forest stands with large trees, in particular those within large, contiguous forest tracts through incentive programs.
- 1.2.1.8 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to municipalities, land developers, and other land managers to retain and/or enhance native vegetation adjacent to aquatic habitats, and along riparian areas and wildlife movement corridors.
- 1.2.1.9 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing Forestry Stewardship Programs.
- 1.2.1.14 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of herbicides and pesticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.15 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of rodenticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.20 Coordinate across government agencies and non-government organizations to create or expand upon tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMP's.

2 Direct Management of Natural Resources

IV. Projects to Conserve New Jersey's Wildlife Populations of Concern Report

A. Organizing Actions around Issues and Needs

The three Action Development Workshops (described in section II.B above) delivered a wide-ranging list of actions, some of which were directed at overarching benefits to multiple SGCNs and their habitats, and some that were highly specific to individual species. The DFW assessed these actions and grouped them when they addressed a particular threat, a suite of related threats, or a conservation need. These groups of actions – or projects – were then divided into jobs that would collectively help accomplish the project.

From this assessment, the DFW developed the report, *Projects to Conserve New Jersey's Wildlife Populations of Concern* (Appendix K). The report lists 32 projects (Table 5) which include 102 jobs; note, one project and one job are under development. For each job, the report lists:

- Objectives & purpose
- Benefits
- Focal SGCN targeted by the job
- Threats and action drivers
- Conservation actions

The job for one project is presented below as an example of the information provided in this report. Please see Appendix K for the complete report.

While the report, *Threats and Conservation Actions for Focal Species of Greatest Conservation Need*, provides guidance for conservation organized around Focal SGCN, the report, *Projects to Conserve New Jersey's Wildlife Populations of Concern*, provides guidance for conservation organized around broad issues, threats, and needs. The *Projects to Conserve New Jersey's Wildlife Populations of Concern* report is not comprehensive or an exhaustive cataloging of conservation projects, nor does it purport to address all of the highest priority issues. Instead, it is simply a starting point for conservation partners that shows how related and interdependent conservation actions work together within a unified “project” to address overarching conservation needs. The information in the two reports is consistent, but the two different structures are intended to accommodate planning from different perspectives.

B. Future Prioritization of Projects

The DFW intends to work closely with conservation partners to more thoroughly prioritize threats and conservation actions, and to further develop and prioritize projects and jobs. This next phase of planning will be based on further assessment of the threats and applicable actions for Focal SGCN and their habitats, and assessment of threats and development of conservation actions based on Conservation Focal Areas. As projects are further developed and prioritized, performance metrics will be developed for high priority projects to measure success and provide adaptive management feedback. Such metrics will likely include quantities such as acres of habitat restored and occupied by target wildlife, population measurements, and reproductive success, that indicate the effectiveness of conservation actions. The measurable results will be used to adapt the projects and jobs to achieve success or develop new conservation actions.

Chapter 3: Threats and Actions for Focal Wildlife & Habitats

Projects that are prioritized and revised to include performance metrics will form the revised *Projects to Conserve New Jersey's Wildlife Populations of Concern* report as part of a future revision to this plan.

Project 29. Limiting Effects of Predators

Job 29.01. Reducing the Impacts of Predators on Beach Nesting Species

Objective: Decrease the impact of predator populations at and adjacent to critical areas for beach dependent wildlife by implementing predator management strategies, including including exclusionary tactics, aversive conditioning, and removal.

Purpose: Decreasing the predation pressure on beach dependent wildlife to result in an increase in adult survival, hatch success, and productivity.

Benefits: Increased reproductive success and survival of beach dependent wildlife.

Threats and Action Drivers associated with this conservation need

8 Invasive and Other Problematic Species, Genes and Diseases

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.4 Invasive non-native terrestrial/wetland animals

8.1.4.2 Free-roaming and feral domestic animals such as cats and dogs causes direct mortality of wildlife and disturbance to wildlife breeding and resting areas.

8.2 Problematic Native Species/Diseases

8.2.2 Named Species

8.2.2.2 Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.13 Wildlife damage management

2.13.0 Nuisance fish and wildlife damage

- 2.13.0.6 Develop, implement and evaluate the effectiveness of predator-control techniques aimed at improving SGCN populations and methods to minimize the impact of those species carrying parasites or diseases that may impact SGCN (e.g., raccoon roundworm kills Allegheny woodrat).

3 Data Collection and Analysis

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.22 Evaluate the effectiveness of predator-control techniques aimed at improving SGCN populations and methods to minimize the impact of those species carrying parasites or diseases that may impact SGCN (e.g., raccoon roundworm kills Allegheny woodrat).

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.21 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation human-subsidized and/or overabundant, native species cause to local nesting species, and provide expert guidance on how residents can help alleviate this threat.
 - 8.1.0.22 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation invasive species cause to native nesting species, and provide expert guidance on how residents can help alleviate this threat.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.6 Develop and provide (or otherwise make publicly available) educational programs and/or materials to enlist landowners, land managers and local communities to discourage the presence of managed cat colonies and trap, neuter and release programs in wildlife habitats.
 - 8.3.0.19 Develop an educational outreach program for the public on the devastating effects predators can have on native nesting wildlife.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.11 Develop a management plan using predator-control techniques aimed at improving SGCN populations and methods to minimize the impact of those species carrying parasites or diseases that may impact SGCN (e.g., raccoon roundworm kills Allegheny woodrat).

V. Future Work with Conservation Focal Areas

As noted in Chapter 2, “Habitats of New Jersey,” delineation of Conservation Focal Areas (CFAs) represents the second of a two-part approach to identifying and understanding threats to New Jersey's [Species of Greatest Conservation Need](#) (SGCN) and developing actions that will address these threats. The CFAs highlight specific areas of New Jersey that feature some of the highest value wildlife habitats and/or present greater opportunities for effective conservation action. In combination with Focal SGCN, conservation actions in CFAs will benefit virtually *all* SGCN and, in turn, all of New Jersey's wildlife. Also, by highlighting specific areas of New Jersey's landscapes for effective conservation actions, to the extent that conservation partners choose to use the CFA maps to guide the selection of areas to implement conservation actions, those actions will be directed towards a variety of “conservation target rich” areas that will benefit *all* wildlife, not just those that appear in the plan as “focal species.”

Following a re-examination and possible refinement of CFAs (see Chapter 2), the DFW will undertake a more geographically specific examination of threats and development of actions targeted at the greatest threats to those areas.

Any future re-examination and modification of CFAs will include evaluation of the Northeast Regional Conservation Opportunity Areas, now called “Nature's Network.”³³ Completion of CHANJ mapping and guidance, described in the Introduction, in Section IV.A, *Connecting Habitats Across New Jersey* (CHANJ), and in Chapter 2, Section I.B, *Use and Future Development of CFAs*, is anticipated in the next year (2018), and the results of that assessment may also be included in any possible re-configuration of CFAs. Whether these or other ongoing geographically specific assessments of habitat are used to modify CFAs, they will be included in future planning to, especially planning that will direct conservation actions at specific locations within the state. The CHANJ products, for example, will provide geographically specific guidelines for addressing the threats posed by roads and other forms of habitat fragmentation, and these guidelines will be incorporated into future revisions of this Plan just as Landscape Project products currently are.

VI. Integrating Flora and Natural Communities as Important Components of Biological Diversity

This plan explicitly focuses on the development and implementation of actions to conserve SGCN and the habitats on which they depend. Although plants are not addressed as species of conservation concern in the plan, New Jersey supports extraordinarily diverse flora of more than 2,140 native taxa, including 818 rare plants of which 356 are listed as state endangered. Ecological communities provide important habitats for these rare plants in addition to SGCN.

Most of the threats confronting New Jersey's wildlife populations similarly affect its native flora and ecological communities. The actions, projects, and monitoring programs presented in this plan for wildlife also provide an opportunity to conserve these other important elements of biological diversity. At the same time, without proper precautions, actions directed at enhancing wildlife, especially on-the-ground actions that modify habitats, may pose risks to rare plants.

Chapter 3: Threats and Actions for Focal Wildlife & Habitats

In recognition of this challenge, the DFW partnered with the New Jersey Natural Heritage Program, the NJDEP's plant conservation program, to develop guidance for integrating plant species of conservation concern into wildlife planning and action implementation. The resulting report focuses on four habitat types within two landscape regions that are critical to a suite of plant and wildlife species, and provides examples of how to integrate rare plant and wildlife conservation planning and adaptive management. The report, presented in Attachment IV (Part 1), follows the geographic organization of the 2008 Revised Plan.

Attachment IV (Part 2) also includes tables indicating occurrences of plants of conservation concern by landscape regions and broad habitat categories.

CHAPTER 4: MONITORING

Monitoring comes in many forms and can serve many different conservation purposes. At the most basic level, monitoring can simply note whether or not a species continues to be present at a given location. At a more detailed level, monitoring can help managers determine the effectiveness of conservation actions and, in turn, adapt management activities to maximize their benefits.

I. Monitoring Programs & Projects

This Plan documents a broad spectrum of threats to SGCN wildlife and their habitats in New Jersey. The identification of focal species and geographic focal areas is the start of a more focused conservation approach, but to increase the value of this plan further, additional work is needed to prioritize work. DFW staff will reach out to consult with conservation partners and stakeholders in the next three years to prioritize projects and actions, and identify monitoring methods to measure success. The USFWS developed TRACS to help identify the metrics by which conservation actions and projects can be evaluated (Appendix M). DFW will lead the process to change or design projects that include appropriate performance metrics to judge the success of conservation actions, and the steps for adapting actions in response to those metrics.

The DFW leverages its relationships with agencies and organizations with conservation interests and/or influences to help construct appropriate and achievable monitoring metrics and programs. Organizations have a variety of interests and roles in wildlife and habitat conservation which lends to the challenge of identifying performance metrics and programs for the wide variety of projects and SGCN wildlife. The DFW will promote the use of results-chain graphics (as presented in B., below) and the TRACS approach to develop target goals and metrics.

A. Past & Current Monitoring Programs

Many of New Jersey's SGCN and habitats have active monitoring programs, some dating back more than 60 years. Table 6 provides a concise list of these 62 programs. Some of these ongoing monitoring programs will provide data useful to evaluating the effectiveness of conservation projects and actions.

Notable monitoring programs in New Jersey include:

- The ENSP's **Landscape Project** maps critical wildlife habitat using species occurrence data applied to dynamic data on suitable habitat types. Adopted by the NJDEP in 1993 to define habitat, it is a powerful tool for conservation planning.
- The DFW's **Habitat Change Analysis Project (HCAP)** tracks wildlife habitat transition and fragmentation trends over time. The ongoing analysis uses GIS to identify potential habitat from available land use and land cover data based on species habitat associations and range extents. Products from the analysis include up-to-date, multi-level, species-specific habitat change information to support agency management initiatives
- **Submerged Aquatic Vegetation Monitoring** in Barnegat Bay is a long-term project that provides an indicator of water quality and the health of the food web for aquatic and waterfowl species.

Chapter 4: Monitoring

- The **Breeding Bird Survey** in New Jersey is part of the national breeding bird survey that is used to detect bird population trends nationally and, to a lesser degree, within the state. Conducted largely by skilled volunteers, the data are considered each time the state reassesses bird species conservation status and trends.
- The **New Jersey bald eagle survey** has successfully tracked the expansion of nesting bald eagles since the time when there was just one nest in the state. The survey is primarily conducted by volunteers, and results are used to track recovery of the state population and as part of the federal monitoring plan for bald eagles.
- The **Saltmarsh Habitat and Avian Research Program** is a new survey that was designed to detect population trends in a group of bird species that are difficult to survey. It is already proving useful for carrying out adaptive management for rare species.
- The **winter bat hibernacula survey**, begun in 1995, has provided valuable data on bat populations after widespread mortality due to white-nose syndrome. It will remain an important measure of cave-dwelling bat populations well into the future.
- Since 1968, the DFW's **Trout Production Stream monitoring** has identified and classified New Jersey waters according to their suitability for trout. The classification levels are based on a waterway's ability to support trout year-round (lakes) or occurrence of natural production, presence/absence of trout, and/or trout associated species (streams). The classifications became part of the state's Surface Water Quality Standards in 1981, and trout-suitable waterways received greater protection under state regulations.
- Since 1992, the NJDEP has conducted **benthic macroinvertebrate sampling** at more than 760 Ambient Macroinvertebrate Network (AMNET) stations within the state's 20 Watershed Management Areas. Results are used to evaluate aquatic life use, designate Category One waters, and inform New Jersey's Long-Term Water Monitoring and Assessment Strategy and other publications.

Table 6. Summary of 62 Species and Guild-Level Monitoring Programs by the NJDEP and Conservation Partners.

Conservation Partners:

Monitoring Program or Action	Implementation Lead	Monitoring Level			Monitoring Target	Metrics	Start Year

B. Strengthening Monitoring through Results Chains

The DFW will use results chains to help show how conservation actions will lead to the desired results. Results chains are simply diagrams that show the connections between threats, actions, and conservation outcomes. Results chains are not only useful for thinking through and selecting conservation actions, they are powerful tools for identifying monitoring strategies. Two sample scenarios using results chains are shown below for bog turtles and scrub-shrub and young forest habitat management.

Scenario 1: Bog Turtle

The following scenario presents a model framework for monitoring and measuring the effectiveness of conservation actions for the bog turtle.

Once abundant throughout New Jersey, bog turtles are now primarily restricted to the remaining rural portions of the state, particularly Sussex, Warren, and Salem counties. Although listed as endangered in the state and as threatened at the federal level, New Jersey is a stronghold for the species in the Northeastern U.S. As of 2015, there were 99 core bog turtle habitats in New Jersey, 54 of which were considered to be metapopulations (which are defined as one or more populations that are close enough for bog turtles to occasionally move between them and for genetic exchange).

Bog turtles inhabit fens, bogs, and wet meadows with mucky, organic soils that are kept saturated by groundwater discharge. Plant communities associated with bog turtle habitats vary, but most are dominated by low-growing grasses, rushes, mosses, and other herbaceous species with little shrub or tree cover. Notable physical features include spring-derived rivulets, shallow, mucky pools, and abundant hummocks of tussock-forming sedges and raised mounds of moss.

Bog turtles are habitat specialists that rely on abundant groundwater resources, organic soils, diverse herbaceous vegetation, and contiguous tracts of land for dispersal. Intense land-uses such as urbanization and industrial farming destroy bog turtle habitats through direct wetland alteration and secondary impacts such as stormwater runoff, local draw down of water tables, and nutrient enrichment.

In partnership with the U.S. Fish & Wildlife Service (USFWS) and other bog turtle recovery partners, New Jersey is currently assessing its 54 known metapopulations. Over the next several

Chapter 4: Monitoring

years, the USFWS Northeast Region (Region Five) will develop new protocols for assessing bog turtle status and update the current recovery plan. These revisions will be informed by intensive efforts over the last five years to standardize data collection across the Northeastern states, new datasets that are emerging from the standardized procedures, and legacy data. A likely focus for recovery will be larger wetland complexes composed of several core bog turtle habitats because they can support key biological dynamics (such as dispersal, colonization, and gene flow) that are necessary to keep populations functionally viable. Fragmented or isolated populations, while still important to protect, are vulnerable to random events such as severe floods, disease, and collection, and are also potentially at risk of becoming genetically impoverished over time.

In the 1990s, the ENSP launched a comprehensive management approach to guide conservation of important bog turtle populations in New Jersey. The management initiative consists of four main actions:

1. developing relationships with private landowners that have bog turtles on their land;
2. facilitating the acquisition of core bog turtle habitats threatened by adjacent land use activities;
3. undertaking and improving habitat management techniques to control and reverse habitat succession and invasive exotic plant proliferation; and
4. working with partners to develop and implement land-use planning that considers bog turtle.

More than half of bog turtle habitats in New Jersey are in need of management or restoration. Succession from open-canopy habitat to woody species and proliferation of invasive plants (e.g., purple loosestrife, *Phragmites*, multiflora rose, Japanese stiltgrass, and reed canary grass) are the primary threats to habitat quality, and most of these plants are extremely difficult to control. However, as aggressively as these plants invade, the ENSP is combating these floristic invaders with equivalent ferocity through several methods.

Grazing by sheep, goats, cattle, and other domestic livestock in bog turtle habitats has been demonstrated to slow natural succession, control expansion of fast-growing invasive species, augment hydrological regimes by reducing surface vegetative matter and breaking up peat accumulation, create microhabitats for bog turtles in the form of footprints, and encourage the growth of hummocky vegetation that bog turtles use for nesting. Over the last 20 years, the ENSP has coordinated and implemented prescribed grazing at more than 20 wetlands across the bog turtle's range in New Jersey. In addition to grazing, the ENSP has coordinated with many partners to cut and remove woody vegetation and treat invasive or exotic vegetation with targeted herbicidal applications. Habitat restoration or maintenance has been carried out at nearly half of New Jersey's core habitat areas.

Bog turtles are often found in wetlands that also support rare plant species. Some habitat management practices (such as invasive species control and grazing) and monitoring practices (such as drift fence arrays) can be harmful to rare plant populations, depending on how the practices are implemented. Attachment IV provides guidance on vegetation management practices that minimize or avoid negative impacts to rare plants in bog turtle habitats. There is a similar risk of unintended consequences for rare plants in other wildlife habitats.

Chapter 4: Monitoring

To restore degraded bog turtle habitats in New Jersey, the ENSP is pursuing the following restoration action: use woody vegetation control and prescribed grazing to reduce invasive plant species cover and slow succession.

A results chain for this restoration action shows the connections between the conservation elements:

- Action:** Use woody vegetation control and prescribed grazing to reduce invasive plant species cover and slow succession at four core habitats per year. Monitor turtle population size and structure at core habitats once every five years.
- Objective:** Increase the number of documented bog turtle occurrences at restored wetlands. Through habitat improvements, increase core habitat population size to at least 15 female turtles. Increase the number of known populations through assessments and surveys of new habitats.
- Threat:** Dense cover of invasive plant species or excessive woody vegetation makes wetlands unsuitable for bog turtles.
- Target:** Bog turtles

Figure 9. Results chain for restoration of wetland habitats to support bog turtles.

To assess the effectiveness of this direct management action, the DFW will follow the regional habitat monitoring protocols developed in coordination with the USFWS and state wildlife agencies across the bog turtle's range in the Northeast, as follows.

- A. Quantify and track changes in vegetation structure.
- B. Quantify and track changes in wetland-specific plant community distribution.
- C. Evaluate the effect of the restoration on bog turtles through supplemental population monitoring protocols.

The data collected from these monitoring efforts will be used to track the effects of the management activities and thereby inform adaptive management of sites in New Jersey and regionally.

Scenario 2: Scrub-shrub & Young Forest Habitat Management

Mosaics of scrub-shrub and young forest habitats are vital for a variety of SGCN, notably golden-winged warbler, northern bobwhite, and wood thrush. Scrub-shrub and young forest habitats are rare in New Jersey in part because they are transitional stages between field and forest, so are always changing.

There are, however, opportunities to maintain and create these important habitats along powerline rights-of-way, at fallow agricultural sites, and on some public lands. With partners such as New Jersey Audubon and the Conserve Wildlife Foundation of New Jersey, the DFW is

Chapter 4: Monitoring

undertaking vegetative management projects and developing best management practices for use by other conservation partners.

To create and retain scrub-shrub and young forest habitats in northern New Jersey, the ENSP is pursuing the following restoration action: In large contiguous forest blocks (>2,500 acres) with >70% mature forest cover, use prescribed forest thinning in mature forests to create a mosaic of early successional forest habitat (not to exceed 20% of entire forest block at a time) that consists of more than 50% native shrubs/saplings and 10-15 trees per acre over 9 inches in diameter at breast height, or an approximate basal area of 30 ft² per acre with 10-40% canopy cover.

A results chain for this restoration action shows the connections between the conservation elements:

- Action:** Use prescribed forest thinning to create early successional forest habitat that consists of more than 50% native shrubs/saplings and 10-15 trees per acre over 9 inches in diameter at breast height, or an approximate basal area of 30 ft² per acre with 10-40% canopy cover
- Objective:** Create scrub-shrub and young forest habitat to support viable populations of early successional species
- Threat:** Natural succession that transitions scrub-shrub and young forest habitats into closed-canopy forests eliminates important habitats for a variety of SGCN
- Target:** Young forest dependent species including golden-winged warbler, northern bobwhite, and wood thrush

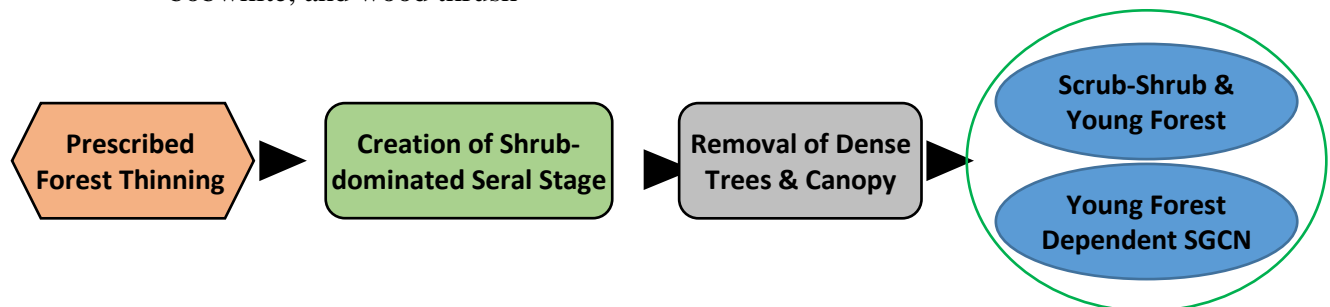

Figure 10. Results chain for creation of scrub-shrub habitats to support young forest dependent species.

To assess the effectiveness of this direct management action, the DFW will undertake strategic monitoring, as follows.

- A. Number of individuals and species (including Focal SGCN) occurring in managed areas annually following management actions.
- B. Vegetative structure as measured in May and June of each year following management actions.

The results of these monitoring efforts will be shown graphically (Figure 11), potentially in the formats shown below.

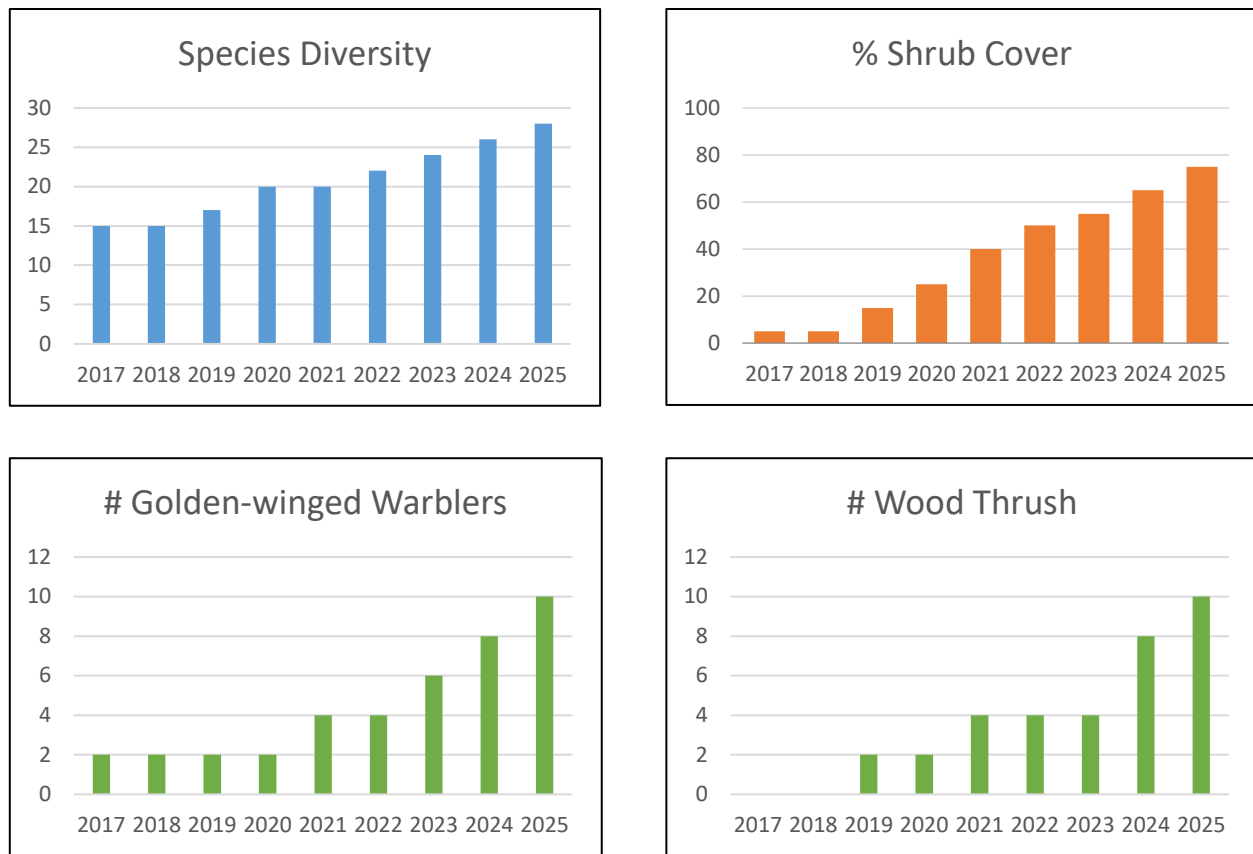

Figure 11. Example of how the results of future monitoring efforts for scrub shrub and young forest species could be depicted.

II. Adaptive Management

Adaptive management is the process through which conservation actions are undertaken, assessed through careful monitoring, and then modified as necessary based on the monitoring results. Successful adaptive management requires the completion of six interrelated steps.

1. Assessing a problem with the recognition that there is uncertainty about what policy or action is best for addressing it.
2. Designing a strategy based on a careful selection of policies and management actions.
3. Implementing a policy or action that is likely to show where additional information is needed.
4. Monitoring key indicators to get insights into responses to the policy or management action.
5. Analyzing the outcomes in relation to the original objectives to determine the effectiveness of the applied policy or action.
6. Adjusting the policy or action based on the analysis, and incorporating the new information into future decisions.

Adaptive management is necessary because there is still so much that is unknown about wildlife, their habitats, and the complex interactions of these with the surrounding world. In addition to

gaining insights into wildlife management from conservation and monitoring efforts in New Jersey, the DFW is also committed to learning from, and contributing to, work on SGCN in other states.

In the next three years, DFW staff will consult with conservation stakeholders to identify the highest priority conservation actions and projects to improve the status of SGCN in the state. Prioritization of actions and projects should highlight the 107 focal SGCN species as well as Conservation Focal Areas that are important for all SGCN. Conservation projects and jobs that result from the prioritization process will incorporate appropriate monitoring approaches that provide measures of success of steps necessary toward achieving the goal of improving species' status. Monitoring efforts should be explored that leverage the assistance of a variety of qualified conservation partners. Descriptions or graphics identifying the results-chain(s) for projects are helpful for focusing actions, monitoring, and results. Adaptive management can then be applied to ongoing management projects that continue or shift actions as necessary.

III. Coordinating State & Regional Monitoring

While it is simple to state monitoring goals, it is much more challenging to implement them. Monitoring can be extremely time and resource intensive. Further, it can be difficult to connect conservation actions to observed population conditions because so many factors and influences are continually at play in nature.

To help overcome these challenges, the Association of Fish & Wildlife Agencies in 2012 proposed a set of best management practices to help states establish monitoring programs that both met their specific goals and integrated smoothly into monitoring programs regionally. A key component of these recommendations was the use of the U.S. Fish & Wildlife Service's Tracking and Reporting on Actions for Conservation of Species (TRACS) system to allow information gathered on SGCN in New Jersey to be integrated with information gathered in other states. This collaborative approach of using the same metrics to track progress toward goals will allow managers to better target their SGCN management actions to achieve the greatest conservation benefits, both in New Jersey and throughout each species' range. We include the table of TRACS indicators in Appendix M.

CHAPTER 5: STATE WILDLIFE ACTION PLAN REVISION PROCESS

I. Future State Wildlife Action Plan Revisions

From 2018 to 2021, the DFW will continue revising the 2017 State Wildlife Action Plan to fill information gaps, provide additional clarity and guidance to plan users, and prioritize conservation efforts, as outlined below.

- **Threats & Actions for Conservation Focal Areas (CFAs):** The DFW identified CFAs that represent important habitats in each physiographic region of the state, but did not assess the threats to each specific area. With input from conservation partners, the DFW plans to develop a database of threats and conservation actions for each CFA. To a large degree, the threats already documented in the plan can be applied to the CFAs, but an assessment and prioritization of threats specific to each will provide a more complete list. Identification and prioritization of actions for CFAs would follow.
- **Actions for Focal Species of Greatest Conservation Need:** The DFW documented threats and conservation actions aimed at the 107 Focal SGCN, but the actions need to be prioritized with input from conservation partners. Prioritization will consider the immediacy of threats, likelihood of success, and feasibility (as the current action lists have done).
- **Projects:** The DFW will continue to review the *Projects to Conserve New Jersey's Wildlife Populations of Concern* report to (a) add and expand jobs to existing projects, and (b) develop new projects. New projects will be added to address threats and prescribe actions for conservation of Focal SGCN and CFAs.
- **Information Gaps:** The DFW will develop a plan for itself and conservation partners to collect information on data-deficient species, especially those that are regional conservation priorities.

A comprehensive review of the entire State Wildlife Action Plan and revisions based upon that review will be undertaken within ten years. To the extent appropriate and feasible for New Jersey's specific planning approach, this review will be conducted according to the "Best Practices for State Wildlife Action Plans – Voluntary Guidance to States for Revision and Implementation (2012)."

II. Coordination with Other Agencies

The ENSP initiated the plan revision process by coordinating with many stakeholders and interest groups. In 2013, invitations were sent to select conservation organizations and resource managers to form an Executive Committee to help steer development of the State Wildlife Action Plan. The organizations that accepted invitations were the U.S. Fish and Wildlife Service-NJ Field Office, the U.S. Department of Agriculture-Natural Resources Conservation Service, the Conserve Wildlife Foundation of New Jersey, the New Jersey Audubon Society, The Nature Conservancy, Ducks Unlimited, the National Wild Turkey Federation, Trout Unlimited, and staff from all Bureaus of the NJ Division of Fish and Wildlife.

Chapter 5: State Wildlife Action Plan Revision Process

The ENSP convened the Executive Committee on eight occasions between the fall of 2013 and the last stages of plan development during 2017. The most significant gathering was a full day meeting in which 22 attendees discussed key decision points such as the criteria used to select SGCN, the strategy and criteria used to further prioritize SGCN into Focal SGCN, and a process for delineating Conservation Focal Areas. Other meetings which preceded or followed that date were held by conference call or were web-enabled meetings.

Additional stakeholder coordination was achieved through regular meetings of the Endangered and Nongame Species Advisory Committee (ENSAC) and the Fish and Game Council. These groups are legislatively established bodies that provide advice and guidance to the DFW. The ENSAC is composed of 11 members appointed by the NJDEP Commissioner, with 4 representing academic institutions, 3 nonprofit conservation organizations, 1 public health/veterinary sciences, and 3 “public at large” members. The ENSAC serves a key role in advising the ENSP on technical and policy issues, and the State Wildlife Action Plan development process and its status was a frequent topic of meetings. The State Wildlife Action Plan was discussed during at least 15 public meetings (7/20/11, 1/16/13, 1/29/14, 6/26/14, 11/19/14, 1/21/15, 4/1/15, 5/20/15, 9/9/15, 11/18/15, 1/7/16, 3/16/16, 5/18/16, 1/18/17, 4/19/17) in which members received updates on process decisions and gave feedback. Guidance from ENSAC members helped steer the plan’s development process and was a valuable component of its revision.

The Fish and Game Council is composed of 11 members, appointed by the governor, with 3 members representing the farming or agricultural community, 6 sportsmen and sportswomen, a public member “knowledgeable in land use management and soil conservation practices,” and the Chairman of the ENSAC. The plan was discussed during at least 23 public meetings (2/11/14, 3/11/14, 4/8/14, 6/10/14, 12/16/14, 1/13/15, 2/10/15, 3/3/15, 4/14/15, 5/12/15, 6/9/15, 8/11/15, 10/13/15, 12/15/15, 1/12/16, 3/8/16, 5/10/16, 6/14/16, 7/12/16, 12/13/16, 1/10/17, 2/14/17, 4/11/17), largely to update the Council on revision progress and major decision points and to consider any feedback.

In light of ongoing interactions between shellfish aquaculture and conservation of shorebirds on Delaware Bay, a presentation on the plan and ongoing revisions was also provided to the New Jersey Aquaculture Advisory Council (AAC) at their November 4, 2016, meeting. The AAC is a legislatively established advisory body that provides input on environmentally sound expansion of New Jersey’s aquaculture industry.

Additional stakeholder input was obtained through three Action Development workshops that the DFW held in 2015 (and which are described in Chapter 3). These meetings focused on developing actions consistent with the TRACS action lexicon that would address the predominant threats that the DFW had identified. In addition to Executive Committee members, the DFW invited a wide variety of conservation stakeholders including municipal, county, state, and federal government agencies, energy companies, members of academia, nonprofits, and environmental consultants (Appendix L). To target specific interest groups and facilitate their most constructive participation, each of the three meetings were set up around a specific theme: Policy, Land Preservation and Management, and Marine. Stakeholders were encouraged to attend the meeting which best represented their interests and expertise. Combined, more than

Chapter 5: State Wildlife Action Plan Revision Process

125 attendees representing over 45 organizations participated in the workshops, resulting in the collection of valuable data on actions that were expressed as priorities to local and regional conservation interests. The DFW's subsequent analysis and categorization of the data not only helped populate the *Threats to and Conservation Actions for the Focal Species of Greatest Conservation Need* report (Appendix J), but resulted in the creation of action projects that the DFW compiled into a second report, *Projects to Conserve New Jersey's Wildlife Populations of Concern* (Appendix K).

Three American Indian tribal groups are represented on the New Jersey Department of State's Commission on American Indian Affairs:

- Ramapough Lenape Indian Nation, who owns or manages land near Mahwah, Bergen County.
- Nanticoke Lenape Tribe, who owns or manages land outside Bridgeton, Cumberland County.
- Powhatan Renape Tribe, who formally managed state-owned land at Rancocas State Park, Burlington County.

In 2011, the DFW made multiple attempts to contact representatives of these groups, requesting meetings to discuss revisions to the Plan, additional ideas regarding conservation needs, and the Plan's focus and priorities. The DFW received no replies to our solicitations and as a result, no coordination with the Native American community occurred during Plan development. During the formal public comment period in 2017-18, the DFW sent correspondence via certified mail to representatives of the Ramapough Lenape Indian Nation and the Nanticoke Lenape Tribe, who continued to own and manage land in the state, to ensure they were aware of the ability to review and provide input on the plan. The DFW received no responses to these mailings.

III. Public Input Process

A. Engaging Public Input during the Revision Process

There have been multiple opportunities for public input during the plan revision process through public comments and personal correspondence.

In early January 2015, the DFW deployed website pages that specifically detailed plan development and progress, and that provided a drop-down menu for submitting comments on each plan section or issue. These pages (<http://www.state.nj.us/dep/fgw/ensp/waphome.htm>) were available and prominently featured and labeled on both the NJDEP and the DFW home pages. In addition to being available online, each time the web pages were updated or expanded upon, notifications were sent out to members of the public who subscribed to the DFW's e-mail listserv. Because existing subscribers included various print or web media outlets, this also resulted in occasional media coverage. The DFW website provided ongoing opportunities to subscribe to the listserv, and the State Wildlife Action Plan revision page encouraged visitors to subscribe to stay abreast of the process. During the revision process, the DFW received 67 public comments via the website touching on subjects including the purpose and objectives of the plan revision, the selection of SGCN and Focal SGCN, the assessment of threats and actions,

Chapter 5: State Wildlife Action Plan Revision Process

and related general issues. Additional comments deemed unrelated to the Plan or the revision process were forwarded to applicable Bureau's within the DFW.

As was noted above in Section III, the DFW provided 15 updates on the plan revision process and progress at meetings of the Endangered and Nongame Species Advisory Committee (ENSAC) between July 2011 and April 2017 and to the Fish and Game Council 23 times between February 2014 and April 2017. The meetings of the ENSAC and the Fish and Game Council were conducted in accordance with New Jersey's Open Public Meetings Act and consequently, the DFW provided public notice of the dates, times, and agenda items for all meetings online, via the DFW listservs, and by public newspaper notification. Members of the public who attended these meetings provided input on the plan revision process and were invited to monitor the State Wildlife Action Plan website and provide comments by way of that site. The single meeting of the Aquaculture Advisory Committee that covered the plan was similarly conducted pursuant to the state's Open Public Meetings Act.

B. Public comment on the Final Revised Plan

New Jersey solicited public comments on the final version of the revised 2017 Wildlife Action Plan for 40 days, (December 11, 2017 to January 19, 2018). The public comment period was announced via a Department press release, announcement on the DFW's State Wildlife Action Plan web page, via e-mail distributions to a variety of DFW email listservers (estimated to have reached over 2,400 persons), and posting on the DFW's Facebook page. Public announcements appeared in 7 newspapers of regional or local distribution. The announcements directed members of the public to submit comments on the final Plan in much the same manner as comments were requested during plan development. The final Plan, complete with all appendices and attachments, was made available on the DFW's web site, with dedicated web pages for each chapter, appendix or attachment. Members of the public wishing to comment on any specific aspect of the Plan could access the web page dedicated to the section of their interest and utilize an electronic comment submission form to direct targeted comments to the Department for consideration. The DFW received a few additional comments via mail. Table 7 summarizes the sources of public comments received.

Table 7. Sources (as were made available) of Public Comments on the 2017 State Wildlife Action Plan.

Comments were received from a total of 44 individual residents, many of whom submitted comments more than once, as well as 19 persons representing affiliated with a total of 14 specific groups, organizations or agencies. While the goal of having public comments submitted via “topic-specific” web page submission forms was to have an immediate “categorization” of comment topics/issues, the DFW found that many of the approximately 150 submissions received included a much greater variety of issues than was the focus of the specific web page used to access the online comment submission form. For obvious reasons, the three additional public comment submissions mailed to the DFW also combined many issues into one submittal. To more efficiently characterize the public comments received and track completion of edits where warranted, the DFW often broke comment submittals apart by “issue” or topic area. As a result, more than 240 issue-oriented public comments were identified and considered with regard to the final 2017 Wildlife Action Plan. Of these comments, approximately 177 were identified as delivering relevant, primarily technical and/or editorial, comments or suggestions. After considering these comments, the DFW found that many helped to improve the Plan by identifying text that was either incorrect, unclear, or required additional information. Some of these comments recommended revisions to, or additions or deletions of threats, actions or “Projects,” or identified resources or perspectives that enhanced the DFW’s understanding or assessment of pertinent issues. These comments all resulted in valuable contributions to the final Plan. Additional comments were found to be beyond the immediate scope of Plan’s development, but will be considered as appropriate during Plan implementation. Many comments received were found not to be directly relevant to the Plan at all, but rather addressed topics related to public hunting and fishing regulations, management, or offered personal perspectives regarding the presence or availability of specific sportfish or game wildlife. Where specific and constructive, these comments have been forwarded to the appropriate DFW section for their information. Lastly, many comments received were found to be strictly editorial in nature and while they informed the DFW as to the many divergent perspectives that exist regarding wildlife and/or wildlife habitat conservation, they provided no tangible, constructive or meaningful input to the 2017 Wildlife Action Plan revision process.

While many of the public comments received were found not to warrant changes to the final version of the Plan, the DFW does feel that many warrant response. Although not required by the US Fish and Wildlife Service, the DFW intends to produce a response document that will aid public understanding of the relevant public comments received on the 2017 Wildlife Action Plan and how they were or will be addressed by DFW. Upon completion in late Spring 2018, the response document will be posted on the DFW Wildlife Action Plan webpage.

Chapter 5: State Wildlife Action Plan Revision Process

Appendix A: Criteria for Selecting Species of Greatest Conservation Need

Criteria for Selecting Species of Greatest Conservation Need

State Wildlife Action Plans are focused on the conservation of species and habitats in an effort to prevent them from becoming more rare and costly to protect or restore. As such, each state is required to identify the species of greatest conservation need (SGCN) and their habitats within the state that require conservation efforts to ensure their future.

Species of Greatest Conservation Need (SGCN) are those species that through a combination of low and/or declining populations or vulnerability to threats, particularly anthropogenic threats, are considered to be at risk of becoming extinct, extirpated, endangered, or threatened. SGCN in New Jersey span taxonomic groups including birds, marine and terrestrial mammals, reptiles, amphibians, fish and several invertebrate groups. To provide a transparent and clearly defined mechanism for identifying SGCN in New Jersey, the Division of Fish and Wildlife (DFW) decided to use the efforts of agencies and organizations who classify species' relative risk of imperilment. Below we provide references the DFW has used for each taxonomic group and the categories within those references that we believe warrant a species to be considered an SGCN in New Jersey if the species meets one or more of the criteria. In addition to these references and criteria, we have also made use of published evaluations that have been performed for specific taxonomic groups. The tables below contain the references/sources, criteria, and justifications for each taxonomic group.

Table 1. Criteria that applies to all taxonomic groups for selecting SGCN.

Species suite	Source	Rank	Justification
All taxonomic groups	US Fish and Wildlife Service (USFWS)	Endangered	USFWS implements a rulemaking/regulatory procedure to assess a species' population status including those meeting the definition of Endangered or Threatened and soliciting biological information regarding Candidate species that will contribute to their status review. Endangered and Threatened species have been included as they have been found to be "in danger of extinction throughout all or a significant portion of its range or are likely to become endangered within the foreseeable future throughout all or a significant portion of its range."
		Threatened	
		Candidate Species	<p>"Candidate species are plants and animals for which the U.S. Fish and Wildlife Service (FWS) has sufficient information on their biological status and threats to propose them as endangered or threatened under the Endangered Species Act (ESA), but for which development of a proposed listing regulation is precluded by other higher priority listing activities. The National Marine Fisheries Service (NMFS), which has jurisdiction over most marine species, also maintains a list of 'species of concern' for which more information is needed before they can be proposed for listing" (FWS, 2011) Additional information regarding candidate species can be found at the following websites:</p> <p>USFWS jurisdiction: http://ecos.fws.gov/tess_public/pub/candidateSpecies.jsp NMFS (NOAA) jurisdiction: http://www.nmfs.noaa.gov/pr/species/esa/candidate.htm</p>

(Table 1 continued)

Species suite	Source	Rank	Justification
All taxonomic groups	NJ Division of Fish and Wildlife	Endangered (with NatureServe Conservation Status S1)	New Jersey has adapted and implements the Delphi Status Review (or Delphi Technique) to determine the relative endangerment or stability of a species' population. A systematic method for reaching consensus among experts, the Delphi Technique is an iterative process characterized by anonymity among the participating experts and controlled feedback via the principal investigator. The results of this status assessment are used to assign the legal status of species in the state. Endangered (E), Threatened (T) and Special Concern (SC) species are included as they represent those species that warrant special attention due to their limited population and success as a result of numerous threats contributing to their continued decline. (NatureServe species' ranks S1 (critically imperiled), S2 (imperiled), or S3 (vulnerable) align with New Jersey's endangered, threatened and special concern status, respectively, except for those that have not been reviewed using the Delphi Technique.)
		Threatened (with NatureServe Conservation Status S2)	
		Special Concern (with NatureServe Conservation Status S3)	
		Candidate Species	
	NatureServe	Conservation Status G1, Critically Imperiled	NatureServe assigns global and regional (i.e., national/subnational) species' ranks by "researching and recording information on a set of conservation status factors. The protocol for assigning a conservation status rank is based on scoring an element against ten conservation status factors, which are grouped into three categories based on the characteristic of the factor*: rarity (six factors), trends (two factors), and threats (two factors). G3 is the lowest global rank contributing to NJ's SGCN list. These include species that are at a "moderate risk of extinction or elimination due to a fairly restricted range, relatively few populations or occurrences, recent and widespread declines, threats, or other factors." N3 is the lowest regional (i.e., national/subnational) rank contributing to NJ's SGCN list. Similar to G3 but more localized, these include species that are at a "moderate risk of extirpation in the jurisdiction due to a fairly restricted range, relatively few populations or occurrences, recent and widespread declines, threats, or other factors."
		Conservation Status G2, Imperiled	
		Conservation Status G3, Vulnerable	
		National Conservation Status Rank (N1), Critically Imperiled	
		National Conservation Status Rank (N2), Imperiled	
		National Conservation Status Rank (N3), Vulnerable	

(Table 1 continued)

Species suite	Source	Rank	Justification
All taxonomic groups	IUCN Red List	Critically Endangered	<p>The IUCN Red List is a “system for classifying species at high risk of global extinction.” The process for qualifying species is extensive.** Taxon valued as <i>Critically Endangered</i>, <i>Endangered</i> and <i>Vulnerable</i> have been assessed based on the reduction of the population’s size, the geographic range of the species and the probability of extinction based on quantitative analysis.</p> <p>A taxon is <i>Near Threatened</i> when it has been “evaluated against the criteria but does not qualify for Critically Endangered, Endangered or Vulnerable now, but is close to qualifying for or is likely to qualify for a threatened category in the near future.” (IUCN website, 01/23/13) As such, NJ has included these species as SGCN.</p>
		Endangered	
		Vulnerable	
		Near Threatened

Table 2. Additional species information that was used to develop criteria for the selection of SGCN mammals.

Species suite	Source	Rank	Justification
Terrestrial	In surrounding states (PA ¹ , NY ² , DE ³ , MD ⁴ and CT) ⁵	Endangered, Threatened or Special Concern	The listing process in each surrounding state varies, but in each state a committee of experts is assembled to evaluate extinction risk of each species. There are no regional priority lists for terrestrial species so the status of species in surrounding states is being used as a surrogate for that information to incorporate species of conservation concern in the region.
	In surrounding states (PA, NY, DE, MD and CT)	NatureServe rank S1-S3	Includes species ranked as S1 (critically imperiled), S2 (imperiled), or S3 (vulnerable) in states surrounding NJ. These state ranks are determined by each state using methods developed by NatureServe*, and are based on the best available information and consider a variety of factors such as species abundance, distribution, population trends and threats. NatureServe state rank procedures often have different criteria, evidence requirements, purposes and taxonomic coverage than state lists of endangered and threatened species. There are no regional priority lists for terrestrial mammal species so the status of species in surrounding states is being used as a surrogate for that information to identify species of conservation concern in the region.
Marine	NOAA Fisheries	Candidate species for NJ waters	NOAA is the federal authority with jurisdiction over marine mammals. Candidate species are those petitioned species that are actively being considered for E or T status, as well as those for which NMFS has initiated an ESA status review. Proposed species are candidate species that were found to warrant listing as either T or E and were proposed as such in the Federal Register after completion of a status review. Species of Concern are those about which NMFS has some concern regarding status and threat, but for which insufficient information is available under the ESA.
		Proposed species for NJ waters	
		Species of Concern for NJ waters

Table 3. Additional species information that was used to develop criteria for the selection of SGCN birds.

Species suite	Source	Rank	Justification
All birds	Listed by USFWS in the most recent Birds of Conservation Concern for Bird Conservation Region (BCR) 28, 29, or 30*	All birds on list who winter, breed, and/or migrate through NJ	The USFWS maintains the Birds of Conservation Concern list of non-hunted birds in the US to represent their highest conservation priorities. This list is separated by BCR and season (breeding and non-breeding). Therefore, any species of bird designated as conservation concern in the BCRs that occurs in NJ (28, 29, 30) is included as long as the species occurs in NJ during the season it is designated as conservation concern.
	South Atlantic Migratory Bird Implementation Plan (2006)	High (rank)	Species meeting these criteria are continental or regional concern in need of management attention, not just monitoring, in the regional and/or national plans for each bird species group. While the focus of this plan is south of NJ, it prioritizes many species that occur in NJ as being important in coastal areas for breeding, wintering, and/or migration.
		Highest (rank)	
	BCR 30* All-bird Plan (2007)	High (rank)	Species meeting these criteria are ranked high for continental concern, BCR concern, and/or BCR responsibility. The ranking is based upon decision-rules and BCR-specific information provided in the continental and regional plans produced by the bird initiatives, State Wildlife Action Plans, results from previous workshops held by bird conservation initiatives, and results from the December 2004 BCR 30 All-bird Workshop.
		Highest (rank)	
	All birds	[Most recent draft of the] BCR29* all-bird species list	Species meeting these criteria are continental concern, BCR concern, and/or BCR responsibility. This ranking is based upon species requiring serious and/or immediate attention.
		[Most recent draft of the] BCR28* all-bird species list	Species meeting these criteria require serious and/or immediate attention for either breeding or non-breeding populations. Ranking is based upon a summary of international, national, and regional plans, a conglomeration of listing in SWAPs in the AMJV region, and recommendations from the BCR 28 technical committee.

* More information about Bird Conservation Regions can be found at <http://nabci-us.org/resources/bird-conservation-regions/>

(Table 3 continued)

Species suite	Source	Rank	Justification
Landbirds	Most recent Partners in Flight breeding and/or non-breeding scores for BCRs 28, 29, or 30*	Regional concern status	Species meeting these criteria are designated as regional concern and included because of high population threats. Species ranked solely because of high relative density were removed from the list.
	Continental Watch List, Eastern Biome Watch List, or Northern Forest Biome Watch List (non-breeding status only) per the Partners in Flight National Landbird Conservation Plan (2004)	All birds on list who winter, breed, and/or migrate through NJ	Species meeting these criteria are on the Watch List and rank high because of high population threats, restricted distributions, and/or declining population trends. Northern Forest Biome was used to include SGCN species that migrate through or winter in NJ.
Shorebirds	Most recent scores/draft of the US Shorebird Conservation Plan	High Concern	Species meeting these criteria are ranked listed nationally as endangered or threatened and/or have known population declines and either low populations or one other threat or high risk factor.
		Highly Imperiled	
	Most recent scores/draft of the North Atlantic Shorebird Conservation Plan	High Concern	Species meeting these criteria have known population declines and either low populations or one other threat or high risk factor.
		Highly Imperiled	
Waterbirds	North American Waterbird Conservation Plan (2001)	Moderate Concern	Species meeting these criteria have, at the very least, declining populations and moderate threats or distributions, or stable populations with known threats or restricted distributions.
		High Concern	
		Highly Imperiled	

(Table 3 continued)

Species suite	Source	Rank	Justification
Waterbirds	BCR 28* Waterbird Conservation Plan (2005)	Moderate Concern	Species meeting these criteria have, at the very least, declining populations and moderate threats or distributions, or stable populations with known threats or restricted distributions.
		High Concern	
		Highly Imperiled	
	Southeast BCR 28 and 29* Waterbird Conservation Plan (2006)	Tier I species	Using Partners in Flight scoring criteria, this list includes all species meeting both continental and regional concern criteria, regional concern criteria only, or continental concern only.
Waterfowl	North American Waterfowl Management Plan (2004)	Moderate High	Species meeting these criteria have decreasing or unknown population trends (ducks) or unknown or below population size objectives (geese and swans). Those species ranked in these categories because of other reasons (harvest importance or negative impacts on other species) were removed so that only species of greatest conservation need are reflected.
		High	
		Highest	
	Atlantic Coast Joint Venture waterfowl Implementation Plan (2005)	Moderate High	Species meeting these criteria have decreasing or unknown population trends (ducks) or unknown or below population size objectives (geese and swans). Species ranked in these categories because of other reasons (harvest importance or negative impacts on other species) were removed from the list.
		High	
		Highest	

* More information about Bird Conservation Regions can be found at <http://nabci-us.org/resources/bird-conservation-regions/>

Table 4. Additional species information that was used to develop criteria for the selection of SGCN reptiles and amphibians.

Species suite	Source	Rank	Justification
Terrestrial and freshwater reptiles and amphibians	Northeast Amphibian and Reptile Species of Regional responsibility and Conservation Concern (ranked within both categories of Regional Responsibility [Northeast comprises <50% of US distribution and Northeast comprises >50% of US/Canada Distribution (includes 'close')])	Moderate Concern	Species meeting these criteria have been ranked based on an assessment of the frequency with which the species were identified within the Northeastern States' Wildlife Action Plans as "Species of Greatest Conservation Need" and the percentage of the species' range within the Northeast. However, Species of Moderate Concern and more severe were included regardless of the percentage of the species' ranges within the northeast region, i.e., <50% or >50% in order to capture several species at the limits of their range that occur in unique ecosystems.
		High Concern	
		Severe Concern	
	Turtles in Trouble: The World's 25+ Most Endangered Tortoises and Freshwater Turtles – 2011	Any species of freshwater turtle that occurs in New Jersey that is identified on this list	This list is a result of a compilation and review of multiple sources including the previous Top 25 lists from Turtle Conservation Fund (TCF, 2003) and Tortoise and Freshwater Turtle Specialist Group (TFTSG, 2007), a synthesis of all the 2007 regional lists, review and recommendations based on extinction risk by/from the membership of the TFTSG, a final review by the 30-member Steering Committee of the TFTSG, and a discussion to finalize the list at a joint leadership meeting of the principals of the Turtle Conservation Coalition.
Terrestrial and freshwater reptiles and amphibians	Vulnerability of At-risk Species to Climate Change in New York	Species considered Moderately Vulnerable	Species meeting these criteria have been ranked based on the document, <i>Vulnerability of At-risk Species to Climate Change in NY</i> , which relies heavily on NatureServe's Climate Change Vulnerability Index (CCVI) tool. The Moderately Vulnerable species designation was used as our lowest selection criteria as NatureServe identifies many reptiles and amphibians as species whose abundance or range is likely to decrease by 2050. In this timeframe, threats such as emerging diseases are also expected to increase the vulnerability of this group. The document identifies the limitations to the CCVI, which does not assign value to a number of other primary and secondary threats to wildlife.
		Species considered Highly Vulnerable	
		Species considered Extremely Vulnerable	

(Table 4 continued)

Species suite	Source	Rank	Justification
Marine reptiles	NOAA Fisheries	Candidate species for NJ waters	NOAA and FWS share jurisdiction over marine turtles, with NOAA having authority when turtles are in the water. Candidate Species are those petitioned species that are actively being considered for listing as E or T, as well as those for which NMFS has initiated an ESA status review. Proposed species are those candidate species that were found to warrant listing as either T or E and were proposed as such in the Federal Register after completion of a status reviews. Species of Concern are those about which NOAA's NMFS has some concern regarding status and threat, but for which insufficient information is available under the ESA.
		Proposed species for NJ waters	
		Species of Concern for NJ waters	

Table 5. Additional species information that was used to develop criteria for the selection of SGCN fish.

Species suite	Source	Rank	Justification
Freshwater	American Fisheries Society publication, "Conservation Status of Imperiled North American Freshwater and Diadromous Fishes" and associated rankings, dated August 2008	Endangered for NJ waters	The AFS-Endangered Species Committee used existing lists to develop a draft of the present list. AFSESC then added taxa meriting consideration and provided rationale for inclusion. Each taxon was assigned current status, listing criteria, and native ecoregion distribution. Endangered species includes taxon that is in imminent danger of extinction throughout all or extirpation from a significant portion of its range. Threatened species includes taxon that is in imminent danger of becoming endangered throughout all or a significant portion of its range. Vulnerable species includes taxon that is in imminent danger of becoming threatened throughout its range (Jelks et al. 2008).
		Threatened for NJ waters	
		Vulnerable for NJ waters	
	US Fish and Wildlife Service	Species petitioned to be listed	USFWS is the federal authority for status designation and listing of freshwater fishes. Species petitioned to be listed under the ESA undergo a 90-day process to determine whether there is enough evidence to move forward with a status review.

(Table 5 continued)

Species suite	Source	Rank	Justification
Marine	American Fisheries Society publication, “Marine, Estuarine, and Diadromous Fish Stocks at Risk of Extinction in North America (Exclusive of Pacific Salmonids)”, dated November 2000	Endangered for NJ waters	AFS recognizes the following categories of risk per Musick et al. (2011): <i>endangered</i> , high risk of extinction in the wild in the immediate future (years); <i>threatened</i> , not <i>endangered</i> but facing risk of extinction in the near future (decades); <i>vulnerable</i> , not <i>endangered</i> or <i>threatened</i> severely but at possible risk of falling into one of these categories in the near future.
		Threatened for NJ waters	
		Vulnerable for NJ waters	
	NOAA Fisheries	Candidate species for NJ waters	NOAA Fisheries/ is the federal authority for determining status and listing of marine fishes. Candidate Species are those petitioned species that are actively being considered for listing as E or T, as well as those species for which NMFS has initiated an ESA status review. Proposed species are those candidate species that were found to warrant listing as either T or E and were officially proposed as such in the Federal Register after completion of a status review. Species of Concern are those about which NOAA’s NMFS has some concern regarding status and threat, but for which insufficient information is available under the ESA.
		Proposed species for NJ waters	
		Species of Concern for NJ waters	
Marine	NOAA Fisheries	Atlantic Highly Migratory Species (HMS)	NOAA Fisheries manages a number of fish species in U.S. Atlantic and Gulf of Mexico waters known as highly migratory species (HMS). These fish—tuna, sharks, swordfish, and billfish—often migrate long distances, crossing domestic and international boundaries. NOAA Fisheries is responsible for managing HMS under the Magnuson-Stevens Fishery Conservation and Management Act. In cooperation with an advisory panel, NOAA’s HMS Management Division develops and implements fishery management plans for these species taking into account all domestic and international requirements under the Atlantic Tunas Convention Act, Marine Mammal Protection Act, the Endangered Species Act, and the Migratory Bird Treaty Act.
	Atlantic States Marine Fisheries Commission	Commercially/Recreationally Important Species	The Atlantic States Marine Fisheries Commission, together with state fisheries managers, develops fisheries management plans (FMPs) for species of value to the commercial and recreational fishing industries. FMPs regulate fishing practices through measures designed to ensure sustainable fish populations well into the future.

Table 6. Additional species information that was used to develop criteria for the selection of SGCN macroinvertebrates.

Species suite	Source	Rank	Justification
Bees/Ants (Hymenoptera)	Xerces Society Red List	PE (possibly extinct)	The list was created by a panel of experts in the field of invertebrate conservation and coordinated by the Xerces Society and the American Museum of Natural History. The list was created with data from NatureServe and various museum and research collections and papers. Members of the panel ranked species based on the level of threats facing them or amount of population decline they have suffered. Species deemed to be of conservation concern but lacking sufficient data for a ranking were listed as DD (data deficient and in need of further research).
		CI (critically imperiled)	
		I (Imperiled)	
		V (vulnerable)

Butterflies/ Lepidoptera	Schweitzer, D. F., M. C. Minno, and D. L. Wagner. 2011. Rare, Declining, and Poorly Known Butterflies and Moths (Lepidoptera) of Forests and Woodlands in the Eastern United States. U.S. Forest Service, Forest Health Technology Enterprise Team, FHTET-2011-01.	All species included in the report and documented in NJ.	This publication was a report created by a panel of Lepidoptera experts. It analyzed all available regional Lepidoptera data from NatureServe, State databases, and Lepidoptera research projects in order to generate a list and report on the species of greatest conservation need.
	Xerces Society Red List	PE (possibly extinct)	The list was created by a panel of experts in the field of invertebrate conservation and coordinated by the Xerces Society and the American Museum of Natural History. The list was created with data from NatureServe and various museum and research collections and papers. Members of the panel ranked species based on the level of threats facing them or amount of population decline they have suffered. Species deemed to be of conservation concern but lacking sufficient data for a ranking were listed as DD (data deficient and in need of further research).

Species suite	Source	Rank	Justification
Crayfish	American Fisheries Society publication, "Conservation Status of Crayfish Species" and associated rankings, dated August 2007	Endangered	The AFS-Endangered Species Committee lists crayfish based on a comprehensive review of US/Canadian status. Definitions are as follows: Endangered (E) species are those species or subspecies in danger of extinction throughout all or significant portion of range. Threatened (T) species are those species or subspecies likely to become endangered throughout all or a significant portion of the range. Vulnerable species include species or subspecies that may become E or T by minor disturbances to its habitat and deserves careful monitoring of abundance and distribution.
		Threatened	
		Vulnerable	
Dragonflies and Damselflies/Odonata	Xerces Society Red List	PE (possibly extinct)	The list was created by a panel of experts in the field of invertebrate conservation and coordinated by the Xerces Society and the American Museum of Natural History. The list was created with data from NatureServe and various museum and research collections and papers. Members of the panel ranked species based on the level of threats facing them or amount of decline they have suffered. Species deemed to be of conservation concern but lacking sufficient data for a ranking were listed as DD (data deficient and in need of further research).

	Northeastern Regional Odonata Status Assessment	All species found to be of regional conservation concern.	This list is being generated by a panel of experts from the Northeastern United States. Data from NatureServe and individual State databases will be analyzed to generate a list of species of regional conservation concern based on threats and population decline.
Freshwater Mussels	US Fish and Wildlife Service	Species petitioned to be listed	FWS is federal authority for status determination and listing of freshwater mussels; species petitioned to be listed under the ESA undergo a 90-day process to determine whether there is enough evidence to move forward with a status review.
Other Mollusks & Crustaceans (fairy shrimp, clam-shrimp)	US Fish and Wildlife Service	Species petitioned to be listed	FWS is federal authority for status determination and listing of freshwater invertebrates. Species petitioned to be listed under the ESA undergo a 90-day process to determine whether there is enough evidence to move forward with a status review.

Table 7. Criteria that dictate if wildlife species are in need of further investigation. They are considered SGCN based on the DFW assessment as being “data deficient.”

Species suite	Source	Rank	Justification
All taxonomic groups	NJ Division of Fish and Wildlife	State Status of Undetermined/Unknown per Delphi process	New Jersey has adapted and implements the Delphi Status Review (or Delphi Technique) to determine the relative endangerment or stability of a species' population. A systematic method for reaching consensus among experts, the Delphi process is an iterative process characterized by anonymity among the participating experts and controlled feedback via the principal investigator. The results of this status assessment are used to assign the legal status of species in the state. <i>Unknown (U)</i> species are those for which it is impossible to assign E, T, or SC because enough information on which to base a judgment simply does not exist.

Appendix B: New Jersey's Species of Greatest Conservation Need and the Selection Criteria Each Fulfilled

New Jersey's Species of Greatest Conservation Need and the Selection Criteria Each Fulfilled

The following table lists New Jersey's 656 Species of Greatest Conservation Need (SGCN), as updated for the State Wildlife Action Plan. All of the state's indigenous wildlife species were evaluated using the best available assessments of conservation status and trends. Each species met at least one of the chosen assessment criteria described in Appendix A, *Criteria for Selecting Species of Greatest Conservation Need*, in order to be included on the SGCN list. The criteria category (or categories) met by each SGCN are indicated below. Species that further advanced to Priority SGCN or Focal Species status are indicated in the far right columns.

Sparkling Jewelwing	<i>Calopteryx dimidiata</i>							X			
Spatterdock Darner	<i>Rhionaeschna mutata</i>		X					X			
Spine-crowned Clubtail	<i>Gomphus abbreviatus</i>			X	X			X		X	
Subarctic Darner	<i>Aeshna subarctica</i>		X		X			X			
Superb Jewelwing	<i>Calopteryx amata</i>		X					X		X	X
Taper-tailed Darner	<i>Gomphaeschna antilope</i>							X			
Tiger Spiketail	<i>Cordulegaster erronea</i>		X					X			
Uhler's Sundragon	<i>Helocordulia uhleri</i>							X			
Umber Shadowdragon	<i>Neurocordulia obsoleta</i>							X		X	
Williamson's Emerald	<i>Somatochlora williamsoni</i>		X					X			
Zebra Clubtail	<i>Stylurus scudderii</i>		X		X			X			
Tiger Beetles											
American Burying Beetle	<i>Nicrophorus americanus</i>	X	X	X	X	X		X		X	
Appalachian Tiger Beetle	<i>Cicindela ancocisconensis</i>			X	X		X	X		X	
Beach-dune Tiger Beetle	<i>Cicindela hirticollis</i>							X			
Cobblestone Tiger Beetle	<i>Cicindela marginipennis</i>			X	X	X	X	X		X	
Common Claybank Tiger Beetle	<i>Cicindela limbalis</i>							X		X	
Little White Tiger Beetle	<i>Cicindela lepida</i>			X	X		X	X		X	X
Margined Tiger Beetle	<i>Cicindela marginata</i>							X			
New Jersey Pine Barrens Tiger Beetle	<i>Cicindela patruela consentanea</i>			X	X		X	X		X	X
Northeastern Beach Tiger Beetle	<i>Cicindela dorsalis dorsalis</i>	X	X	X	X		X	X		X	X
Southeastern Beach Tiger Beetle	<i>Cicindela dorsalis media</i>				X		X	X		X	X
Unnamed tiger beetle	<i>Cicindela patruela</i>				X		X	X		X	

¹ Species was added to the SGCN list due to an official status change in the time since the original list was drafted in February 2015. Species did not advance beyond the SGCN list; thus their addition did not affect the Focal Species selection process.

² Data are under development by Rutgers University.

Appendix C: Species of Greatest Conservation Need, their Distribution within New Jersey, and Habitat Associations

Species of Greatest Conservation Need, their Distribution within New Jersey, and Habitat Associations

The following table lists New Jersey's 656 Species of Greatest Conservation Need (SGCN), the Landscape regions in which they occur, and the general habitat types with which each species is associated.

Species of Greatest Conservation Need		Landscape Region						Habitat Association										
Common Name	Scientific Name	Atlantic Coast	Delaware Bay	Piedmont Inner Coastal Plain	Pinelands	Skylands	Marine	Forest	Grassland	Shrub	Wetlands	Beach and Dune	Barren and Exposed Rock	Tidal Mudflat	Coldwater Stream	Warmwater Stream	Marine Near Shore Zone	Marine Off Shore Zone
Mammals																		
Marine Mammals																		
Bottlenose Dolphin	<i>Tursiops truncatus</i>	X					X										X	X
Fin Whale	<i>Balaenoptera physalus</i>						X										X	X
Gray Seal	<i>Halichoerus grypus</i>	X					X					X	X	X			X	X
Harbor Porpoise	<i>Phocoena phocoena</i>	X					X										X	X
Hooded Seal	<i>Cystophora cristata</i>	X					X					X	X	X			X	X
Humpback Whale	<i>Megaptera novaeangliae</i>						X										X	X
North Atlantic Right Whale	<i>Eubalaena glacialis</i>						X										X	X
Short-beaked Common Dolphin	<i>Delphinus delphis</i>						X											X
Short-finned Pilot Whale	<i>Globicephala macrorhynchus</i>						X											X
Striped Dolphin	<i>Stenella coeruleoalba</i>						X											X
Terrestrial Mammals																		
Allegheny Woodrat	<i>Neotoma magister</i>			X				X							X			
American Pygmy Shrew	<i>Sorex hoyi</i>					X		X			X							
Big Brown Bat	<i>Eptesicus fuscus</i>	X	X	X	X	X		X										
Bobcat	<i>Lynx rufus</i>					X		X		X	X							
Eastern Small-footed Myotis	<i>Myotis leibii</i>			X		X		X					X					
Fisher	<i>Martes pennanti</i>			X		X		X										
Hairy-tailed Mole	<i>Parascalops breweri</i>			X		X		X	X	X								
Hoary Bat	<i>Lasiurus cinereus</i>	X	X	X	X	X		X										
Indiana Bat	<i>Myotis sodalis</i>			X		X		X			X						X	X
Least Shrew	<i>Cryptotis parva</i>	X	X	X	X	X			X	X	X							
Little Brown Bat	<i>Myotis lucifugus</i>	X	X	X	X	X		X										
Long-tailed Shrew	<i>Sorex dispar</i>					X		X					X					
Marsh Rice Rat	<i>Oryzomys palustris</i>	X	X	X							X							
Meadow Jumping Mouse	<i>Zapus hudsonius</i>	X	X	X	X	X			X	X	X							
Northern Flying Squirrel	<i>Glaucomys sabrinus</i>					X		X										
Northern Myotis	<i>Myotis septentrionalis</i>	X	X	X	X	X		X			X							
Red Bat	<i>Lasiurus borealis</i>	X	X	X	X	X		X										
Silver-haired Bat	<i>Lasionycteris noctivagans</i>	X	X	X	X	X		X										
Smokey Shrew	<i>Sorex fumeus</i>			X		X		X										
Southern Bog Lemming	<i>Synaptomys cooperi</i>	X	X	X	X	X			X		X							
Star-nosed Mole	<i>Condylura cristata</i>	X	X	X	X	X					X							
Tricolored Bat	<i>Perimyotis subflavus</i>	X	X	X	X	X		X										
Tuckahoe Masked Shrew	<i>Sorex cinereus nigriculus</i>		X								X							
Water Shrew	<i>Sorex palustris</i>					X		X										
Woodland Jumping Mouse	<i>Napaeozapus insignis</i>			X		X		X										
Birds																		
Acadian Flycatcher	<i>Empidonax virescens</i>		X	X	X	X		X										
American Bittern	<i>Botaurus lentiginosus</i>	X	X	X	X	X					X							
American Black Duck	<i>Anas rubripes</i>	X	X	X	X	X		X			X				X	X		
American Coot	<i>Fulica americana</i>	X	X	X	X	X					X				X	X		
American Golden Plover	<i>Pluvialis dominica</i>	X	X	X				X		X	X		X					
American Kestrel	<i>Falco sparverius</i>		X	X	X	X			X									
American Oystercatcher	<i>Haematopus palliatus</i>	X	X	X							X	X		X				
American Woodcock	<i>Scolopax minor</i>	X	X	X	X	X		X		X	X							
Atlantic Brant	<i>Branta bernicla hrota</i>	X	X	X	X	X	X				X				X	X	X

Audubon's Shearwater	<i>Puffinus iherminieri</i>						X										X	X
Bald Eagle	<i>Haliaeetus leucocephalus</i>	X	X	X	X	X		X			X							
Baltimore Oriole	<i>Icterus galbula</i>	X	X	X	X	X		X										
Bank Swallow	<i>Riparia riparia</i>	X	X	X	X	X							X					
Barn Owl	<i>Tyto alba</i>	X	X	X		X			X		X							
Barred Owl	<i>Strix varia</i>		X	X	X	X		X			X							
Bay-breasted Warbler	<i>Dendroica castanea</i>	X	X	X	X	X		X		X								
Belted Kingfisher	<i>Megaceryle alcyon</i>	X	X	X	X	X					X				X	X		
Bicknell's Thrush	<i>Catharus bicknelli</i>	X	X	X	X	X		X		X								
Black Rail	<i>Laterallus jamaicensis</i>	X	X								X							
Black Scoter	<i>Melanitta nigra</i>	X	X	X	X	X	X				X				X	X	X	X
Black Skimmer	<i>Rynchops niger</i>	X	X	X			X				X	X					X	X
Black Tern	<i>Chlidonias niger</i>	X	X				X				X	X		X			X	X
Black-and-white Warbler	<i>Mniotilta varia</i>	X	X	X	X	X		X		X								
Black-bellied Plover	<i>Pluvialis squatarola</i>	X	X					X		X	X		X					
Black-billed Cuckoo	<i>Coccyzus erythrophthalmus</i>	X	X	X	X	X		X		X								
Blackburnian Warbler	<i>Dendroica fusca</i>					X		X										
Black-crowned Night-heron	<i>Nycticorax nycticorax</i>	X	X	X	X	X		X		X	X			X	X	X		
Black-throated Blue Warbler	<i>Dendroica caerulescens</i>					X		X										
Black-throated Green Warbler	<i>Dendroica virens</i>				X	X		X										
Blue-headed (Solitary) Vireo	<i>Vireo solitarius</i>			X		X		X										
Blue-winged Warbler	<i>Vermivora pinus</i>	X	X	X	X	X		X	X	X								
Bobolink	<i>Dolichonyx oryzivorus</i>		X	X	X	X			X									
Bridled tern	<i>Onychoprion anaethetus</i>	X					X										X	X
Broad-winged Hawk	<i>Buteo platypterus</i>		X	X	X	X		X										
Brown Thrasher	<i>Toxostoma rufum</i>	X	X	X	X	X		X		X								
Bufflehead	<i>Bucephala albeola</i>	X	X	X	X	X	X				X				X	X	X	X
Canada Goose	<i>Branta canadensis</i>	X	X	X	X	X	X		X		X				X	X	X	X
Canada Warbler	<i>Wilsonia canadensis</i>			X		X		X		X								
Canvasback	<i>Aythya valisineria</i>	X	X	X	X	X					X				X	X		
Cape May Warbler	<i>Dendroica tigrina</i>	X	X	X	X	X		X		X								
Caspian Tern	<i>Hydroprogne caspia</i>	X	X				X				X	X		X			X	
Cattle Egret	<i>Bubulcus ibis</i>	X	X	X					X	X	X							
Cerulean Warbler	<i>Dendroica cerulea</i>			X	X	X		X		X								
Chimney Swift	<i>Chaetura pelagica</i>	X	X	X	X	X		X										
Chuck-will's-widow	<i>Caprimulgus carolinensis</i>	X	X					X										
Clapper Rail	<i>Rallus longirostris</i>	X	X	X							X							
Cliff Swallow	<i>Petrochelidon pyrrhonota</i>	X		X		X			X		X							
Common Eider	<i>Somateria mollissima</i>	X	X				X				X						X	
Common Gallinule	<i>Gallinula galeata</i>	X	X	X		X					X				X	X		
Common Loon	<i>Gavia immer</i>						X										X	X
Common Nighthawk	<i>Chordeiles minor</i>	X	X	X	X	X		X					X					
Common Tern	<i>Sterna hirundo</i>	X	X	X			X				X	X					X	
Cooper's Hawk	<i>Accipiter cooperii</i>		X	X	X	X		X										
Dickcissel	<i>Spiza americana</i>		X	X					X									
Dunlin	<i>Calidris alpina</i>	X	X							X	X		X					
Eastern Kingbird	<i>Tyrannus tyrannus</i>	X	X	X	X	X		X	X	X								
Eastern Meadowlark	<i>Sturnella magna</i>		X	X	X	X			X									
Eastern Towhee	<i>Pipilo erythrophthalmus</i>	X	X	X	X	X		X	X	X								
Eastern Wood-pewee	<i>Contopus virens</i>	X	X	X	X	X		X										
Field Sparrow	<i>Spizella pusilla</i>	X	X	X	X	X			X	X

Introduction

New Jersey's State Wildlife Action Plan (SWAP) includes 656 species of greatest conservation need (SGCN). Recognizing that this list was too large for an effective plan with achievable goals, the SWAP executive committee (a group consisting primarily of conservation partners) and the state Division of Fish & Wildlife (DFW) identified a subset of these species called Focal SGCN. The 107 Focal SGCN are state and regional priorities and represent broad taxonomic groups, habitat types, and landscapes across New Jersey. There is also capacity in the state to positively affect their long-term persistence. Focal SGCN were selected through an assessment process that considered state and regional imperilment, the importance of New Jersey populations to each species' range-wide viability, and the feasibility that conservation actions would benefit the species. The process of filtering the full SGCN list to the 107 Focal SGCN is described more fully in Chapter 1 of this State Wildlife Action Plan.

Concentrating on Focal SGCN will help focus planning and conservation efforts to achieve results for the Focal SGCN **and** for the many other SGCN not formally addressed within the plan. This approach is not meant to suggest or imply that the state's conservation interests are limited to the 107 Focal SGCN.

Recognizing that synergies exist between species with overlapping habitats, the 107 Focal SGCN were grouped by the expert taxonomic teams into guilds that reflected similarities in the species' taxonomies, ecological requirements, threats, and actions needed to conserve them. This assessment categorized 77 of the species into 18 groupings, while the remaining 30 species remained ungrouped.

Understanding the Focal SGCN Profiles

The following pages include summary profiles of each Focal SGCN. These profiles include:

- General information on appearance, life history requirements, and geographic distribution within New Jersey.
- State Wildlife Action Plan categorization of taxonomic and guild type, and conservation targets.
- Conservation status at the federal, regional, and state levels (including breeding versus nonbreeding for birds), and their ranks within the NatureServe international database.
- Status of the species' population abundance and trend.
- Broad habitat categories (descriptions of these are provided in Chapter 1 of this plan).
- Landscape Region(s) where the species occurs in New Jersey.
- A statement indicating whether species habitat mapping is available through the New Jersey Landscape Project maps (details on the Landscape Project map are provided in Attachment II).
- References to additional information on abundance and population trends, as well as other conservation plans that might be available.

Mammals

Allegheny Woodrat

Neotoma magister

The Allegheny Woodrat is a medium-size rodent that superficially resembles the introduced Norway Rat, although the woodrat has a bicolor, furred tail, larger ears, eyes, and head, and longer whiskers. They typically occur in rocky areas associated with mountain ridges such as cliffs, caves, talus slopes and rocky fissures and the presence of mast-producing trees nearby are important. Allegheny Woodrat populations were once present from Connecticut, west to Indiana, and south to Alabama, but they have been experiencing significant declines in the past 30 years. They are now extirpated from Connecticut and New York and since 1984 New Jersey has had just one population remaining. The population decline is likely the result of a variety of interacting factors: chestnut blight, gypsy moth infestations, raccoon roundworm, and land cover change.

Indiana Bat

Myotis sodalis

The Indiana Bat is one of four NJ bat species belonging to the *Myotis* genus. It is about 3.5 inches in body length with a 10 inch wingspan and is distinguished by its grayish lackluster fur, short, sparse toe hairs, and other subtle physical traits. In summer, Indiana Bats inhabit forests - particularly wooded wetlands and riparian areas - where they roost by day beneath loose tree bark. At night they navigate using echolocation to feed on insects like moths, beetles, flies, and mosquitoes. Adult females form maternity colonies of up to 100 individuals, and each female raises just one pup per year. Indiana Bats spend the winter hibernating below ground in caves and mines that meet their highly selective preferences for temperature and humidity. They are known to use just two hibernacula in NJ; both are abandoned iron mines. Since 2006, a fungal disease called White-nose Syndrome has spread across North America, bringing devastation to bats as they hibernate. An estimated 40,000 Indiana Bats have died from the disease range-wide. Absent WNS, their lifespan approaches 20 years.

Little Brown Bat

Myotis lucifugus

The Little Brown Bat is one of the most widespread and familiar bats of North America, thanks to its adaptable and colonial nature. It is one of four NJ bat species belonging to the *Myotis* genus. Little Browns are about 3 inches in body length with a 9-10 inch wingspan and are distinguished by their glossy brown fur, long toe hairs, and other subtle physical traits. In spring and summer, Little Browns live in forests all across NJ and spend the day roosting in tree crevices, beneath loose bark, or in buildings. At night they navigate by echolocation to feed on insects. Maternity colonies can number in the hundreds or even the thousands, with each mother bat raising just one pup per year. Little Brown Bats spend the winter hibernating below ground in caves and mines. Since 2006, a fungal disease called White-nose Syndrome (WNS) has spread across North America, bringing devastation to bats as they hibernate. The mortality rate for Little Brown Bats is nearly 100%. Absent WNS, Little Browns are champions of longevity with a lifespan approaching 30 years.

North Atlantic Right Whale

Eubalaena glacialis

The North Atlantic Right Whale is both a Federal and State Endangered species, and is among the most critically endangered large whales in the world. It is primarily a coastal species and is not typically encountered far offshore or in very deep water. Right Whales use NJ waters as a migratory pathway between summer feeding and winter breeding grounds. Feeding behavior has been documented along the NJ coast, with individuals observed very close to the shoreline. Threats to Right Whales include collisions with ships, entanglement in fishing gear, habitat degradation, oil spills, climate and ecosystem changes, disturbance from whale watching activities, and noise from industrial activities.

Northern Myotis

Myotis septentrionalis

The Northern Myotis (a.k.a. Northern Long-eared Bat) is one of four NJ bat species belonging to the *Myotis* genus. Each is about 3 inches in body length with a 9-10 inch wingspan. Subtle physical differences set the Northern Myotis apart, including its longer ears (17-19 mm long), dagger-like tragus, and yellowish-hued fur. This bat is an agile flier and prefers dense forest habitats in summer. At night it navigates using echolocation to feed on small insects like caddisflies, moths, and beetles. It roosts by day beneath loose tree bark or in a wide array of tree cavities and crevices, occasionally making use of man-made structures as well. Adult females form small maternity colonies, and each mother bat raises just one pup per year. The Northern Myotis spends the winter hibernating below ground in caves and mines. Since 2006, a fungal disease called White-nose Syndrome (WNS) has spread across North America, bringing devastation to bats as they hibernate. The mortality rate for Northern Myotis is as high as 99%; as such, the species was listed as threatened under the Federal Endangered Species Act in April 2015. Absent WNS, this bat has a lifespan approaching 20 years.

Birds

American Oystercatcher

Haematopus palliatus

The American Oystercatcher is a medium sized shorebird with a distinctive long orange bill and bright yellow eyes. It breeds on the beaches and marshes of Atlantic coastal NJ. It lays its eggs directly on the sand or in the marsh in a more structured nest (using some vegetation) than other beach nesting birds, though it is still rather simple. The eponymous adults feed on bivalves like oysters, mussels and clams. The chicks are semi-precocial and mobile within a few hours of hatching but rely on adults to feed them. The chicks will shadow their parents, taking visual cues on how to forage. Like other coastal birds, human generated disturbance and sea level rise (coupled with a stabilized coast) are among their primary threats.

American Woodcock

Scolopax minor

The American Woodcock is a short-legged shorebird that uses forests, wooded edges, wet meadows, and open fields for breeding, roosting, foraging, and/or courtship displays. It has a short neck and long straight bill, and is well-camouflaged against leaf litter on the forest floor. Like other shorebirds, the young are precocial and able to move and forage on their own shortly after hatching. Proper and targeted forested management can be beneficial for this species.

Black Rail

Laterallus jamaicensis

The Black Rail is a small, secretive bird that inhabits freshwater marshes in NJ. This diminutive species is difficult to study as it is hard to detect through traditional surveys. It lives in areas that are challenging to access and it remains hidden among grasses for most of its life. This bird builds a nest in the reeds, low to the ground. Susceptible to flooding and predation, if the nest hatches, the chicks leave the nest within one day and are fed by the adults. The species is declining throughout the mid-Atlantic, mainly due to the loss and conversion of high marsh habitat from development and sea-level rise.

Black Skimmer

Rynchops niger

The Black Skimmer is a striking black and white medium sized shorebird with an orange bill that breeds on the beaches and marshes of the Atlantic Coast of NJ. It is the only bird in North America that has a longer lower than upper mandible, used to feed on fish, scooping them up as it skims the water with the lower jaw extended. Skimmer eggs are laid directly on the sand (beaches) or wrack (marsh) and the chicks are semi-precocial. The chicks are mobile but spend a large majority of their time roosting within the colony, waiting for adults to bring food for them. Like other coastal bird species, human generated disturbance and sea level rise (coupled with a stabilized coast) are among their primary threats.

Blue-winged Warbler

Vermivora pinus

The Blue-winged Warbler is a small, yellow Neotropical migrant songbird with blue-gray wings, two white wingbars, and a black line through its eye. It nests on the ground in shrubby fields, shrub/forest wetlands, utility rights-of-way, and near forest edges. The temporary nature of shrubby and young forest habitat makes this species vulnerable, although proper and targeted forest management can be beneficial for this species.

Bobolink

Dolichonyx oryzivorus

The Bobolink is a songbird closely related to blackbirds and orioles. Adult breeding males are mostly black with yellow on the back of the head/neck and white back/rump; females and non-breeding males are brown with dark brown streaks on the back and head. This species nests on the ground in large expanses of early successional/grassland habitat, including hayfields, and is susceptible to impacts from mowing during the nesting season. The temporary nature of early successional/grassland habitat makes this species vulnerable, although proper and targeted management can be beneficial.

Cerulean Warbler

Dendroica cerulea

The Cerulean Warbler is a small blue and white Neotropical migrant songbird with two white wingbars. Males have a dark band across their white throats. These tree-canopy nesters require large expanses of deciduous forest with complex forest structure and are often associated with canopy gaps, internal forest edges, edges of small timber harvests, and narrow utility rights-of-way. Cerulean Warblers are less abundant near the "hard" edges between forest cover and large expanses of open land, but proper and targeted forest management can be beneficial for this species.

Common Tern

Sterna hirundo

The Common Tern is a medium sized tern that breeds in Atlantic coastal NJ's marshes and, to a lesser degree, beaches. It is an aggressive bird whose dive-bombing behavior helps it ward off predators of its eggs and chicks. Its similar appearance can make it superficially difficult to distinguish from Forster's Terns. One distinction is that Common Terns can often be found nesting in close proximity to Black Skimmers in NJ, which is not true of Forster's colonies in this state. The chicks are semi-precocial and remain within the confines of the colony while waiting for the adults to bring them food. Within 3-4 weeks, the young can fly and typically leave the nesting area shortly after. The impacts of stabilization of the coast combined with sea-level rise are major threats for this species.

Forster's Tern

Sterna forsteri

The Forster's Tern is a medium sized tern that nests in the Atlantic coastal marshes. It feeds primarily on fish, which it obtains by diving into coastal waters. It lays its eggs on marsh wrack and is susceptible to predators and flooding. Its appearance is very similar to that of Common Terns and care must be taken not to confuse the two. It is one of the few tern species in NJ whose winter range is restricted to North America; other tern species travel farther, into South America. The impacts of stabilization of the coast combined with sea-level rise are major threats.

Grasshopper Sparrow

Ammodramus savannarum

The Grasshopper Sparrow is a small, brown songbird with an unmarked chest, large head, short tail, and dark crown with a pale middle stripe. Most often heard than seen, the male's song consists of two notes followed by a long, insect-like buzz (like a grasshopper). This species nests on the ground in large expanses of early successional/grassland habitat, including hayfields, and is susceptible to impacts from mowing during the nesting season. The temporary nature of early successional/grassland habitat makes this species vulnerable, although proper and targeted management can be beneficial.

Kentucky Warbler

Oporornis formosus

The Kentucky Warbler is a small yellow Neotropical migrant songbird with an olive green back, black "sideburns", and yellow spectacles. This ground nester requires large expanses of deciduous forest with well-developed ground cover and thick understory. Kentucky Warblers are more abundant in moist forests, such as bottomland hardwoods or near streams, and avoid agricultural areas. Proper and targeted forest management can be beneficial for this species.

Least Tern

Sternula antillarum

The Least Tern is the smallest tern in North America and nests on the beaches and marshes of the Atlantic NJ coast. It feeds exclusively on fish, which it obtains by diving for them in coastal waters, such as oceans and bays. Its eggs are laid directly on the sand and its chicks are semi-precocial. They are mobile but rely on the adults to feed them. The adults are aggressive, dive-bombing predators, yet their diminutive size means this tactic is not overly effective. Like other coastal bird species, human generated disturbance and sea level rise (coupled with a stabilized coast) are among their primary threats.

Little Blue Heron

Egretta caerulea

The Little Blue Heron is a small wading bird that nests in mixed species colonies in scrub-shrub and phragmites habitat in Atlantic coastal marshes of NJ. New Jersey is on the northern part of their breeding range and numbers have never been very high, but inventory counts indicate they have declined from historical highs (declines have leveled off). Little Blue Herons forage by stalking their prey from a stationary position, spearing it when opportunity allows. In its first year, the bird's plumage is white before molting to the adult purplish-blue. The impacts of stabilization of the coast combined with sea-level rise are major threats for this species.

Northern Bobwhite

Colinus virginianus

The Northern Bobwhite is a small quail with a small head, round wings, and a short tail. Males are patterned brown with white and black on their heads and throats; females look similar but have a light brown on their heads and throats. Bobwhites nest on the ground in areas with an open, grassy ground layer such as open pine forests, overgrown fields, shrublands, and grasslands. The temporary nature of early successional/grassland habitat makes this species vulnerable, although proper and targeted management can be beneficial.

Northern Harrier

Circus cyaneus

The Northern Harrier is found in NJ year round in larger tracts of marsh and field habitats. The decline in large and fallow grasslands in the state has contributed to its decline. However, its main nesting range has been Atlantic and Delaware Bay coastal marshes, where harriers rely on high marsh (which floods infrequently, compared to low marsh that floods daily). High marsh habitats along the coasts have declined due to management and other factors that have favored low marsh habitat.

Peregrine Falcon

Falco peregrinus

The Peregrine Falcon is a raptor found statewide but with specialized requirements that limit its nesting range in the state to elevated structures (e.g., buildings, bridges, cliffs). As a top-level predator feeding on resident and migratory birds, it is vulnerable to the adverse effects of contaminants in the environment, both those prevalent in the US and elsewhere in the Western Hemisphere.

Pied-billed Grebe

Podilymbus podiceps

Pied-billed Grebes are small, secretive birds that nest in freshwater marshes, lakes and estuaries in NJ. They are diving birds and exhibit excellent control over their buoyancy. They have a number of interesting behaviors, including carrying their young on their backs, and consuming their own feathers to assist in digestion. This species occurs in low numbers in the state and is difficult to survey, but is known to be vulnerable to disturbance and freshwater wetland loss.

Piping Plover

Charadrius melodus

The Piping Plover is a small shorebird that is Federally Threatened and State Endangered. It nests exclusively in the Coastal Region and only on beaches in NJ, where it lays its eggs directly on the sand, relying on camouflage for protection. The chicks are precocial and are walking and feeding themselves within hours of hatching. Like other coastal bird species, human generated disturbance and sea level rise (coupled with a stabilized coast) are among their primary threats.

Red Knot

Calidris canutus

The Red Knot is a robin-sized shorebird found in NJ primarily during its spring migration between South American wintering and Arctic nesting areas. In May to early June, Red Knots and other shorebirds concentrate on Delaware Bay beaches to take advantage of the high densities of spawning horseshoe crabs and crab eggs. Fat-rich crab eggs allow birds to make large, rapid weight gains, important for survival and reproduction. In late summer/early fall, Red Knots stop on the NJ Atlantic coast to fatten before making non-stop trans-ocean flights to South America; some remain in NJ for ≥ 2.5 months to grow new flight feathers before migrating south. Its long migration path and limited number of quality stopover sites make this Red Knots vulnerable to disruption of critical resources, catastrophic events, and sea-level rise.

Red-headed Woodpecker

Melanerpes erythrocephalus

The Red-headed Woodpecker is a medium-sized woodpecker with a large round head, stiff tail, and thin sharp bill. Adults have red heads (including face and neck), black backs, large white wing patches, and white bellies. Immatures have brown heads, a black row of spots on their white wing patches, and gray streaks on their chests. This cavity-nester is a resident of forests that are sparse, generally 20% to 50% canopy density, with low understory. The temporary nature of this habitat type makes this species vulnerable, although proper and targeted forest management can be beneficial. This species can be found statewide and tends to prefer hardwood forest over pines for its nesting areas.

Ruddy Turnstone

Arenaria interpres

The Ruddy Turnstone is a shorebird found in NJ primarily during its spring stopover on Delaware Bay, migrating between Central and South American wintering sites and Arctic nesting areas. In May to early June, Ruddy Turnstones and six other migrant shorebird species concentrate on Delaware Bay beaches to take advantage of high densities of spawning horseshoe crabs and crab eggs. Fat-rich crab eggs allow birds to make large, rapid weight gains, important for survival and reproduction. In late summer/early fall, Ruddy Turnstones stop on the Atlantic coast of NJ and other eastern US States to fatten before making non-stop, trans-ocean flights to Central and South America. Recent unpublished surveys of major wintering areas in northern Brazil indicate this species has substantively declined. Its long migration and limited number of quality stopover sites make Ruddy Turnstones vulnerable to disruption of critical resources, catastrophic events, and sea-level rise.

Scarlet Tanager

Piranga olivacea

The Scarlet Tanager is a medium-sized Neotropical migrant songbird that breeds in a variety of deciduous and mixed forests. Adult breeding males are bright red with black wings and tail; adult non-breeding males are olive-yellow with black wings and tail. Females and immatures are olive yellow with olive wings and tail. This species nests in multi-layered woods of intermediate to old age and reproduces most successfully in large tracts of mature forest (>60 years old). Like many other mature forest birds, scarlet tanagers are sensitive to the effects of agriculture and development, but utilize young forest after the nesting period. Proper and targeted forest management can be beneficial for this species.

Snowy Egret

Egretta thula

The Snowy Egret is a medium sized wading bird that nests in mixed colonies (most often with Great Egrets) in scrub-shrub habitat in the Atlantic coastal marshes of NJ. This is one of the species whose population declined due to the millinery trade of the late 1800s. Protections in the early 1900s led to an increase in populations in the US. Today, the impacts of coastal stabilization combined with sea-level rise are the major threats for this species.

Tricolored Heron

Egretta tricolor

The Tricolored Heron was once called Louisiana Heron and this name indicates the location of the majority of the US population (the southern US) for this medium sized wading bird. Its current name is apt, as this bird is white, slate blue and reddish-purple. They nest in mixed species colonies in scrub-shrub habitat in the marshes of Atlantic coastal NJ. They lay 2-7 eggs, incubate for 20-25 days and the chicks can fly by 5 weeks. The impacts of coastal stabilization combined with sea-level rise are major threats for this species.

Vesper Sparrow

Pooecetes gramineus

The Vesper Sparrow is a large, lighter-brown sparrow with fine streaks on its chest, dark markings on its back, and a white eyering. This species nests on the ground in large expanses of early successional/grassland habitat, including hayfields, and is susceptible to impacts from mowing during the nesting season. The temporary nature of early successional/grassland habitat makes this species vulnerable, although proper and targeted management can be beneficial.

Wood Thrush

Hylocichla mustelina

The Wood Thrush is a Neotropical migrant songbird that is slightly smaller than a robin with a reddish-brown back, particularly near the nape, white chest with black spots, and white eyering. This species nests in tall shrubs or small trees in deciduous and mixed forests with a well-developed mid-canopy and understory layers. Like many other mature forest birds, the Wood Thrush is sensitive to the effects of agriculture and development, but utilize young forest after the nesting period. Proper and targeted forest management can be beneficial for this species.

Reptiles & Amphibians

Atlantic Green Turtle

Chelonia mydas

The Atlantic Green Turtle is a Federal and State Threatened sea turtle species. From late May until November, NJ coastal waters provide important seasonal foraging habitat. The adults are the only sea turtles that feed exclusively on plants. Nesting in the U.S. is mainly within Florida and Hawaii. They do not nest as far north as New Jersey, although there has been a documented attempt. Green turtle populations are threatened by overharvesting, loss of nesting habitat, interactions with fisheries, entanglement or ingestion of marine debris, oil spills, habitat degradation, beachfront lighting, ocean pollution, dredging, and power plant impingement.

Atlantic Leatherback

Dermochelys coriacea

The Atlantic Leatherback is a Federal and State Endangered sea turtle species. It is the largest living reptile species in the world. Leatherbacks have the widest global distribution of all sea turtle species. Due to thermoregulatory adaptations, Leatherbacks are able to maintain a higher body temperature, thereby allowing them to tolerate colder waters. New Jersey's coastal waters provide foraging habitat between May and November, where turtles feed almost exclusively on jellyfish. In the US, nesting occurs in the Caribbean and SE Florida. Threats to Leatherbacks include overharvesting, entanglement in fishing gear, dredging, ingestion of marine debris, and habitat loss and degradation.

Atlantic Loggerhead

Caretta caretta

The Atlantic Loggerhead turtle is a Federal Threatened and State Endangered sea turtle species. In New Jersey, it has been recorded in the Atlantic Ocean as well as in the Barnegat, Delaware, and Raritan bays, usually between the months of May to November. Their large heads contain powerful crushing jaws with which they feed on crabs and other shellfish. Along the U.S. Atlantic Coast, the major nesting areas range from Florida to North Carolina. Loggerhead populations have declined due to overharvesting and loss of nesting habitat. Entanglement in fishing nets or marine debris, and ingestion of marine debris represent the most serious threats to their existence and recovery.

Atlantic Ridley

Lepidochelys kempii

The Atlantic (Kemp's) Ridley is a Federal and State Endangered species. It is the smallest marine turtle in the world. From late May until November, Kemp's Ridleys forage on crabs, fish, jellyfish, and mollusks in NJ's coastal waterways. Nearly 95% of nesting activity occurs within the state of Tamaulipas, Mexico. They do not nest as far north as New Jersey. Current threats include exploitation for food, entanglement in fishing gear, oil spills, habitat degradation, beachfront lighting, ocean pollution (including marine debris, which may be ingested), dredging, collisions with boats, and power plant impingement.

Bog Turtle

Glyptemys muhlenbergii

The Bog Turtle is a small freshwater turtle that inhabits fens, bogs, and wet meadows that are characterized by substrates of mucky, organic soil that is kept saturated by groundwater discharge. The turtle's shell is colored black to a mahogany brown, often with sunburst patterning. A distinctive yellow to orange neck blotch is a distinguishing characteristic. A habitat specialist, the species once occupied much of the suitable habitat in the state's Piedmont and Highlands Valley. Historic wetland loss and current habitat fragmentation and succession of habitat threaten this rare turtle. While wetland dependent, adjacent natural land cover types including forests, scrub-shrub, and grassland habitats may serve as important wetland buffers and be used by the turtles at different times of year.

Carpenter Frog

Lithobates virgatipes

The Carpenter Frog is sometimes referred to as the sphagnum frog because of its close association with sphagnum bogs. It has a high tolerance for acidic waters and is often found in emergent vegetation of standing or slow moving waters throughout the Coastal Plains physiographic province. It is easily identified by four yellow stripes running lengthwise on a brownish ground color. Its lack of dorsolateral ridges and rhythmic double-tapping call are also key identification characteristics.

Corn Snake

Elaphe guttata guttata

The Corn Snake (*Elaphe guttata guttata*) is a State Endangered and regionally imperiled species with most of NJ's remaining population limited to the physiographic province, the Pinelands Region, and suitable fringe habitats. It is a mostly semi-fossorial species inhabiting a variety of habitats ranging from mature, upland pine and pine-oak forests with uprooted trees, stumps and logs, and open grassy fields and/or sandy and/or loamy areas within and adjacent to the forests. This snake will hibernate below tree stumps while mole tunnels, decaying logs, and tree stumps provide suitable nest habitats for egg laying. This snake shows a strong fidelity to both winter hibernacula and nesting areas, with both often being used repeatedly by the same snake(s). Their foods include rodents, birds and reptiles, but small/younger snakes will primarily rely on lizards and insects.

Eastern Box Turtle

Terrapene carolina carolina

The combination of the high, domed, weakly keeled carapace, and the hinged plastron that can tightly close front and back, make the Eastern Box Turtle distinct from all other turtles in New Jersey. The carapace and plastron have yellow, orange, olive or tan markings on a brown or black background; different animals may show relatively darker or lighter coloration. The Eastern Box Turtle has a hooked upper jaw, and four toes on each hind foot. A species who occupies a variety of habitat types, and often a familiar backyard visitor, fragmented Piedmont and Highlands populations are in greater jeopardy than those of the Pinelands region, due to upland habitat loss. Pathogens, such as Ranavirus, threaten box turtles statewide.

Eastern Hognose Snake

Heterodon platirhinos

The Eastern Hognose Snake (*Heterodon platirhinos*) is a regionally imperiled species and, although this snake's NJ range is statewide, it is considered uncommon. This snake will inhabit a variety of habitats with a sandy substrate, but can also be found in hardwood, mixed and open pine forests, open fields, and along wetland edges. It is a terrestrial species, spending most of its time above ground rather than concealed under objects or debris. Females lay eggs in depressions within sandy substrates, under logs, and in the soil under and among rocks. Their primary food sources are frogs and toads.

Eastern Redbelly Turtle

Pseudemys rubriventris

The Eastern Redbelly Turtle is the largest native basking turtle in New Jersey. The key identifying characteristics are the red-orange plastron, reddish markings on a dark carapace, and cusps flanking the notch at the tip of the upper jaw. Many large adults, particularly in southern New Jersey, are highly melanistic, but even these may still show some faint reddish markings when wet. The hingeless plastron is often marked with large gray blotches that fade with age. The species appears stable throughout much of its state range, although nesting females and dispersing individuals are threatened by vehicle strikes at road crossings throughout the fragmented landscape. In addition, natural succession of nesting habitat may shift annual movements into less familiar, and potentially more dangerous areas.

Eastern Spadefoot

Scaphiopus holbrookii

The Eastern Spadefoot is the only spadefoot that occurs east of the Mississippi river, and can be found in forests or fields with sandy or loose soil. It is seldom seen, emerging from its burrow only after warm, heavy rains or lengthy wet periods. Two yellowish lines curve down the back from each eye, and the large yellow eyes have a vertical pupil. A defining characteristic is the sharp, arcing spade found on the inner side of each hind foot.

Eastern Tiger Salamander

Ambystoma tigrinum tigrinum

The Eastern Tiger Salamander is the largest salamander in New Jersey, belonging to the family "Ambystomatidae," which are commonly referred to as "mole salamanders" due to the fossorial nature of the member species. Juveniles and adults are largely terrestrial and occur within closed canopy deciduous or mixed coniferous-deciduous forests, residing in underground refugia such as abandoned small mammal borrows or under coarse woody debris. Adults emerge only when necessary to forage and to migrate seasonally to fish-free, typically ephemeral breeding areas or vernal ponds. Breeding season migrations occur between November and March. Individual salamanders may migrate as far as 300 meters to reach breeding sites. Fidelity to the natal breeding pool is strong. Over 90% of sexually mature (3-4 year old) individuals return to the pool of their origin to reproduce. Adults are thereafter nearly 100% faithful to their originally selected breeding location. Egg and larval development stages are aquatic, and on average require 4 to 6 months (depending on water temperatures) until juveniles are able to metamorphose and exit the breeding ponds, dispersing widely into adjacent contiguous forests. Drought or premature desiccation of breeding sites can result in complete breeding seasonal failure for a local population. Eastern Tiger Salamanders are New Jersey's most imperiled amphibian.

Longtail Salamander

Eurycea longicauda longicauda

Although typically yellow, the ground color of the Longtail Salamander can range from yellowish orange to yellowish brown, with occasional reddish individuals. There are black spots on the back and sides. The underside is whitish to pale yellow. A key identifying feature is the row of irregular vertical black bars on the sides of the long, slender, keeled tail. The tail is disproportionately long, almost two-thirds of the animal's total length. Habitat loss has led to a range contraction in the state. Stream and riparian alteration and filled in vernal pools limit the salamanders breeding success.

New Jersey Chorus Frog

Pseudacris kalmi

The New Jersey Chorus Frog can be found in a variety of habitats throughout the state, including swamps, ditches, and vernal pools; however, it is not common in the core Pinelands. Ground color can be quite variable and ranges from gray to brown to olive, however it always has a light stripe along the upper lip and a dark stripe through the eye that runs down the flank to the groin. A dark triangle may be present between the eyes, and three dark stripes running down the back are usually present; the middle stripe commonly forms a "Y" towards the rear. The call is a repeated creaking that sounds like running a finger over the small teeth of a comb.

Northern Black Racer

Coluber constrictor constrictor

The Northern Black Racer (*Coluber constrictor constrictor*) is a regionally imperiled species; NJ is one of this species' strongholds. This snake can be found throughout NJ in a variety of habitats ranging from dense to sparse hardwood, mixed and pine forests, rock outcrops in northern NJ, agricultural lands, old fields, and residential properties. This snake is primarily terrestrial, however they tend to climb trees and shrubs more frequently than some of the other terrestrial snakes in search of prey, escaping predators, and at times, sleeping. Their foods include insects, frogs, toads, small birds, and rodents, and racers have been known to eat newborns and hatchlings of other snakes; food selection may change with the snake's size/age.

Northern Diamondback Terrapin

Malaclemys terrapin terrapin

The Northern Diamondback Terrapin exclusively inhabits coastal salt marshes, estuaries, tidal creeks and ditches with brackish water, bordered by *Spartina* grass. The species has a very small home range, with some individuals occupying the same creek year after year. In NJ, terrapins can be found in all coastal counties from Delaware Bay, the Atlantic Coast, northward to the lower Hackensack River. Terrapin populations are threatened by coastal development, drowning in crab traps, road mortality, nest predation, illegal collection, and abandoned ghost traps. In addition, their high site fidelity and tendency to aggregate in hibernacula make them especially vulnerable to overharvesting.

Northern Pine Snake

Pituophis melanoleucus melanoleucus

The Northern Pine Snake (*Pituophis melanoleucus melanoleucus*) is a State Threatened species with most of NJ's remaining population limited to the Pinelands National Reserve within the physiographic province, the Pinelands Region, and suitable fringe habitats. It is a mostly semi-fossorial species with rather narrow habitat requirements. This snake inhabits pine and pine-oak forests, and well-drained sandy and/or sparsely vegetated open areas. It has the ability to burrow in loose, sandy soils; an essential need for nest and hibernacula excavation, as well as pursuing rodent prey. This snake shows a strong fidelity to both winter hibernacula and nesting areas, with both often being used repeatedly by the same snake(s). Their foods include rodents and other small mammals, birds and their eggs, but smaller/younger snakes may rely on rodents, lizards and insects.

Northern Red Salamander

Pseudotriton ruber ruber

The Northern Red Salamander is red to reddish orange and has numerous irregular black spots and a yellow iris. The underside is marked with black or brown spots; some younger individuals may have unmarked bellies. Older adults are usually less brilliant and more of an orangish or purplish brown color. Spots tend to run together on older individuals. This salamander appears well dispersed through the suitable habitats in the state, such as headwater streams, springs, seeps, and other groundwater fed features. The loss or alteration of these habitats will impact local populations negatively.

Northern Scarlet Snake

Cemophora coccinea copei

The Northern Scarlet Snake (*Cemophora coccinea copei*) is a regionally imperiled species considered uncommon in NJ. It is limited in NJ to the physiographic province, the Outer Coastal Plain. It is a mostly semi-fossorial species inhabiting hardwood, mixed and pine forests, as well as adjacent well-drained sandy, loamy and/or sparsely vegetated open areas. It may also be found in or near damp woodlands. This species seems to prefer being under shelter such as logs, boards, or debris, and will lay its eggs underground or under moist humus. They feed primarily on the eggs of other reptiles.

Pine Barrens Treefrog

Hyla andersonii

The Pine Barrens Treefrog is easily identified by the lavender stripes bordered by white that run through the eye and along the side of the body and are set on a bright green ground color. There is considerable orange concealed on the inner surface of the thigh. The call is a distinctive, repetitive, nasal "quonk-quonk." This species is primarily restricted to the brown, acidic waters of the the Pine Barrens. While it prefers ponds and vernal pools, it can be found calling from burrow pits, temporary streams, and the edges of permanent impoundments.

Timber Rattlesnake

Crotalus horridus

The Timber Rattlesnake (*Crotalus horridus*) is a State Endangered and regionally imperiled species. It is a forest-dwelling species in NJ's northern mountains and Pinelands Region. The northern populations rely heavily on geomorphic features (e.g., talus, rock outcrops and fissures) for winter hibernation, gestation, and birthing; sites that are often considered ancestral sites due to their repeated use by individuals and generations. The Pinelands population hibernates along the edges of wetlands and stream embankments. Individuals within the Pinelands may shift their hibernacula slightly during their lives, but typically remain within the same localized area and aquatic system. Pinelands' gravid females gestate and birth in a variety of places ranging from natural debris (e.g., fallen trees, rotting tree stumps) to old railroad ties, and garbage (e.g., car hoods, refrigerator doors) and will reuse areas whenever possible. The rattlesnakes' life history strategy (i.e., late reproductive maturity, low fecundity, long intervals between breeding) predisposes them to population declines. Their primary food source is rodents, although larger adults can eat ground-foraging birds and small rabbits.

Wood Turtle

Glyptemys insculpta

The Wood Turtle is a medium-sized freshwater turtle found in the central and northern parts of the state. The species prefers residing in and near stream and riparian habitats, but is also known to disperse well into the surrounding uplands. The shell is a light to dark brown, with a central keel, and often sunburst patterning. An orange to red coloration shows on the neck and limbs. Upland habitat loss, natural succession of nesting areas, stream alterations, and vehicle-caused road mortality have all contributed to the decline of health New Jersey populations. The Wood Turtle is also collected illegally from the wild.

Atlantic Sturgeon

Acipenser oxyrinchus

A primitive anadromous bony fish native to the east coast of North America. Characterized by a gray, round, elongate body covered in rows of bony scutes and having mandibular barbels. A bottom-feeder inhabiting the riverine, marine, and intermediate habitats. Generally larger than Shortnose Sturgeon, shorter-lived, and possess a differently structured snout. Once valued for caviar, now a member of the Federal Endangered species list.

Banded Sunfish

Enneacanthus obesus

The Banded Sunfish closely resembles the more widely distributed Bluespotted Sunfish, with an olive-colored base with bluish-gold colored spots, but has 5 to 8 vertical bars. This species rarely reaches 4 inches in length. Found along the Atlantic Coast from Florida to Maine, its New Jersey distribution is primarily limited to the Pinelands. It is more common than the other native sunfish in the Pinelands, found in nearly 70% of surveys conducted within the Pinelands since 2000. The Banded Sunfish inhabits heavily vegetated ponds and sluggish sand or mud bottomed pools. Threats to Banded Sunfish include land-use changes that impact water quality resulting in increased pH and nutrient load, loss of native aquatic vegetation, and competition and predation exerted by non-native fishes. Similar to other native fishes in the Pinelands, the naturally acidic water serves to protect the acid-tolerant native species against the establishment of non-native fishes.

Blackbanded Sunfish

Enneacanthus chaetodon

One of the most attractive freshwater fish in New Jersey, the Blackbanded Sunfish has a shimmering silver body with six distinct black vertical bars, red-bordered pelvic fins, and measures up to 3 ¼ inches. The American Fisheries Society recognizes it as a vulnerable species, with drastic declines reported along the Atlantic Coast from Florida to New Jersey, where it is listed as Endangered in three states. Its current stronghold is the Pinelands, where the naturally acidic water hinders the ability of non-native fishes such as Largemouth Bass, Bluegill, and Crappie to establish significant populations, due to their reduced ability to spawn in waters with a pH of less than 5. The Blackbanded Sunfish prefers forested ponds that are heavily vegetated with native species such as Bladderworts. Within their preferred habitats they can be locally common. Threats to Blackbanded Sunfish include land-use changes that impact water quality resulting in increased pH and nutrient load, loss of native aquatic vegetation, and competition and predation exerted by non-native fishes.

Bridle Shiner

Notropis bifrenatus

The Bridle Shiner is a slender 2-inch minnow with a dark lateral band extending from snout to base of tail, straw-colored above and white below, closely resembling the Ironcolor Shiner. This species has declined throughout its range from North Carolina to Maine where it was once considered abundant and has significantly declined in New Jersey since the 1950's. Only found in a few scattered locations in the northern portion of New Jersey, of which their concentration resides in the Millstone watershed. This fish prefers vegetated ponds, sluggish streams, and medium-sized rivers. This very short-lived minnow is threatened by habitat alteration such as vegetation removal, turbidity, changes in water level/flow, and predation from non-native fish species.

Brook Trout

Salvelinus fontinalis

Brook Trout, the only salmonid fish species native to New Jersey, is highly valued for its beauty, sport fish qualities, and as an indicator of good water quality and a healthy ecosystem. To survive and reproduce it requires clean, cold water (<21°C) year-round, and a rocky, silt-free substrate. This habitat is primarily found in small headwater streams scattered throughout the Appalachian foothills and mountains within the two northern physiographic provinces (Ridge and Valley, and Highlands). Today, Brook Trout survive in less than half their original range in our state. Habitat degradation and fragmentation caused by urbanization, road and dam construction, and also the stockings of non-native trout species have contributed to this decline. The effects of climate change and the potential threat of air temperature increases may further reduce the current range of this coldwater fish species.

Comely Shiner

Notropis amoenus

The Comely Shiner is a medium-sized minnow reaching 4 inches. This stream-lined, silver-colored minnow is relatively indistinct, that is often identified by its signature “anchor shaped” pigment on the underside of its chin. Found in Atlantic sloped drainages from North Carolina to New York, their status is Threatened or very rare in the neighboring states of Delaware, Maryland, and New York. They have a scattered distribution in New Jersey, found in the Delaware River and a few of its tributaries from Gloucester to Sussex County and within the Raritan watershed. Found in only 1% of more than 2000 fisheries surveys conducted since the year 2000, this fish is almost always found in low abundance. Comely Shiners are found in runs and flowing pools, over sand and gravel, in medium to large rivers. It is considered sensitive to environmental degradation, primarily pollution, and siltation of spawning habitat. Although this species seems to coexist with non-native fishes in larger river systems, when found in smaller streams it is almost always found as part of a native fish assemblage, absent the presence of non-native species.

Ironcolor Shiner

Notropis chalybaeus

The Ironcolor Shiner is a slender 2-inch minnow with a dark and thick lateral band extending from the base of the tail to the snout, and into the lower jaw, with olive coloration above and white below, closely resembling the Bridle Shiner. This species has declined throughout its range along the Atlantic coast and is possibly the rarest native freshwater fish in New Jersey, which is near the northern extent of its range. In New Jersey they have been reduced to two disjunct locations, separated by approximately 50 miles. As a sight feeder, this minnow prefers clear heavily vegetated pools over a sand bottom within ponds and slow moving streams and can tolerate moderate acidity. Primary threats to this species include habitat alteration affecting vegetation and water quality and predation from non-native fish species.

Mud Sunfish

Acantharchus pomotis

The Mud Sunfish is one of the larger native sunfish, reaching 8 inches. This dark brown fish is marked with approximately six indistinct lateral bands and has a rounded tail. Found along the Atlantic Coast from Florida to New York, its distribution in New Jersey is primarily limited to the Outer Coastal Plain, with rare occurrences in the central and northern portions of the state. Similar to other native fishes in the Pinelands, the naturally acidic water hinders the ability of non-native fishes such as Largemouth Bass, Bluegill, and Crappie to establish significant populations, due to their reduced ability to spawn in waters with a pH of less than 5. The Mud Sunfish prefers forested ponds and sluggish streams and were found in 45% of surveys conducted within the Pinelands since 2000. Threats to Mud Sunfish include land-use changes that impact water quality resulting in increased pH and nutrient load, loss of native aquatic vegetation, and competition and predation exerted by non-native fishes.

Shortnose Sturgeon

Acipenser brevirostrum

A primitive anadromous bony fish native to the east coast of North America. Characterized by a gray, round, elongate body covered in rows of bony scutes and having mandibular barbels. A bottom-feeder inhabiting the riverine, marine, and intermediate habitats. Generally smaller than Atlantic Sturgeon, longer-lived, and possess a differently structured snout. A member of the Federal Endangered species list.

Swamp Darter

Etheostoma fusiforme

The Swamp Darter is the smallest of the three native darter species in New Jersey, rarely exceeding 2 inches in length, with a girth no more than a centimeter. Found primarily from Louisiana up the Mississippi drainage, northeastward to southern Maine, it is currently listed as Special Concern or Threatened in several states in the northeast. This lowland species has not been documented in New Jersey's Inner Coastal Plain in recent years and like several other native fishes, seems relegated to the Pinelands, where it is abundant. It is found in standing or slow-moving water over mud, sand, or detritus, often associated with submerged vegetation. Individuals mature at age one and rarely live past their second summer. Although not considered to be particularly environmentally sensitive, water quality changes that favor non-native predators may significantly impact the Swamp Darter.

Macroinvertebrates

A Notodontid Moth (H. varia)

Heterocampa varia

Heterocampa varia is a species of notodontid moth that occurs in the pine-scrub oak habitats found within the New Jersey Pinelands Region. The larvae feed on a variety of mature oak leaves. This species is largely threatened by the alteration of the natural fire and disturbance regimes that it depends on for maintenance of its habitats.

American Bumble Bee

Bombus pensylvanicus

The American Bumble Bee is a widespread species of bumble bee that inhabits a wide variety of grassland and farmland habitats and nests mostly above ground among tall grasses but will also nest underground. This species is found throughout NJ but has been suffering a gradual decline in the northern parts of its range including NJ.

Arogos Skipper

Atrytone arogos arogos

Arogos Skipper is a species of grass skipper and occurs in two disjunct and entirely different regions of New Jersey. There are two populations of Arogos Skipper in New Jersey, one in Morris County and the other in the Pinelands Region of southern NJ and concentrated in Ocean and Burlington Counties. It has a flight period that occurs during late June through mid-July in northern New Jersey and during late July through early August in southern New Jersey. The Morris County population depends on Little Blue Stem (*Schizachyrium scoparium*) as its larval food plant and is concentrated on the former Succasunna Sand Plains area around Kenvil and Succasunna. Here the primary habitat is xeric grasslands and fields. The populations of this species are largely threatened by the loss and fragmentation of its habitats by human development. The Pinelands population of this species occurs in the Pine Barrens Reed Grass Savannas found within the Pinelands Region of New Jersey. Its host plant is Pine Barrens Reed Grass (*Calamovifa brevipilis*) that occurs in the wetter, fire impacted areas of the Pinelands Region. These populations are largely threatened by the alteration of the natural fire and disturbance regimes that it depends on for maintenance of its habitats. Alterations of the natural hydrology can also have an impact on these habitats.

Brook Floater

Alasmidonta varicosa

The Brook Floater is a State Endangered freshwater mussel species. It inhabits streams and smaller rivers, and is often associated with rapids or riffles on rock and fine gravel substrates. In NJ, Brook floaters occupy sections of the Stony Brook, Lamington, Raritan and Musconetcong Rivers, as well as the Flatbrook. Low population numbers may indicate that no new reproduction is occurring. As with most freshwater mussels, the Brook Floater requires particular host fish species to complete its life cycle. Population declines are tied to habitat destruction, water quality degradation, dam construction, and the invasion of exotic species.

Dwarf Wedgemussel

Alasmodonta heterodon

The Dwarf Wedgemussel is both a Federal and State Endangered species. It is a rare freshwater mussel found in streams and rivers that prefers sandy substrates with slow to moderate currents. In NJ, this includes areas within the upper Delaware River, Flat Brook, sections of the Paulins Kill, and the Pequest River where their presence has been documented. Like most freshwater mussels, the Dwarf Wedgemussel requires particular host fish species to complete its life cycle. Due in part to habitat destruction, water quality degradation, overcollection, and interruption of fish hosts, this species has suffered population losses throughout the northeast and middle Atlantic Region of the US in the last century.

Eastern Lampmussel

Lampsilis radiata

The Eastern Lampmussel is a State Threatened freshwater mussel species. It can be found in a variety of habitats in medium to coarse sandy substrates. In NJ, the species has been reported in the Paulins Kill, Kymer Brook, Ramapo, Pequannock, Wallkill, and Whippany Rivers as well as several lakes. As with most freshwater mussels, the Eastern Lampmussel requires particular host fish species to complete its life cycle. Threats to populations include habitat destruction, water quality degradation, dam construction and the invasion of exotic species.

Frosted Elfin

Callophrys irus

The Frosted Elfin is species of hairstreak butterfly that historically occurred throughout the state of NJ but is now largely restricted to Atlantic, Cape May, and Cumberland Counties. It occurs in a wide variety of open habitats and is found mostly in pine and oak barrens and open grassland/savannah areas where its host plant, Wild Indigo (primarily *Baptisia tinctoria* in NJ) occurs. These areas often include utility right-of-ways and airports. It should be noted that this species of butterfly also uses several species of Lupine as a larval host plant in some portions of its range including areas just north of New Jersey in NY and MA. This species requires disturbance for the maintenance of stands of its host plant and is threatened by alteration of the natural fire regimes that it depends on for maintenance of its habitats.

Georgia Satyr

Neonympha helicta

The Helicta Satyr (also known as Georgia Satyr) is a satyr species that occurs within the New Jersey Pinelands Region. It is found in areas of pine lowland meadows, wet savannahs, and bogs. It uses a variety of *Carex* sedge and grasses as larval food plants. The populations found in New Jersey possibly represent a unique subspecies. This species is largely threatened by the alteration of the natural fire and disturbance regimes that it depends on for maintenance of its habitats.

Green Floater

Lasmigona subviridis

The Green Floater is a State Endangered freshwater mussel species. It is found in smaller streams, pools and eddies, preferring slow currents and gravelly or sandy substrates. There is some evidence that the species may not require a host fish in order to complete its life cycle. Green floaters once occurred in the Passaic, Raritan, Delaware and Pequest Rivers, but haven't been found alive in NJ since 1996, when a single individual was recorded in the Stony Brook. Regional population declines are tied to habitat destruction, water quality degradation, dam construction, and the invasion of exotic species.

Leonard's Skipper

Hesperia leonardus

Leonard's Skipper is a species of grass skipper found in scattered colonies throughout the state of New Jersey. Its larval host plant is Little Blue Stem (*Schizachyrium scoparium*) and it is found in a wide variety of open grassland and savannah habitats including often very small patches of open, grassy areas. In northern New Jersey, these areas are usually found on open ridge tops. This species is largely threatened by the alteration of the natural fire and disturbance regimes that it depends on for maintenance of its habitats.

Little White Tiger Beetle

Cicindela lepida

The Little White Tiger Beetle is a species of coastal beach tiger beetle that also occurs in the inland Pinelands Region of NJ. It occurs in undisturbed coastal beach habitats from the area of Little Egg Harbor Inlet south to the tip of Cape May. It is a beetle that feeds on a variety of other insects and invertebrates. Its larvae live in sand burrows that often occur in the dune and dune edge areas of beaches. The inland populations of this beetle occur in open, sandy areas of the New Jersey Pinelands and are often found along road edges and severely burned areas. It is threatened by human disturbance of beach areas and sandy areas in the Pinelands. It is also threatened by alteration of the natural fire regimes that help to maintain open, sandy, bare patches of habitat in the Pinelands.

Maritime Sunflower Borer Moth

Papaipema maritima

Maritime Sunflower Borer Moth is a species of papaipema moth that is found in southern New Jersey and occurs in a variety of grassland, meadow, and coastal marsh habitats. The larvae are a borer of *Helianthus giganteus*, the Giant Sunflower. This species is threatened by habitat loss or alteration due to human activity as well as the takeover of its habitat by the invasive Common Reed (*Phragmites australis*).

Northeastern Beach Tiger Beetle

Cicindela dorsalis dorsalis

The Northeastern Beach Tiger Beetle is a species of coastal beach tiger beetle that was historically found from the area of Little Egg Harbor Inlet north to Sandy Hook. It was largely extirpated due to habitat loss and alteration and human disturbance of beach habitats and is now restricted to the area of Sandy Hook. It is a predatory beetle that feeds on a variety of other insects and invertebrates. Its larvae live in sand burrows between the high tide line and the dunes. The larvae are adapted to relocate their burrows inland/up beach during the winter months. It is closely related to the Southeastern Beach Tiger Beetle.

Northern Metalmark

Calephelis borealis

The Northern Metalmark butterfly is restricted to the limestone region of northwestern NJ and currently only occurs in Warren and Sussex Counties. This species inhabits woodland openings and glades, primarily red cedar glades that contain its nectar plants and its larval foodplant, Roundleaf Ragwort (*Pakera obovatus*). Roundleaf Ragwort is often found in and near the edge of forest stands in this region. This species is highly dependent on a variety of nectar plants that occur in these forest openings. Many former colonies of this butterfly had ample areas of the host food plant, but those areas have succeeded to the point that all available nectar sources were shaded out by the mature forest stand. The greatest threats to this species include the lack of natural disturbance to maintain the forest openings and glades that this species depends upon and the large number of invasive plant species found within its habitat. Invasive plants outcompete and shade out the larval host plant and nectar sources leading to the extirpation of this species from several locations.

Robust Baskettail

Epitheca spinosa

The Robust Baskettail is found in scattered locations in southern New Jersey. The species occurs in swampy ponds and lakes and along slow rivers. Its larvae inhabit submerged aquatic vegetation in these water-bodies. The adults will often forage in fields and other open areas adjacent to these aquatic habitats. Alterations of water quality is the greatest threat to this species.

Rusty Patched Bumble Bee

Bombus affinis

The Rusty Patched Bumble Bee is an eastern species of bumble bee that occurs in and adjacent to woodlands. It nests underground in old borrows or holes and nectars on a wide variety of flowers. Historically it was found throughout the state of NJ but has suffered extensive declines over the last 20 years.

Sand Myrtle Looper/Pink

Cyclophora culicaria

The Sand Myrtle Pink is a species of noctuid moth found in the New Jersey Pinelands Region that has not been formally described. Its larval host plant is Sand Myrtle (*Leiphyllum buxifolium*). This species is largely threatened by the alteration of the natural fire and disturbance regimes that it depends on for maintenance of its habitats.

Scarlet Bluet

Enallagma pictum

The Scarlet Bluet damselfly occurs in the New Jersey Pinelands Region and is found in sandy bottomed ponds and lakes. This species has a highly restricted range in the northeastern United States, and New Jersey is its stronghold. Its larvae live in aquatic vegetation found in these water-bodies, and the adults will forage in the surrounding terrestrial habitat.

Septima's Clubtail

Gomphus septima

Septima's Clubtail and more specifically, the subspecies *G.s. delawarensis*, is a unique subspecies that occurs only in the Delaware River watershed. This species occurs in medium to large rivers and its larvae burrow in sandy and silty areas of riverbed. The adults of this species forage in fields and forests adjacent to the river. Alterations to natural stream hydrology and water quality are the greatest threat to this species.

Southeastern Beach Tiger Beetle

Cicindela dorsalis media

The Southeastern Beach Tiger Beetle is a species of coastal beach tiger beetle that was historically found from the area of Little Egg Harbor inlet south to the tip of Cape May. It was largely extirpated due to habitat loss and alteration and human disturbance of beach habitats and is now restricted to the areas of Little Beach and Holgate around the Little Egg Harbor Inlet. It is a predatory beetle that feeds on a variety of other insects and invertebrates. Its larvae live in sand burrows between the high tide line and the dunes. The larvae are adapted to relocate their burrows inland/up beach during the winter months. It is closely related to the Northeastern Beach Tiger Beetle.

Triangle Floater

Alasmidonta undulata

The Triangle Floater is a State Threatened freshwater mussel species that inhabits a variety of stream, river and lake habitats. It can be found from Salem County in the south to Sussex County in the north. Although widely distributed in NJ waterways, the species seldom occurs in large numbers. As with most freshwater mussels, the Triangle Floater requires particular host fish species to complete its life cycle. Triangle Floaters are threatened by habitat destruction, water quality degradation, dam construction and the invasion of aquatic species.

Yellow Lampmussel

Lampsilis cariosa

The Yellow Lampmussel is a State Threatened freshwater mussel species. It prefers large rivers that drain more than 1,200 sq. kilometers and is often found in sand/silt or cobble substrates. Heavy shell morphology allows the species to inhabit high flow waterways and makes individuals resistant to crushing. As with most freshwater mussels, the Yellow Lampmussel requires particular host fish species to complete its life cycle. New Jersey occurrences of the species are restricted to the Delaware River, where they are especially vulnerable to dredging activities. The Yellow Lampmussel is threatened by habitat destruction, water quality degradation, and the invasion of aquatic species.

Appendix E: Delineating Conservation Focal Areas

Delineating Conservation Focal Areas

The DFW enlisted internal and external stakeholders to inform the selection of GIS data and the method of analysis employed to delineate Conservation Focal Areas (CFAs). A wide variety of GIS data addressing biodiversity and habitat quality, connectivity, rarity and/or impairment within terrestrial, freshwater aquatic, and marine environs were found to be available at statewide and regional scales. To provide a regional context, the Department utilized a variety of conservation planning data compiled by the North Atlantic Landscape Conservation Cooperative (NALCC). Relevant regional data developed by NALCC partners included TNC's [Geospatial Condition Analysis](#) and UMass's [Northeast Index of Ecological Integrity](#). These and other regional datasets served to complement the host of publicly available conservation-relevant state and local data in New Jersey. As applicable, a number of unpublished or derivative datasets were also utilized in developing CFAs.

The DFW decided to employ a weighted co-occurrence analysis that combines many independent datasets with different metrics to identify areas of high resource value. With some additional spatial optimization techniques, this approach allowed for the identification of specific geographic areas of agreement across a diverse set of geospatial data and metrics. These areas will be the focus of the DFW's assessment of threats and actions affecting New Jersey's wildlife habitats, and will identify locations where conservation actions can be carried out to benefit high priority fish and wildlife resources throughout the state.

General GIS Method – Phase 1

Once specific datasets were identified as having significant relevance to the CFA mapping objectives, data was acquired and necessary conversion and standardization processes were carried out in preparation for conducting a co-occurrence analysis. Where necessary, data were rescaled to New Jersey and reclassified into 30' grid cells. Inputs were then organized by three environments (terrestrial, freshwater aquatic, and marine) and into five categories (ecological condition, conservation infrastructure, fish and wildlife habitats, biodiversity and negative influences). For each input, metrics were reviewed by DFW biologists and converted into a standard weighting system which normalized all datasets to address the objectives of the CFA mapping process. Accordingly, weights were assigned following a standardized five tier scale ("5" being the highest value and "1" being the lowest) based upon factors which included (but were not limited to): the relevance of the data layer to our CFA mapping objectives, the degree to which the "regional" datasets addressed habitat values or conditions that were specific to New Jersey, and the original range of the source dataset values. The exception to the positive five tier scale included negative weights that ranged from -10 to -1 and a "restricted" category that excluded an area from being mapped as a CFA regardless of its intersection with one or more resource elements with positive values. Additionally, as the final mapping effort was based upon the "additive mapping" of valued habitats, the *proportion* to which any one dataset addressed a specific mapping objective needed to be factored in (i.e., if several datasets existed that were correlated with one specific issue, individual dataset weights were reduced to address confounding influences).

Phase 1 Process Summary:

- Compiled ~40 inputs spanning terrestrial, freshwater aquatic and marine environments from state and regional sources.
- Performed conversion, re-scaling and reclassification so that each input was standardized into 30' cells.
- Categorized data into five geodatabases: Ecological Condition, Conservation Infrastructure, Fish & Wildlife Habitats, Biodiversity and Negative Influences.
- Assigned relative importance (weights) to each input.

General GIS Method – Phase 2

Once inputs were reclassified according to assigned weights into 30' grid cells, a (weighted) co-occurrence analysis was performed that calculated the sum of all inputs. The resultant grid was then stratified by Landscape Region and rescaled by calculating percentile values for each cell relative to every other cell within the region. Cells were reclassified according to percentile ranks. For example, percentile values 0.90-1.00 were classified as the 90th percentile, 0.80-0.89 were classified as the 80th percentile and so forth.

Phase 2 Process Summary:

- Performed weighted co-occurrence analysis that combines inputs to identify areas where several different qualities are present (“resource-rich” areas).
- Stratified by Landscape Regions (calculated percentile ranks relative to each region) in order to have even distribution of areas between regions.

General GIS Method – Phase 3

Areas that represented the top 70 percent of the data within each region were extracted and converted to vector data made up of contiguous polygons. Terrestrial areas smaller than 3.14 acres were removed from the result (there was no size threshold applied to aquatic areas). The remaining polygons served as core areas from which geoprocessing routines were applied to identify key connections (e.g., riparian corridors) and proximate areas within the 50th percentile or above. Identified areas were combined/dissolved with the core areas and generalization routines were run to create protective buffers and smooth boundaries of resultant contiguous polygons. Regional Conservation Opportunity Areas (RCOA) or “Nature’s Network” data on terrestrial, wetland and aquatic cores developed during the process of creating CFAs was used as a guide to incorporate some additional areas that were not captured in the initial CFA delineation. Lastly, urban areas were erased from the result and a minimum size threshold of 3.14 acres was applied to all contiguous areas.

Phase 3 Process Summary:

- Extracted percentile ≥ 70 in each Landscape Region
- Applied minimum size criteria to identify core areas
- Applied connectivity rules to select key connections between high value areas
- Ran basic generalization/simplification processes to provide protective buffers and smooth boundaries of areas
- Utilized RCOA (“Nature’s Network”) data on terrestrial and aquatic cores as guide to add in areas not captured
- Erased all areas coded as “urban” in 2012 land-use/land-cover
- Applied minimum size criteria to all contiguous areas

A graphic that depicts the Conservation Focal Area development process is available at:
http://www.state.nj.us/dep/fgw/ensp/wap/pdf/cons_focal_areas.pdf

Terrestrial Datasets Selected

Generally, GIS datasets available for terrestrial landscapes spoke to issues of habitat types, or degrees or measures of habitat quality or impairment. Among the datasets that addressed “habitat types,” the most basic were layers produced by the State of New Jersey identifying core forest, grassland, wetland and shrub habitats (derived from 2012 land use/land cover data). While important indicators of space available to direct conservation actions and worthy of inclusion to the CFA mapping project, these were essentially considered a data “baseline,” identifying generic habitats remarkable merely due to their size or habitat type. The relative importance or significance of all other available datasets were weighted in comparison to this baseline.

Table 1. Summary of terrestrial datasets selected by DFW biologists.

Conservation Infrastructure				
No	Dataset	Merit	Relevance	Weight
1	Preserved Lands Composite	Indicator of preserved lands (highly actionable areas).	Medium. One of few layers addressing open space.	3
2	Natural Areas	Indicator of preserved lands (highly actionable areas).	Medium. One of few layers addressing open space.	3
Ecological Condition				
No	Dataset	Merit	Relevance	Weight
9	Permeability - Regional Flow	Indicator of habitat connectivity, if perhaps the “courser” of several applied.	Medium/High. Ranked based upon categories of flow.	3
				4

Freshwater Aquatic Datasets

Datasets available for freshwater aquatic landscapes largely addressed measures of habitat quality or impairment, suitability for SGCN species, or general species diversity. By their nature, aquatic habitats are typically mapped and valued as narrow, linear features in the landscape. Aquatic habitat mapping within the State has historically been much less abundant or detailed than that available for terrestrial landscapes. For example, the mapping of aquatic habitats – to the extent that it might suggest “patches” – does not address the varied and immensely relevant benthic or substrate characteristics of a watercourse in the same manner as is available for the mapping of terrestrial habitat patches. However, available water quality and

even species occurrence data can collectively speak to important parameters such as water temperature, clarity, chemistry and quality.

Table 2. Summary of the aquatic datasets selected by DFW staff.

Ecological Condition				
No	Dataset	Merit	Relevance	Weight
17	Category 1 waters (300' buffer)	Very good indicator of water quality, rare species use and focus on anti-degradation.	High. Good state-wide dataset.	5
19	Pinelands Streams (300' buffer)	Very good identification of water quality and unique water quality parameters.	High, if only for the Pinelands. Balances Trout Production Waters data layer.	5
25	Ambient Biomonitoring Network	Very good indicator of biodiversity and habitat quality	High.	3
				2
				1
26	Metric Riparian Landcover (90-meter buffer)	Indicator of impairment.	Low-Medium. Used to identify <u>un</u> impaired aquatic habitats.	4
				3
				2
				1
27	Metric Impervious Surfaces (90-meter buffer)	Indicator of impairment.	Low-Medium. Used to identify <u>un</u> impaired aquatic habitats.	3
				2
				1
Biodiversity

				1
Fish & Wildlife Habitats				
No	Dataset	Merit	Relevance	Weight
18	Trout Production water (300' buffer)	Excellent indicator of water quality and species biodiversity.	High, if primarily for the northern half of state. Balances with Pinelands Streams layer.	5
20	Freshwater Mussel Habitat (300' buffer)	Very good indicator of water quality, benthic habitat types and biodiversity.	High.	4
21	Odonate Streams (300' buffer)	Good indicator of biodiversity and habitat quality.	Medium-High.	4
22	Diadromous Fish Streams(300'buffer)	Good indicator of biodiversity and habitat quality.	High.	5

Marine Datasets

The intent of the DFW’s mapping of “marine CFA’s” within its SWAP is to identify *aquatic* marine habitats, including Barnegat Bay and relevant portions of the State’s other major bays, such as the Delaware, Raritan and Great Bays. Coastal/intertidal wetlands or shorelines and freshwater/brackish estuarine systems, for example, are *not* mapped as “marine” CFA’s, but rather by the “terrestrial” or “aquatic” CFA data layers, respectively. Some exceptions may be evident, such as the identification of seal haul-out sites, which are not literally “aquatic.” But such habitats that are intrinsically linked to the aquatic species in the marine CFAs are most relevant in the marine CFA mapping. As was the case with available freshwater aquatic resource data layers, marine aquatic data availability is not quite as robust as that for terrestrial layers. It is worth noting that marine data layers generally did not include details of specific habitat types, benthic conditions or habitat diversity in the same manner as terrestrial habitat data. While there were data sets available for some key marine habitats (such as eelgrass [*Zostera marina*]) beds or artificial reef sites), much of the data that created the SWAP marine CFA mapping was specific to species occurrence data that served to highlight areas of high quality habitat or biodiversity.

Table 3. Summary of the marine datasets selected by DFW staff.

Conservation Infrastructure				
No.	Dataset	Merit	Relevance	Weight
35	The Marine Protected Areas Inventory	Indicates areas protected for a marine conservation purpose	Medium/High	3
Biodiversity				
No.	Dataset	Merit	Relevance	Weight
28	Submerged Aquatic Vegetation	Excellent indicator of habitat supporting biodiversity	High	5
				4
29	Marine Species Richness by 1.3km grid	Very good indicator of general marine biodiversity.	Medium-High	5
				4
				3
31	Artificial Reef Sites	Good indicator of unique habitat and location of increased biodiversity.	Med-High. Dataset somewhat limited.	4
36	Back-bay and Estuarine Waterbody Spawning Access Areas	Designates specific areas utilized by anadromous fish to access back-bay and estuarine waterbodies (for spawning, etc.)	High	5
37	Shipwreck Dense Areas	Good indicator of unique benthic habitat and location of increased biodiversity.	Medium. Sliding scale based on dataset.	3
				3
				2
38	Sportfishing Areas	Indicates areas historically proven to represent productive and diverse fish habitats	Medium	2
39	Ocean Trawl Species Rich Areas	Indicates areas of high biological diversity as well as a “source population” for recovered habitats.	Medium/High	3
40	Seabird Annual Average Abundance Composite	Predictive indicator of seabird abundance throughout the entire “marine” CFA region.	Medium	5

Fish & Wildlife Habitats				
No.	Dataset	Merit	Relevance	Weight
30	Seal Haul-out Sites	Excellent indicator of unique habitat conditions critical to marine mammals.	Medium-High	4
32	Hard Clam Distribution in Barnegat Bay, 2012	Species-based indicator of habitat type.	Low	1
33	Mullica River/Great Bay/Delaware Bay Oysters	Species-based indicators of habitat type.	Low	1
Negative Influences				
No.	Dataset	Merit	Relevance	Weight
34	Mullica River/Great Bay Leases	Designates areas of anticipated anthropogenic activity/disturbance.	Medium “negative” relevance.	-5
41	Shipping Density (all vessels)	Indicator of marine environment stressors or impairment.	Low to Medium negative relevance.	-5
				-10

As was noted in the body of the plan, these datasets represent the first draft of CFA maps, and maps may be further developed or refined in the future as new GIS data become available or as use and implementation of the maps reveals opportunities for refinement or improvements.

Table 4. Master list of datasets employed in the development of Conservation Focal Areas (CFAs).

No.	Dataset	Categories	Weight	Source	URL	Description	Notes
1	Preserved Lands Composite		3	DEP - derived from publicly available state open space and other sources	See Notes	This layer is a composite of protected open space and recreation areas owned in fee simple interest by the NJDEP that have a high likelihood of being managed for wildlife conservation and acquired lands of USFWS.	Derived from multiple sources including: http://njogis-newjersey.opendata.arcgis.com/datasets/b75fe11ed90543c1b4ee87e66af63b8b_1 ; http://njogis-newjersey.opendata.arcgis.com/datasets/9603495beb394997b7bd441b7bcbcdbe_2 ; http://www.fws.gov/GIS/Data/CadastralID/B/index_cadastral.html ; https://gapanalysis.usgs.gov/padus/
2	Natural Areas		3	DEP - unpublished	NA	This layer includes areas of land or water, owned in fee simple or held as a conservation easement by the Department, which has retained its natural character, although not necessarily completely undisturbed, or having rare or vanishing species of plant and animal life, or having similar features of interest. All the natural areas are worthy of preservation for present and future residents of the State.	http://www.state.nj.us/dep/parksandforests/natural/natareas.html
3	Natural Heritage Priority Sites	B1/B2/B3	5	DEP	http://www.nj.gov/dep/gis/stateshp.html#PRIORITY	This layer identifies critically important areas to conserve New Jersey's biological diversity, with particular emphasis on rare plant species and ecological communities.

(Table 4 continued)

No.	Dataset	Categories	Weight	Source	URL	Description	Notes
4	Human Influences: Developed Lands	Developed	R	DEP - derived from NJDEP 2012 LULC	http://www.nj.gov/dep/gis/lulc12c.html	Developed lands and associated buffers. This layer is derived from the 2012 Land Use/Land Cover, which includes all the Residential (1100), Commercial & Services (1200), Industrial (1300), Industrial & Commercial Complexes (1500), Mixed Urban Or Built-Up (1600), and part of Transportation, Communication & Utilities (1400), Other Urban Or Built-Up (1700), and Recreational Land (1800).	Urban LULC was coded as "restricted" (R). 90-meter buffers were applied and given a weight of -5 or -10 depending on the class. See URBAN_ROADS tab for weight applied for each class.
		High Density Dev buffer	-10				
		Low Density Dev buffer	-5				
5	Human Influences: Roads	Major Roadway (Paved Area)	R	DEP - derived from NJDOT/NJOIT	https://njgin.state.nj.us/NJ_NJGINExplorer/jviewer.jsp?pg=ROADS	Roadways and associated buffers. This layer represents all the segmented Road Centerlines of New Jersey. In the analysis, all the roads are divided into three subgroups, which are state, county, and local roads.	Local roads were buffered by 15 feet and were coded with a weight of -5. Major Roadway lines classified as 500 and 600 Series County Routes were buffered by 25 feet, while lines classified as Interstate Highways, U.S. Routes, NJ State Highways and Toll Authority Routes were buffered by 37.5 feet. These road widths are intended to capture the paved area and were determined by randomly selecting roads and averaging measured widths using aerial imagery. These areas were coded as "restricted" (R). 500 and 600 Series County Routes were then buffered from 25 feet to 320 feet and the buffer area was coded with a weight of -5. Interstate Highways, U.S. Routes, NJ State Highways and Toll Authority Routes were buffered from 37.5 feet to 332.5 feet and the buffer area was coded with a weight of -10.
		Interstate and State Highway buffer	-10

No.	Dataset	Categories	Weight	Source	URL	Description	Notes
11	LNDR (Landscape Project)	3,4,5	2	DEP -derived from publicly available Landscape Project	http://www.nj.gov/dep/gis/landscape.html	Habitat patches ranked 3, 4, or 5 derived from the Landscape Project (Version 3.1). It contains species-specific patches that have one or more occurrences of State threatened species, State endangered species, or wildlife listed as endangered and threatened pursuant to the Federal Endangered Species Act of 1973.	
12	Habitats of High Regional Responsibility for NJ	95%-100%	5	TNC-Geospatial Condition Analysis	https://www.conservationgateway.org/ConservationByGeography/NorthAmerica/UnitedStates/edc/reportsdata/terrestrial/habitatmap/Pages/default.aspx	This layer derived from the Terrestrial Habitat Map for the Northeast US. It represents the habitats which New Jersey contains at least 25% of the total habitat in the Northeast region.	See the Northeast Habitat Guide reports for the PCT breakdown by state: http://easterndivision.s3.amazonaws.com/NortheastHabitatGuides.pdf
		60%-94%	4				
		25%-59%	3				
13	Metric Landscape Complexity	0.2-0.4	1	TNC-Geospatial Condition Analysis	https://www.conservationgateway.org/ConservationByGeography/NorthAmerica/UnitedStates/edc/Pages/geospatial.aspx	This layer is derived from Condition of the Northeast Terrestrial and Aquatic Habitats. It refers to the variety of landforms created by an area's topography, the range of its elevation gradients, and the density of its wetlands. Areas of high landscape diversity are important for the long-term population persistence of plants, invertebrates, and other species.	
		0.4-0.7	2

15	Metric Local Connectedness	0.3-0.5	1	TNC-Geospatial Condition Analysis	https://www.conservationsgateway.org/ConservationByGeography/NorthAmerica/UnitedStates/edc/Pages/geospatial.aspx	This layer is derived from Condition of the Northeast Terrestrial and Aquatic Habitats. It estimates the degree of permeability, or conversely the degree of resistance, surrounding each cell in the region.	
		0.5-0.8	2				
		0.8-1.0	3				
16	Northeast Index of Ecological Integrity	0.2-0.3	1	UMASS	https://nalcc.databasin.org/datasets/f577118c89244e7e9229062308769e76	This dataset depicts the ecological integrity of locations (represented by 30 m grid cells) throughout the northeastern United States based on environmental conditions existing in approximately 2010. Ecological integrity is defined as the ability of an area (e.g., local site or landscape) to sustain important ecological functions over the long term. In particular, the functions include the long-term ability to support biodiversity and the ecosystem processes necessary to sustain biodiversity.	Included is a product rescaled for NJ. The source data (updated March 1, 2017) can be downloaded at: https://nalcc.databasin.org/datasets/f577118c89244e7e9229062308769e76

17	Category 1 (plus 90 meter buffer)	C1	5	DEP - derived from publicly available Surface Water Quality Standards	http://www.nj.gov/dep/gis/stateshp.html#SWQS	This layer was derived from New Jersey's Surface Water Quality Standards. It represents all the Category 1 (C1) waters. All C1 streams and waterbodies were buffered by 90 meters in order to capture surrounding riparian areas.	
18	Trout Production (plus 90 meter buffer)	TP	5	DEP - derived from publicly available Surface Water Quality Standards	http://www.nj.gov/dep/gis/stateshp.html#SWQS	This layer was derived from New Jersey's Surface Water Quality Standards. It represents all the trout production (TP) waters. All TP streams and waterbodies were buffered by 90 meters in order to capture surrounding riparian areas.	

(Table 4 continued)

No.	Dataset	Categories	Weight	Source	URL	Description	Notes
19	Pinelands Streams (plus 90 meter buffer)	PL	5	DEP	http://www.nj.gov/dep/gis/stateshp.html#SWQS	This layer was derived from New Jersey's Surface Water Quality Standards. It represents all the streams in the Pinelands Region (PL). All PL streams were buffered by 90 meters in order to capture surrounding riparian areas.	
20	Freshwater Mussel Habitat (plus 90 meter buffer)		4	DEP -derived from publicly available Landscape Project	http://www.nj.gov/dep/gis/landscape.html	This layer is derived from the Landscape Project (Version 3.1), which represents the stretches of stream that serve as habitat for endangered, threatened, and special concern freshwater mussel species. All freshwater mussel waters were buffered by 90 meters in order to capture surrounding riparian areas.	
21	Odonate Streams (plus 90 meter buffer)		4	DEP - unpublished	NA	This layer represents the stretches of stream that serve as habitat for endangered, threatened, and special concern odonate species. All odonate waters were buffered by 90 meters in order to capture surrounding riparian areas.	
22	Diadromous Fish Streams (plus 90 meter buffer)		5	TNC- Geospatial Condition Analysis	https://www.conservationsgateway.org/ConservationByGeography/NorthAmerica/UnitedStates/edc/Pages/geospatial.aspx	Includes: documented current freshwater habitat (spawning and overwintering) for at least one of the following diadromous fish: alewife, American shad, blueback herring, hickory shad, striped bass, Atlantic sturgeon, and/or Atlantic salmon.	

(Table 4 continued)

No.	Dataset	Categories	Weight	Source	URL	Description	Notes
23	Aquatic Richness by HUC14	1	1	DEP - unpublished	NA	The number of unique species categorized as aquatic was calculated for the streams and waterbodies within each HUC 14.	This layer conflates the unique species count from each HUC 14 to all water features (buffered by 300 ft.) within each HUC 14. Species data includes an Aquatic_Ranked field that shows species considered. Aquatic_R_Metric shows rank assigned to species.
		2	2				
		3	3				
		4-6	4				
		7-11	5				
24	Streams and Waterbodies ranked by Aquatic Species	S common	1	DEP - unpublished	NA	Streams and Waterbodies from the National Hydrography Dataset (NHD) were buffered by 90 meters and combined to create an “aquatic habitat” base layer. Using species data as a guide, the layer was hand-edited to estimate appropriate areas of habitat. Aquatic species data was then spatially joined to the habitat layer in order to assign the maximum rank (based primarily on species status) of the species present to the intersecting habitat area.	Species data includes an Aquatic_Ranked field that shows species considered. Aquatic_R_Metric shows rank assigned to species.
		S not common	2				
		SC/SC/S	3				
		T/T/SC	4				
		E/ET	5				
25	Ambient Biomonitoring Network	Fair	1	DEP	http://www.nj.gov/dep/gis/stateshp.html#AMNET	This layer represents point sites sampled by NJDEP as part of its Ambient Biomonitoring Network (AMNET). Sites are sampled in every Watershed Management Area (WMA) in the State. Historically, the New Jersey Impairment Score (NJIS), based on family level taxonomy, was used for the entire state to make assessments at three levels of impairment; non-impaired, moderately impaired, and severely impaired. NHD stream segments were coded with impairment scores and a buffer of 90 meters was applied.	
		Good	2				
		Excellent	3

No.	Dataset	Categories	Weight	Source	URL	Description	Notes
26	Metric Riparian Landcover (90-meter buffer)	0-1	4	USGS/DEP - unpublished	NA	The riparian zone is the land area directly adjacent to a stream or river and subject to its influence. The amount of agriculture and developed land within each riparian buffer zone by overlaying the 2011 National Landcover dataset on the 90-meter stream buffers.	To assess the amount of conversion in riparian lands around streams and waterbodies, we calculated the amount of agriculture and developed land within each riparian buffer zone by overlaying the 2011 National Landcover dataset on the 90 meters riparian buffers. We also transformed the landcover information into a summary impact index by summing the percent of development and agriculture in the buffer zone, and weighting the effect of medium to high intensity development twice as much as of agriculture: Impact= 0.5 * % agriculture + 0.75* % low intensity development+ 1.0* % medium to high intensity development. The impact index ranged from 100 for a watershed with its buffer zone totally developed to 0 where the buffer zone was completely within natural cover. National Landcover Dataset 2011 classes were classed as follows: Low Intensity Developed = 21, 22, 31 (revised non-natural barren class), Medium to High Intensity Developed = 23, 24, Agriculture = 81, 82, Forest = 41, 42, 43, Wetland = 90, 95, Open / Grassland/ Shrubland = 32, 52, 71.
		1-10	3				
		10-25	2				
		25-50	1				

(Table 4 continued)

No.	Dataset	Categories	Weight	Source	URL	Description	Notes
27	Metric Impervious Surfaces (90- meter buffer)	CLASS 1	3	USGS/DEP - unpublished	NA	Impervious surfaces are hard substrates like paved roads, parking lots, and roof tiles. The amount of impervious cover for each stream segment and waterbody using the 2011 National Landcover Impervious Surface Dataset.	To examine impervious surfaces in the state, we summarized the amount of impervious cover for each stream segment and waterbody using the 2011 National Landcover Impervious Surface Dataset. We grouped each stream and waterbody into one of four impact categories. Percent Imperviousness Impact Categories: Class 1: Undisturbed: $0 < 0.5\%$ Class 2: Low impacts: $0.5\text{-}2\%$ Class 3: Moderate Impacts: $\geq 2\text{-}10\%$ Class 4: High Impacts: $\geq 10\%$ The NLCD 2011 Percent Developed Imperviousness values were first converted to impervious area. Then, the impervious grid was clipped and snapped to the NHDPlus catchments that the impervious surface area grid was allocated by summing the area of impervious surface within each catchment. The percent impervious for each catchment was calculated as follows: $(\text{allocated impervious area})/(\text{catchment area}) \times 100\%$
		CLASS 2	2				
		CLASS 3	1				
28	Submerged Aquatic Vegetation	SAV: 40- 100% cover	5	Rutgers	http://crssa.rutgers.edu/projects/sav/downloads.html	This layer represents submerged aquatic vegetation (SAV) of the Barnegat Bay - Little Egg Harbor estuary, from 2003 to 2009. The three classes of SAV are: 1) Dense (80% - 100% cover), 2) Moderate (40% - 80% cover), and 3) Sparse (10% - 40% cover).	Grant F. Walton Center for Remote Sensing and Spatial Analysis (CRSSA), Rutgers University. 2011. Submerged aquatic vegetation (SAV) CRSSA image classification of the Barnegat Bay - Little Egg Harbor estuary, New Jersey: 2009
		SAV: 10- 40% cover	4

(Table 4 continued)

No.	Dataset	Categories	Weight	Source	URL	Description	Notes
35	The Marine Protected Areas Inventory		3	NOAA	http://marineprotectedareas.noaa.gov/helpful_resources/inventory.html	The Marine Protected Areas Inventory (MPA Inventory) is a comprehensive geospatial database designed to catalog and classify marine protected areas within US waters. The MPA Inventory was developed with extensive input from state and federal MPA programs, and drawn from other publicly available data.	
36	Back-bay and Estuarine Waterbody Spawning Access Areas		5	DEP - unpublished	NA	Direct ocean access "Primary" sites were designated by an area with a radius twice that of the minimum width of the passage. All other "Secondary" access sites were designated by an area with a diameter equal to the minimum width of the passage. All areas were assigned a CFA Rank of 5. Access of the ocean to and from the bays and rivers is critical to the life history of a multitude of fish species for the needs of spawning and migration events.	New Jersey Marine Fisheries Administration
37	Shipwreck Dense Areas	3	2	NOAA/AWOIS	https://nauticalcharts.noaa.gov/data/wrecks-and-obstructions.html	Recorded shipwrecks were examined by the density in which they coexisted. The top 20% of the densest shipwreck areas received a 250 meter radius buffer surrounding each shipwreck. CFA Ranks were calculated by standardizing the inverse of the area per wreck at each site to a maximum of 3. Shipwrecks provide long-term, small area bottom structure that have the potential to function as reefs, providing surface for corals and habitat for various structure-dependent fish species. Also provide sites for recreational activities such as fishing and scuba-diving.

38	Sport fishing Areas		2	DEP	http://www.state.nj.us/dep/gis/stateshp.html#SPORTFISH	The Department first mapped prime fishing areas in the 1980s, and in 2003 updated the data by surveying charter boat, party boat, and private boat captains to identify the areas they consider recreationally significant fishing areas or prime fishing areas. All areas were assigned a CFA Rank of 2. Prime fishing areas have a demonstrable history of supporting a significant local quantity of recreational and commercial fishing activity.	New Jersey Marine Fisheries Administration
39	Ocean Trawl Species Rich Areas		3	DEP - unpublished	NA	A total of the number of fish species caught between 2010 and 2015 was calculated from the New Jersey Ocean Stock Assessment Survey (a groundfish trawl survey) at each surveyed site. A density raster was created from this data and the top 10% was isolated and defined as an area of high species richness. All areas were assigned a CFA Rank of 3. Areas of high species richness can function as emigration sources to lower species-rich areas if those habitats become suitable. High biological diversity can function as an indicator of a healthy ecosystem.	New Jersey Marine Fisheries Administration

No.	Dataset	Categories	Weight	Source	URL	Description	Notes
40	Seabird Annual Average Abundance Composite	0-0.2	1	NOAA	https://marinecadastre.gov/data/	The data represent predicted number of individuals of each listed seabird species per standardized survey segment (15-minute travel time at 10 knots = approx. 2.5 nautical miles (Nm) or 2.9 statute miles.) Therefore, if the average annual abundance number for a species is 0.2-0.3, then this model estimates that, on average, a single animal would be seen for every 3.3 - 5 survey segments conducted at randomly selected times of the year. Note that some species models were not estimated for all seasons due to very low/no abundance in those seasons, so the annual abundance is based only on the actual seasons modeled, assuming 0 abundance in other seasons. This data is a composite of the following 15 species: Common Eider, Common Loon, Long-tailed Duck, Northern Gannett, Razorbill, Red-throated Loon, Roseate Tern, White-winged Scoter, Black-legged Kittiwake, Black Scoter, Corys Shearwater, Great Shearwater, Leach's Storm Petrel and Red Phalarope. 41	Shipping Density (all vessels)	1-6	-2	NOAA/USCG	https://marinecadastre.gov/data/	Automatic Identification Systems (AIS) are a navigation safety device that transmits and monitors the location and characteristics of many vessels in U.S. and international waters in real-time. These products represent vessel traffic from the Atlantic in 2013 from all vessels with AIS transponders. The densities are reported in 100-meter grid cells for all vessels and broken into nine vessel type groupings. Vessel groupings include: cargo, fishing, military, passenger, pleasure, tanker, tug-tow, other, and not available categories. The data are based on 2013 vessel track line data for the Atlantic, which is defined as UTM zones 17, 18, 19, and 20. The data are best interpreted using a high to low density scale and do not represent actual vessel counts. Appendix F: Habitat Crosswalks

Habitat Crosswalks

The *Habitat Crosswalks* are described in detail within Chapter 2, Section IV. They are based on two habitat classification system/mapping schemes:

1. The New Jersey Department of Environmental Protection's (DEP) land use/land cover data.
2. The Northeast Terrestrial Wildlife Habitat Classification System.

The ENSP's Landscape Project mapping, which remains the principal basis for the DFW's mapping of endangered, threatened and special concern wildlife species habitats, relies on New Jersey's land use/land cover data as a base layer. We decided to continue the use of the New Jersey land use/land cover mapping to describe and depict wildlife habitats in the context of this plan to make New Jersey's State Wildlife Action Plan relevant and accessible to New Jersey's users, and because we believe it to be more spatially precise than the Northeast Terrestrial Wildlife Habitat Classification System. This land use/land cover data set is used to characterize the Conservation Focal Areas (CFAs) and, at a broader scale of habitat types, to characterize the Focal SGCN habitat associations. However, we recognize the need to facilitate use of this plan at a multi-state or regional level and, therefore, we have provided a cross-walk to aid the translation between these two habitat classification/mapping schemes.

Following are two habitat crosswalks, including:

- A comparative association between DEP's land use/land cover data and the habitat categories used to characterize Focal SGCN habitat associations described in Chapter 1 and presented within the *Profiles of the Focal Species of Greatest Conservation Need*, Appendix D.
- A comparative association between the DEP's land use/land cover data and the Northeast Terrestrial Wildlife Habitat Classification System.

A third habitat crosswalk that focuses on the comparative association between the DEP's land use/land cover data and the habitat categories used to characterize Conservation Focal Areas can be found in Appendix G.

Table 1. Habitat crosswalk between DEP’s land use/land cover habitat categories, the habitat categories used to characterize the CFAs, and the categories used to characterize SGCN habitat associations.

Table 2. Comparative association between the DEP's land use/land cover data and the Northeast Terrestrial Wildlife Habitat Classification System.

In progress: The DFW is working with the State's Natural Heritage Program to complete a comparative association between the DEP's land use/land cover data and the Northeast Terrestrial Wildlife Habitat Classification System. As described above, the DFW recognizes the benefit of such a crosswalk for multi-state and regional conservation efforts. This crosswalk is under development and will be incorporated into the Plan once it is completed.

Appendix H: List of Threats and Action Drivers

List of Threats and Action Drivers

Below are the threats and action drivers relative to wildlife and wildlife habitats. They were defined and categorized by the three-level lexicons developed by the International Union for the Conservation of Nature's (IUCN) and the U.S. Fish & Wildlife Service (detailed in Chapter 3), and serve to standardize the categories for threats and action drivers, and, later, conservation actions to address them. In addition, New Jersey chose to develop an even finer fourth level of actions that are specific to New Jersey.

IUCN Threat and TRACS Action Driver Categories			
Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements

1 Residential and Commercial Development: *Threats to native habitat and wildlife associated with the conversion of natural land to development for residential, commercial and industrial or other non-agricultural land uses with a substantial footprint.*

1.1 Housing and Urban Areas: *Expansion or development of new residential areas of cities, towns and settlements including non-housing development that is typically integrated with housing.*

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale): *Habitat loss, fragmentation, and degradation (including wildlife travel corridors) associated with habitat conversion to housing and associated infrastructure and traffic.*

1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.1.1.2 Loss, alteration and/or degradation of habitat.

1.1.1.3 Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.

1.1.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.

1.1.1.5 Impervious surfaces can lead to a decrease in water recharge.

1.1.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.1.1.7 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.1.2 Residential development using materials that cause collision hazards: *Residential development that increases collision risk because of height, lighting scaffolding, and/or reflectance or transparency of materials used.*

1.1.2.1 Collision risk to volant species (birds, bats and invertebrates).

1.2 Commercial and Industrial Areas: *Commercial and non-extractive industrial development and operations.*

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale): *Habitat loss, fragmentation, and degradation (including wildlife travel corridors) resulting from habitat conversion to commercial or industrial use and associated infrastructure and traffic (Note: The conversion of natural landscapes to structures and infrastructure within military bases are included within this category).*

1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.2.1.2 Loss, alteration and/or degradation of habitat.

1.2.1.3 Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.

1.2.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.

1.2.1.5 Impervious surfaces can lead to a decrease in water recharge.

1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
			<p><u>1.2.1.7</u> Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.</p> <p>1.2.2 Commercial development using materials that cause collision hazards: <i>Commercial and industrial development that increases collision risk because of height, lighting scaffolding, and/or reflectance or transparency of materials used.</i></p> <p><u>1.2.2.1</u> Collision risk to volant species (birds, bats and invertebrates).</p> <p>1.3 Tourism and Recreational Areas: <i>Tourism and recreation sites with a substantial footprint.</i></p> <p>1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale): <i>Conversion of significant natural habitats (including wildlife travel corridors) into active recreation parks (e. g., ball fields, camping areas, golf courses) (Note: The conversion of natural landscapes to recreational and/or outdoor training areas within military bases are included within this category).</i></p> <p><u>1.3.1.1</u> Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.</p> <p><u>1.3.1.2</u> Loss, alteration and/or degradation of habitat.</p> <p><u>1.3.1.3</u> Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.</p> <p><u>1.3.1.4</u> Impervious surfaces can lead to a decrease in water recharge.</p> <p><u>1.3.1.5</u> Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.</p> <p><u>1.3.1.6</u> Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.</p> <p>2 Agriculture and Aquaculture: <i>Threats to native habitat and/or fish/wildlife associated with the conversion of natural habitat to farming, ranching, silviculture, mariculture or aquaculture, including expansion and intensification and/or changes in practices.</i></p> <p>2.1 Annual and Perennial Crops (non-timber): <i>Planting and harvesting of crops planted for food, fodder, fiber, fuel or other uses.</i></p> <p>2.1.1 Shifting Agriculture: <i>Changing the agricultural use of a land from one that can be beneficial to animals (e.g., hay fields, pastureland) if managed for target species to one of lesser or no use (e.g., intensive tree/shrub nurseries).</i></p> <p><u>2.1.1.1</u> Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.</p> <p><u>2.1.1.2</u> Conversion, and subsequent loss, of high salt marsh to low salt marsh threatens high-marsh dependent species and those dependent on the marsh-upland ecotone.</p> <p><u>2.1.1.3</u> Conversion of agricultural landscape that results in increased erosion, runoff, and chemical and thermal pollution decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.</p> <p><u>2.1.1.4</u> Salt hay farming on Delaware Bay marshes, and the subsequent conversion of those farms to fully tidal marshes, results in compressed sediments that are less resilient to coastal forces of erosion and sea level rise.</p> <p><u>2.1.1.5</u> Lack of competitive market prices to maintain native grasslands causes conversion to other crops that have more monetary value but less value as wildlife habitat.</p> <p>2.1.2 Small-holder Farming: <i>Small-scale and/or family farms, primarily for personal consumption or local markets, that causes habitat loss, degradation and/or fragmentation.</i></p> <p><u>2.1.2.1</u> Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.</p> <p><u>2.1.2.2</u> Fragments terrestrial and aquatic habitats.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
			<p><u>2.1.2.3</u> Agricultural practices (e.g., mechanized, row-crop agriculture) can render lands unsuitable for most wildlife due to soil degradation and erosion.</p> <p><u>2.1.2.4</u> Agricultural practices (e.g., mechanized, row-crop agriculture) can cause direct mortality to wildlife when harvesting takes places.</p> <p><u>2.1.2.5</u> Lack of competitive market prices to maintain native grasslands causes conversion to other crops that have more monetary value but less value as wildlife habitat.</p> <p>2.1.3 Agro-industry: <i>Industrial-scale agriculture, including new or expansion of existing facilities that causes habitat loss, degradation and/or fragmentation.</i></p> <p><u>2.1.3.1</u> Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.</p> <p><u>2.1.3.2</u> Fragments terrestrial and aquatic habitats.</p> <p><u>2.1.3.3</u> Agricultural practices (e.g., mechanized, row-crop agriculture) can render lands unsuitable for most wildlife due to soil degradation and erosion.</p> <p><u>2.1.3.4</u> Agricultural practices (e.g., mechanized, row-crop agriculture) can cause direct mortality to wildlife when harvesting takes places.</p> <p><u>2.1.3.5</u> Loss of ecotones by implementing clean farming (edge-to-edge) practices degrades habitat for early successional wildlife.</p> <p><u>2.1.3.6</u> Lack of competitive market prices to maintain native grasslands causes conversion to other crops that have more monetary value but less value as wildlife habitat.</p> <p>2.2 Wood and Pulp Plantations: <i>Growing and harvesting trees and other woody vegetation for timber, fiber or fuel.</i></p> <p>2.2.1 Small Holder: <i>Small-scale wood or pulp plantations and associated facilities or expansion of existing facilities that causes habitat loss, degradation and/or fragmentation.</i></p> <p><u>2.2.1.1</u> Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.</p> <p><u>2.2.1.2</u> Tree harvesting can cause direct mortality to wildlife, especially if done during peak activity periods or vulnerable life stages (e.g., denning, nesting, gestation/birthing, basking, roosting, pre-volancy, etc.).</p> <p><u>2.2.1.3</u> Improper design or restoration of skid roads may result in ponded areas that serve as habitat sinks for amphibians.</p> <p>2.2.2 Agro-industry Plantations: <i>Industrial-scale wood or pulp plantations and associated facilities or expansion of existing facilities that causes habitat loss, degradation and/or fragmentation.</i></p> <p><u>2.2.2.1</u> Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.</p> <p><u>2.2.2.2</u> Tree harvesting can cause direct mortality to wildlife, especially if done during peak activity periods or vulnerable life stages (e.g., denning, nesting, gestation/birthing, basking, roosting, pre-volancy, etc.).</p> <p><u>2.2.2.3</u> Improper design or restoration of skid roads may result in ponded areas that serve as habitat sinks for amphibians.</p> <p>2.3 Livestock Farming and Ranching: <i>Raising of animals for human consumption or other human use.</i></p> <p>2.3.2 Small-holder Grazing: <i>Small-scale and/or family farms, primarily for personal consumption or local markets, that use or converts natural habitat to facilities (including expansion of existing facilities), grazing land or other livestock farming.</i></p> <p><u>2.3.2.1</u> Inappropriately located, newly created horse/livestock farms may fragment forest habitats.</p> <p><u>2.3.2.2</u> Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.</p> <p><u>2.3.2.3</u> Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.</p> <p><u>2.3.2.4</u> Livestock allowed to wade into waterbodies trample and degrade aquatic habitats.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
		2.3.3	Agro-industry Grazing: <i>Industrial-scale use or conversion of natural habitat to facilities (including expansion of existing facilities), grazing land or other livestock farming.</i>
			<u>2.3.3.1</u> Inappropriately located, newly created horse/livestock farms may fragment forest habitats.
			<u>2.3.3.2</u> Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.
			<u>2.3.3.3</u> Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.
			<u>2.3.3.4</u> Livestock allowed to wade into waterbodies trample and degrade aquatic habitats.
		2.4	Marine and Freshwater Aquaculture: <i>Propagation, rearing, and subsequent harvesting of aquatic organisms in controlled or selected environments, including interventions in the rearing process to increase production such as stocking, feeding, transplanting and providing for protection from predators.</i>
		2.4.1	Subsistence/Artisinal Aquaculture: <i>Small-scale aquaculture, primarily for personal consumption or local markets, that causes habitat loss or degradation.</i>
			<u>2.4.1.1</u> May degrade freshwater and intertidal habitat due to farming techniques and damage from associated structures.
			<u>2.4.1.2</u> Increased risk of parasite introduction into marine environments.
			<u>2.4.1.3</u> Potential for increased nutrient and effluent loads.
			<u>2.4.1.4</u> Potential increased noise pollution.
			<u>2.4.1.5</u> Increased risk of persistent human disturbance from tending activities that hinder or preclude habitat use by SGCN.
			<u>2.4.1.6</u> Potential for aquaculture structures to create impingement/entanglement hazard and/or preclude benthic habitat use by SGCN.
			<u>2.4.1.7</u> Potential for fish to escape and compete with, predate upon, interbreed with, or spread disease to SGCN fish species.
		2.4.2	Industrial Aquaculture: <i>Large-scale aquaculture, primarily for wholesale, that causes habitat loss or degradation.</i>
			<u>2.4.2.1</u> May degrade freshwater and intertidal habitat due to farming techniques and damage from associated structures.
			<u>2.4.2.2</u> Increased risk of parasite introduction into marine environments.
			<u>2.4.2.3</u> Potential for increased nutrient and effluent loads.
			<u>2.4.2.4</u> Potential increased noise pollution.
			<u>2.4.2.5</u> Increased risk of persistent human disturbance from tending activities that hinder or preclude habitat use by SGCN.
			<u>2.4.2.6</u> Potential for aquaculture structures to create impingement/entanglement hazard and/or preclude benthic habitat use by SGCN.
			<u>2.4.2.7</u> Potential for fish to escape and compete with, predate upon, interbreed with, or spread disease to SGCN fish species.
			<u>2.4.2.8</u> Potential for fish to escape and compete with, predate upon, or spread disease to fish species that serve as hosts for SGCN freshwater mussels.

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
---------	---------	---------	--

3 Energy Production and Mining: *Threats to native habitat and/or fish/wildlife associated with exploring for, developing, producing and distributing energy or geological resources.*

3.1 Oil and Gas Facilities and Pipelines: *Distribution of oil and natural gas.*

3.1.1 Distribution processes of petroleum and other liquid hydrocarbons: *Placement of new facilities and pipelines or expansion of existing facilities and pipeline to develop, produce and/or distribute petroleum and other liquid hydrocarbons that causes habitat loss, degradation, and/or fragmentation.*

3.1.1.1 Fragments terrestrial and aquatic habitats.

3.1.1.2 Loss, alteration and/or degradation of habitat.

3.1.1.3 Increased risk of oil spills.

3.1.1.4 Increased noise pollution.

3.1.1.5 Increased vehicular and ship traffic associated with construction and operations, and therefore an increased risk of wildlife mortality from strikes.

3.1.1.6 Increased risk of collision between marine mammals, sea turtles and fish and the marine-based structures/facilities.

3.1.2 Natural gas distribution processes: *Placement of new facilities and pipelines or expansion of existing facilities and pipelines to develop, produce and/or distribute natural gas that causes habitat loss, degradation, and/or fragmentation.*

3.1.2.1 Fragments terrestrial and aquatic habitats.

3.1.2.2 Loss, alteration and/or degradation of habitat.

3.1.2.3 Increased risk of gas leaks and explosions.

3.1.2.4 Increased noise pollution.

3.1.2.5 Increased vehicular and ship traffic associated with construction and operations, and therefore an increased risk of wildlife mortality from strikes.

3.1.2.6 Increased risk of collision between marine mammals, sea turtles and fish and the marine-based structures/facilities.

3.2 Mining and Quarrying: *Exploring for, developing, producing and distributing minerals and rocks.*

3.2.2 Surface Mining - Rock Quarry (and sand quarries): *Placement of new facilities or expansion of existing facilities to develop, produce and/or distribute quarry products that causes habitat loss, degradation, and/or fragmentation.*

3.2.2.1 Fragments terrestrial and aquatic habitats.

3.2.2.2 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

3.2.2.3 Increased risk of vehicle strikes/mortality to wildlife.

3.2.4 Sand Dredging (outside shipping lanes): *Dredging offshore sand (for placement on Atlantic coastal beaches) from sensitive areas that alters and/or degrades the natural, benthic habitat(s).*

3.2.4.1 Loss, alteration and/or degradation of benthic marine habitats.

3.2.4.2 Increased noise pollution.

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
---------	---------	---------	--

3.2.4.3 Potential for direct mortality of benthic organisms.

3.3 Renewable Energy: *Exploring, developing, producing and distributing renewable energy.*

3.3.1 Wind Power: *Placement of new facilities or expansion of existing facilities that causes habitat loss, degradation, and/or fragmentation and/or that leads to increased bird and bat fatalities within their movement corridors and foraging areas.*

3.3.1.1 Turbines, blades, and structure foundations create a collision risk to volant species (birds, bats and invertebrates) and marine animals.

3.3.1.2 Fragments terrestrial habitats.

3.3.1.3 Loss, alteration and/or degradation of habitat.

3.3.1.4 Increased commercial infrastructure.

3.3.2 Solar Power: *Placement of new facilities or expansion of existing facilities that causes habitat loss, degradation, and/or fragmentation.*

3.3.2.1 Fragments terrestrial habitats.

3.3.2.2 Loss, alteration and/or degradation of habitat.

3.3.2.3 Increased commercial infrastructure.

3.4 Conventional Power Plants: *Placement of new facilities or expansion of existing facilities that causes impacts to groundwater hydrology and/or alters the water temperature and/or pH of aquatic systems.*

3.4.0 Conventional Power Plants: *Placement of new facilities or expansion of existing facilities that causes impacts to groundwater hydrology and/or alters the water temperature and/or pH of aquatic systems.*

3.4.0.1 Methane flares cause injuries and mortality to birds perching on stacks.

3.4.0.2 Loss, alteration and/or degradation of habitat due to new or the expansion of current facilities.

3.4.0.3 Alteration of the temperature, pH and/or hydrology of aquatic ecosystems change plant communities and can harm wildlife and/or impact their behavior and survivorship.

4 Transportation and Service Corridors: *Threats to native habitat and/or fish/wildlife associated with long, narrow transportation corridors outside of human settlements and industrial developments and the vehicles that use them that causes habitat loss, degradation and fragmentation, wildlife mortality, species isolation and more.*

4.1 Roads and Railroads: *Non-energy related transportation corridors on land.*

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale): *Placement of new roads that result in the degradation of habitat including pathways for invasive species, the fragmentation of habitat resulting in the loss of interior conditions for forest interior dwelling species, increased access by predators and parasites resulting in reduced breeding success, and increased access for people resulting in future development activities, and the implementation of physical barriers (e.g., residential curbs, "NJ Barriers") that disrupt wildlife movement corridors.*

4.1.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species and inhibiting dispersal of non-volant animals, reducing gene flow.

4.1.1.2 Loss, alteration and/or degradation of habitat associated with road and railroad construction and maintenance, and degradation of adjacent habitats.

4.1.1.3 Re-establishment of abandoned railroad lines may displace wildlife, in particular, less mobile species using the area to fulfill critical life history requirements.

4.1.1.4 Re-establishment of abandoned railroad lines may increase the risk of direct mortality on wildlife.

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
			<p><u>4.1.1.5</u> Re-establishment of abandoned railroad lines may decrease turtles' abilities to disperse due to their difficulty traversing the railroad ties and tracks, leading to decreased genetic exchange.</p> <p>4.1.2 Movement of cars and other vehicles on roads and railroads (large and small scale): <i>Vehicular traffic densities that increase wildlife mortality and disrupt movement corridors.</i></p> <p><u>4.1.2.1</u> Increased vehicle traffic increases the risk of wildlife mortality from strikes.</p> <p>4.2 Utility and Service Lines: <i>Distribution of energy & resources.</i></p> <p>4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads: <i>Placement of new service lines and communication towers, their facilities and associated access roads that result in the degradation of habitat including pathways for invasive species, the fragmentation of habitat resulting in the disruption of movement corridors and/or loss of interior conditions for forest interior dwelling species, wildlife mortality through strikes or other contact with associated equipment (e.g., electrical lines, towers), increased access by predators and parasites resulting in reduced breeding success, and increased access for people resulting in future development activities.</i></p> <p><u>4.2.1.1</u> Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species, inhibiting dispersal of non-volant animals, reducing gene flow, and creating barriers to fish when service line-associated roads cross streams (e.g., bridges, culverts, fords, etc.).</p> <p><u>4.2.1.2</u> Loss, alteration and/or degradation of habitat associated with rights-of-way construction and maintenance, and degradation of adjacent habitats.</p> <p><u>4.2.1.3</u> Powerline structures attract perching raptors, increasing the risk of raptor electrocution.</p> <p><u>4.2.1.4</u> Lines that cross or run parallel to streams result in a loss or reduction of vegetated riparian buffers and streamside shading, affecting water quality and in-stream habitat for aquatic biota.</p> <p><u>4.2.1.5</u> Tall radio and utility towers with guy lines pose a strike hazard for migrant bats and birds, especially in poor visibility conditions (e.g., fog, nighttime, poor weather conditions).</p> <p>4.2.2 Management of rights-of-way or communication tower facilities and/or their associated access roads: <i>Managing the vegetation within and adjacent to the rights-of-way, communication tower facilities and/or their associated access roads in a manner that results in direct mortality of wildlife (e.g., mowing during ground-nesting birds' or reptiles nesting season) or the creation of unsuitable habitat or conditions (e.g., herbiciding important food plants for invertebrates).</i></p> <p><u>4.2.2.1</u> Improper or poorly scheduled vegetation management can cause direct mortality to and may reduce productivity of wildlife.</p> <p>4.3 Shipping Lanes: <i>Transportation on and in freshwater and ocean waterways.</i></p> <p>4.3.1 Movement of large ships in shipping lanes: <i>Ship traffic densities that increase marine and freshwater species' mortality and/or disrupt movement corridors or migratory patterns.</i></p> <p><u>4.3.1.1</u> Increased ship traffic increases the risk of wildlife mortality from strikes.</p> <p><u>4.3.1.2</u> May disturb nesting and foraging of shoreline birds and aquatic animals, and/or alter migratory patterns of aquatic and marine wildlife.</p> <p>4.3.2 Dredging impacts: <i>Removal, transportation and placement of dredged material in containment facilities that causes the alteration of natural habitats, and/or the direct mortality of wildlife.</i></p> <p><u>4.3.2.1</u> Threatens wildlife by disrupting/removing stream bottom habitat.</p> <p><u>4.3.2.2</u> Historic and current reuse of containment facilities over time may disrupt/displace nesting birds.</p> <p><u>4.3.2.3</u> Transportation of materials to and from disposal facilities may pose temporary disturbance to wildlife impacting foraging and nesting success.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
---------	---------	---------	--

4.4 Flight Paths: *Transportation in air and space.*

4.4.1 Airplane flight paths: *Flight travel paths (for large and small aircraft) that conflict with and thereby increased fatalities of birds, bats and invertebrates, especially during migration, within migration corridors and concentration areas, and important foraging grounds.*

4.4.1.1 Increased noise disturbance to wildlife, disrupting their normal behaviors.

4.4.1.2 Increased risk of collision between airplanes and birds, bats and insects.

5 Biological Resource Use: *Threats to native habitat and/or fish/wildlife associated with overharvesting biological resources for commercial, recreation, subsistence, research or cultural purposes, including both deliberate and unintentional harvesting beyond sustainable levels, and actions of persecution or control of undesirable wildlife or plants.*

5.1 Hunting and Collecting Terrestrial Animals: *Overharvesting terrestrial wild animals or animal products; includes accidental mortality/bycatch.*

5.1.1 Intentional Use: *Excessive or illegal collection of butterflies and other insects, the illegal collection of reptiles and amphibians and localized excessive beaver trapping.*

5.1.1.1 Illegal collection of wildlife can have detrimental impacts on populations.

5.1.1.2 Legal but excessive harvest of SGCN game species.

5.1.2 Unintentional effects: *Includes unintended impacts to non-target species such as, but not limited to, the bycatch of marsh birds in muskrat traps or the introduction of lead (ammunition) into the environment and in dead animals later scavenged.*

5.1.2.1 Lead in ammunition is consumed by wildlife in the course of foraging and scavenging causing injury and death.

5.1.2.2 Disruption of normal wildlife behavior.

5.1.3 Persecution/Control: *Harming, killing or controlling the presence of species considered undesirable (e.g., snakes, bats, invertebrates) and similar-looking species (i.e., those species misidentified as an undesirable species).*

5.1.3.1 Wanton killing of perceived dangerous and/or undesirable animals.

5.1.3.2 Improper exclusion methods and/or timing can result in injury, death, or entrapment of bats in buildings.

5.2 Gathering Terrestrial Plants: *Overharvesting plants, fungi (mushrooms) and other non-timber/non-animal species.*

5.2.2 Unintentional effects: *Includes unintended impacts to non-target species through the trampling or other means of destruction of plants, fungi and/or ecological communities.*

5.2.2.1 Stepping on nests or young/hatchling animals.

5.2.3 Control: *Harming, killing or controlling the presence of plants and/or ecological communities considered undesirable (e.g., doesn't meet humans' aesthetic desires or is a native, invasive plant that is taking over a local landscape).*

5.2.3.1 Alteration or control of undesirable plants or plant communities can destroy important food and nectar plants for native insects and animals.

5.2.3.2 Clearing of scrub-shrub vegetation [and snags] diminishes cover and nesting habitat.

5.2.3.3 Removal of riparian or near-stream vegetation alters water quality and in-stream habitat for aquatic organisms by reducing streamside shading, increasing bank erosion, and affecting the natural filtering ability of trees, shrubs, and grasses.

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
---------	---------	---------	--

5.3 Logging and Wood Harvesting: *Harvesting trees and other woody vegetation for timber, fibre, or fuel.*

5.3.1 Intentional Use (subsistence/small scale): *Harvesting trees and other woody vegetation from natural landscapes on public or private lands at a small-scale primarily for personal use or local markets, leading to the loss, fragmentation, degradation, and/or isolation of forested habitats and species. For the purposes of NJ's SWAP, small scale is defined as meeting the Forest Stewardship Council's "Small and Low Intensity Managed Forest" (SLIMF).*

5.3.1.1 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may fragment their terrestrial habitats.

5.3.1.2 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may cause the loss, alteration and/or degradation of wildlife habitat.

5.3.1.3 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase soil erosion, impacting SGCN habitats.

5.3.1.4 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase the risk of invasive species establishment, impacting SGCN habitats.

5.3.1.5 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may decrease structural diversity and biomass leading to reduced biodiversity and ecological integrity.

5.3.1.6 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices in Atlantic White Cedar stands may destroy a unique wildlife wetland habitat that is difficult, and takes time, to restore.

5.3.2 Intentional Use (large scale): *Harvesting trees and other woody vegetation from natural landscapes on public or private lands on a large-scale for commercial markets, leading to loss, fragmentation, degradation, and isolation of forested habitats and species. For the purposes of NJ's SWAP, large scale is defined as forest harvest exceeding the Forest Stewardship Council's "Small and Low Intensity Managed Forest" (SLIMF).*

5.3.2.1 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may fragment their terrestrial habitats.

5.3.2.2 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may cause the loss, alteration and/or degradation of wildlife habitat.

5.3.2.3 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase soil erosion, impacting SGCN habitats.

5.3.2.4 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase the risk of invasive species establishment, impacting SGCN habitats.

5.3.2.5 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may decrease structural diversity and biomass leading to reduced biodiversity and ecological integrity.

5.3.2.6 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices in Atlantic White Cedar stands may destroy a unique wildlife wetland habitat that is difficult, and takes time, to restore.

5.3.3 Unintentional effects (subsistence/small scale): *Includes unintended impacts to wildlife and/or their critical habitats as a result of small-scale/subsistence forestry practices. For the purposes of NJ's SWAP, small scale is defined as meeting the Forest Stewardship Council's "Small and Low Intensity Managed Forest" (SLIMF).*

5.3.3.1 Direct mortality of wildlife, direct loss of suitable habitats (roost, foraging, shelter, etc.), and can disrupt sensitive species, decreasing the likelihood of success and/or reproduction.

5.3.3.2 Poorly planned/implemented tree harvesting adjacent to waterways and vernal pools can lead to increased water temperatures, soil erosion and sedimentation, and reduces the potential for woody debris within the aquatic system, leading to negative impacts on wildlife.

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
			<p>5.3.4 Unintentional effects (large scale): <i>Includes unintended impacts to wildlife and/or their critical habitats as a result of commercial-scale forestry practices but also includes impacts to wildlife and/or their critical habitats as a result of a lack of forest management which may result in conditions of overstocked stands, excessive understory or stagnation at a particular forest stand condition. For the purposes of NJ's SWAP, large scale is defined as forest harvest exceeding the Forest Stewardship Council's "Small and Low Intensity Managed Forest" (SLIMF).</i></p> <p><u>5.3.4.1</u> Direct mortality of wildlife, direct loss of suitable habitats (roost, foraging, shelter, etc.), and can disrupt sensitive species, decreasing the likelihood of success and/or reproduction.</p> <p><u>5.3.4.2</u> Extensive infrastructure and larger equipment requirements present a potential risk of direct injury/mortality to wildlife.</p> <p><u>5.3.4.3</u> Poorly planned/implemented tree harvesting adjacent to waterways and vernal pools can lead to increased water temperatures, soil erosion and sedimentation, and reduces the potential for woody debris within the aquatic system, leading to negative impacts on wildlife.</p> <p><u>5.3.4.4</u> Infrastructure and/or equipment use may result in subtle changes to drainage patterns, adversely affecting vernal pool and wetland hydrology.</p> <p><u>5.3.4.5</u> Lack of appropriate, sustainable forest management can lead to a decrease in forest habitat diversity, degraded habitat for many forest species, the loss of habitat for early-successional species, and/or the loss of unique habitats for species that need canopy breaks and multi-aged tree composition to fulfill various life history requirements.</p> <p>5.4 Fishing and Harvesting of Aquatic Resources: <i>Harvesting aquatic wild animals or plants for commercial, recreation, subsistence, research, or cultural purposes including both deliberate and unintentional harvesting, and actions of persecution or control of undesirable animals or plants.</i></p> <p>5.4.1 Intentional Use (subsistence/small scale): <i>Excessive harvest of aquatic animals or plants from public or private "lands" (i.e., aquatic systems) at a small-scale primarily for personal use or local markets that leads to the loss or degradation of aquatic habitats and/or decline of aquatic species.</i></p> <p><u>5.4.1.1</u> Legal but excessive harvest of SGCN and/or sensitive game species can threaten populations especially for species already suffering from multiple threats.</p> <p><u>5.4.1.2</u> Overharvesting of one species may lead to detrimental impacts on another; e.g., the harvesting of horseshoe crabs reduces the food availability for migrating shorebirds dependent on crab eggs.</p> <p><u>5.4.1.3</u> Collection of fish for food, bait, or aquarium trade can lead to population exploitation.</p> <p><u>5.4.1.4</u> Illegal collection of aquatic and semi-aquatic wildlife can have detrimental impacts on populations.</p> <p>5.4.2 Intentional Use (large scale): <i>Excessive harvest of aquatic animals or plants from public or private "lands" (i.e., aquatic systems) at a large-scale for commercial markets that leads to the loss or degradation of aquatic habitats and/or decline of aquatic species (e.g., excessive horseshoe crab harvest).</i></p> <p><u>5.4.2.1</u> Overharvesting of one species may lead to detrimental impacts on another; e.g., overharvest of menhaden affecting piscivorous birds.</p> <p><u>5.4.2.2</u> Collection of fish for food, bait, or aquarium trade can lead to population exploitation.</p> <p><u>5.4.2.3</u> Legal but excessive harvest of commercial SGCN species can threaten populations.</p> <p><u>5.4.2.4</u> Illegal collection of aquatic and semi-aquatic wildlife can have detrimental impacts on populations.</p> <p>5.4.3 Unintentional effects (subsistence/small scale): <i>Includes unintended impacts to aquatic animals and/or vegetation as a result of small-scale/subsistence fishing/harvesting practices (e.g., diamond-backed terrapin by-catch within crab traps without excluder devices), the introduction of fishing-gear (e.g., line and hooks) into aquatic systems in which animals become entangled, injured or killed, the disruption of substrate/benthic habitat during trawling activities conducted as a result of product harvesting and/or scientific research.</i></p> <p><u>5.4.3.1</u> Abandoned fishing tackle and gear, crab pots without excluders and ghost crab pots increase the risk of injury and death to marine mammals, sea turtles, sea birds, pinnipeds and fish species as well as terrestrial and semi-aquatic species as a result of consuming tackle or gear, entrapment and entanglement in gear.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
			<p><u>5.4.3.2</u> Commercial/recreational shellfish dredging may impact marine ecosystems by uprooting submerged aquatic vegetation, disrupting substrates, increasing turbidity, and increasing predator species in localized areas.</p> <p><u>5.4.3.3</u> Heavy fishing pressure in localized areas can prevent foraging birds from hunting prime areas decreasing their likelihood of success and reproduction.</p> <p><u>5.4.3.4</u> Fish introduced for sport fishing can negatively impact native species by competing for resources and/or altering the habitat (e.g., disrupting benthic communities and/or severely impacting aquatic vegetation).</p> <p><u>5.4.3.5</u> Trawling disrupts habitat and threatens marine species including benthic/bottom feeding fishes, invertebrates and other benthic organisms as it disrupts and homogenizes the substratum, can lead to species decline and reduced species diversity.</p> <p><u>5.4.3.6</u> Fishing gear used by commercial fisheries results in bycatch or entanglement of non-targeted wildlife leading to injury and/or mortality.</p> <p><u>5.4.3.7</u> Improperly sanitized equipment, relocation of fish, importation and release of non-native species, and the use of bait from a different location can spread invasive species and diseases from one waterbody to another.</p> <p><u>5.4.3.8</u> Lead in fishing tackle is consumed by wildlife in the course of foraging and scavenging, causing injury and death.</p> <p><u>5.4.3.9</u> Decreased survival rate of horseshoe crabs bled for medical uses results in a diminished food supply for migrating shorebirds.</p> <p>5.4.4 Unintentional effects (large scale): <i>Includes unintended impacts to aquatic animals and/or vegetation as a result of large-scale/commercial fishing/harvesting practices (e.g., diamond-backed terrapin by-catch within crab traps without excluder devices), the introduction of fishing-gear (e.g., abandoned long lines, nets and hooks) into aquatic systems in which animals become entangled, injured or killed, the disruption of substrate/benthic habitat during commercial trawling activities.</i></p> <p><u>5.4.4.1</u> Fish introduced for sport fishing can negatively impact native species by competing for resources and/or altering the habitat (e.g., disrupting benthic communities and/or severely impacting aquatic vegetation).</p> <p><u>5.4.4.2</u> Commercial/recreational shellfish dredging may impact marine ecosystems by uprooting submerged aquatic vegetation, disrupting substrates, increasing turbidity, and increasing predator species in localized areas.</p> <p><u>5.4.4.3</u> Heavy fishing pressure in localized areas can prevent foraging birds from hunting prime areas decreasing their likelihood of success and reproduction.</p> <p><u>5.4.4.4</u> Trawling disrupts habitat and threatens marine species including benthic/bottom feeding fishes, invertebrates and other benthic organisms as it disrupts and homogenizes the substratum, can lead to species decline and reduced species diversity.</p> <p><u>5.4.4.5</u> Fishing gear used by commercial fisheries results in bycatch or entanglement of non-targeted wildlife leading to injury and/or mortality.</p> <p><u>5.4.4.6</u> Overexploitation of riparian, estuarine, and marine fisheries may deplete food resources required by marine mammals, sea turtles, marine fish and piscivorous birds, in turn resulting lower reproduction and survival.</p> <p><u>5.4.4.7</u> Improperly sanitized equipment, relocation of fish, use of bait from a different location, can spread invasive species and diseases from one waterbody to another.</p> <p><u>5.4.4.8</u> Decreased survival rate of horseshoe crabs bled for medical uses results in a diminished food supply for migrating shorebirds.</p> <p>5.4.5 Persecution/Control: <i>Harming, killing or controlling the presence of aquatic animals and plants considered undesirable and similar-looking species (i.e., those species misidentified as an undesirable species).</i></p> <p><u>5.4.5.1</u> Perception of diamondback terrapin as "bait stealers" may lead to harming/killing or relocation of individuals by recreational and/or commercial crabbers.</p> <p><u>5.4.5.2</u> Illegal collection of protected turtle species as a result of misidentification as a snapping turtle which has a limited season for harvest.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
---------	---------	---------	--

6 Human Intrusions and Disturbance: Threats to native habitat and/or fish/wildlife associated with non-consumptive uses of biological resources as a result of human activity.

6.1 Recreational Activities: People spending time in nature or traveling (by foot or motorized machinery) outside of established transportation or shipping corridors, usually for recreational reasons.

6.1.1 Off-road vehicles (motorized and non-motorized): *Vehicle use in natural landscapes that leads to the loss or degradation of habitat and/or aquatic systems and the decline of associated terrestrial and aquatic wildlife through habitat degradation and/or direct mortality (e.g., vehicles driving over dunes or through streams increase erosion and sediment threats degrading the habitat for beach nesting birds and aquatic wildlife, respectively, increase the spread of invasive plants which can alter the natural ecosystem, etc.).*

6.1.1.1 Inappropriate use of off-road vehicles creates new roads/trails which fragments habitat.

6.1.1.2 Inappropriate use of off-road vehicles can degrade terrestrial and aquatic habitat and reduce the suitability of adjacent habitats for wildlife.

6.1.1.3 Increased risk of harassment that results in a change in wildlife behavior and/or direct mortality from vehicle strikes.

6.1.1.4 Increased noise pollution.

6.1.1.5 Vehicle use on beaches can cause disturbance, harms breeding and foraging habitats, and can cause direct mortality of beach-nesting birds.

6.1.1.6 Off-road vehicles can be a mechanism of transference of wildlife diseases and invasive plant species if gear and apparel are not properly sanitized between sites.

6.1.2 Boating: *Recreational boating within sensitive wildlife areas that cause the disruption of waterbird colonies, other nesting habitats, or roosting areas.*

6.1.2.1 Alteration and/or degradation of aquatic habitat.

6.1.2.2 Increased disturbance to marine animals and ocean-, bay- and marsh-associated birds which can alter their behavior decreasing the likelihood of their success and/or reproduction.

6.1.2.3 Motorized boat propellers can inflict physical harm aquatic wildlife species.

6.1.2.4 A lack of law enforcement staff limits NJ's ability to enforce the Marine Mammal Protection Act which restricts approach distances to marine mammals.

6.1.2.5 Watercraft can be a mechanism of transference of wildlife diseases and invasive plant species if gear is not properly sanitized between sites.

6.1.3 Use of beaches: *Pedestrian and dog activities within sensitive beach habitats that cause the disruption of nesting, roosting, foraging birds on beaches.*

6.1.3.1 Increases disturbance to beach nesting birds that reduces nesting success, and reduces foraging and resting opportunities for a wide range of nesting and migrating shorebirds.

6.1.4 Exploration of caves/mines: *Recreational activities within caves and mines that leads to the disruption of roosting or hibernating bats and other organisms. (Note: the risk of spreading disease is categorized under threat 8.)*

6.1.4.1 Poses significant threats to cave-hibernating bats as such activity forces bats to arouse from hibernation, depleting critical fat reserves needed to survive the winter.

6.1.4.2 Vandalism to mines and caves supporting colonies of wintering bats can lead to large-scale mortality during hibernation, and long-term habitat loss, reducing available hibernation sites, if damage goes unrepaired or uncontrolled.

6.1.4.3 Participants may introduce wildlife diseases when gear and apparel are not properly sanitized between sites.

6.1.5 Wildlife observation and photography: *Wildlife and nature observation and photography that leads to the disruption of wildlife activities (e.g., breeding, foraging, mating, etc.).*

6.1.5.1 Improperly conducted recreational activities may disrupt normal wildlife behaviors which can result in reduced reproductive success or survival, abandonment of critical sites, etc.

6.1.5.2 Participants may introduce wildlife diseases and invasive plant species when gear and apparel is not properly sanitized between sites.

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
			<p>6.1.6 Recreational use of cliffs, rocks and ridgelines: <i>Recreational activities such as hang-gliding and rock climbing and scrambling that leads to the disruption of wildlife activities along mountain ridgelines and within rocky habitats.</i></p> <p><u>6.1.6.1</u> Recreational rock-climbing and rock-scrambling can cause reduced reproductive success or reproductive failure for wildlife by disrupting normal reproductive behaviors and/or reduce breeding success by forcing them into suboptimal habitats.</p> <p><u>6.1.6.2</u> Participants may introduce wildlife diseases and invasive plant species when gear and apparel is not properly sanitized between sites.</p> <p><u>6.1.6.3</u> Recreational use of rock outcrops and ridgelines by hikers and bikers can lead to direct mortality through wanton killing or incidental take, and alter natural behaviors, reducing breeding and/or foraging success.</p> <p>6.1.7 Other: <i>Recreational activities (such as pyrotechnics or drones) that may disrupt normal wildlife activities, or recreation that results in transfer of pathogens deleterious to wildlife.</i></p> <p><u>6.1.7.1</u> Use of recreational or commercial pyrotechnics may cause temporary disturbance to wildlife, in particular to nesting birds.</p> <p><u>6.1.7.2</u> Human presence in sensitive areas may introduce wildlife diseases or pathogens into the system.</p> <p><u>6.1.7.3</u> Drone use in areas with sensitive wildlife (e.g., nesting and foraging birds, migrating and foraging/feeding whales) can alter their behavior and can cause disturbance that impacts their reproductive and/or foraging success.</p> <p>6.2 Military Exercises: <i>Actions by formal or paramilitary forces without a permanent footprint.</i></p> <p>6.2.1 Military exercises: <i>Includes military-related activities and exercises at military bases.</i></p> <p><u>6.2.1.1</u> Military testing and training exercises may inflict disturbance and potential physical harm to wildlife.</p> <p><u>6.2.1.2</u> Low to mid-frequency active sonar threaten marine mammals by disrupting navigation, foraging and communications ability, and activities may disrupt normal behaviors of nesting birds and other wildlife.</p> <p><u>6.2.1.3</u> Lack of opportunity for non-federal wildlife managers to influence activities on military bases may result in detrimental impacts to SGCN and/or missed opportunities to engage in projects that benefit SGCN.</p> <p>6.3 Work and Other Activities: <i>People spending time or traveling in natural environments for reasons other than recreation or military activities, such as law enforcement, maintenance activities, research, etc.</i></p> <p>6.3.1 Unauthorized research projects at significant habitats: <i>Includes excessive trampling impacts of rare natural communities, ground-nesting wildlife (birds, reptiles), and aquatic breeders such as amphibians, fish and mussels.</i></p> <p><u>6.3.1.1</u> Participants may introduce wildlife diseases and invasive plant species when gear and apparel is not properly sanitized between sites.</p> <p><u>6.3.1.2</u> Accidental trampling of nests, eggs/egg masses, and unseen individuals may impact reproductive success or cause direct mortality to SGCN.</p> <p><u>6.3.1.3</u> Activities conducted without proper precautions may disturb and disrupt normal wildlife behaviors, which may impact reproductive success or survival, cause abandonment of critical sites, etc.</p> <p><u>6.3.1.4</u> Illegal transfer of freshwater fish from one waterbody/watershed to another can result in the spread of non-native, invasive and/or undesirable fish or mussel species and/or diseases.</p> <p><u>6.3.1.5</u> Illegal transfer of freshwater mussels from one waterbody/watershed to another can result in the spread of non-native, invasive and/or undesirable mussel species and/or diseases.</p> <p>6.3.2 Authorized research projects at significant habitats: <i>Includes excessive trampling impacts of rare natural communities, ground-nesting wildlife (birds, reptiles), and aquatic breeders such as amphibians, fish and mussels, and also the impacts of sonar use on marine wildlife.</i></p> <p><u>6.3.2.1</u> Seismic air guns used during scientific marine research threatens spawning, feeding and breeding marine fishes in essential fish habitat areas off the NJ coast and may cause disturbance and physical harm to whales, dolphins, pinnipeds and sea turtles. Seismic surveys may also disturb marine mammals by disrupting navigation, foraging and communications ability.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
			<p><u>6.3.2.2</u> Participants may introduce wildlife diseases and invasive plant species when gear and apparel is not properly sanitized between sites.</p> <p><u>6.3.2.3</u> Accidental trampling of nests, eggs/egg masses, and unseen individuals may impact reproductive success or cause direct mortality to SGCN.</p> <p><u>6.3.2.4</u> Activities conducted without proper precautions may disturb and disrupt normal wildlife behaviors, which may impact reproductive success or survival, cause abandonment of critical sites, etc.</p> <p><u>6.3.2.5</u> Authorized transfer of freshwater fish from one waterbody/watershed to another can result in the spread of non-native, invasive and/or undesirable fish or mussel species and/or diseases.</p> <p><u>6.3.2.6</u> Authorized transfer of freshwater mussels from one waterbody/watershed to another can result in the spread of non-native, invasive and/or undesirable mussel species and/or diseases.</p> <p>6.3.3 Other "work" unrelated to research: <i>Includes maintenance and construction activities of structures such as bridges and dams that disturb or otherwise impact wildlife species using the structure to fulfill part of their life history requirements (e.g., breeding, roosting, etc.).</i></p> <p><u>6.3.3.1</u> Construction projects may disrupt normal wildlife behavior which can result in reduced reproductive success or survival, abandonment of critical sites, etc. (e.g., bridge-nesting birds).</p> <p><u>6.3.3.2</u> Intensive dune and beach management (including overuse of dune fencing, sand mining, mechanical beach raking, storm clean up), reduces foraging habitat for beach nesting and migratory shorebirds, and poses risks of injury and mortality to unfledged chicks.</p> <p><u>6.3.3.3</u> Beach nourishment projects create suitable habitat for beach-nesting birds in areas of high human use, increasing the likelihood of disturbance to the birds, harm to the eggs, and injury and/or mortality to chicks.</p> <p><u>6.3.3.4</u> Workers may introduce wildlife diseases and invasive plant species when gear and apparel is not properly sanitized between sites.</p> <p><u>6.3.3.5</u> Unauthorized manipulation of water level (for dam repair, dredging, aquatic vegetation control, etc.) particularly during spawning season or during the summer when temperatures are high and dissolved oxygen is low can have negative impacts on fish and fish habitat.</p> <p>7 Natural Systems Modifications: <i>Threats to native habitat and/or fish/wildlife associated with actions that convert or degrade habitat in service of "managing" natural or semi-natural systems, often to improve human welfare.</i></p> <p>7.1 Fire and Fire Suppression: <i>Changing fire frequency and/or intensity outside of its natural range of variation.</i></p> <p>7.1.1 Increase in Fire Frequency/Intensity: <i>Illegal and wild fires that result in the destruction or degradation of sensitive habitats and/or direct mortality of wildlife.</i></p> <p><u>7.1.1.1</u> Increase in frequency and intensity of wild fires as a result of droughts and heat waves drying out vegetation and litter.</p> <p><u>7.1.1.2</u> Increase in frequency of wild fires as a result of illegal activities.</p> <p><u>7.1.1.3</u> Unnatural fire regimes occurring as a result of military exercises.</p> <p><u>7.1.1.4</u> Lack of diversity in age structure and composition of vegetation due to expansive, frequent fires.</p> <p>7.1.2 Suppression of Fire Frequency/Intensity: <i>Lack of fire in fire-dependent habitats resulting in the degradation or loss of native landscapes and associated wildlife.</i></p> <p><u>7.1.2.1</u> Shift in vegetative communities as a result of suppression of natural fires.</p> <p><u>7.1.2.2</u> Lack of diversity in age structure and composition of vegetation due to the suppression of fire.</p> <p>7.2 Dams and Water Management/Use: <i>Changing water flow patterns from their natural range of variation either deliberately or as a result of other activities.</i></p> <p>7.2.1 Abstraction of Surface Water (domestic use): <i>Includes water diversion for domestic use; ditching, impounding, and stream channelization.</i></p> <p><u>7.2.1.1</u> Changing water levels due to water body drawdowns (legal and illegal) may lower dissolved oxygen levels, increase water temperatures, expose wildlife to predation, and increase exposure to winter temperatures, altering wildlife behavior and survival.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
			<p><u>7.2.1.2</u> Controlled water releases and/or improper water level management of water bodies may alter downstream dissolved oxygen levels, water temperatures, sediment deposition, and flow rates, altering wildlife behavior and survival.</p> <p><u>7.2.1.3</u> Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, and eliminates shallow water habitats.</p> <p><u>7.2.1.4</u> Water intake systems associated with municipal water supply threaten aquatic organisms due to injury or mortality from impingement and/or entrainment.</p> <p><u>7.2.1.5</u> Abstraction of surface water may deplete upland mesic habitats of water needed by plants and wildlife.</p> <p><u>7.2.1.6</u> Impoundments may alter the water levels in high marshes and mudflats, impacting those foraging and nesting habitats.</p> <p>7.2.2 Abstraction of Surface Water (commercial use): <i>Includes water diversion for commercial use; ditching, impounding, stream channelization.</i></p> <p><u>7.2.2.1</u> Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, eliminates shallow water habitats, and disrupts/removes stream bottom habitat.</p> <p><u>7.2.2.2</u> Changing water levels due to water body drawdowns (legal and illegal) may lower dissolved oxygen levels, increase water temperatures, expose wildlife to predation, and increase exposure to winter temperatures, altering wildlife behavior and survival.</p> <p><u>7.2.2.3</u> Controlled water releases and/or improper water level management of water bodies may alter downstream dissolved oxygen levels, water temperatures, sediment deposition, and flow rates, altering wildlife behavior and survival.</p> <p><u>7.2.2.4</u> Water intake systems associated with industrial use and power plants threaten aquatic organisms due to injury or mortality from impingement and/or entrainment.</p> <p><u>7.2.2.5</u> Abstraction of surface water may deplete upland mesic habitats of water needed by plants and wildlife.</p> <p><u>7.2.2.6</u> Impoundments may alter the water levels in high marshes and mudflats, impacting those foraging and nesting habitats.</p> <p>7.2.3 Abstraction of Surface Water (agricultural use): <i>Includes water diversion for agricultural use; ditching, impounding, stream channelization.</i></p> <p><u>7.2.3.1</u> Controlled water releases and/or improper water level management of water bodies may alter downstream dissolved oxygen levels, water temperatures, sediment deposition, and flow rates, altering wildlife behavior and survival.</p> <p><u>7.2.3.2</u> Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, and eliminates shallow water habitats.</p> <p><u>7.2.3.3</u> Impounding water to create or expand bogs for cranberry farming leads to the loss of natural wetlands and the alteration of the natural hydrology in the area.</p> <p><u>7.2.3.4</u> Water intake systems associated with agriculture threaten aquatic organisms due to injury or mortality from impingement and/or entrainment.</p> <p><u>7.2.3.5</u> Changing water levels due to water body drawdowns (legal and illegal) may lower dissolved oxygen levels, increase water temperatures, expose wildlife to predation, and increase exposure to winter temperatures, altering wildlife behavior and survival.</p> <p><u>7.2.3.6</u> Abstraction of surface water may deplete upland mesic habitats of water needed by plants and wildlife.</p> <p><u>7.2.3.7</u> Impoundments may alter the water levels in high marshes and mudflats, impacting those foraging and nesting habitats.</p> <p>7.2.5 Abstraction of Ground Water (domestic use): <i>Disrupting and/or permanently altering groundwater hydrology in support of the construction of residential developments.</i></p> <p><u>7.2.5.1</u> Heavy withdrawal of ground water for domestic use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.</p> <p><u>7.2.5.2</u> Abstraction of ground water may deplete upland mesic habitats of water needed by plants and wildlife.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
			<p>7.2.6 Abstraction of Ground Water (commercial use): <i>Disrupting and/or permanently altering groundwater hydrology in support of mining operations, hydrofracturing or other commercial activities (excluding development).</i></p> <p><u>7.2.6.1</u> Heavy withdrawal of ground water for industrial and commercial use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.</p> <p><u>7.2.6.2</u> Abstraction of ground water may deplete upland mesic habitats of water needed by plants and wildlife.</p> <p>7.2.7 Abstraction of Ground Water (agricultural use): <i>Disrupting and/or permanently altering groundwater hydrology as a result of pumping water for irrigation.</i></p> <p><u>7.2.7.1</u> Heavy withdrawal of ground water for agricultural use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.</p> <p><u>7.2.7.2</u> Abstraction of ground water may deplete upland mesic habitats of water needed by plants and wildlife.</p> <p>7.2.9 Small Dams: <i>Altering the physical, biological and chemical environment of streams and rivers as a result of installing small dams and/or conducting periodic dam-associated draw downs. For the purposes of NJ's SWAP, a "small dam" is considered to be any dam similarly defined in New Jersey's Dam Safety Standards, N.J.A.C. 7:20, June 16, 2008, i.e., any dam that impounds <15 acre-feet of water to the top of the dam, has less than 15 ft height of dam, and has a drainage area above the dam of 150 acres or less.</i></p> <p><u>7.2.9.1</u> Alter the physical, chemical and biological stream environment, causing changes in substrate composition, flow rates, dissolved oxygen, and water temperatures.</p> <p><u>7.2.9.2</u> Dams act as a barrier to fish movement, limiting the distribution of anadromous fish and fish that act as hosts for mussels.</p> <p><u>7.2.9.3</u> Dams act as a barrier to movement, limiting the ability of aquatic or semi-aquatic wildlife to move safely between habitats.</p> <p>7.2.10 Large Dams: <i>Altering the physical, biological and chemical environment of streams and rivers as a result of installing large dams and/or conducting periodic dam-associated draw downs. For the purpose of NJ's SWAP, a "large" dam" is considered to be any dam greater in structure size, volume of water retention or size drainage area above the dam than would otherwise meet the definition of a "small dam" used herein (and as is similarly defined at N.J.A.C. 7:20, Dam Safety Standards, June 16, 2008).</i></p> <p><u>7.2.10.1</u> Alter the physical, chemical and biological stream environment, causing changes in substrate composition, flow rates, dissolved oxygen, and water temperatures.</p> <p><u>7.2.10.2</u> Dams act as a barrier to fish movement, limiting the distribution of anadromous fish and fish that act as hosts for mussels.</p> <p><u>7.2.10.3</u> Dams act as a barrier to movement, limiting the ability of aquatic or semi-aquatic wildlife to move safely between habitats.</p> <p>7.2.11 Dams (size unknown): <i>Altering the physical, biological and chemical environment of streams and rivers as a result of installing dams (of a size that does not qualify as "small" or "large") and/or conducting periodic dam-associated draw downs.</i></p> <p><u>7.2.11.1</u> Alter the physical, chemical and biological stream environment, causing changes in substrate composition, flow rates, dissolved oxygen, and water temperatures.</p> <p><u>7.2.11.2</u> Dams act as a barrier to fish movement, limiting the distribution of anadromous fish and fish that act as hosts for mussels.</p> <p><u>7.2.11.3</u> Dams act as a barrier to movement, limiting the ability of aquatic or semi-aquatic wildlife to move safely between habitats.</p> <p>7.2.12 Culverts: <i>Placement or improper management of culverts that create barriers to terrestrial and/or aquatic organisms rather than assist their safe dispersal.</i></p> <p><u>7.2.12.1</u> Improper design, placement, installation and maintenance of culverts and other stream crossing structures can impede or prevent the movements of terrestrial organisms and can restrict or limit stream flow, impeding the movement of aquatic organisms along riparian corridors.</p> <p>7.2.13 Stream Burial: <i>Loss of headwater and/or intermittent streams as a result of stream burial.</i></p> <p><u>7.2.13.1</u> Eliminates riparian habitats.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
			<p><u>7.2.13.2</u> Eliminates in-stream habitat and water resources for wildlife.</p> <p><u>7.2.13.3</u> Alters the hydrology and quality of downstream aquatic and riparian habitats.</p> <p>7.2.14 Tidal Water Management: <i>Hydrological alterations to tidal wetlands/waters as a result of tide gate structures and/or management.</i></p> <p><u>7.2.14.1</u> Freshwater tidal management for flood control alters water levels and salinity in tidal wetlands.</p> <p><u>7.2.14.2</u> Tidal water management for the purpose of managing for select species may alter existing hydrologic or vegetative conditions to the detriment of other species.</p> <p><u>7.2.14.3</u> Open marsh water management (and other techniques) to control mosquito populations may alter existing hydrologic or vegetative conditions to the detriment of other species.</p> <p><u>7.2.14.4</u> Manipulation of marsh water levels may disturb nesting areas and flood nests.</p> <p>7.3 Other Ecosystem Modifications: <i>Other actions that convert or degrade habitat in service of “managing” natural systems to improve human welfare.</i></p> <p>7.3.1 Shoreline Stabilization: <i>Installation of rip-rap, jetties, bulkheads, groins, etc. that alters the behavior of or otherwise impacts beach and marine wildlife. Installation of rip-rap, gabion and bulkheads on freshwater lakes and streams impacting freshwater aquatic and semi-aquatic species.</i></p> <p><u>7.3.1.1</u> Efforts to stabilize barrier islands and shorelines, including jetties, groins, bulkheads, interfere with the natural geological processes needed to create and maintain high quality habitat for beach strand species.</p> <p><u>7.3.1.2</u> Efforts to stabilize stream corridors, particularly near roads and infrastructure, in which vegetated and dynamic shorelines are replaced with unvegetated and rigid structures such as rip-rap, gabion, concrete raceways and bulkheads interfere with fish spawning, nursery and foraging areas.</p> <p><u>7.3.1.3</u> Efforts to stabilize barrier islands and shorelines, including jetties, groins, and bulkheads, degrade foraging areas for migrating whales and sea turtles.</p> <p>7.3.2 Inappropriate timing of mowing: <i>Managing roadsides, rights-of-way, hay and other fields, etc. through mowing at times that increase the risk of disturbance and/or direct mortality to ground nesting/breeding birds, reptiles, small mammals and invertebrates.</i></p> <p><u>7.3.2.1</u> Increased risk of direct mortality and/or reduced productivity of wildlife, as well as reduced use by migrating species.</p> <p>7.3.3 Removal of coarse woody debris (streams, forests, scrub-shrub habitats): <i>Removing woody debris that could otherwise provide shelter, nesting and foraging habitat for birds, reptiles and amphibians, and small mammals.</i></p> <p><u>7.3.3.1</u> Decreases the available detritus that normally accumulates behind and within stream obstructions, minimizing or eliminating food sources and shelters for fishes, invertebrates and amphibians.</p> <p><u>7.3.3.2</u> Decreases habitat and/or corridor suitability due to limited or absent shelter and foraging habitat.</p> <p><u>7.3.3.3</u> Removal of dead trees (snags), large felled logs (i.e., those ≥ 12" dbh), and other downed woody material diminishes nesting, roosting, and sheltering options for wildlife, and increases the ease at which deer can browse regenerating vegetation.</p> <p><u>7.3.3.4</u> Decreases available basking, shelter, and foraging habitats.</p> <p>7.3.4 Lack of natural disturbance patterns or ecosystem functions due to species loss: <i>Habitat alteration/shifting and/or species decline as a consequence of the loss of other plants and/or animals.</i></p> <p><u>7.3.4.1</u> The management and/or loss of beavers decreases natural disturbance patterns.</p> <p><u>7.3.4.2</u> The loss of top-tier predators results in an overabundance of prey species which alter or degrade the natural function of the ecological system.</p> <p><u>7.3.4.3</u> The extinction of prehistoric herd grazers and the more recent decline of the state’s dairy industry has reduced the low-impact maintenance of early successional habitat relied upon by wildlife.</p> <p><u>7.3.4.4</u> Human interference in natural processes such as clean up (e.g., beach-filling, shoreline hardening, tree/log removal from forests) after storms, in particular those causing post-hurricane washover and/or barrier island westward movement, and tree felling limits the disturbance needed to maintain appropriate habitats for wildlife.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
			<p><u>7.3.4.5</u> The lack of forest disturbance minimizes the diversity of herbaceous vegetation and other shrubs and trees that need a lot of sunlight to grow.</p> <p>7.3.5 Poor habitat management: <i>Managing habitats and aquatic systems in a manner that is not beneficial to, and may cause harm and/decline of, the wildlife inhabitants and/or native plant communities.</i></p> <p><u>7.3.5.1</u> Improper or poorly scheduled maintenance of man-made corridors (e.g., roadsides and medians) can cause direct mortality to and may reduce productivity of wildlife.</p> <p><u>7.3.5.2</u> Shifting from natural vegetation to lawns can cause increased temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.</p> <p><u>7.3.5.3</u> Vegetation clearing removes terrestrial and riparian corridors for animal movement, shelter, and resting areas.</p> <p><u>7.3.5.4</u> Vegetation clearing or inappropriate alteration adjacent to aquatic habitats threatens aquatic species by degrading habitat and water quality (altering temperature and dissolved oxygen, increasing siltation and desiccation, etc.).</p> <p><u>7.3.5.5</u> Habitat management that alters or removes vegetation without implementing long-term management increases the risk of invasive and exotic plants establishing themselves, outcompeting native vegetation.</p> <p><u>7.3.5.6</u> Habitat management, including that which occurs on public and private lands, that does not consider timing and species' behaviors can result in the direct mortality and/or alteration or loss of habitat.</p> <p><u>7.3.5.7</u> Improperly planned habitat management and/or mitigation efforts along roadsides and within the medians can attract wildlife and increase the risk of vehicle strikes.</p> <p><u>7.3.5.8</u> Storm water outfall pipes can create habitats in small streams that are conducive to non-native predatory fish which can negatively impact native fish species.</p> <p><u>7.3.5.9</u> Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, eliminates shallow water habitats, and disrupts/removes stream bottom habitat.</p> <p><u>7.3.5.10</u> Ditching, draining and filling of marshes and wetlands eliminates habitat and degrades the remaining surrounding areas for wildlife.</p> <p><u>7.3.5.11</u> Salt marsh water management to control mosquitoes may result in negative effects on other species (e.g., changing hydrology of low and high marsh).</p> <p><u>7.3.5.12</u> Lack of diversity in age structure and composition of vegetation due to lack of natural disturbances and/or vegetation management.</p> <p><u>7.3.5.13</u> Private landowners with rare species on their properties are not always cooperative in the protection and management of the species' habitats. Landowners may be held accountable for their actions when they cause harm to the species or destroy the habitat, but it is often too late for the species' population.</p> <p><u>7.3.5.14</u> Intentional felling and removal of dead standing trees or snags eliminates resting, nesting or feeding habitat, and precludes the snags eventual contribution to coarse woody debris and forest floor structure and habitat.</p> <p><u>7.3.5.15</u> Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.</p> <p><u>7.3.5.16</u> Lack of proactive management to preserve or maintain viable and functioning marshes for SGCN wildlife.</p> <p><u>7.3.5.17</u> Decreased diversity in height and species of herbaceous vegetation resulting in reduced cover and food for nesting and foraging wildlife.</p> <p><u>7.3.5.18</u> Lack of funding or competitive market prices to maintain native grasslands for grassland-dependent species causes conversion of fallow or hay fields to other crops or shrublands.</p> <p>8 Invasive and Other Problematic Species, Genes and Diseases: <i>Threats to native habitat and/or fish/wildlife from non-native and native plants, animals, pathogens/microbes, or genetic materials that have or are predicted to have harmful effects on biodiversity following their introduction, spread and/or increase in abundance.</i></p> <p>8.1 Invasive Non-native/ Alien Species/ Diseases: <i>Harmful plants, animals and pathogens not originally found within the ecosystem(s) in question and directly or indirectly introduced into it and spread by human activities.</i></p> <p>8.1.1 Unspecified Species: <i>Includes threats to native plants and animals by undetermined causes or general categories (e.g., "pest damage" to trees), but that are suspected or predicted to be as a result of the introduction of non-native plants, animals or pathogens.</i></p> <p><u>8.1.1.1</u> Displace or outcompete native species for resources.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
			<p><u>8.1.1.2</u> Alters, degrades and/or reduces the structural diversity of the natural composition of the landscape, including aquatic systems.</p> <p><u>8.1.1.3</u> Invasive, non-native insects can damage native vegetation at a large scale, leading to die-offs, altering the ecological community.</p> <p><u>8.1.1.4</u> Invasive, non-native animals increase the risk of predation on native animals and/or herbivory on native vegetation.</p> <p><u>8.1.1.5</u> Invasive, non-native animals and plants increase the risk of introduction and transference of diseases.</p> <p><u>8.1.1.6</u> Invasive, non-native plants may create physical barriers for some species.</p> <p>8.1.2 Invasive non-native aquatic animals: <i>Non-native, aquatic animals that have a detrimental impact on the natural aquatic ecosystem by damaging or causing change in the native vegetation (and potential food source), hydrology and/or a decline of native aquatic animals. Examples include Japanese shore crab, mitten crab, Asian clam (Corbicula), Zebra mussels, Flathead catfish and northern snakehead.</i></p> <p><u>8.1.2.1</u> Parasites introduced into the marine environment can alter the reproductive and feeding behavior of native wildlife, leading to their decline.</p> <p><u>8.1.2.2</u> Displace or out-compete native species for resources (food, shelter), alter the composition of the native landscapes/aquatic systems, diminishing habitat suitability and reducing ecological integrity of natural communities, and may introduce disease into a population.</p> <p>8.1.3 Invasive non-native aquatic plants: <i>Non-native, aquatic plants that have a detrimental impact on the natural aquatic ecosystem by damaging or causing change in the native vegetation (and potential food source), hydrology and/or a decline of native aquatic animals. Examples include Eurasian water-milfoil (Myriophyllum spicatum) and curly-leaf pondweed (Potamogeton crispus).</i></p> <p><u>8.1.3.1</u> Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.</p> <p>8.1.4 Invasive non-native terrestrial/wetland animals: <i>Non-native, terrestrial and/or wetland-associated animals that have a detrimental impact on the natural ecosystem by damaging or causing change in the native vegetation (and potential food source), hydrology and/or a decline of native aquatic animals. Examples include feral cats, gypsy moth, Asian long-horned beetle (Anoplophora glabripennis), emerald ash borer (Agrilus planipennis), and hemlock wooly adelgid (Adelges tsugae), European starlings (Sturnus vulgaris) and house wrens.</i></p> <p><u>8.1.4.1</u> Displace or out-compete native species for resources (food, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.</p> <p><u>8.1.4.2</u> Free-roaming and feral domestic animals such as cats and dogs causes direct mortality of wildlife and disturbance to wildlife breeding and resting areas.</p> <p>8.1.5 Invasive non-native terrestrial/wetland plants: <i>Non-native, terrestrial and/or wetland-associated plants that have a detrimental impact on the natural ecosystem by damaging or causing change in the native vegetation (and potential food source), hydrology and/or a decline of native aquatic animals. Examples include phragmites, Japanese barberry, multiflora rose, Ailanthus and garlic mustard.</i></p> <p><u>8.1.5.1</u> Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.</p> <p>8.1.6 Invasive non-native fungal/bacterial diseases: <i>Non-native fungal and bacterial diseases that infect and have a detrimental impact on native wildlife and/or their habitats. Examples of such diseases include chytrid fungus (Batrachochytrium dendrobatidis) and Pseudogymnoascus destructans which causes white-nose syndrome in bats, and Sudden Oak Death fungus (Phytophthora ramorum).</i></p> <p><u>8.1.6.1</u> The introduction of non-native fungal and bacterial diseases threatens native populations and ecosystems.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
			<p>8.2 Problematic Native Species/Diseases: <i>Harmful plants, animals, pathogens and other microbes that are originally found within the ecosystem(s) in question, but have become out-of-balance or released directly or indirectly due to human activities.</i></p> <p>8.2.1 Unspecified Species: <i>Native species (plants, animals or pathogens) that are causing an imbalance in the natural ecosystem either through the destruction of habitat or intense predation/scavenging on other wildlife. This includes undetermined but suspected causes/species and broad, non-specific species categories such as "subsidized predators."</i></p> <p><u>8.2.1.1</u> Overabundant native insects can damage native vegetation at a large scale, leading to die-offs, altering the ecological community.</p> <p><u>8.2.1.2</u> Invasive pathogens and insects may increase in range and abundance as limiting factors (such as temperature) are altered as a result of climate change.</p> <p><u>8.2.1.3</u> Invasive, native species can out-compete non-invasive species for resources (food, light, shelter), leading to the demise of some species populations.</p> <p><u>8.2.1.4</u> Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.</p> <p>8.2.2 Named Species: <i>Native species (plants, animals or pathogens) that are causing an imbalance in the natural ecosystem either through the destruction of habitat or intense predation/scavenging on other wildlife. This includes identified species as the cause of the impact such as white-tailed deer, beaver, fox, raccoon, crow and gull species, skunks, and raccoon roundworm.</i></p> <p><u>8.2.2.1</u> Dogs on beaches create severe disturbance to beach nesting birds and reduce their nesting success.</p> <p><u>8.2.2.2</u> Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.</p> <p>8.3 Introduced Genetic Material: <i>Human altered or transported organisms or genes that leads to the hybridization (and therefore, loss) of [true] native species.</i></p> <p>8.3.0 Introduced Genetic Material: <i>Human-induced hybridization or genetic dilution through direct introduction of species from another region or indirect introduction from habitat modification creating habitat connectivity that naturally would not have occurred otherwise.</i></p> <p><u>8.3.0.1</u> Introduction of farm-reared species (e.g., bobwhite and brook trout) for hunting and fishing purposes introduces genetic material into the native population when species hybridize.</p> <p><u>8.3.0.2</u> Species hybridizing as a result of the alteration of, and subsequent connectivity of, habitats that once separated species.</p> <p>8.4 Problematic Species/Diseases of Unknown Origin: <i>Harmful plants, animals, pathogens and other microbes currently found within or are a future risk to the ecosystem(s) in question but are of unknown or unconfirmed origin.</i></p> <p>8.4.1 Unspecified Species: <i>Problematic species/diseases including those that are currently unidentified or non-specific species categories causing or suspected to cause harm to native wildlife and/or their habitats.</i></p> <p><u>8.4.1.1</u> Non-native or poorly understood diseases and parasites could potentially impact native animals.</p> <p>8.4.2 Named Species: <i>Identified problematic species/diseases causing or suspected to cause harm to native wildlife and/or their habitats but for which its origin is unknown or unconfirmed. Examples of such a species are Ophidiomyces ophiodiicola believed to be the source of snake fungal disease but has not been confirmed as a native or non-native fungus to New Jersey as with Ranavirus (infecting amphibians and turtles), also not confirmed as native or non-native to NJ.</i></p> <p><u>8.4.2.1</u> Honey bee diseases such as Deformed Wing Virus (DWV) and Nosema ceranae have been found to be able to be transmitted to wild bumble bees.</p> <p><u>8.4.2.2</u> Diseases of unknown origin, such as snake fungal disease and Ranavirus, can cause significant mortality among native animal populations.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
---------	---------	---------	--

8.5 Viral/Prion-induced Diseases

8.5.1 Unspecified Species (Disease)

8.5.1.1 There is a large knowledge gap regarding the existence of, or potential for, other diseases impacting native wildlife.

8.5.2 Named Species (Disease): *Includes West Nile Virus, arenavirus, sudden oak death, Avian Influenza.*

8.5.2.1 Diseases such as West Nile Virus, arenavirus, sudden oak death, Avian Influenza, and snake fungal disease cause morbidity or mortality to native populations.

8.5.2.2 Viral Hemorrhagic Septicemia (VHS) (recently introduced into the Great Lakes) has caused mortality in 30 common fish species across many families. Although many of the fish SGCN have not been tested, it is hypothesized that they may be vulnerable. If introduced into NJ, VHS is predicted to cause widespread fish kills.

8.6 Diseases of Unknown Cause: *Diseases impacting habitat and/or fish/wildlife which have not been identified.*

8.6.0 Unknown Diseases

8.6.0.1 Diseases yet to be identified by pathologists and virologists cause decreased fitness or mortality to native populations.

9 Pollution: *Threats to native habitat and/or fish/wildlife from the introduction of exotic) and/or excess materials or energy from point and nonpoint sources.*

9.1 Domestic and Urban Waste Water: *Water-borne sewage and non-point runoff from housing and urban areas that include nutrients, toxic chemicals and/or sediments.*

9.1.1 Sewage: *Habitat is degraded and/or animals are harmed or killed as a result of leaking septic systems, discharge from municipal wastewater treatment plants, untreated sewage.*

9.1.1.1 Degradation of aquatic and marine water quality and habitats by changing turbidity, flow and water chemistry.

9.1.1.2 Leads to increased eutrophication and algae blooms that result in oxygen depletion.

9.1.1.3 Contaminants in sewage treatment effluents and Combined Sewer Overflows can cause developmental and behavioral abnormalities and reproductive failure in wildlife.

9.1.2 Run-off: *Habitat is degraded and/or animals are harmed or killed as a result of runoff of oil and sediment from roads, chemicals from roads and lawns, road salt, golf course chemicals, etc. into adjacent aquatic and terrestrial habitats.*

9.1.2.1 Chemical fertilizers and nutrient run-off changes the pH in streams and ponds and causes eutrophication in inland waters and estuaries, which can make habitat unsuitable for specialist species and increase the risk of invasive and generalist species.

9.1.2.2 Contaminants degrade aquatic and marine water quality and can bioaccumulate in benthic organisms, threatening wildlife by causing developmental and behavioral abnormalities and reproductive failure.

9.1.2.3 Contaminants from road runoff (oil, sediment, salt, etc.) impact native vegetation and the species that rely upon them, degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.

9.2 Industrial and Military Effluents: *Water-borne pollutants from industrial and military sources including mining, energy production, and other resource extraction industries that include nutrients, toxic chemicals and/or sediments.*

9.2.1 Oil Spills: *Habitat is degraded and/or animals are harmed or killed as a result of terrestrial and aquatic leakage from fuel tanks and spills from pipelines, and from PCBs in river sediments and the subsequent impacts of bioaccumulation of PCBs in the food web.*

9.2.1.1 Oil spills render resting, breeding and foraging habitats temporarily unavailable to wildlife, altering normal wildlife behavior.

9.2.1.2 Oil spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
			<p><u>9.2.1.3</u> Oil spills cause external oiling of wildlife and ingestion of oil, both of which can injure or kill wildlife.</p> <p>9.2.2 Seepage from Mining: <i>Includes acid mine drainage, mine tailings.</i></p> <p><u>9.2.2.1</u> Contaminants from mining degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.</p> <p>9.2.3 Other: <i>Other industrial pollutants impacting habitat and/or animals which are not specifically captured under the classification scheme such as toxic chemicals from factories, illegal dumping of chemicals, other industrial effluent, ship waste discharge, etc.</i></p> <p><u>9.2.3.1</u> Point and nonpoint source pollution such as polychlorinated biphenyls (PCBs), pesticides, heavy metals, and endocrine disrupting compounds (EDC's) into freshwater and marine systems pose threats to wildlife through direct contact and/or ingestion, and to aquatic species and their predators through bioaccumulation, impacting the reproductive success and neurological function of many avian and fish species.</p> <p><u>9.2.3.2</u> Chemical spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.</p> <p><u>9.2.3.3</u> Chemical spills may render resting, breeding and foraging habitats temporarily unavailable to wildlife, altering normal wildlife behavior.</p> <p>9.2.4 Other: Hydrofracturing: <i>The threat of future (and when/if appropriate, current) hydrofracturing-associated toxic spills from failure of wastewater ponds, failure of pipe casements, etc.</i></p> <p><u>9.2.4.1</u> Contaminants from hydrofracturing degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.</p> <p><u>9.2.4.2</u> Uncontrolled effluents escaping from hydrofracturing facilities can cause injury to wildlife and alter normal behaviors.</p> <p>9.2.5 Other: Industrial toxic settling ponds: <i>Harm or death to animals that enter or drink from toxic settling ponds.</i></p> <p><u>9.2.5.1</u> Surficial or open industrial effluent ponds can cause injury or death to wildlife that become exposed through ingestion or submersion.</p> <p>9.3 Agricultural and Forestry Effluents: <i>Water-borne pollutants from agricultural, silvicultural, and aquaculture systems that include nutrients, toxic chemicals and/or sediments, including the effects of these pollutants on the site where they are applied.</i></p> <p>9.3.1 Nutrient Loads: <i>Aquatic and terrestrial environments become degraded or destroyed and/or animals are harmed as a result of nutrient loading from fertilizer run-off, manure from feedlots, nutrients from aquaculture, etc.</i></p> <p><u>9.3.1.1</u> Chemical fertilizers and nutrient run-off changes the pH in streams, ponds and wetlands and causes eutrophication in inland waters and estuaries, which can make habitat unsuitable for specialist species and increase the risk of invasive and generalist species.</p> <p><u>9.3.1.2</u> Animal waste degrades terrestrial and aquatic habitats, especially streams, ponds and wetlands, resulting in eutrophication, which disrupts oxygen and nutrient balances, and causes injury and mortality to aquatic organisms.</p> <p><u>9.3.1.3</u> Organic nutrient inputs from aquaculture may, depending upon type and location, adversely impact intertidal and subtidal habitats and water bodies where there is insufficient tidal flushing.</p> <p><u>9.3.1.4</u> Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades wetland and aquatic habitats with runoff, increasing sediment and nutrient loads and pH.</p> <p><u>9.3.1.5</u> Conversion of native forests to plantations degrades wetland and aquatic habitats through increased runoff.</p> <p>9.3.2 Soil Erosion and : <i>Aquatic and terrestrial environments become degraded or destroyed and/or animals are harmed as a result of soil erosion from overgrazing, increased run-off and hence sedimentation due to the conversion of forests (or other natural landscapes) to agricultural lands, etc.</i></p> <p><u>9.3.2.1</u> Soil erosion, sedimentation and destruction of streambanks and riparian buffers degrade waters making them unsuitable for riparian-dependent wildlife.</p> <p><u>9.3.2.2</u> Soil erosion and sedimentation limit the re-establishment of plants needed by terrestrial wildlife as cover and a food base.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
			<p><u>9.3.2.3</u> Conversion of native forests to plantations degrades wetland and aquatic habitats through increased sedimentation.</p> <p>9.3.3 Herbicides and Pesticides: <i>Herbicide, pesticides and fertilizer run-off from agricultural fields degrade or destroy adjacent aquatic and terrestrial habitats and/or cause harm to non-target species (plants and animals).</i></p> <p><u>9.3.3.1</u> Pesticides degrade terrestrial and aquatic habitats, especially streams, ponds and wetlands. Aquatic wildlife are particularly sensitive to these contaminants, which can cause developmental and behavioral abnormalities and reproductive failure. Some contaminants may bioaccumulate in predatory fish and birds and disrupt reproduction.</p> <p><u>9.3.3.2</u> Use of rodenticides can cause secondary actions of injury and death to animals in the course of scavenging.</p> <p><u>9.3.3.3</u> Use of pesticides can directly harm non-target species through direct contact and/or by reducing and/or contaminating their food supply.</p> <p><u>9.3.3.4</u> Use of herbicides can destroy beneficial food and nectar plants for insects.</p> <p>9.3.4 Other: <i>Other agricultural and/or forestry management-related pollutants impacting habitat and/or animals which are not specifically captured under the classification scheme; identify type/source.</i></p> <p><u>9.3.4.1</u> Spills, leaks or discharges of fuel, oil or other contaminant fluids from machinery or equipment used in the normal course of agricultural or forestry activities can degrade or destroy adjacent aquatic and terrestrial habitats and/or cause harm to non-target species (plants and animals).</p> <p>9.3.5 Control of insect pests and plants leading to mortality of non-target species not associated with agriculture: <i>Herbicide and pesticides applied in environments through directional application (i.e., not aerial spraying) that lead to the harm of non-target species (plants and animals) such as the use of larvacides and adulticides for mosquito control that may harm amphibians and beneficial invertebrates.</i></p> <p><u>9.3.5.1</u> Use of pesticides, insecticides, and/or herbicides can directly harm non-target species, such as amphibians and beneficial invertebrates through direct contact and/or by reducing and/or contaminating their food supply.</p> <p><u>9.3.5.2</u> Use of herbicides can destroy beneficial food and nectar plants for insects.</p> <p><u>9.3.5.3</u> Use of pesticides and herbicides can minimize the abundance of invertebrates needed as a food source for many birds.</p> <p><u>9.3.5.4</u> Improper use of current insecticides, such as those containing esfenvalerate, prallethrin, or piperonyl butoxide, or past use of pesticides containing chlordane still present in the soils, are toxic to various wildlife species, and can cause injury, mortality, or other effects that impair population viability.</p> <p><u>9.3.5.5</u> Use of pesticides and herbicides can minimize the abundance of food sources for native wildlife populations.</p> <p>9.4 Garbage and Solid Waste: <i>Threats to native fish/wildlife as a result of rubbish and other solid materials.</i></p> <p>9.4.1 Direct hazards to wildlife: <i>Includes waste that can harm or kill wildlife by entangling or strangling animals leading to their predation, starvation or fatal injury, causing fatal blockages in their digestive systems when waste is mistakenly eaten, etc., including but not limited to municipal solid waste, litter from cars and boats, waste that entangles or strangles wildlife, construction debris, etc.</i></p> <p><u>9.4.1.1</u> Wildlife may ingest garbage causing choking or impingement in the digestive system, or they may become physically entangled in it (e.g., plastic or abandoned fish nets); conditions that make them unable to feed or drink, cause them to suffocate or drown, or otherwise restrict the animal's movement making them more susceptible to predators, starvation or injury.</p> <p><u>9.4.1.2</u> Garbage and solid waste destroys natural habitats and obstructs wildlife movements.</p> <p>9.5 Air-Bourne Pollutants: <i>Atmospheric pollutants from point and nonpoint sources.</i></p> <p>9.5.1 Acid Rain: <i>Habitat and water quality degradation and/or the acidification of ocean water as a result of acid rain, excess nitrogen deposition, wind dispersion of pollutants or sediments, radioactive fallout, smoke from forest fires, etc.</i></p> <p><u>9.5.1.1</u> Causes acidification of water bodies, resulting in changes to aquatic and marine communities and reducing biodiversity, and creating conditions that are unsuitable for some aquatic (freshwater and marine) and semi-aquatic species that are sensitive to pH shifts.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
			<p><u>9.5.1.2</u> Leaches calcium from the soils which in turn reduces the availability of prey, particularly calcium-rich prey such as snails.</p> <p>9.5.2 Smog: <i>Habitat and water quality degradation as a result of smog from vehicle emissions, smoke from forest fires, wind dispersion of pollutants or sediments, and in the future, potentially, hydrofracturing pollutants, etc.</i></p> <p><u>9.5.2.1</u> Fine airborne particulate pollutants (such as smoke from controlled burns, soil particles from plowing arid soil, etc.) can adversely affect low mobility wildlife species, including avian species during nesting.</p> <p>9.5.3 Ozone: <i>Impacts to habitat and water quality and animals as a result of ground-level ozone formed in association with vehicle emissions, factory smoke emissions, smoke from forest fires, wind dispersion of pollutants or sediments, etc.</i></p> <p><u>9.5.3.1</u> Ozone pollution adversely affects many native plant species, altering the health and composition of wildlife species habitats, and prolonged exposure can affect the respiratory systems of affected wildlife.</p> <p>9.5.4 Other: <i>Other air-bourne pollutants impacting habitat and/or animals which are not specifically captured under the classification scheme; identify type/source.</i></p> <p><u>9.5.4.1</u> Dust and/or airborne sedimentation from construction sites, agricultural operations or related earth disturbances can introduce mineral or organic sediments into adjacent wildlife habitats, degrading their quality and suitability for wildlife short-term and/or long-term.</p> <p>9.5.5 Methane: <i>Includes methane from hydrofracturing emissions, refineries and landfills.</i></p> <p><u>9.5.5.1</u> Methane burners/flares, particularly "intermittent" flares, can result in direct mortality or harm to raptors and other avian species.</p> <p>9.5.6 Herbicides and Pesticides: <i>Herbicide and pesticides applied to environments through aerial application that lead to the harm of non-target species (plants and animals) such as the aerial application of chemicals to control pests, such as gypsy moths, mosquitos.</i></p> <p><u>9.5.6.1</u> May result in injury or direct mortality of non-target species.</p> <p>9.6 Excess Energy: <i>Inputs of heat, sound, or light that disturb or otherwise impact wildlife or ecosystems.</i></p> <p>9.6.1 Light Pollution: <i>Lighting that causes changes in animal behavior that may result in injury, death or failed reproduction such as lamps attracting insects, tower lights disorienting migrating birds, etc.</i></p> <p><u>9.6.1.1</u> Artificial lighting can reduce suitability of adjacent habitat for species sensitive to artificial lights by disorienting wildlife, reducing foraging suitability or success, or increasing visibility to predators, resulting in reduced diversity and/or productivity of species in adjacent habitat.</p> <p>9.6.2 Thermal Pollution: <i>Changes in water temperatures as a result of discharged heated water from power plants and impervious surfaces, damaging atmospheric radiation resulting from ozone holes, etc. that causes changes in animal behavior and may result in injury, death, failed reproduction, or detrimental shifts in migratory patterns.</i></p> <p><u>9.6.2.1</u> Water temperature changes due to industrial discharge of heated water may impact species composition in the receiving waterbody. Species such as sea turtles and migrating fish may be attracted to the thermal plume and become more vulnerable to mortality during emergency shutdowns during cooler months.</p> <p><u>9.6.2.2</u> Water temperature changes to aquatic systems can deter or preclude use by SGCN (e.g., alter habitat suitability for wildlife species, reduce prey base) or present stressors that are harmful if not fatal to wildlife.</p> <p><u>9.6.2.3</u> Water temperature changes due to industrial discharge of heated water in aquatic systems may be stressful/fatal to free floating freshwater mussel glochidia.</p> <p>9.6.3 Noise Pollution: <i>Noise that causes changes in animal behavior that may result in injury, death, failed reproduction, or detrimental shifts in migratory patterns such as noise from highways or airplanes, sonar from submarines that disturb whales, the construction activities associated with offshore wind and other energy development, etc.</i></p> <p><u>9.6.3.1</u> Acute and chronic noise pollution in and adjacent to terrestrial and aquatic (marine and freshwater) environments could disrupt normal behaviors of wildlife such as migration, communication, feeding, eluding predators, resting and breeding, etc.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
---------	---------	---------	--

11 Climate Change and Severe Weather: *Threats to native habitat and/or fish/wildlife associated with long-term climatic changes or other severe weather that may eliminate or otherwise harm or degrade a vulnerable species or habitat, respectively.*

11.1 Habitat Shifting or Alteration: *Major changes in habitat composition and location not associated with sea-level rise.*

11.1.0 Macro- and Micro-Climate Alterations: *Permanent changes in macro- and micro-habitat conditions that reduce habitat suitability for habitat specialist or niche species.*

11.1.0.1 Alters native terrestrial and aquatic habitats at the macro- and micro-climate levels that can affect suitability for wildlife, in particular specialist species.

11.2 Droughts: *Periods in which rainfall falls below the normal range of variation.*

11.2.1 Droughts: *Increased periods and/or frequency of droughts leading to changes in the hydrology of aquatic systems and ground water and subsequent loss/alteration of aquatic and terrestrial habitats, the elimination of small wetlands and streams, etc., and subsequent impacts or loss of animals dependent on such habitat such as freshwater mussels.*

11.2.1.1 Contribute to hardened soils, decreasing water recharge during rains and increasing the likelihood of flash floods during storms.

11.2.1.2 Lead to lower groundwater levels and therefore, less available water for people and habitats.

11.2.1.3 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

11.2.1.4 Increase stress on vegetation making them more susceptible to pest damage.

11.2.1.5 Leads to lower river levels that may impact the ability of anadromous species to reach spawning grounds.

11.2.1.6 Increased desiccation risk for amphibians and altered wetland hydrology for critical habitats including breeding pools.

11.3 Temperature Extremes: *Periods in which temperatures exceed or go below the normal range of variation; includes heat waves, extreme cold spells, oceanic temperature changes, etc.*

11.3.1 Temperature extremes: *Periods of extreme temperature ranges (high or low) that lead to the loss of habitats, disrupts migratory patterns of both marine and terrestrial wildlife, reduces water flow in streams/rivers, increases water temperature and/or changes water pH which impacts aquatic animals, lowers the water level of wetlands, riverine, lacustrine and vernal pool habitats, and causes premature drying of vernal habitats.*

11.3.1.1 Increasing temperatures may cause habitat loss and degradation by desiccating and/or raising the temperatures of small wetlands and streams leading to the loss of freshwater mussels and other aquatic species and species reliant upon these habitats.

11.3.1.2 Increased temperatures can negatively impact wetland, riverine, lacustrine and vernal pool-associated or -dependent wildlife by reducing flows, increasing water temperatures, lowering water levels and causing premature drying of vernal habitats.

11.3.1.3 Temperature extremes of surface water and air degrades marine habitats and ecosystems, threatening marine wildlife. Such extremes also disrupt offshore currents and migratory patterns, species' ranges, and/or impact communities/food chains, all of which further impact the ecosystem.

11.3.1.4 Extremely low temperatures and/or extensive periods of unseasonably low temperatures during critical life history stages (e.g., hibernation, gestation/nesting) can alter animals' behaviors and decrease survivorship.

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
			<p>11.4 Storms and Flooding: <i>Extreme precipitation and/or wind events, including hurricanes, tornados, ice storms, excessive beach erosion.</i></p> <p>11.4.1 Storms and flooding: <i>Extreme flooding alters the hydrology of aquatic habitats and causes water quality degradation as a result of increased silt loads, stream bottom shifting and increased turbidity of streams and rivers. It also disrupts migratory patterns of both marine and terrestrial wildlife, and coastal flooding breaches existing natural sand berms along shores that normally limit tidal flooding events and cause conversion of "barrier wetlands" to open water or other natural communities.</i></p> <p><u>11.4.1.1</u> Extreme storms and flooding events threaten aquatic and marine wildlife through habitat degradation and alteration, including alterations to off-shore or back-bay benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic and marine wildlife.</p> <p><u>11.4.1.2</u> Potentially damage coastal habitats, including beach- and marsh-nesting bird habitats and interdunal wetlands, and can increase marsh erosion.</p> <p><u>11.4.1.3</u> Increase risk of saltwater intrusion to freshwater habitats altering the water chemistry and potentially altering aquatic wildlife community.</p> <p><u>11.4.1.4</u> Flood events alter river or stream morphology, benthic conditions and habitat availability for wildlife, cause bank erosion, and deposit sediments in floodplain wetlands altering wildlife habitat.</p> <p><u>11.4.1.5</u> Storm damage can alter forest structure via blow-downs or micro-bursts, and can destroy bird nesting in the locales where the storms occur.</p> <p><u>11.4.1.6</u> Increased storms and flooding reduce nesting success, especially for ground-nesting birds.</p> <p><u>11.4.1.7</u> Potentially damage coastal habitats, including beach and marsh habitats used by spawning horseshoe crabs, nesting diamondback terrapins, and resting and foraging birds.</p> <p>11.4.2 Increased rainfall: <i>Increased periods and frequency of rainfall saturates the ground and limits water recharge within watersheds, causes long-term increases in soil moisture.</i></p> <p><u>11.4.2.1</u> Extreme rain events threaten aquatic wildlife through habitat degradation and alteration, including alterations to benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic wildlife.</p> <p><u>11.4.2.2</u> Extreme rain events can damage wildlife nesting and resting habitats, including impacts to avian eggs and chick and small mammal survivorship.</p> <p><u>11.4.2.3</u> More frequent rain events can alter terrestrial and wetland vegetation communities as well as wetland hydrology, shifting wildlife community use.</p> <p>11.5 Sea-level Rise: <i>Habitat alterations, degradation and/or destruction and subsequent impacts on animals dependent on those habitats as a result of salt water intrusion such as existing tidal marshes converting to open water and adjacent uplands converting to tidal marshes.</i></p> <p>11.5.0 Sea-level Rise</p> <p><u>11.5.0.1</u> Contributes to the conversion of high salt marsh to low salt marsh, threatening species that depend on high marsh habitat and those dependent on the marsh-upland ecotone.</p> <p><u>11.5.0.2</u> Increased risk of saltwater intrusion into freshwater systems impacting associated wildlife and native vegetation.</p> <p><u>11.5.0.3</u> Alters salinity conditions; increased salinity will alter and degrade aquatic ecosystems, threatening anadromous species by shifting normal breeding areas upstream into potentially unsuitable areas, and causing mortality to salt-intolerant mussels and other species by inundating areas of the lower Delaware River and tributaries.</p> <p><u>11.5.0.4</u> Increased erosion of beach, mudflat and marsh habitats critical for a number of coastal species to fulfill life history requirements.</p> <p><u>11.5.0.5</u> Sea-level rise will result in the conversion of some upland habitats to tidal marshes impacting the species that rely upon those upland areas.</p> <p><u>11.5.0.6</u> Alters salinity conditions in back bays and tidal creeks, thereby impacting food availability, composition and abundance for wildlife.</p> <p><u>11.5.0.7</u> Sea level rise exacerbates marsh loss caused by prior human manipulations (e.g., impoundments, grid-ditching) that reduced the elevation of the marsh.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
			<p>11.6 Phenology Shifting or Alteration: <i>Changes in the seasonal cycles of plants and animals that causes mismatched timing of life history requirements with food sources and/or alters the range of species leading to competition or hybridization.</i></p> <p>11.6.1 Phenology shifts related to pollination ecology: <i>Timing of host plant life history is mismatched with timing of wildlife life history, i.e., plants may bloom before required pollinators are present leading to failed foraging, decreased opportunity for pollination and thus, propagation within local ecological systems.</i></p> <p><u>11.6.1.1</u> Alters inter-specific relationships of wildlife and vegetation, ultimately leading to detrimental impacts on the ecological system.</p> <p>11.6.2 Phenology shifts related to predator-prey ecology: <i>Mismatched timing of animal movements with their prey item's life cycle leading to a lack of food and subsequent illness, failed reproduction and/or death (e.g., migratory songbirds may not return in spring at time of maximum caterpillar emergence).</i></p> <p><u>11.6.2.1</u> Alters inter-specific relationships (e.g., competition, parasitism, predation) of wildlife, ultimately leads to detrimental impacts on the ecological system.</p> <p><u>11.6.2.2</u> Shifts timing of species migration, breeding and hibernation, and available food resources, causes redistribution of species, or mortality for species that are unable to relocate due to their already isolated habitat or limited mobility.</p> <p>11.6.3 Phenology shifts related to species redistribution: <i>Changes in species distribution driven by climate-caused changes in species' ranges and/or competition.</i></p> <p><u>11.6.3.1</u> Shifts in timing of species migration, breeding and hibernation, and available food resources, as a result of wildlife range shifts driven by climate change.</p> <p><u>11.6.3.2</u> Shifts in nesting times or egg incubation durations can limit nest success and longterm populations.</p> <p>12 Resource Management Needs: <i>Need for information on fish/wildlife species, species suites and/or their habitats to inform future conservation efforts and management decisions.</i></p> <p>12.1 Resource information collection needs: <i>Need to collect information on fish and wildlife and/or their habitats.</i></p> <p>12.1.1 Lack of initial baseline inventory: <i>Need to gather baseline data regarding fish, wildlife populations and/or habitat status, availability and condition as part of long-term trend analysis.</i></p> <p><u>12.1.1.1</u> Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.</p> <p><u>12.1.1.2</u> Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.</p> <p><u>12.1.1.3</u> Lack of studies specific to structural shellfish aquaculture (racks, bottom cages, bottom screens, etc.) and tending activities which may adversely impact horseshoe crabs, shorebirds and other benthic-dependent species.</p> <p><u>12.1.1.4</u> Lack of information on the morphometrics and trends of coastal salt marshes and salt marsh islands.</p> <p><u>12.1.1.5</u> Lack of information regarding the SGCN populations that use managed salt marshes and the best techniques for making improvements for marsh-dependent SGCN wildlife.</p> <p><u>12.1.1.6</u> Lack of information regarding migratory pathways and response of wildlife to lights and noise associated with offshore wind turbines.</p> <p>12.1.2 Lack of up-to-date existing information: <i>Need to conduct (routine, regular, ongoing) surveys/assessments to provide the up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.</i></p> <p><u>12.1.2.1</u> Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.</p> <p><u>12.1.2.2</u> Lack of wildlife monitoring at sites with structures that pose high risk of mortality to SGCN wildlife.</p> <p>12.1.3 Need to answer research question: <i>Need to address unanswered or unresolved conservation question(s) regarding fish/wildlife species, species suites and/or their habitats that will inform future conservation efforts and management decisions.</i></p> <p><u>12.1.3.1</u> There are significant knowledge gaps regarding distribution, dispersal, diseases, population trends, etc. of SGCN.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
			<p><u>12.1.3.2</u> There is an urgent need to answer questions about the future vulnerability or resiliency of NJ's cave-hibernating bats to White-nose Syndrome, and about the potential for an effective treatment to the disease.</p> <p><u>12.1.3.3</u> Lack of studies specific to structural shellfish aquaculture (racks, bottom cages, bottom screens, etc.) and tending activities which may adversely impact horseshoe crabs, shorebirds and other benthic-dependent species.</p> <p><u>12.1.3.4</u> Lack of information regarding the potential short- and long-term impacts of wind turbines and other tall coastal structures on migratory populations.</p> <p>12.1.4 Need to develop new technique: <i>Need to develop and evaluate new species or habitat survey methods or techniques because current survey/assessment efforts fail to obtain the necessary data. Need to develop and evaluate new (species or habitat) management techniques.</i></p> <p><u>12.1.4.1</u> Improve and evaluate survey methods for SGCN and their habitats; alter as needed.</p> <p><u>12.1.4.2</u> Improve and evaluate survey methods for species not easily detected through standard survey methods.</p> <p><u>12.1.4.3</u> Lack of techniques for high marsh preservation that includes impoundments and elevated islands.</p> <p><u>12.1.4.4</u> Lack of consideration of habitat management opportunities in the course of salt marsh management for mosquito control.</p>

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms

- 12.3.0.1 Regulatory habitat protections within state land use regulations are spatially limited to specific geographic areas (e.g., Pinelands, Coastal Area) or geographic features (e.g., wetlands, streams) and so fail to protect critical habitats that exist outside of these regulated areas.
- 12.3.0.2 Delays between State species status reviews and regulation amendments to incorporate the findings leads to extended periods when imperiled species do not receive the benefit of land use and other regulatory protections.
- 12.3.0.3 Lack of a licensing program and standards for NJ Nuisance Wildlife Control Operators (NWCs) leads to inadequate controls over handling of wildlife and lack of reporting of non-game/SGCN species (and all wildlife) encountered in nuisance situations.
- 12.3.0.4 The NJ Administrative Code (N.J.A.C.) fails to protect native, freshwater fish species from collection and/or their use as bait.
- 12.3.0.5 NJDEP land use regulations provide no protection for spawning habitats of native, freshwater fish that are identified as candidates for State endangered, threatened, or special concern status.
- 12.3.0.6 Certain geographic or habitat features, such as vernal pools and headwater wetlands or streams, may be too small, mischaracterized, or misidentified to benefit from regulatory protection.
- 12.3.0.7 Activities that threaten SGCN, their food sources, and/or habitats are often regulated separately and without consideration for the cumulative and synergistic effects over time or over a larger spatial scale. Therefore, regulations can fail to protect SGCN populations over time.
- 12.3.0.8 Lack of stable funding to support State marine fisheries research, monitoring, and management is a significant impediment to biologically-based management of fish and shellfish populations in New Jersey, which can result in overharvest and severe population declines.
- 12.3.0.9 Prescribed burns implemented by the NJ Forest Fire Service are constrained by State air quality regulations to a timeframe where seasonal weather conditions are less than ideal for effective burning. As a result, the Forest Fire Service is limited in the number of overall prescribed burns it can implement to restore habitat for wildlife.
- 12.3.0.10 Land use regulatory processes pertaining to habitat creation, enhancement or restoration projects can be costly and/or burdensome, precluding or discouraging the development or implementation of conservation projects.

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
---------	---------	---------	--

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform

- 12.4.0.1 A species-by-species management focus as opposed to ecological systems and biodiversity generally has greater opportunity for unintended consequences for other species and may be less efficient in developing appropriate management actions.
- 12.4.0.2 Policies and procedures for lands management that lack consideration of the impacts of activity timing can result in unintended impacts to wildlife during vulnerable periods.
- 12.4.0.3 Lack of internal understanding regarding beneficial habitat impacts of storm events leads to policies and practices that reverse or decrease such beneficial effects (e.g., beach-filling, shoreline hardening, “hazard” tree and log removal from forests, etc).
- 12.4.0.4 Lack of a mandatory reporting system for lost crab traps threatens diamondback terrapins and other marine species due to persistent trapping/attraction of organisms by ghost pots.
- 12.4.0.5 Bureau of Forest Fire Management policy has traditionally implemented prescribed burns on State lands for the sole purpose of public safety (i.e., addressing hazard fuel reduction), missing opportunities to burn in a manner that would additionally manage habitat for ecological diversity.
- 12.4.0.6 Techniques for ecological management or restoration of shorelines are not fully developed or evaluated for effectiveness for target and non-target SGCN in coastal areas.
- 12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

14 Education/ Outreach Needs: *Need to inform and educate citizenry of fish and wildlife issues, habitat needs and available resources.*

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats: *Lack of general knowledge or understanding (ecological literacy) of fish and wildlife and habitat conservation.*

- 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.
- 14.1.1.2 Lack of general knowledge of SGCN life histories and vulnerabilities as they relate to land management practices.
- 14.1.1.3 Lack of understanding of the need to manage both natural and anthropogenic (e.g., yards, lawns, hayfields, etc.) habitats to minimize impacts or increase benefits to SGCN and their habitats.

14.2 Outreach needs

14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions: *Need to develop greater understanding of and support for agency's/organization's conservation work among general public and constituent groups (i.e., conservation partners, government agencies, the general public, farmers, business, homeowners, recreationists).*

- 14.2.1.1 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various forest management practices.
- 14.2.1.2 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various aquatic and riparian management practices.
- 14.2.1.3 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various coastal management practices.
- 14.2.1.4 Need to develop greater understanding of and support for efforts implemented to maintain disturbance-free habitats that allow coastal wildlife populations to thrive alongside human residential and recreational uses.
- 14.2.1.5 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various wetland management practices.

Level 1	Level 2	Level 3	Level 4: NJ-specific Threat and Action Driver Statements
---------	---------	---------	--

15 Administrative Needs: *Need to provide the tools for a fish and wildlife agency to support its agency functions.*

15.2 Coordination/administration needs: *Need for fish and wildlife agency administrative support and program coordination.*

15.2.3 Need for multi-state, regional and landscape scale planning: *Needs that can only be achieved via coordination or action among states or regional conservation partners/stakeholders.*

15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Appendix I: List of the Conservation Actions

List of Conservation Actions

Below is the list of conservation actions as defined and categorized by the three-level lexicon of actions developed by the U.S. Fish & Wildlife Service for their database, Tracking and Reporting on Actions for Conservation of Species (TRACS). In addition, New Jersey chose to develop an even finer fourth level of actions that are specific to New Jersey.

TRACS Conservation Action Categories			
Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements

1 Coordination and Administration

1.2 Incentives: *Development and delivery of economic incentives to private landowners to influence responsible stewardship of land/water and specific species.*

1.2.1 Incentives

- 1.2.1.1 Enhance critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates through incentive programs with adjacent private landowners to increase the effective size of the habitat.
- 1.2.1.2 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to increase the effective size of SGCN habitats by protecting/restoring adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats.
- 1.2.1.3 Secure and promote the protection/restoration of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through incentive programs.
- 1.2.1.4 Secure and promote the protection, restoration, and/or development of old-growth forest stands with large trees, in particular those within large, contiguous forest tracts through incentive programs.
- 1.2.1.5 Secure and promote the protection/restoration of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through incentive programs.
- 1.2.1.6 Secure and promote the protection/restoration of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers through incentive programs.
- 1.2.1.7 Secure and promote the protection/restoration of fish SGCN habitats by protecting lands adjacent to fish SGCN habitats and/or aquatic systems feeding into such habitats through incentive programs.
- 1.2.1.8 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to municipalities, land developers, and other land managers to retain and/or enhance native vegetation adjacent to aquatic habitats, and along riparian areas and wildlife movement corridors.
- 1.2.1.9 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing Forestry Stewardship Programs.
- 1.2.1.10 Coordinate across government agencies and non-government organizations to maximize the availability of and enrollment in existing landowner incentive programs (e.g., "farm bill," partners, etc.) to maintain and/or improve habitat.

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>1.2.1.11</u> Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.</p> <p><u>1.2.1.12</u> Create incentives (non-monetary and/or monetary) for land developers to redevelop abandoned areas (e.g., shopping centers, office complexes) to minimize the loss of natural habitats and reduce the extent of impervious surfaces as part of new construction to increase water recharge in those areas.</p> <p><u>1.2.1.13</u> Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to land developers to minimize the impacts of new residential and commercial developments on SGCN and their habitats.</p> <p><u>1.2.1.14</u> Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of herbicides and pesticides, and implementing more ecologically safe strategies when using such products.</p> <p><u>1.2.1.15</u> Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of rodenticides, and implementing more ecologically safe strategies when using such products.</p> <p><u>1.2.1.16</u> Create incentives (non-monetary and/or monetary) within State regulations (mitigations requirements or credit, BMP satisfaction, etc.) to promote the use of retailers who refrain from selling specified invasive or other problematic plant species.</p> <p><u>1.2.1.17</u> Develop a public-relations oriented certification program for private retailers who refrain from selling specified invasive or other problematic plant species.</p> <p><u>1.2.1.18</u> Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and land managers to control and reduce the impacts of invasive, native and non-native species in order to increase structural habitat diversity.</p> <p><u>1.2.1.19</u> Create incentives for federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to farmers, woodland landowners, and private landowners to adopt and/or endorse consistent BMPs concerning controlled burns to maintain and/or improve wildlife habitat.</p> <p><u>1.2.1.20</u> Coordinate across government agencies and non-government organizations to create or expand upon tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMP's.</p> <p><u>1.2.1.21</u> Create and/or support market-based programs that subsidize or create branding for products derived sustainably from managed wildlife habitats.</p> <p><u>1.2.1.22</u> Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to horse/livestock farm owners and managers to increase structural habitat diversity in and around the farms by managing vegetation for a variety of species, in particular, farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>1.2.1.23</u> Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to provide cost shares and/or plan approvals for management based on management approaches and prescriptions.</p> <p><u>1.2.1.24</u> Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners, with habitat of suitable patch size to support breeding grassland-dependent species, to alter the timing of vegetation management to benefit grassland and pollinator species.</p> <p><u>1.2.1.25</u> Create incentives (non-monetary and/or monetary) within State regulations to assist and programs to deliver those incentives to aquaculture growers to relocate, for example, from intertidal to subtidal lease areas through buyouts of leases or microloans, and/or promoting on-lease conservation measures used by aquaculture growers (such as the implementation of conservation easements, use of living shorelines, incorporation of BMPs for habitat protection, etc.) for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.</p> <p><u>1.2.1.26</u> Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing landowner incentive programs.</p> <p><u>1.2.1.27</u> Create legislation to re-instate incentives for citizens bringing their own shopping bag(s) to grocery stores in an effort to decrease the amount of plastic shopping bags in circulation.</p> <p><u>1.2.1.28</u> Create incentives to implement dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.</p>

2 Direct Management of Natural Resources

2.1 Create new habitat or natural processes: *Creation of new habitat or natural processes for the benefit of fish and wildlife and recreational users.*

2.1.1 Habitat conversion: *Conversion of one type of habitat into another (e.g., creating bottomland forest from agricultural land, wetland creation) Note: Forest and wetland would be the appropriate broad habitat types to code for these two examples.*

2.1.1.1 Create high marsh habitat through impoundments and diking of low marsh areas that are less susceptible to breaching by storms and sea-level rise.

2.1.1.2 Utilize dredged materials to create marsh islands to provide nesting habitat for birds and marine turtles.

2.2 Dam and barrier removal: *Removal of barriers to maintain aquatic species populations and restore ecological functions in streams (e.g., dam or dike removal, notching of dams).*

2.2.1 Culvert work: *Replacement or repair of road culverts (e.g., installing larger culvert, eliminating perching).*

2.2.1.1 Replace existing barriers to wildlife movement with and/or install appropriately-sized systems to accommodate wildlife dispersal.

2.2.5 Obstruction removal: *Removal of other obstructions (e.g., beaver dams).*

2.2.5.1 Enhance fish SGCN habitats by removing obstructions to fish passage to benefit those species.

2.3 Fire management: *Use of fire to benefit fish and wildlife and their habitats.*

2.3.2 Fuel reduction: *Application of treatments to reduce the risk of high-severity wildfires and to manage changes in the ecological functions of forests (e.g., mechanical thinning).*

2.3.2.1 Prevent wildfires by reducing natural fuel (e.g., leaf litter).

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
---------	---------	---------	---

2.3.3 Prescribed burning: *Application of fire in a knowledgeable manner to forest fuels on a specific land under selected weather conditions to accomplish predetermined, well-defined management objectives (e.g., burning an established native grass community to reduce or eliminate invading brush or exotic species).*

2.3.3.1 Evaluate different management techniques of prescribed burns that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.

2.3.3.2 Conduct prescribed burning in Northern New Jersey forests to maintain and regenerate a mosaic of upland forest habitats.

2.3.3.3 Conduct prescribed burning to improve wildlife habitat.

2.4 Fish and wildlife habitat structures: *Installation of structures to benefit fish and wildlife and their habitats.*

2.4.2 Hibernacula: *Creation or improvement of overwintering sites.*

2.4.2.1 Investigate the need to stabilize important bat hibernacula to ensure structural soundness and install the necessary supports.

2.6 Hazard or infrastructure removal: *Removal of hazards or infrastructure to benefit fish and wildlife and their habitats.*

2.6.6 Shoreline armoring removal: *Removal of shoreline armoring to improve aquatic habitats (e.g., jetties, riprap).*

2.6.6.1 Remove shoreline armoring to reduce its impacts on aquatic habitats.

2.8 Invasive species control: *Control of invasive animal and plant species to maintain native species populations and restore ecological functions.*

2.8.0 Invasive species control strategies and implementation

2.8.0.1 Control invasive insect infestations by implementing BMP strategies through biological, chemical and/or mechanical means that will depress, or when appropriate, eradicate populations in a manner that avoids excessive harm to non-target species using BMPs to control infestations and limit their spread based on an inventory of invasive insect distribution and response to outbreaks.

2.8.0.2 Develop, implement, monitor and evaluate pest control/management strategies to reduce the impacts of over-abundant wildlife species (native and/or native, invasive species) on native vegetation and the degradation of habitats supporting SGCN. Over-abundant wildlife species include but are not limited to mute swans, Canada geese, beaver and white-tailed deer.

2.8.0.3 Work with NJ Invasive Species Strike Team to identify areas with and eradicate aquatic invasive species such as the Asian Swamp Eel, Northern Snakehead, and the Chinese pond mussel. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.

2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>2.8.0.5</u> Implement biologically safe and appropriate control/management strategies, and where appropriate, eradication strategies to reduce the impacts and/or limit the distribution of invasive and/or non-native plant species within or near aquatic systems using methods that will provide the most protection to the aquatic and riparian ecological system, and minimize disturbance to the soil and wildlife. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.</p> <p><u>2.8.0.6</u> Implement long-term management of invasive and/or non-native plants to help maintain functioning ecological systems and biological diversity, and to enhance travel corridors. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.</p> <p>2.9 Living shorelines: <i>Physical manipulation in shoreline areas to maintain fish and wildlife habitats and/or restore ecological functions.</i></p> <p>2.9.1 Beach renourishment: <i>Placement of sand onto beaches and employing other techniques for their renourishment.</i></p> <p><u>2.9.1.1</u> Implement best management practices for using mined sand or dredged material to improve habitat for wildlife, particularly for spawning horseshoe crabs and migrating shorebirds.</p> <p><u>2.9.1.2</u> Coordinate the beneficial placement of dredge materials to create, enhance, and/or maintain colonial waterbird nesting, in particular along the Intra-Coastal Waterway.</p> <p><u>2.9.1.3</u> Where beach renourishment projects are deemed necessary, implement such projects with a design to increase availability of nesting and foraging habitat for beach nesting birds.</p> <p><u>2.9.1.4</u> Implement beach renourishment strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimizes harm to wildlife, particularly SGCN.</p> <p><u>2.9.1.5</u> Expand the acreages and enhance the effective size of SGCN habitats by utilizing beach renourishment to restore adjacent, less optimal or unsuitable, habitats.</p> <p><u>2.9.1.6</u> Reclaim degraded rare species habitats using beach renourishment, when appropriate, to restore habitat value for the documented/target SGCN.</p> <p><u>2.9.1.7</u> Protect significant natural and/or unique communities by implementing best management practices for beach renourishment, when applicable.</p> <p><u>2.9.1.8</u> Minimize habitat loss of critical coastal beach habitats that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas through beach renourishment.</p> <p><u>2.9.1.9</u> Manage beaches to divert human activity away from staging areas for red knots and other migratory shorebirds during critical periods.</p> <p><u>2.9.1.10</u> Repair beaches associated with marshes damaged by salt hay farm/dike abandonment and restore degraded sites for targeted SGCN species and their habitats.</p> <p><u>2.9.1.11</u> Enhance critical migratory stopover beach habitats for songbirds, raptors, shorebirds, bats and invertebrates through beach renourishment and expand management to adjacent private lands to increase the effective size of the habitat.</p> <p><u>2.9.1.12</u> Implement beach habitat management on state and other conservation lands to enhance food availability for migratory species (birds, bats, invertebrates).</p> <p><u>2.9.1.13</u> Conduct beach renourishment to maintain, enhance and/or create feeding and roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.</p> <p><u>2.9.1.14</u> Implement best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated beach habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.</p> <p><u>2.9.1.15</u> Implement beach management strategies to benefit urban-associated SGCN.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>2.9.1.16</u> Prevent or ameliorate near-term impacts of climate change throughout the State but in particular within the coastal and Delaware Bay areas by implementing habitat management strategies that will establish/improve habitat resilience, such as beach renourishment, that benefits wildlife inhabiting these areas.</p> <p>2.9.2 Erosion control structures: <i>Installation of hard structures (e.g., seawall bulkhead) or living structures (e.g., greenwall systems) to control erosion.</i></p> <p><u>2.9.2.1</u> Install breakwaters in the form of living shorelines to reduce the impact of wave erosion while preserving the natural character of the site.</p> <p>2.9.3 Sand dune restoration: <i>Application of techniques to restore sand dunes (e.g., fencing off sea-grass areas).</i></p> <p><u>2.9.3.1</u> Prevent or ameliorate near-term impacts of climate change throughout the State but in particular within the coastal and Delaware Bay areas by implementing habitat management strategies that will establish/improve habitat resilience, such as sand dune restoration, that benefits wildlife inhabiting these areas.</p> <p><u>2.9.3.2</u> Implement sand dune restoration strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimizes harm to wildlife, particularly SGCN.</p> <p><u>2.9.3.3</u> Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats through sand dune restoration.</p> <p><u>2.9.3.4</u> Reclaim degraded rare species habitats using sand dune restoration needed to restore habitat value for the documented/target SGCN.</p> <p><u>2.9.3.5</u> Protect significant natural and/or unique communities by implementing best management practices for sand dune restoration.</p> <p><u>2.9.3.6</u> Minimize habitat loss of critical coastal dune habitats that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas through sand dune restoration.</p> <p><u>2.9.3.7</u> Manage sand dunes to divert human activity away from staging areas for red knots and other migratory shorebirds during critical periods.</p> <p><u>2.9.3.8</u> Implement sand dune restoration strategies to benefit urban-associated SGCN.</p> <p><u>2.9.3.9</u> Enhance critical migratory stopover sand dune habitats for songbirds, raptors, shorebirds, bats and invertebrates through sand dune restoration and expand management to adjacent private lands to increase the effective size of the habitat.</p> <p><u>2.9.3.10</u> Implement sand dune restoration strategies on state and other conservation lands to enhance food availability for migratory species (birds, bats, invertebrates).</p> <p><u>2.9.3.11</u> Conduct sand dune restoration to maintain, enhance and/or create feeding and roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State and evaluate the effectiveness of such management.</p> <p><u>2.9.3.12</u> Implement best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated sand dune habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.</p> <p>2.10 Planting/seeding: <i>Planting or seeding to maintain fish and wildlife habitats and/or restore ecological functions.</i></p> <p>2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration</p> <p><u>2.10.0.1</u> Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>2.10.0.2</u> Improve the availability of prey/food resources through terrestrial and aquatic plantings and habitat restoration for SGCN populations, in particular for those populations thought to be limited due wholly or in part to a lack of (or contaminated) food resources, and for migratory species (birds, bats, invertebrates).</p> <p><u>2.10.0.3</u> Restore and/or enhance habitats to benefit urban-associated SGCN.</p> <p><u>2.10.0.4</u> Restore and/or enhance suitable travel corridors connecting conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats.</p> <p><u>2.10.0.5</u> Implement habitat restoration and/or enhancement activities that include the creation of vegetative buffers between sensitive habitats (e.g., aquatic systems) and human-inhabited areas (e.g., residences, parks, etc.) and that is conducted during appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.</p> <p><u>2.10.0.6</u> Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats.</p> <p><u>2.10.0.7</u> Restore/reclaim and enhance degraded rare species habitats through strategic revegetation and management efforts for documented/target SGCN.</p> <p><u>2.10.0.8</u> Protect significant natural and/or unique communities by implementing best management practices when conducting habitat restoration strategies.</p> <p><u>2.10.0.9</u> Restore and/or enhance riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation, alteration and/or changes in hydrology and subsequent disturbances to and behavioral changes of wildlife (e.g., restoring biologically appropriate buffers, revegetation or restoration efforts, etc.).</p> <p><u>2.10.0.10</u> Minimize the loss of important habitats (e.g., coastal scrub-shrub and grassy habitats, high and low marsh habitats, etc.) that provide nesting, migrating, and wintering areas for SGCN birds and other coastal and marsh-dependent species through habitat restoration efforts.</p> <p><u>2.10.0.11</u> Restore and/or enhance critical migratory terrestrial and aquatic habitats (e.g., beach, grasslands, forest, scrub-shrub, etc.) for songbirds, raptors, shorebirds, waterfowl, bats and invertebrates through habitat restoration efforts and expand habitat restoration to adjacent private lands to increase the effective size of the habitat.</p> <p><u>2.10.0.12</u> Create and/or maintain scrub-shrub habitats through revegetation efforts with little to no impact on forested, wetland and grassland habitats to maintain populations of shrub-dependent SGCN.</p> <p><u>2.10.0.13</u> Restore and/or enhance impoundments to provide suitable foraging and nesting habitat for SGCN species inhabiting them (e.g., bitterns, rails, ducks, turtles and some invertebrates).</p> <p><u>2.10.0.14</u> Implement best management practices (BMPs), protective strategies and guidelines for restoring and enhancing healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.</p> <p><u>2.10.0.15</u> Restore and/or enhance terrestrial and aquatic habitats proximate to but not adjacent to roads and other transportation corridors for terrestrial-bound SGCN species whose behavior (i.e., dispersal across roads) may be altered by doing so, and therefore decrease road mortality of such species (e.g., amphibians, snakes, turtles, small mammals).</p> <p><u>2.10.0.16</u> Reverse the trend of Native Widgeon grass invading former eelgrass bed habitats by actively restoring eelgrass in applicable areas.</p> <p><u>2.10.0.17</u> Maintain, enhance and/or restore SGCN-inhabited/used freshwater wetlands through restoring submerged aquatic vegetation.</p> <p><u>2.10.0.18</u> Implement a habitat improvement and restoration program to restore cold-water fish habitat, ecosystems and populations.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>2.10.0.19</u> Provide woody debris within documented Tiger Salamander pools to benefit Tiger Salamanders and other associated vernal pool herpetofauna for shelter, egg-attachment and soil protection.</p> <p><u>2.10.0.20</u> Expand breeding opportunities for obligate vernal pool breeders and related herpetofauna by creating vegetated buffers for dispersal from breeding pools in all directions, or as needed to establish the connectivity of metapopulations.</p> <p><u>2.10.0.21</u> Restore and/or enhance understory habitats that suppress invasive species and provide critical resources and enhance sheltering, foraging, and nesting cover for wildlife.</p> <p><u>2.10.0.22</u> Restore and/or enhance terrestrial and aquatic habitats to promote the regeneration of native vegetation and enhance structural diversity to benefit SGCN (e.g., vegetative buffers of aquatic systems, allow coarse, woody debris to remain in terrestrial, aquatic and riparian habitats to provide shelter, riparian stabilization and necessary microclimates, plant native trees, shrubs and grasses, etc.).</p> <p><u>2.10.0.23</u> Restore and/or enhance roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.</p> <p><u>2.10.0.24</u> Use NJ's CHANJ mapping and guidance to establish vegetation and enhance or create corridors between fragmented habitats with similar vegetation, slope, soils, structure, etc. to ensure vegetative integrity is maintained to allow wildlife to safely disperse, and corridors are buffered with natural habitats to minimize disturbance to wildlife within the corridors.</p> <p><u>2.10.0.25</u> Enhance SGCN fish habitats through aquatic and riparian vegetation restoration.</p> <p><u>2.10.0.26</u> Reestablish/restore historically important submerged aquatic vegetation beds in Delaware Bay tributaries to benefit SGCN waterfowl, waterbirds, terrapins, sea turtles and finfish.</p> <p>2.10.1 Coral: Application of techniques to reestablish coral reefs.</p> <p><u>2.10.1.1</u> Reestablish coral reefs to improve the availability of prey/food resources for SGCN whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources.</p> <p>2.11 Vegetation management: Physical manipulation of vegetation to maintain fish and wildlife habitats and/or restore ecological functions.</p> <p>2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration</p> <p><u>2.11.0.1</u> Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.</p> <p><u>2.11.0.2</u> Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas for target SGCN and/or species groups; management should complement rare species needs in a targeted area.</p> <p><u>2.11.0.3</u> Create suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats through vegetation management.</p> <p><u>2.11.0.4</u> Implement vegetation management strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife, particularly SGCN.</p> <p><u>2.11.0.5</u> Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats through vegetation management.</p> <p><u>2.11.0.6</u> Reclaim degraded rare species habitats by conducting vegetation management needed to restore habitat value for the documented/target SGCN.</p> <p><u>2.11.0.7</u> Protect significant natural and/or unique communities by implementing best management practices through vegetation management.</p> <p><u>2.11.0.8</u> Maintain, enhance and/or restore biologically appropriate buffers for SGCN-inhabited/used freshwater wetlands through vegetation management.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>2.11.0.9</u> Minimize habitat loss of critical coastal habitats that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas through vegetation management.</p> <p><u>2.11.0.10</u> Enhance critical migratory stopover beach habitats for songbirds, raptors, shorebirds, bats and invertebrates through vegetation management and expand management to adjacent private lands to increase the effective size of the habitat.</p> <p><u>2.11.0.11</u> Implement vegetation management on state and other conservation lands to enhance food availability for migratory species (birds, bats, invertebrates).</p> <p><u>2.11.0.12</u> Conduct vegetation management to create feeding and roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.</p> <p><u>2.11.0.13</u> Implement best management practices (BMPs), protective strategies, and guidelines for vegetation management to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.</p> <p><u>2.11.0.14</u> Conduct vegetation management adjacent to roads for SGCN species whose behavior (i.e., dispersal across roads) <i>may</i> be altered by doing so, and therefore decrease road mortality of such species (e.g., amphibians, snakes, turtles, small mammals).</p> <p><u>2.11.0.15</u> Implement vegetation management to benefit urban-associated SGCN.</p> <p><u>2.11.0.16</u> Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.</p> <p><u>2.11.0.17</u> Implement vegetation management strategies to improve the availability of prey/food resources for SGCN whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources.</p> <p><u>2.11.0.18</u> Implement forest management/silvicultural strategies that promote the development of new old-growth forests and/or minimize the loss of old-growth forest stands with large trees and within large, contiguous tracts.</p> <p><u>2.11.0.19</u> Implement forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN.</p> <p><u>2.11.0.20</u> Create and/or maintain scrub-shrub habitats through management efforts with little to no impact on forested, wetland and grassland habitats to maintain populations of shrub-dependent SGCN.</p> <p><u>2.11.0.21</u> Minimize the degradation, alteration and/or changes in hydrology of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) and subsequent disturbances to and behavioral changes of wildlife by maintaining or enhancing these areas and biologically appropriate buffers through habitat management and/or revegetation or restoration efforts.</p> <p><u>2.11.0.22</u> Minimize habitat loss of high and low marsh habitats that provide nesting, migrating and wintering areas for SGCN birds and other marsh-dependent SGCN by maintaining or enhancing these areas through habitat management and/or revegetation or restoration efforts.</p> <p><u>2.11.0.23</u> Implement appropriate habitat management actions in areas where natural disturbances, such as wildfire, have been precluded.</p> <p><u>2.11.0.24</u> Conduct vegetation management adjacent to aquatic habitats following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>2.11.0.25</u> Conduct vegetation management along access roads following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.</p> <p><u>2.11.0.26</u> Conduct vegetation management along roadsides and medians, avoiding peak activity periods for wildlife, that enhances wildlife dispersal naturally and safely across roads and similar barriers to/between terrestrial and/or aquatic habitats.</p> <p><u>2.11.0.27</u> Conduct vegetation management for target shrub- or young forest-dependent SGCN following BMPs to minimize the risk of the establishment of invasive and non-native plants.</p> <p><u>2.11.0.28</u> Conduct vegetation management in agricultural areas following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.</p> <p><u>2.11.0.29</u> Conduct vegetation management on transportation and service corridors (i.e., rights-of-way) following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.</p> <p><u>2.11.0.30</u> Identify and prioritize areas where various management tools (such as increasing salinity through the management of water levels or chemical applications) may be effective in reducing phragmites within and restoring marsh habitat.</p> <p><u>2.11.0.31</u> In areas where vegetative communities are shifting due to fire suppression and controlled burns are not feasible, manage vegetation to improve wildlife habitat.</p> <p><u>2.11.0.32</u> Increase structural habitat diversity around and when feasible, within agricultural landscapes by managing vegetation for a variety of species, in particular, those farms that have removed scrub-shrub habitat and/or fragmented forests, and by implementing ecologically best practices (e.g., no-till farming, maintaining hedgerows, buffer set-asides, etc.).</p> <p><u>2.11.0.33</u> Increase structural habitat diversity by implementing long-term vegetation management to minimize the potential for the establishment of invasive and/or non-native plants that may outcompete native vegetation.</p> <p><u>2.11.0.34</u> Increase structural habitat diversity by managing residential, commercial and recreational areas' landscapes for a variety of species. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.</p> <p><u>2.11.0.35</u> Increase structural habitat diversity by managing vegetation adjacent to aquatic habitats in a manner that provides a buffer from runoff and erosion and a microclimate to stabilize seasonal temperatures to benefit a variety of aquatic and semi-aquatic species.</p> <p><u>2.11.0.36</u> Increase structural habitat diversity by managing vegetation for a variety of species and considering their life history requirements (e.g., travel corridors, shelter, resting and breeding areas) to minimize the risk of harm.</p> <p><u>2.11.0.37</u> Increase structural habitat diversity by minimizing the removal of coarse, woody debris in terrestrial, aquatic and riparian habitats which benefits wildlife.</p> <p><u>2.11.0.38</u> Increase structural habitat diversity in and around horse/livestock farms by managing vegetation for a variety of species, in particular, in and around farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).</p> <p><u>2.11.0.39</u> Increase structural habitat diversity in and around solar farms by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>2.11.0.40</u> Increase structural habitat diversity surrounding areas used for energy, mining, and transportation and service corridors by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides, and avoid managing habitat during the breeding seasons for ground-nesting birds, reptiles, amphibians and small mammals.</p> <p><u>2.11.0.41</u> Increase structural habitat diversity through the implementation of a variety of vegetation management practices such as prescribed burns (either increasing or decreasing their frequency depending on the site and objective), plantings, etc. that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.</p> <p><u>2.11.0.42</u> Increase structural habitat diversity within wind farms for terrestrial bound and low-flying species and around wind farms for other wildlife by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.</p> <p><u>2.11.0.43</u> Manage forests to increase variation in age structure and composition using BMPs that promote and maintain functioning ecological forest-based systems and biological diversity.</p> <p><u>2.11.0.44</u> Manage phragmites adjacent to coastal marshes of interest, in particular those that are within underdeveloped areas and are unprotected, through herbicide application and water management to improve resiliency of the marshes to sea level rise.</p> <p><u>2.11.0.45</u> Regularly and/or rotationally create young forest habitat in targeted areas to maintain and regenerate a mosaic of upland forest habitats that will benefit shrub- and young forest-dependent species.</p>

2.12 Water management: *Management of water to benefit fish and wildlife and their habitats.*

2.12.1 Ditch plugs: *Installation of earthen plugs into drainage ditches to restore wetlands.*

2.12.1.1 Implement best management practices (BMPs), protective strategies, and guidelines for ditch plugging to maintain and enhance healthy, resident and migratory SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

2.12.2 Diversion/headgate: *Installation or maintenance of structures to divert water.*

2.12.2.1 Prevent or ameliorate near-term impacts of climate change throughout the State but in particular within the coastal and Delaware Bay areas by implementing habitat management strategies that will establish/improve habitat resilience, such as using diversions, that benefits wildlife inhabiting these areas.

2.12.3 Drainage: *Removal of tile drains or drainage ditches to restore wetland hydrology.*

2.12.3.1 Remove drainage ditches to benefit urban-associated SGCN.

2.12.3.2 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) such as removing drainage ditches to restore natural stream flows and wetlands, that benefit wildlife inhabiting these areas.

2.12.3.3 Remove tile drains and drainage ditches to improve wetland hydrology and restore natural stream flows during appropriate times to avoid sensitive periods (e.g., nesting, denning, roosting) and minimizes harm to wildlife, particularly SGCN.

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>2.12.3.4</u> Expand the acreages and enhance the effective size of SGCN habitats by reclaiming/restoring adjacent, degraded habitats by removing tile drains and drainage ditches.</p> <p><u>2.12.3.5</u> Remove drainage ditches adjacent to roads to decrease the attraction for amphibians, reptiles and small mammals, and thereby minimizing road mortality of such species (e.g., amphibians, snakes, turtles, small mammals).</p> <p><u>2.12.3.6</u> Protect significant natural and/or unique communities by and when removing tile drains and drainage ditches.</p> <p><u>2.12.3.7</u> Minimize habitat loss of critical coastal habitats that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas by removing drainage ditches.</p> <p><u>2.12.3.8</u> Enhance critical migratory stopover beach habitats for songbirds, raptors, shorebirds, bats and invertebrates by removing drainage ditches and expanding management to adjacent private lands to increase the effective size of the habitat.</p> <p><u>2.12.3.9</u> Implement drain removal on state and other conservation lands to enhance food availability for migratory species (birds, bats, invertebrates).</p> <p><u>2.12.3.10</u> Use tile drain and drainage ditch removal to create feeding and roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.</p> <p><u>2.12.3.11</u> Implement best management practices (BMPs), protective strategies, and guidelines when removing tile drains and drainage ditches to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.</p> <p>2.12.5 Spring development: <i>Application of techniques to improve the flow, quantity and yield of water from a natural spring.</i></p> <p><u>2.12.5.1</u> Implement a habitat improvement and restoration program to restore cold-water fish habitat, ecosystems and populations.</p> <p>2.12.6 Tide gate: <i>Installation or maintenance of structures to increase the hydro-period and water depth of a wetland.</i></p> <p><u>2.12.6.1</u> Prevent or ameliorate near-term impacts of climate change throughout the State but in particular within the coastal and Delaware Bay areas by implementing habitat management strategies that will establish/improve habitat resilience, such as tide gates, that benefits wildlife inhabiting these areas.</p> <p>2.12.7 Waterfowl impoundment maintenance: <i>Maintenance of impoundments for waterfowl habitat (e.g., renovation of impoundment dikes).</i></p> <p><u>2.12.7.1</u> Manage impoundments to benefit SGCN species inhabiting them (e.g., bitterns, rails, ducks, turtles and some invertebrates).</p> <p><u>2.12.7.2</u> Use impoundment management to create feeding and roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.</p> <p><u>2.12.7.3</u> Implement best management practices (BMPs), protective strategies, and guidelines for impoundment management to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.</p> <p><u>2.12.7.4</u> Implement impoundment management strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimizes harm to wildlife, particularly SGCN.</p> <p><u>2.12.7.5</u> Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats through impoundment management.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>2.12.7.6</u> Reclaim degraded rare species habitats through impoundment management needed to restore habitat value for the documented/target SGCN.</p> <p><u>2.12.7.7</u> Protect significant natural and/or unique communities by implementing best management practices for impoundment management.</p> <p><u>2.12.7.8</u> Repair impoundments damaged by salt hay farm/dike abandonment and conduct restoration of degraded sites for targeted SGCN species and their habitats.</p> <p><u>2.12.7.9</u> Minimize habitat loss of critical coastal habitats in Delaware Bay that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas through impoundment management.</p> <p><u>2.12.7.10</u> Enhance critical migratory stopover beach habitats for songbirds, raptors, shorebirds, bats and invertebrates through impoundment management and expand management to adjacent private lands to increase the effective size of the habitat.</p> <p><u>2.12.7.11</u> Restore existing salt hay farm areas by repairing breaches in impoundments to create habitat for high marsh nesting species and waterfowl.</p> <p><u>2.12.7.12</u> Implement impoundment management to benefit urban-associated SGCN.</p> <p><u>2.12.7.13</u> Manage impoundments adjacent to roads for SGCN species whose behavior (i.e., dispersal across roads) may be altered by doing so, and therefore decrease road mortality of such species (e.g., marsh birds, amphibians, turtles, small mammals).</p> <p><u>2.12.7.14</u> Prevent or ameliorate near-term impacts of climate change throughout the State but in particular within the coastal and Delaware Bay areas by implementing habitat management strategies that will establish/improve habitat resilience, such as impoundment management, that benefits wildlife inhabiting these areas.</p> <p><u>2.12.7.15</u> Implement impoundment management on state and other conservation lands to enhance food availability for migratory species (birds, bats, invertebrates).</p> <p>2.12.8 Watering facilities: <i>Installation or maintenance of structures to collect and store water for the benefit of wildlife (e.g., water holes, guzzlers, wells).</i></p> <p><u>2.12.8.1</u> Install water control structures to reduce the impact of salt water intrusion to particularly vulnerable high marsh habitats.</p> <p><u>2.12.8.2</u> Manage water levels in impoundments to improve coastal marsh habitat availability to wildlife and improve resiliency of the marshes to sea level rise.</p> <p>2.13 Wildlife damage management: <i>Assessment and management of damage from nuisance native fish and wildlife. Includes control of predators by biological, chemical or mechanical means to maintain populations of species at risk and restore ecological functions (e.g., gull or cormorant control, nest exclusion devices, cave gating) Note: Limited eligibility for funding through WSFR grant programs.</i></p> <p>2.13.0 Nuisance fish and wildlife damage</p> <p><u>2.13.0.1</u> Investigate the impacts of mosquito control methods on predator SGCN (bats, insectivorous birds). Develop, implement and evaluate the effectiveness of mosquito control-BMPs designed to avoid depletion or contamination of SGCN's insect prey base and drinking sources with pyrethroids, organophosphates, or other chemicals.</p> <p><u>2.13.0.2</u> Develop, implement and evaluate the effectiveness of BMPs for mosquito control methods that may produce benefits for coastal marsh dependent SGCN wildlife, including but not limited to high-marsh nesting birds and migrating shorebirds and landbirds.</p> <p><u>2.13.0.3</u> Investigate alternative saltmarsh mosquito control methods that may produce benefits for coastal marsh dependent SGCN wildlife, including but not limited to high-marsh nesting birds and migrating shorebirds and landbirds.</p> <p><u>2.13.0.4</u> Investigate the effects of mosquito control methods on freshwater aquatic and semi-aquatic SGCN including but not limited to, amphibian, fish, dragonfly, and damselfly populations.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>2.13.0.5</u> Investigate the impacts of human-subsidized and/or naturally occurring predator species on SGCN to assess the need for integrated wildlife damage management techniques (e.g., predator exclosures, fish blockages, electric fence, culls) and/or policy changes on state land management that minimize the impacts of human-subsidized predators.</p> <p><u>2.13.0.6</u> Develop, implement and evaluate the effectiveness of predator-control techniques aimed at improving SGCN populations and methods to minimize the impact of those species carrying parasites or diseases that may impact SGCN (e.g., raccoon roundworm kills Allegheny woodrat).</p> <p><u>2.13.0.7</u> Develop, implement, monitor and evaluate management strategies to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.</p> <p><u>2.13.0.8</u> Implement and assess management strategies to control and reduce the impacts of detrimental species and diseases that pose threats to native wildlife or communities.</p> <p>2.14 Wildlife disease management: <i>Assessment and management of wildlife disease situations. Includes control or treatment of diseased animals to maintain populations of species at risk and restore ecological functions (e.g., chronic wasting disease, brucellosis, tuberculosis, plague management activities).</i></p> <p>2.14.0 Wildlife disease strategy development and investigation</p> <p><u>2.14.0.1</u> Investigate diseases/pathogens impacting SGCN and/or their habitats.</p> <p><u>2.14.0.2</u> Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.</p> <p><u>2.14.0.3</u> Protect SGCN from exotic pathogen introduction or incident through implementation of a "rapid response plan"; DFW to give priority attention to these species in planning and/or implementing a response.</p> <p><u>2.14.0.4</u> Conduct long-term monitoring of diseases in vulnerable wildlife to determine the magnitude of exposure within populations and around the State, the impacts to those species, in particular SGCN, and investigate the feasibility of mitigating for such impacts.</p> <p><u>2.14.0.5</u> Assess the impacts of diseases on the life cycles of wildlife.</p> <p><u>2.14.0.6</u> Distribute antihelminthic drugs targeting raccoon roundworm in raccoons proximal to Allegheny woodrat populations and/or implement a raccoon control strategy.</p>

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

- 3.0.0.1 Conduct long-term monitoring of resident and migratory SGCN populations using standardized survey protocols to determine the variables that may impact their long-term persistence in the State (e.g., population viability, distribution, dispersal, home range and habitat use, travel corridors, food availability, vulnerability to pollutants and disease, etc.). Compile this information to determine the likely causes of population declines and to understand metapopulation dynamics. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.2 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) where data gaps exist regarding SGCN distribution, and their critical and supportive habitats. Conduct surveys using standardized survey protocols to acquire baseline data, and provide the data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>3.0.0.3</u> Gather baseline data on SGCN inhabiting permanently protected natural lands regarding their distribution and population (e.g., abundance, dispersal, demography including productivity and survival, etc.), and identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) critical and supporting habitats within those landscapes.</p> <p><u>3.0.0.4</u> Conduct long-term studies on SGCN inhabiting permanently protected natural lands to develop population trend data and changes in demography, and to determine if critical and/or supporting habitats are limited or changing; i.e., diminishing in value, acreage or connectivity.</p> <p><u>3.0.0.5</u> Gather baseline data on resident and migratory SGCN (in particular migratory species for which New Jersey habitats are significant), terrestrial, freshwater and marine species, regarding the location and condition of their critical and supporting habitats (e.g., foraging, roosting, nesting/breeding, stopover, migration paths, etc.), and population demography (e.g., productivity, survival, dispersal). Compile this information into a database that includes descriptions of the conditions of the habitats and species, and a GIS component of the locations of these important habitats. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.</p> <p><u>3.0.0.6</u> Conduct long-term studies on resident and migratory SGCN to determine if there are changes to the populations' demography (productivity, survival, dispersal) and/or to their critical and/or supporting habitats (i.e., diminishing in value, acreage or connectivity, etc.), in particular changes that would not maintain SGCN at viable levels for species populations. Update data and GIS maps; provide updated information to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.</p> <p><u>3.0.0.7</u> Collect baseline data to document species distributions, in particular SGCN, and current habitat for future analysis of possible distribution shifting as a result of habitat shifting or alteration associated with climate change impacts.</p> <p><u>3.0.0.8</u> Conduct long-term studies and compare baseline metrics of documented species distributions and associated habitats to identify possible species and/or habitat shifting or alteration associated with climate change impacts.</p> <p><u>3.0.0.9</u> Identify SGCN (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources, and compile/collect and evaluate data/information regarding potential management strategies to improve the availability of such SGCN's food resources.</p> <p><u>3.0.0.10</u> Conduct long-term studies to evaluate the effectiveness of management strategies implemented to enhance food/prey availability for SGCN [whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources] through studies that investigate the populations and health of the food resources as well as the target SGCN. Revise management strategies as needed and continue to monitor the effectiveness of the efforts.</p> <p><u>3.0.0.11</u> Develop, implement and evaluate the effectiveness of town plans that avoid impacts to SGCN species and their habitats.</p> <p><u>3.0.0.12</u> Compile available life history information on urban-associated SGCN (e.g., predators, levels of nest/young depredation, breeding longevity and reproductive effort over time, preferred nesting/reproductive requirements, fidelity to breeding and wintering sites, comprehensive assessment of migration routes and destinations) for future development of management strategies to benefit such species.</p> <p><u>3.0.0.13</u> Investigate the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats. Evaluate and modify management practices as appropriate.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>3.0.0.14</u> Identify areas with invasive, aquatic plants and animals and collect a detailed baseline assessment of the species' status and distribution. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort. Researchers and contractors performing Forest Stewardship Inventories and/or Plans on state lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.</p> <p><u>3.0.0.15</u> Conduct long-term monitoring of areas identified as having invasive, aquatic plants and animals to track the species' status/progress over time with or without the implementation of management strategies. Areas without management strategies should be assessed and prioritized for management/control. Areas where management strategies are being implemented should include an assessment of the management effort and identify/recommend and implement necessary changes to improve its success. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort.</p> <p><u>3.0.0.16</u> Develop a baseline status (through studies and assessments, review of available data, enlistment of species experts, etc.) of marsh- and beach-dependent SGCN (and their habitats) whose populations may be impaired due to habitat degradation as a result of salt hay farm/dike abandonment.</p> <p><u>3.0.0.17</u> Conduct long-term monitoring of marsh- and beach-dependent SGCN (and their habitats) to evaluate the effectiveness of the management strategies implemented to repair degraded marshes and beaches damaged by salt hay farm/dike abandonment within all bay shore areas.</p> <p><u>3.0.0.18</u> Develop, implement and evaluate the effectiveness (through research and long-term monitoring) of engineering standards that embrace both shore protection/resiliency and habitat creation for shorebirds, horseshoe crabs and other coastal species along the Atlantic and Delaware Bay coasts that minimize horseshoe crab impingement and damage to beach habitat from residential and commercial construction.</p> <p><u>3.0.0.19</u> Identify the presence and status (e.g., functioning, structure, slated for removal, etc.) of existing dams and culverts within and/or that may impact SGCN and their habitats, and create a database that includes a GIS component identifying the locations of such structures and their status. Share this information with appropriate organizations and/or agencies evaluating the benefits and risks of such structures on SGCN and their habitats.</p> <p><u>3.0.0.20</u> Once baseline data identifying and describing the status of existing dams and culverts have been gathered, conduct evaluations at a variety of sites to determine whether the benefits of culvert and dam creation or removal outweigh the risks to SGCN species and their habitats, and if other variables/conditions specific to individual sites/locations result in a different outcome. Identify and target appropriate dams and culverts for removal and/or reconstruction to minimize harm to SGCN species and their habitats.</p> <p><u>3.0.0.21</u> Conduct long-term monitoring to determine the impacts of the fish and shellfish aquaculture industries on focal and non-focal SGCN and their habitats (i.e., NJ bays, estuaries, ocean areas). Assess the success of management actions implemented to minimize these impacts and make specific recommendations to the NJ DEP regarding how such management efforts may be improved to minimize harm to wildlife and their habitats.</p> <p><u>3.0.0.22</u> Develop, implement and evaluate the success of a habitat improvement and restoration program to restore cold-water fish habitat, ecosystems and populations.</p> <p><u>3.0.0.23</u> Identify (through wildlife and aquatic system surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and research water quality parameters for all [types of] aquatic systems for various SGCN populations.</p> <p><u>3.0.0.24</u> Identify (through aerial and topographic maps), and confirm through field surveys, potential vernal pools using standard protocols. Provide confirmed vernal pool locations (and when possible, a description of the pools condition) and species' presence data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>3.0.0.25</u> Identify pathways of migratory SGCN in the Atlantic Coastal and Marine Regions (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and use the data to help evaluate the potential short- and long-term impacts of wind turbines, radio towers, utility guy lines, and other tall coastal structures on migratory populations.</p> <p><u>3.0.0.26</u> Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species including objectives and guidance pertaining to and the condition/status of critical and supporting habitats.</p> <p><u>3.0.0.27</u> Evaluate the effectiveness of strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals through research and monitoring. Develop and provide NJ DEP and other appropriate governing agencies/commissions a summary of findings and recommendations to improve such efforts.</p> <p><u>3.0.0.28</u> Evaluate best management practices for using mined sand or dredged material to improve habitat for wildlife, particularly for spawning horseshoe crabs and migrating shorebirds.</p> <p><u>3.0.0.29</u> Conduct long-term monitoring of sensitive marine species habitats and migration and/or spawning areas to determine their continued use or changes as a result of habitat shifts or alterations that may warrant further management actions.</p> <p><u>3.0.0.30</u> Conduct research to investigate the feasibility of managing and/or creating roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.</p> <p><u>3.0.0.31</u> Conduct short- and long-term studies (e.g., wildlife surveys and habitat assessments) to evaluate the effectiveness of vegetation management efforts to maintain, enhance and/or create roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.</p> <p>3.2 Research, survey or monitoring - fish and wildlife populations: <i>Collection and analysis of data as part of research, survey or monitoring primarily focused on fish and wildlife populations Note: includes compilation, management, synthesis, analysis and reporting of spatial and non-spatial data Note: Code work on fish and wildlife diseases to Wildlife Disease Management within Direct Management of Natural Resources.</i></p> <p>3.2.0 Data deficiency</p> <p><u>3.2.0.1</u> Division of Fish and Wildlife should maintain a robust, up-to-date database and mapping of species occurrences.</p> <p><u>3.2.0.2</u> Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.</p> <p><u>3.2.0.3</u> Survey for and monitor populations of freshwater aquatic focal SGCN to assess the populations' demography, trends, condition, distribution, etc.</p> <p><u>3.2.0.4</u> Conduct long-term monitoring of the impacts of contaminants to vulnerable wildlife to determine the magnitude of exposure within populations and around the State, the impacts to those species, in particular SGCN, and investigate the feasibility of mitigating for such impacts. Maintain records on exposure of vulnerable wildlife to environmental toxins (such as flame retardants and endocrine disruptors), so that sources may be identified and controlled or eliminated.</p> <p><u>3.2.0.5</u> Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.</p> <p><u>3.2.0.6</u> Develop, implement and conduct studies to evaluate the effectiveness of methods implemented to reduce road mortality of wildlife (e.g. wildlife underpasses, road closures).</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>3.2.0.7</u> Track (via a database that includes a GIS component) and research problematic species and diseases to determine their distribution, impacts on SGCN wildlife/wildlife communities, and develop potential control measures.</p> <p><u>3.2.0.8</u> Implement and conduct long-term monitoring of control measures aimed at minimizing the impacts of problematic species and/or diseases to evaluate the effectiveness of such efforts and to identify and incorporate additional strategies as appropriate.</p> <p><u>3.2.0.9</u> Maintain an inventory of invasive insect distribution and where they exist, conduct long-term monitoring of habitat conditions to assist in developing strategies to combat the impacts to SGCN habitats. Report potential infestations to NJ DEP.</p> <p><u>3.2.0.10</u> Evaluate the effectiveness of sanitation/decontamination protocols in minimizing the transference of wildlife diseases and invasive plant species.</p> <p><u>3.2.0.11</u> Investigate the impacts of ORV use as a mechanism to spread wildlife diseases and invasive plant species to native wildlife and habitats. Integrate this information when mapping undeveloped roads and trails to identify potentially sensitive areas in northern NJ forests.</p> <p><u>3.2.0.12</u> Investigate the impacts of ORV use and ORV-created noise on terrestrial and aquatic wildlife behavior and the impact of direct mortality from vehicle strikes. Integrate this information when mapping undeveloped roads and trails to identify potentially sensitive areas in northern NJ forests.</p> <p><u>3.2.0.13</u> Continue the research and studies undertaken by the State's Shad and River Herring/Alewife Technical Working Group regarding an assessment to determine if the herring should be listed as a "stock in the fishery."</p> <p><u>3.2.0.14</u> Identify spawning areas for species such as Atlantic and Shortnose sturgeon, Alewife, and Blueback Herring, and document shifts of these areas over time. Assess their reproductive success over time, including fecundity, early life stages and juvenile success, etc.</p> <p><u>3.2.0.15</u> Identify and compile information regarding critical time periods in which freshwater SGCN fish are vulnerable (e.g., spawning periods) using literature searches, review of available data, enlistment of species experts, etc.).</p> <p><u>3.2.0.16</u> Conduct long-term monitoring to evaluate the success of marine conservation zone designations on marine SGCN.</p> <p><u>3.2.0.17</u> Conduct monitoring at constructed wind farms (within or outside of NJ) to assess the impacts on migratory species (birds, bats, insects) and determine if NJ's land use planning efforts and/or smart-growth plans need to be revised.</p> <p><u>3.2.0.18</u> Conduct baseline surveys/inventories to better understand the distribution of fish and invertebrate (including freshwater mussels) populations.</p> <p><u>3.2.0.19</u> Develop, implement and evaluate aquaculture practices in coastal areas that are compatible with the recovery of SGCNs and industry needs.</p> <p><u>3.2.0.20</u> Evaluate the effectiveness of BMPs for mosquito control methods that may produce benefits for coastal marsh dependent SGCN wildlife, including but not limited to high-marsh nesting birds and migrating shorebirds and landbirds.</p> <p><u>3.2.0.21</u> Investigate the effects of mosquito control methods on freshwater aquatic and semi-aquatic SGCN including but not limited to, amphibian, fish, dragonfly, and damselfly populations.</p> <p><u>3.2.0.22</u> Evaluate the effectiveness of predator-control techniques aimed at improving SGCN populations and methods to minimize the impact of those species carrying parasites or diseases that may impact SGCN (e.g., raccoon roundworm kills Allegheny woodrat).</p> <p><u>3.2.0.23</u> Conduct long-term monitoring to evaluate the accuracy of and make necessary changes to a GIS predictive model of right whale migration routes off the NJ coast.</p> <p><u>3.2.0.24</u> Develop, implement and evaluate the effectiveness of BMPs for lighting of/on tall structures that minimize harm to and/or disorient wildlife, in particular but not limited to migratory birds, bats and invertebrates. Implement BMPs into state, county and local permitting processes.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>3.2.0.25</u> Conduct short- and long-term evaluations of structural stabilization strategies implemented at bat hibernacula and identify needed improvements to ensure structural soundness and of the potential impacts on bat hibernacula (i.e., the bats and internal conditions) when hibernacula are gated.</p> <p><u>3.2.0.26</u> Develop, implement and evaluate efforts to remove horseshoe crab impingement hazards, and provide recommendations of potential improvements, if warranted.</p> <p>3.2.1 Abundance determination: <i>Determination of relative abundance or estimation of size of fish and wildlife populations (e.g., adult population estimate, juvenile relative abundance).</i></p> <p><u>3.2.1.1</u> Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) population abundance and trends for SGCN using standardized survey protocols. Provide data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.</p> <p><u>3.2.1.2</u> Conduct wildlife surveys on resident and migratory SGCN regarding their population abundance and trends.</p> <p>3.2.2 Age, size and sex structure: <i>Determination of age, size or sex structure of fish and wildlife populations (e.g., age and growth, length frequency, sex ratio).</i></p> <p><u>3.2.2.1</u> Conduct wildlife surveys on resident and migratory SGCN regarding their survivorship.</p> <p>3.2.3 Baseline inventory: <i>Baseline survey and inventory to understand distribution of fish and wildlife populations.</i></p> <p><u>3.2.3.1</u> Identify the distribution of whales (particularly right whale) during seasonal migrations. Methods include but are not limited to: a) Conduct surveys in shipping lane vicinities and along the coast during whale migration to determine the seasonal distribution, b) Develop a predictive GIS model (based on available species occurrence information and habitat data) to predict right whale migration routes off the NJ coast, and c) Identify whale distribution and right whale migration routes through the participation in the East Coast's Sightings Advisory System for mariners.</p> <p><u>3.2.3.2</u> Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) suitable areas for marine conservation zone designation and promote policies and regulations that support the designation of such areas.</p> <p><u>3.2.3.3</u> Develop a database of the distribution of seabird species (near-shore migrants and pelagic birds).</p> <p><u>3.2.3.4</u> Establish population estimates and trends for all managed fish species.</p> <p><u>3.2.3.5</u> Investigate and develop strategies to reduce "by-catch" of SGCN and other non-target species. Present findings and strategies to NJ DEP and conservation organizations for review and possible implementation. Develop a database documenting by-catch for use in management planning decisions.</p> <p><u>3.2.3.6</u> Investigate the feasibility and potential for success of conducting genetic rescue through translocation and/or reintroduction of animals into suitable habitat that was historically occupied to increase genetic diversity and reconnect isolated populations. Methods of investigation should include, but are not limited to, thorough literature reviews, expert opinions, identifying potential pitfalls (e.g., species' fidelity to their range or critical areas), and an examination of historic and current SGCN population distribution and suitable habitat availability.</p> <p><u>3.2.3.7</u> Identify roads or portions of roads, paved or unimproved (through site surveys, land use/land cover assessments and analyses, review of available data, enlistment of species experts, etc.) with high incidences of road mortality and/or presence of snakes, turtles, medium-sized and large mammals. Conduct assessments of the roads and incorporate information into a database that includes descriptions (e.g., qualifiers to help prioritize the roads' risk to wildlife) and a GIS component of the locations of such areas. Share this information with appropriate organizations and/or agencies working to implement measures (e.g., wildlife passages, road closures) to minimize the risk to these species.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>3.2.3.8</u> Investigate the need to stabilize important bat hibernacula (e.g., structural soundness) and install the necessary supports.</p> <p><u>3.2.3.9</u> Investigate hazardous environmental issues that may impact grassland invertebrates.</p> <p>3.2.4 Food habits: <i>Studies on food habits of fish and wildlife species or their utilization as prey.</i></p> <p><u>3.2.4.1</u> Monitor and investigate the populations and health of SGCN prey/food resources for those SGCN whose populations are thought to be limited due wholly or in part to a lack of food resources or toxins in food resources.</p> <p>3.2.5 Genetics: <i>Genetics studies of fish and wildlife populations (e.g., population connectivity, hybridization).</i></p> <p><u>3.2.5.1</u> Investigate the feasibility and potential for success of conducting genetic rescue through translocation and/or reintroduction of animals into suitable habitat that was historically occupied to increase genetic diversity and reconnect isolated populations. Methods of investigation should include, but are not limited to, thorough literature reviews, expert opinions, identifying potential pitfalls (e.g., species' fidelity to their range or critical areas), and an examination of historic and current SGCN population distribution and suitable habitat availability.</p> <p>3.2.7 Population assessment: <i>Assessments of biological information to determine status of fish and wildlife populations (e.g., population viability analysis, fisheries stock assessment).</i></p> <p><u>3.2.7.1</u> Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.</p> <p><u>3.2.7.2</u> Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species to meet and maintain recovery goals.</p> <p>3.3 Research, survey or monitoring - habitat: <i>Collection and analysis of data as part of research, survey or monitoring primarily focused on fish and wildlife habitats Note: includes compilation, management, synthesis, analysis and reporting of spatial and non-spatial data.</i></p> <p>3.3.1 Baseline inventory: <i>Baseline survey and inventory to understand distribution of fish and wildlife habitat quality and quantity (e.g., wetland mapping).</i></p> <p><u>3.3.1.1</u> Conduct habitat assessments of significant natural and/or unique communities to Identify threats to native terrestrial and aquatic habitats through systematic monitoring, review of available data, enlistment of habitat management and/or species experts, etc. Incorporate findings into a database that includes descriptions/qualifiers of the habitats, identifies and values/qualifies the threats, and includes a GIS component of the locations of the assessed areas. Share this information with landowners/managers (e.g., federal, state and local government agencies or non-government organization).</p> <p><u>3.3.1.2</u> Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) resident and migratory SGCN habitats. Investigate their suitability for the various life history requirements of the species that dependent upon them to determine the ability for maintaining applicable SGCN populations in perpetuity.</p> <p><u>3.3.1.3</u> Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) remaining high and low marsh habitats with natural buffers and stable water levels that provide suitable habitat for SGCN and marsh habitats that would benefit from restoration. Conduct research to assess their condition for nesting, migrating and wintering birds.</p> <p><u>3.3.1.4</u> Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and investigate the suitability of corridors that connect large, contiguous tracts of similar habitats to increase their effective size (i.e., forest with forest, grassland with grassland, wetlands with wetlands, etc.) for dependent SGCN.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>3.3.1.5</u> Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) where habitat restoration and/or enhancement would benefit wildlife SGCN.</p> <p><u>3.3.1.6</u> Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) that could, through revegetation and/or enhancement efforts, become suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN.</p> <p><u>3.3.1.7</u> Map and prioritize existing and potential areas for early succession forest management. Share the results with state, county and municipal planners.</p> <p><u>3.3.1.8</u> Assess the availability and suitability of forest habitats for SGCN species (particularly reptiles and amphibians, birds, pollinators, and tiger beetles) in southern forests since Superstorm Sandy.</p> <p><u>3.3.1.9</u> Inventory forests throughout northern New Jersey to develop a baseline characterization of the structure and composition of habitats and identify deficient forest habitat types.</p> <p><u>3.3.1.10</u> Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and document fish SGCN habitats by plotting their distributions in GIS and submitting the data to the State for integration into the DEP's Biotics database.</p> <p><u>3.3.1.11</u> Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and investigate the quality and importance of areas with submerged aquatic vegetation to benefit waterfowl, finfish, and shellfish species.</p> <p><u>3.3.1.12</u> Conduct an initial assessment of and document the availability and suitability of intact, preserved forest blocks containing vernal pools within the possible range of Eastern Tiger Salamander, which appear under-represented on a landscape scale. Incorporate findings into a database that includes descriptions and qualifiers of the habitats, and a GIS component of the locations of such areas. Share this information with appropriate organizations and/or agencies working to implement habitat restoration and enhancement strategies to provide opportunities for this salamander to disperse and expand its current range.</p> <p><u>3.3.1.13</u> Conduct wildlife surveys to confirm or reconfirm locations with suitable hydrologic conditions for tiger salamanders and associated vernal pool herpetofauna.</p> <p><u>3.3.1.14</u> Compile information (obtained through literature reviews, communication with other States along the Atlantic coast, academia, etc.) regarding the impacts of above water operation of wind turbines on migratory marine birds and bats. Provide data to appropriate governing agencies and/or State commissions for integration into permitting review processes.</p> <p><u>3.3.1.15</u> Conduct a literature review to determine the potential impacts of underwater vibrational noise on marine mammals, sea turtles and fishes emanating from offshore wind turbines during routine operations.</p> <p><u>3.3.1.16</u> Gather "best information" for spatial modeling and update/create a current model/depiction of anticipated habitat shifts from sea-level rise, flooding, etc.</p> <p><u>3.3.1.17</u> Identify and map undeveloped roads and trails in all conserved forests, and create a database of locations. Integrate information regarding potentially sensitive areas.</p> <p><u>3.3.1.18</u> Conduct an assessment using available data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels.</p> <p><u>3.3.1.19</u> Identify and codify legal ORV access areas on state (and if appropriate, other conserved) lands. Provide GIS mapping to the landowner for potential use in directing such recreational activities.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>3.3.1.20</u> Identify areas (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) where invasive, non-indigenous plants and animals are either already established or are becoming established. Create a system for reporting and qualifying new locations of invasive species and for prioritizing areas for control measures according to the potential level of impact on the ecosystem and SGCN and the likelihood of success. Researchers and contractors encountering invasive plant species while performing plant and/or forest inventories on state or other conserved lands and/or private lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.</p> <p><u>3.3.1.21</u> Conduct comprehensive baseline surveys of all marsh islands; surveys to include, but are not limited to, documented elevations, and assessments of the habitat's current condition and vulnerability of dependent SGCN species in relation to the increased inundation rate.</p> <p><u>3.3.1.22</u> Identify, assess and prioritize marsh habitats for restoration where various management tools (such as increasing salinity through the management of water levels or chemical applications) may be effective in reducing the presence of phragmites.</p> <p><u>3.3.1.23</u> Identify areas (through surveys/studies, predictive modeling, review of available data, enlistment of habitat management and/or species experts, etc.) where the State can allow coastal marsh migration due to sea level rise, and target these areas for land acquisition and/or land management to accommodate this transition. Targeted areas should include underdeveloped areas adjacent to unprotected coastal marshes.</p> <p><u>3.3.1.24</u> Conduct regular investigations of SGCN habitat health and biodiversity on public and private lands to identify locations in need of revegetation, reduction of over-abundant, native wildlife and/or exotic species, conservation focal areas requiring limitations on human activity, etc.</p> <p><u>3.3.1.25</u> Compile an inventory of all horseshoe crab impingement hazards and share with permitting agencies, and the fisheries organizations and industry.</p> <p><u>3.3.1.26</u> Survey all historic locations and unsurveyed suitable habitats to identify populations of freshwater aquatic focal species.</p> <p><u>3.3.1.27</u> Develop a matrix that lists every commercial and recreational fishery and aquaculture facility that operates in state waters and for each fishery listed, provide details regarding their fishing seasons, gear descriptions, locations and number of fishers. Add a GIS component to overlay species of concern and sensitive areas.</p> <p><u>3.3.1.28</u> Identify key habitats for the potential allowance of natural coastal processes without interfering through shoreline stabilization, etc. and evaluate the risks and benefits if coastal migration was permitted to occur naturally. Create a GIS map of the identified areas; provide the assessment and mapping to local towns and other appropriate governing agencies.</p> <p><u>3.3.1.29</u> Identify coastal wildlife habitats unimpacted by development and/or at greatest risk of habitat loss to help guide enlightened coastal stabilization efforts (i.e., use of soft stabilization) to reduce the impacts on wildlife and their habitats.</p> <p><u>3.3.1.30</u> Using available data, model a comprehensive Marine Submerged Aquatic Vegetation Mapping project (similar to the Statewide freshwater wetlands mapping project) of sufficient quality and integrity that it could support the NJ DEP's coastal regulatory programs. Continue to conduct surveys to gather additional data to test and improve the model.</p> <p>3.3.2 Monitoring: <i>On-going monitoring of fish and wildlife habitat quality and quantity (e.g., annual early successional habitat survey, artificial reef condition).</i></p> <p><u>3.3.2.1</u> Evaluate the effectiveness of forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>3.3.2.2</u> Conduct long-term monitoring of resident and migratory SGCN habitats using standardized survey protocols to determine changes in habitat quality/suitability and threats (e.g., habitat loss and degradation, increased edge habitat, water quality) and other variables that may impact their long-term persistence in the State and to provide information needed for determining causes of population declines and understanding metapopulation dynamics.</p> <p><u>3.3.2.3</u> Continue to update wildlife and habitat databases and revise models of critical SGCN habitats using the most current data available and where lacking, develop new SGCN and/or habitat models as data on species habitat requirements and applicable GIS data layers become available.</p> <p><u>3.3.2.4</u> Protect water quality and aquatic-dependent species by appropriately designating Category 1 waters and enforcing protective regulations. Seek appropriate classifications for stream segments based on Endangered and Threatened Status and/or the Index of Biotic Integrity (IBI) results that do not fulfill Category One requirements.</p> <p><u>3.3.2.5</u> Conduct long-term monitoring of water quality of SGCN aquatic habitats (and aquatic systems feeding into those habitats) to evaluate protection and management efforts to reduce, if not eliminate, chemical contamination, siltation, eutrophication, and other forms of pollution/contamination of aquatic systems.</p> <p><u>3.3.2.6</u> Investigate the effectiveness and potential impacts of marsh management techniques by studying the effects of Open Marsh Water Management on wildlife species, in particular high marsh nesting birds and waterfowl. Evaluate best management practices as appropriate.</p> <p><u>3.3.2.7</u> Conduct studies on land use practices such as ditching, impounding, dredging, open marsh water management, burning, and marsh restoration to evaluate the effectiveness and potential impacts on marsh-dependent SGCN.</p> <p><u>3.3.2.8</u> Evaluate the effectiveness of current prescribed burning practices on Pinelands dependent species.</p> <p><u>3.3.2.9</u> Investigate the effectiveness of various silviculture techniques for enhancing forests for forest-dependent SGCN.</p> <p><u>3.3.2.10</u> Evaluate the efficacy and success of different management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.</p> <p><u>3.3.2.11</u> Evaluate and compare the effectiveness of delayed mowing of warm season grass fields versus cool season hay fields to benefit grassland-dependent species.</p> <p><u>3.3.2.12</u> Evaluate and compare the effectiveness of different management techniques (e.g., prescribed burning, mowing, brush-hogging, etc.) for maintaining suitable habitat for grassland-dependent species and species dependent upon early successional habitats.</p> <p><u>3.3.2.13</u> Evaluate the effectiveness of management strategies (e.g., timing restrictions for mowing, cooperative agreements with utility companies for maintenance of rights-of-ways) that maintain and enhance large existing areas of grassland in perpetuity. Focus on habitat patches that can be managed to enhance the total size of suitable grassland habitat and create interspersed early-successional habitat.</p> <p><u>3.3.2.14</u> Research and evaluate the effectiveness of water quality management practices on water-dependent and semi-dependent SGCN, particularly those practices associated with permitting or mitigation actions.</p> <p><u>3.3.2.15</u> Investigate the effectiveness of management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.</p> <p><u>3.3.2.16</u> Evaluate the effectiveness of best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>3.3.2.17</u> Conduct long-term habitat monitoring to determine the continued availability and suitability of intact, preserved forest blocks containing vernal pools within the possible range of Eastern Tiger Salamander. Update the database (to be developed during baseline assessments) regarding the forests' and vernal pools' conditions. Share this information with appropriate organizations and/or agencies working to implement habitat restoration and enhancement strategies to provide opportunities for this salamander to disperse and expand its current range.</p> <p><u>3.3.2.18</u> Conduct long-term monitoring of and wildlife surveys at locations with suitable hydrologic conditions for Eastern Tiger Salamanders and associated vernal pool herpetofauna.</p> <p><u>3.3.2.19</u> Once baseline data on the marsh islands' and associated SGCN species' vulnerability to inundation is completed, continue to conduct long-term monitoring the islands to determine sustainability for wildlife dependent on these areas.</p> <p><u>3.3.2.20</u> Once a system is developed for reporting and qualifying new locations of invasive species, develop, implement and monitor/evaluate invasive species removal strategies at identified locations. Priority should be given to those areas critical to SGCN and/or contain unique and/or rare plant communities supporting SGCN and/or other fish/wildlife species.</p> <p><u>3.3.2.21</u> Develop, implement and evaluate the effectiveness of management strategies use to restore marsh habitat (e.g., phragmites reduction).</p> <p><u>3.3.2.22</u> Conduct short- and long-term monitoring of the current natural processes affecting sediment transport along the coast. Share findings with organizations/agencies attempting to design beach nourishment projects in a manner that will be beneficial to wildlife.</p> <p><u>3.3.2.23</u> Conduct long-term monitoring of marine submerged aquatic vegetation and update the Marine Submerged Aquatic Vegetation Mapping [to be developed under baseline activities] to provide the NJ DEP's coastal regulatory programs with the most current data.</p> <p><u>3.3.2.24</u> Conduct regular inventories of forests throughout northern New Jersey to characterize the changing structure and composition of habitats and monitor forest conditions.</p> <p>3.5 Techniques development: <i>Research and development of techniques important for the conservation and management of fish and wildlife.</i></p> <p>3.5.1 Artificial propagation studies: <i>Research on artificial propagation of fish and wildlife (e.g., nutrition studies, culture methods).</i></p> <p><u>3.5.1.1</u> Conduct studies to evaluate the impacts (beneficial and detrimental) of aquaculture on migratory shorebirds, waterfowl, finfish, shellfish and other SGCN and their habitats, including evaluation of the relative effects of location and aquaculture techniques.</p> <p><u>3.5.1.2</u> Develop and conduct studies that evaluate relative efficacy and feasibility of management actions designed to minimize adverse impacts and enhance beneficial effects.</p> <p>3.5.3 Habitat restoration methods: <i>Development or improvement of methods to restore habitats and natural processes (e.g., evaluations of water level fluctuations).</i></p> <p><u>3.5.3.1</u> Work with land management agencies to determine the appropriate actions needed to restore/reclaim degraded habitat for the documented/target SGCN.</p> <p><u>3.5.3.2</u> Develop management strategies to improve the availability of prey/food resources for SGCN whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources. Monitor and investigate the management strategies over time to determine success and/or the need to revise methods.</p> <p><u>3.5.3.3</u> Develop/improve management techniques that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.</p> <p><u>3.5.3.4</u> Modify best management practices of Open Marsh Water Management based on evaluation of the effectiveness and potential impacts of marsh management techniques on wildlife species, in particular high marsh nesting birds and waterfowl.</p> <p><u>3.5.3.5</u> Develop best management practices for using mined sand or dredged material to improve habitat for wildlife, particularly for spawning horseshoe crabs and migrating shorebirds.</p> <p><u>3.5.3.6</u> Develop/improve management strategies to repair marshes and associated beaches damaged by salt hay farm/dike abandonment for all bay shore areas currently degraded.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>3.5.3.7</u> Develop/improve forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.</p> <p><u>3.5.3.8</u> Develop best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.</p> <p><u>3.5.3.9</u> Develop strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.</p> <p><u>3.5.3.10</u> Develop a habitat improvement and restoration program to restore cold-water fish habitat.</p> <p><u>3.5.3.11</u> Develop strategies to protect native terrestrial and aquatic habitats and dependent SGCN species from the identified threats.</p> <p><u>3.5.3.12</u> Develop management actions to minimize the documented adverse impacts and reduce risks of potential adverse impacts of aquaculture on migratory shorebirds and other SGCN, including waterfowl, finfish, and shellfish and their habitats.</p> <p><u>3.5.3.13</u> Developing engineering standards that embrace both shore protection/resiliency and habitat creation for shorebirds, horseshoe crabs and other coastal species along the Atlantic and Delaware Bay coasts.</p> <p><u>3.5.3.14</u> Develop aquaculture practices in the Delaware Bay that are compatible with the recovery of SGCN.</p> <p><u>3.5.3.15</u> Modify management practices based on the effects of pesticides, herbicides and other biological controls on critical and supporting SGCN habitats.</p> <p><u>3.5.3.16</u> Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.</p> <p><u>3.5.3.17</u> Investigate and improve marsh management techniques to benefit critical wildlife species, in particular high marsh nesting birds and waterfowl.</p> <p><u>3.5.3.18</u> Develop recommendations to improve methods on land use practices such as ditching, impounding, dredging, open marsh water management, burning, and marsh restoration based on potential impacts on marsh-dependent SGCN.</p> <p><u>3.5.3.19</u> Work with foresters to develop prescribed burning practices for Pinelands dependent species that increase or maintain habitat quality for these species in the Pinelands.</p> <p><u>3.5.3.20</u> Develop guidance on various silviculture techniques for enhancing forests for forest-dependent SGCN.</p> <p><u>3.5.3.21</u> Develop management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.</p> <p><u>3.5.3.22</u> Identify (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) and modify management strategies (e.g., timing restrictions for mowing, cooperative agreements with utility companies for maintenance of rights-of-ways), based on research, that maintain and enhance large existing areas of grassland in perpetuity.</p> <p><u>3.5.3.23</u> Revise water quality management practices based on research on water-dependent and semi-dependent SGCN, particularly when associated with permitting or mitigation actions.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>3.5.3.24</u> Based on research, modify management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.</p> <p><u>3.5.3.25</u> Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to develop the necessary management strategies to reach or maintain viable population levels.</p> <p><u>3.5.3.26</u> Amend management strategies of gating bat hibernacula and/or installing additional supports for structural soundness based on the effectiveness and potential impacts on bat hibernacula (bats and internal conditions).</p> <p><u>3.5.3.27</u> Conduct an assessment and develop a location list of available equipment for boom deployment during oil spills.</p> <p><u>3.5.3.28</u> Conduct baseline surveys to determine areas in Barnegat and Great bays appropriate for eelgrass restoration. Develop necessary techniques to implement restoration efforts.</p> <p><u>3.5.3.29</u> Explore the use of alternative vegetation (i.e., commodity crops) to address agriculture concerns.</p> <p>3.5.4 Fish and wildlife research, survey and management techniques: <i>Development or improvement of research techniques or management tools (e.g., tag retention studies, sampling device improvements, testing of animal control devices).</i></p> <p><u>3.5.4.1</u> Develop studies to evaluate management strategies to improve the availability of prey/food resources for SGCN whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources. Monitor and investigate the management strategies over time to determine success and/or the need to revise methods.</p> <p><u>3.5.4.2</u> Develop, implement, monitor and evaluate management strategies to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.</p> <p><u>3.5.4.3</u> Investigate alternative saltmarsh mosquito control methods that may produce benefits for coastal marsh dependent SGCN wildlife, including but not limited to high-marsh nesting birds and migrating shorebirds and landbirds.</p> <p><u>3.5.4.4</u> Investigate the effects of mosquito control methods on freshwater aquatic and semi-aquatic SGCN including but not limited to, amphibian, fish, dragonfly, and damselfly populations.</p> <p><u>3.5.4.5</u> Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.</p> <p><u>3.5.4.6</u> Investigate the feasibility of mitigating for the impacts of contaminants to vulnerable wildlife, particularly SGCN. Maintain records on exposure of vulnerable wildlife to environmental toxins (such as flame retardants and endocrine disruptors), so that sources may be identified and controlled or eliminated.</p> <p><u>3.5.4.7</u> Investigate the feasibility and potential for success of conducting genetic rescue through translocation and/or reintroduction of animals into suitable habitat that was historically occupied to increase genetic diversity and reconnect isolated populations. Methods of investigation should include, but are not limited to, thorough literature reviews, expert opinions, identifying potential pitfalls (e.g., species' fidelity to their range or critical areas), and an examination of historic and current SGCN population distribution and suitable habitat availability.</p> <p><u>3.5.4.8</u> Develop a habitat improvement and restoration program to restore cold-water fish ecosystems and populations.</p> <p><u>3.5.4.9</u> Conduct studies to evaluate the impacts of roads on SGCN and develop, implement and conduct studies to evaluate the effectiveness of methods to reduce road mortality of wildlife (e.g. wildlife underpasses, road closures).</p> <p><u>3.5.4.10</u> Develop BMPs for lighting of/on tall structures that minimize harm to and/or disorientation of wildlife, in particular but not limited to migratory birds, bats and invertebrates.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>3.5.4.11</u> Develop aquaculture practices in the Delaware Bay that are compatible with the recovery of SGCN.</p> <p><u>3.5.4.12</u> Investigate and develop strategies to reduce "by-catch" of SGCN and other non-target species. Present findings and strategies to NJ DEP and conservation organizations for review and possible implementation. Develop a database documenting by-catch for use in management planning decisions.</p> <p><u>3.5.4.13</u> Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.</p> <p><u>3.5.4.14</u> Develop and implement agreements, and update existing agreements, with government agencies regarding the protection of critical SGCN habitats (e.g., significant breeding populations of beach nesting birds, colonial waterbird nesting areas, bat colonies, etc.).</p> <p><u>3.5.4.15</u> Investigate the success of management strategies used to protect and/or enhance SGCN populations and when appropriate, aid in identifying failures/resource problems and issues, and developing new strategies.</p> <p><u>3.5.4.16</u> Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels and develop the necessary management strategies.</p> <p><u>3.5.4.17</u> Investigate new, non-invasive techniques for SGCN population evaluation through literature review, expert opinion, trial studies (if low risk), etc.</p> <p><u>3.5.4.18</u> Investigate the effectiveness of survey techniques through selected "ground truthing" and literature and peer review in order to increase efficacy of survey, minimize surveyor bias and error, and increase accuracy of trend data.</p> <p><u>3.5.4.19</u> Develop reliable, standardized survey and monitoring protocols for SGCN species, for which none currently exist, and their habitats.</p> <p><u>3.5.4.20</u> Evaluate the effectiveness and potential impacts on bat hibernacula (bats and internal conditions) of gating bat hibernacula and/or installing additional supports for structural soundness. Amend management strategies as needed.</p> <p><u>3.5.4.21</u> Develop BMPs to address problematic species and diseases of unknown origin.</p> <p><u>3.5.4.22</u> Investigate the efficacy of implementing strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities.</p> <p><u>3.5.4.23</u> Reduce the impacts of entrainment, impingement and thermal discharge at power plants by working with conservation partners, academia, etc. to ensure that best available technologies are utilized wherever possible.</p>

4 Education

4.1 Educator/Instructor training: *Training of educators/instructors on aquatic resources.*

4.1.0 Public education

- 4.1.0.1 Provide educational resources and training programs to private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
---------	---------	---------	---

4.1.1 Aquatic resource education: *Training of new instructors and teachers in aquatic resource education who will teach others Note: This includes teachers, nature center staff and camp counselors who attend ARE workshops, teachers who help the agency write curriculum, etc.*

4.1.1.1 Provide educational resources and training programs to teachers in aquatic resource education that includes information regarding climate change and sea-level rise for incorporation into the class curriculum and/or as the focus of school field trips.

4.1.1.2 Provide educational resources and training programs to teachers in aquatic resource education that includes information regarding how coastal stabilization negatively impacts wildlife by preventing natural processes for incorporation into the class curriculum and/or as the focus of school field trips.

5 Facilities and Areas

5.15 Wildlife Management Areas: *Facilities at Wildlife Management Areas.*

5.15.6 Roads

5.15.6.1 Clearly post areas/roads where vehicle access is permitted.

5.15.6.2 Clearly post areas/trails where vehicle access is not permitted.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

6.0.0.1 Enhance and increase the effective size of critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates by securing adjacent habitats through an appropriate combination of fee title, non-fee title and landowner agreements.

6.0.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats through an appropriate combination of fee title, non-fee title and landowner agreements.

6.0.0.3 Secure and protect riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through an appropriate combination of fee title, non-fee title and landowner agreements.

6.0.0.4 Secure and protect fish SGCN habitats by protecting lands adjacent to fish SGCN habitats and/or aquatic systems feeding into such habitats through an appropriate combination of fee title, non-fee title and landowner agreements.

6.0.0.5 Secure and protect critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

6.0.0.6 Secure and protect old-growth forest stands with large trees and/or stands that are approaching or being actively managed for old growth forests, in particular those within large, contiguous forest tracts, through an appropriate combination of fee title, non-fee title and landowner agreements.

6.0.0.7 Secure and protect critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

6.0.0.8 Secure and protect scrub-shrub habitats for SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
---------	---------	---------	---

6.1 Land acquisition

6.1.1 Fee title: *Acquisition of lands through fee title acquisition.*

6.1.1.1 Use state, federal, and local land acquisition programs (e.g., Green Acres, Blue Acres, etc.) to acquire abandoned or failing bay shore communities and to relocate displaced people and infrastructure.

6.3 Conservation area designation: *Designation of a site or landscape as having unique and important value to fish and wildlife with or without legal protections (e.g., waterfowl breeding area, Marine Protected Area).*

6.3.0 Conservation area designation strategies

6.3.0.1 Promote the protection of critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates and enhance these lands by increasing the effective size through conservation area designations of stopover habitats and adjacent private lands.

6.3.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN and/or connect conserved SGCN habitats through conservation area designations.

6.3.0.3 Increase the protection of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through conservation area designations.

6.3.0.4 Promote the protection of fish SGCN habitats by protecting lands adjacent to fish SGCN habitats and/or aquatic systems feeding into such habitats through conservation area designations.

6.3.0.5 Promote the protection of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through conservation area designations.

6.3.0.6 Promote the protection of old-growth forest stands with large trees and/or stands that are approaching or being actively managed for old growth forests, in particular those within large, contiguous forest tracts, through conservation area designations.

6.3.0.7 Promote the protection of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through conservation area designations.

6.3.0.8 Promote the protection of scrub-shrub habitats for SGCN through conservation area designations.

6.3.0.9 Promote the protection of critical marine habitats for SGCN through conservation area designations.

6.4 Private lands agreements: *Number of acres that are protected by agreement with private landowners, but which do not involve active habitat improvement Note: Used extensively within the Landowner Incentive Program.*

6.4.0 Private land agreement strategies

6.4.0.1 Enter into private lands agreements to expand control burns on private lands, in particular those adjacent to conserved lands to improve SGCN habitats.

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
---------	---------	---------	---

7 Law Enforcement

7.1 Law enforcement: *Enforcement of laws and regulations related to the protection of fish and wildlife.*

7.1.2 National Level

7.1.2.1 Enforce regulations to protect nesting bird colonies from human disturbance.

7.1.3 Sub-national Level

7.1.3.1 Enforce slow wake zones and marine conservation area regulations to protect aquatic vegetation.

7.1.3.2 Increase the number of law enforcement officers tending to wildlife issues to a reasonable number to sufficiently cover the State and marine waters.

7.1.4 Scale Unspecified

7.1.4.1 Improve enforcement of policies and/or regulations that promote the reduction of run-off and point and non-point source pollution into NJ's aquatic systems (streams, rivers, lakes/ponds, bays, ocean, wetlands, etc.).

7.1.4.2 Restrict human activity from staging areas for red knots and other migratory shorebirds through increasing law enforcement presence.

7.1.4.3 Increase law enforcement presence proximate to sensitive areas [e.g., avian nesting sites, in particular rookeries, and reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively)] to deter human activity and subsequent disturbance to SGCN.

7.1.4.4 Improve enforcement of policies/regulations aimed at protecting and preserving critical coastal and marsh habitats, and secure mitigation for losses that create an environmental benefit.

7.1.4.5 Enforce current policies and/or regulations to increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal SGCN, and implement and enforce amended policies/regulations.

7.1.4.6 Recruit law enforcement to assist in the protection and enhancement of SGCN populations, in particular endangered species, through improved awareness of species through trainings, partnerships, and other methods. Information should include but is not limited to: 1) Issues concerning illegal collection of reptiles, 2) Persecution of rare snakes, 3) Illegal recreational activities on public lands (e.g., off-road vehicles) and their impact on wildlife, 4) Identification of sensitive areas, critical sites and/or "hot-spots" for collection.

7.1.4.7 Increase law enforcement presence to enforce regulations governing recreational activities (e.g., the use of personal watercraft and off road vehicles, caving, rock climbing, etc.) on conserved lands and within other sensitive habitats, and discourage activities that cause harm or disturbance to vegetation, wetlands, fish and wildlife.

7.1.4.8 Implement policies that protect critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates.

7.1.4.9 Implement policies that improve and secure habitat connections between conserved SGCN habitats.

7.1.4.10 Implement policies that promotes expanding acreages and enhances the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.

7.1.4.11 Implement and enforce policies/regulations that will increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>7.1.4.12</u> Implement policies and/or regulations that protect significant natural and/or unique communities in perpetuity.</p> <p><u>7.1.4.13</u> Implement policies that protect vernal pool habitats to benefit SGCN that rely upon them and promotes connectivity of SGCN populations.</p> <p><u>7.1.4.14</u> Implement policies that protect existing and developing old-growth forest stands with large trees, in particular those within large, contiguous forest tracts.</p> <p><u>7.1.4.15</u> Implement policies that preserve and protect critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.</p> <p><u>7.1.4.16</u> Implement policies that protect and restore riparian areas.</p> <p><u>7.1.4.17</u> Improve the enforcement of policies and/or regulations that protect wetlands, riparian and floodplain areas, and aquatic habitats (including open waters).</p> <p><u>7.1.4.18</u> Increase law enforcement presence at important nesting areas on marsh islands to increase the likelihood of boat users acting in a manner that reduces disturbance to birds.</p> <p><u>7.1.4.19</u> Implement policies that protect and restore scrub-shrub habitats to benefit shrub-dependent SGCN.</p> <p><u>7.1.4.20</u> Implement policies and/or regulations with the objective of reducing "by-catch" of SGCN and other non-target species.</p> <p><u>7.1.4.21</u> Implement regulations for lighting of/on tall structures that will minimize harm to and/or disorientation of wildlife, and enforce within state, county and local permitting processes.</p> <p><u>7.1.4.22</u> Implement policies and/or regulations that prohibit the presence of managed cat colonies and trap, neuter and release programs in or near critical wildlife habitats.</p> <p><u>7.1.4.23</u> Implement policies that minimize wildlife road mortality.</p> <p><u>7.1.4.24</u> Implement protective measures to benefit urban-associated SGCN such as restricting human access, buffering sensitive areas with postings, noise and/or light restrictions in sensitive areas and/or during sensitive periods such as breeding, etc.</p> <p><u>7.1.4.25</u> Encourage the enforcement of municipal laws regulating domestic pets that may predate on wildlife.</p> <p><u>7.1.4.26</u> Educate law enforcement personnel that there may be unauthorized research projects taking place and to encourage them to investigate any activities that appear to be harmful to wildlife.</p>

8 Outreach

8.1 Partner/stakeholder engagement: *Engagement of partners to achieve shared objectives and broader coordination across overlapping areas.*

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.1 Coordinate research efforts among government agencies, non-government conservation partners and other stakeholders to investigate the impacts of aquaculture on migratory shorebirds, waterfowl, finfish, shellfish and other SGCN and their habitats, to determine relative effects of farming locations and aquaculture techniques, and to evaluate management actions to minimize such impacts.
- 8.1.0.2 Develop a team of personnel from government entities, conservation organizations and other stakeholders engaged in oil/gas spill response for marine and freshwater habitats to develop a feasible plan for oil spill response and/or to amend NJ's current oil spill response plan that clearly outlines each organizations responsibilities and an assessment and location list of available equipment for boom deployment during oil spills.
- 8.1.0.3 Develop an outreach team of personnel from government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>8.1.0.4</u> Engage government agencies, conservation partners and other stakeholders in constructive dialogues encouraging them to influence policy change and the creation of incentives through a habitat bill and/or municipal ordinances for backyard habitat.</p> <p><u>8.1.0.5</u> Engage government agencies, conservation partners and other stakeholders in discussions focused on establishing a long-term monitoring program for submerged aquatic vegetation distribution throughout Barnegat, Little Egg Harbor and Great Bay.</p> <p><u>8.1.0.6</u> Engage government agencies, conservation partners and other stakeholders in discussions focused on sharing information regarding coastal and marine critical wildlife habitats, developing comprehensive mapping to assist in reducing impacts of energy production activities, and establishing a long-term monitoring program to update the data. Ensure this information is available to appropriate personnel for planning or response measures.</p> <p><u>8.1.0.7</u> Engage government agencies, conservation partners and other stakeholders to collaboratively develop and implement an extensive educational/outreach program targeting coastal boating and recreation communities about eelgrass/widgeongrass, their impacts on marine environments, and the value, fragility and location of submerged aquatic vegetation beds and habitats.</p> <p><u>8.1.0.8</u> Engage government agencies, conservation partners and other stakeholders to collaboratively develop and implement an extensive educational/outreach program targeting sportsmen's organizations and fisheries addressing the potential effects of over-harvesting wildlife and promote "catch and release".</p> <p><u>8.1.0.9</u> Review the marine fish code enforcement policies relative to SGCN or sensitive game species' populations and fecundity, and amend the harvest quota or "bag limits" as needed, and address enforcement of such quotas.</p> <p><u>8.1.0.10</u> Engage government agencies, conservation partners and other stakeholders to collaboratively develop and implement an extensive educational/outreach program targeting sportsmen's organizations and fisheries, as well as public constituents, addressing the potential impacts of over-harvesting wildlife can have on the ecological system and to promote "sustainable harvest".</p> <p><u>8.1.0.11</u> Engage government agencies, conservation partners and other stakeholders to collaboratively develop and implement an extensive educational/outreach program targeting sportsmen's organizations and fisheries, as well as public constituents, addressing the unintended effects abandoned fishing gear, tackle and crab pots can have on wildlife, and promote the collection and/or reporting of abandoned items and their locations.</p> <p><u>8.1.0.12</u> Engage government agencies, conservation partners and other stakeholders to collaboratively develop and implement an extensive educational/outreach program targeting sportsmen's organizations and fisheries, as well as public constituents, addressing the unintended effects fishing gear and tackle can have on wildlife.</p> <p><u>8.1.0.13</u> Engage DOD in a constructive dialogue regarding strategies to minimize disturbances to all SGCN (i.e., beyond their federal requirements) from forest management and other practices on their lands.</p> <p><u>8.1.0.14</u> Engage DOD in a constructive dialogue regarding strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities.</p> <p><u>8.1.0.15</u> Engage government agencies, conservation partners and other stakeholders in discussions encouraging and supporting the creation of laws and policies requiring vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.</p> <p><u>8.1.0.16</u> Engage local governments in discussions regarding the importance of them adopting/passing ordinances which require assessing and addressing secondary impacts (i.e., ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.</p> <p><u>8.1.0.17</u> Engage municipalities in constructive dialogue to identify and minimize destruction of areas prioritized for early succession forest management.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>8.1.0.18</u> Engage NJDOT, NJ Transit Authority and other road management entities, wildlife conservation organizations/agencies (e.g., Division of Fish and Wildlife, New Jersey Conservation Foundation, Conserve Wildlife Foundation of NJ), and communities and citizens in discussions regarding the importance of and methods to enhance habitat connectivity, and work together to develop feasible strategies for ensuring that wildlife can disperse naturally and safely across roads and similar barriers to terrestrial and/or aquatic habitats.</p> <p><u>8.1.0.19</u> Engage government agencies, conservation partners and other stakeholders to collaboratively develop a list of important projects, targeting SGCN and/or their habitat, as a guide for graduate student research. Distribute the list and contact information to all State colleges and universities.</p> <p><u>8.1.0.20</u> Organize a small focal group of government and non-government agencies/organizations responsible for decisions regarding beach/dune management to share and coordinate their goals so that comprehensive planning can attempt to meet all needs.</p> <p><u>8.1.0.21</u> Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation human-subsidized and/or overabundant, native species cause to local nesting species, and provide expert guidance on how residents can help alleviate this threat.</p> <p><u>8.1.0.22</u> Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation invasive species cause to native nesting species, and provide expert guidance on how residents can help alleviate this threat.</p> <p><u>8.1.0.23</u> Work with the NJ Division of Fish and Wildlife's Bureau of Marine Fisheries, local recreational and commercial fisheries associations, and fishers to develop a process that encourages fishermen to report the number and location of lost pots to the appropriate state agency/agencies at the end of the harvest season.</p> <p><u>8.1.0.24</u> Engage government agencies, conservation partners and other stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.</p> <p><u>8.1.0.25</u> Provide technical support to public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.</p> <p><u>8.1.0.26</u> Coordinate across federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to woodland landowners to adopt or endorse consistent best management practices concerning controlled burns to maintain and/or improve forested habitat for wildlife.</p> <p><u>8.1.0.27</u> NJ Division of Fish and Wildlife and their Game Council, and appropriate conservation partners and other stakeholders to review the freshwater fish code relative to SGCN or sensitive game species' populations and fecundity, and support amendments to the harvest quota or "bag limits" as needed.</p> <p><u>8.1.0.28</u> Engage government agencies, conservation partners and other stakeholders to collaboratively develop and implement an extensive educational/outreach program targeting sportsmen's organizations, as well as public constituents, addressing the unintended hazard of lead-shot on wildlife, in particular scavengers.</p> <p><u>8.1.0.29</u> Government agencies and conservation partners to advise members of the relevant scientific community of the need for specific studies, reports or investigations targeting the data-deficiency regarding the interactions between migratory shore birds, horseshoe crabs, and oyster-growers, and the potential impacts on shore birds and horseshoe crabs.</p> <p><u>8.1.0.30</u> Government agencies and conservation partners to advise members of the relevant scientific community of the need for specific studies, reports or investigations targeting the data-deficiency regarding SGCN and/or their habitats.</p> <p><u>8.1.0.31</u> Government agencies, conservation partners and other stakeholders to work together to create GIS mapping for marine wildlife and habitat to assist in reducing impacts of energy production activities. Ensure this information is available to appropriate personnel for planning or response measures.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>8.1.0.32</u> Work with NJ DEP's Water Management, other state agencies and watershed organizations to determine if mitigation is warranted at applicable power plants.</p> <p><u>8.1.0.33</u> Engage government agencies, conservation partners and other land managers, communities, landowners, and commercial and industrial stakeholders in discussions regarding the importance of protecting and methods to protect priority wetlands beyond the levels afforded through regulation by maintaining and/or restoring optimal biological buffers around wetlands.</p> <p><u>8.1.0.34</u> Work with the NJ Education Association and Department of Education to design curriculum and outdoor experimental learning opportunities, and provide training to teachers on implementation of these activities.</p> <p><u>8.1.0.35</u> Promote backyard habitat management to create and/or enhance food availability for migratory species (birds, bats, invertebrates) on private lands.</p> <p><u>8.1.0.36</u> Reduce "by-catch" of SGCN and other non-target species by enlisting voluntary cooperation to use exclusion devices, appropriate trap sizes, etc. through education and outreach.</p> <p><u>8.1.0.37</u> Enlist landowners and NJ citizens in the protection of and survey efforts for SGCN, in particular rare species, by increasing enrollment in landowner incentives, forest stewardship, backyard habitat management and wildlife-related volunteer programs.</p> <p><u>8.1.0.38</u> Engage partners, stakeholders and land managers in constructive dialogue promoting forest stewardship for SGCN that use core forests and forested corridors.</p> <p><u>8.1.0.39</u> Deploy stewards at active nesting areas to work with and educate the public on how to reduce disturbance to birds.</p> <p><u>8.1.0.40</u> Encourage researchers, land managers, naturalists and enthusiasts to follow proper procedures for the coordination and/or permitting of research/management activities involving wildlife and sensitive habitats, and discourage activities that alter vegetation or wetlands, or cause harm or disturbance to wildlife.</p> <p><u>8.1.0.41</u> Engage beach-owning entities (e.g., government, non-government and non-profit organizations, and landowners) in a constructive dialogue to develop guidelines for management of beach/dune communities and to ensure that each group is educated and aware of the needs of the other groups.</p> <p><u>8.1.0.42</u> Engage citizens, wildlife observers and photographers through discussions and distributable information regarding the importance of and encouraging implementing responsible and ethical behavior when observing wildlife by developing an alliance of wildlife photographers and widely circulating recommendations on how to reduce impact.</p> <p><u>8.1.0.43</u> Engage Nuisance Wildlife Control Operators (NWCOs), conservation partners, and the public in conserving bat populations by advising proper exclusion methods from buildings, offering bat houses where roosting habitat is needed, and improving the public's understanding and acceptance of bats.</p> <p><u>8.1.0.44</u> Engage conservation partners, stakeholders, government agencies and other land stewards in constructive dialogues encouraging their inclusion of controlled burns in forest and other stewardship plans.</p> <p><u>8.1.0.45</u> Form cooperative partnerships with airports and airline companies to facilitate habitat creation away from airports and outside of flight patterns, and to identify seasonal wildlife strike risks to determine if seasonal shifts in flight patterns will minimize this risk.</p> <p><u>8.1.0.46</u> Form cooperative partnerships with dredging companies to facilitate habitat creation and enhancement within project areas, and to identify seasonal timing of activities that would minimize impacts to wildlife and their habitats.</p> <p><u>8.1.0.47</u> Form cooperative partnerships with energy companies to facilitate habitat creation and enhancement away from and outside of project areas, the restoration of appropriate habitats within project areas (e.g., rights-of-way could benefit butterflies and some bird species), and to identify seasonal timing of activities that would minimize impacts to wildlife.</p> <p><u>8.1.0.48</u> Form cooperative partnerships with transportation and shipment agencies and companies to facilitate habitat creation and enhancement away from and outside of project areas and to identify seasonal timing of activities that would minimize impacts to wildlife.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>8.1.0.49</u> Reduce the impacts of entrainment, impingement and thermal discharge at power plants by working with conservation partners, academia, etc. to ensure that best available technologies are utilized wherever possible.</p> <p><u>8.1.0.50</u> Engage Nuisance Wildlife Control Operators (NWCs), conservation partners, and the public in conserving snake populations by advising proper removal from buildings, exclusion methods from buildings, and improving the public's understanding and acceptance of snakes.</p> <p>8.2 Recruitment and retention activities: <i>Participation in programs intended to recruit and retain anglers, boater, hunters or wildlife watchers.</i></p> <p>8.2.3 For wildlife watching: <i>Participation in programs intended to recruit and retain wildlife watchers Note: this activity has limited eligibility for funding through WSFR grant programs.</i></p> <p><u>8.2.3.1</u> Develop and implement nature-focused tourism opportunities including wildlife viewing sites, interpretive signage highlighting unique ecosystems/habitats, and wildlife-related recreational opportunities that do not negatively impact SGCN or their habitats.</p> <p>8.3 WSFR program/subprogram outreach: <i>Provision of educational information on WSFR grants and grant programs to a variety of audiences through a variety of means (e.g., participating in trade shows to share information WSFR funded work; building kiosks to display WSFR program information at supported areas and facilities).</i></p> <p>8.3.0 WSFR program/subprogram outreach strategies</p> <p><u>8.3.0.1</u> Utilize WSFR grant funds, in combination with alternate funding sources as needed, to implement a scientific data-driven, extensive educational/outreach program targeting sportsmen's organizations and fisheries, as well as public constituents, addressing the potential impacts of over-harvesting wildlife can have on the ecological system and to promote "sustainable harvest".</p> <p><u>8.3.0.2</u> Utilize WSFR grant funds, in combination with alternate funding sources as needed, to implement an extensive educational/outreach program consisting of displays, fliers, list-serve mailings, Facebook posts and speaking engagements with sportsmen's organizations and fisheries, as well as public constituents, addressing the unintended effects fishing gear and tackle can have on non-target species.</p> <p><u>8.3.0.3</u> Utilize WSFR grant funds, in combination with alternate funding sources as needed, to implement catch and release outreach program(s).</p> <p><u>8.3.0.4</u> Utilize WSFR grant funds, in combination with alternate funding sources as needed, to implement an extensive educational/outreach program consisting of displays, fliers, list-serve mailings, Facebook posts and speaking engagements with sportsmen's organizations and fisheries addressing the unintended effects abandoned fishing gear, tackle and crab pots can have on wildlife.</p> <p><u>8.3.0.5</u> Develop and provide (or otherwise make publicly available) educational programs and/or materials that provide homeowners information on how to design dwellings and other structures in a manner that is wildlife friendly (e.g., using bird-safe glass on windows).</p> <p><u>8.3.0.6</u> Develop and provide (or otherwise make publicly available) educational programs and/or materials to enlist landowners, land managers and local communities to discourage the presence of managed cat colonies and trap, neuter and release programs in wildlife habitats.</p> <p><u>8.3.0.7</u> Develop and provide (or otherwise make publicly available) educational programs and/or materials that describe the negative impacts of off-road vehicles and watercraft use in and adjacent to critical SGCN habitats, and the importance of confining such activities to more appropriate locations and/or seasons.</p> <p><u>8.3.0.8</u> Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate recreationists and encourage landowners to eliminate garbage in the vicinity of suitable wildlife habitat, in particular SGCN habitat. Information should include the detrimental impacts garbage may have on various wildlife species.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>8.3.0.9</u> Develop and provide (or otherwise make publicly available) educational programs and/or materials to enlist landowners and land managers to include only native plants in landscaping and restoration projects. Provide information to assist them in detecting problematic establishment of invasive, non-indigenous plants.</p> <p><u>8.3.0.10</u> Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate landowners and NJ citizens on threats to fish and wildlife (including marine animals).</p> <p><u>8.3.0.11</u> Develop and provide (or otherwise make publicly available) educational programs and/or materials to the public, wildlife-related professionals, foresters, etc., that describe the value of species that are often feared (e.g., snakes, bats, spiders, Allegheny woodrat) and/or deemed a "nuisance" (e.g., squirrel, deer, snapping turtle), and therefore, persecuted by people. Include information on tolerance, proper identification, eviction from human dwellings, how to minimize the animal's presence on the property, and/or how to live in harmony with the animal.</p> <p><u>8.3.0.12</u> Promote awareness of WSFR (Wildlife and Sportfish Restoration) Outreach/Awareness grants, an important funding source for conservation among hunters and anglers as well as the general public.</p> <p><u>8.3.0.13</u> Conduct an educational campaign to encourage observer ethics and respect for wildlife and natural habitat.</p> <p><u>8.3.0.14</u> Develop an educational outreach program using a variety of media to ensure maximizing the distribution of information, in particular targeting sportsmen's organizations and fisheries, regarding the unintended effects abandoned fishing gear, tackle and crab pots can have on wildlife, including non-target species.</p> <p><u>8.3.0.15</u> Develop an educational outreach program for citizens regarding: 1) The impacts to wildlife as a result of plastic bags entering aquatic and marine systems, 2) The importance of decreasing the amount of plastic shopping bags in circulation, 3) The need for businesses to voluntarily charge for bags or reimburse people for using their own non-plastic bags, and 4) The need for their assistance through public pressure on legislators and government to pass legislation that that limits the amount of plastic shopping bags in circulation.</p> <p><u>8.3.0.16</u> Develop an educational outreach program using a variety of media to ensure maximizing the distribution of information, in particular targeting sportsmen's organizations and fisheries, promoting "catch and release" and the impacts excessive harvests can have on wildlife populations.</p> <p><u>8.3.0.17</u> Develop an educational outreach program using a variety of media to ensure maximizing the distribution of information, in particular targeting sportsmen's organizations and fisheries, promoting "sustainable harvest" using scientific data, and garner support from constituents through this outreach.</p> <p><u>8.3.0.18</u> Develop an Eelgrass/Widgeon Grass education and mapping program to educate coastal boating and recreation communities about the value, fragility and location of submerged aquatic vegetation beds and habitats.</p> <p><u>8.3.0.19</u> Develop an educational outreach program for the public on the devastating effects predators can have on native nesting wildlife.</p> <p><u>8.3.0.20</u> Develop an educational outreach program for landowners, particularly those in the coastal and bay areas, boaters, and the general public with information about the negative impacts on marine wildlife and habitats, and steps they can implement to reduce these impacts.</p> <p><u>8.3.0.21</u> Develop an educational outreach program for the general public, in particular those within and adjacent to coastal and riparian areas on the realities of sea-level rise to help citizens living in these areas understand how this will affect them, how coastal stabilization negatively impacts wildlife by preventing natural processes, and how their decisions impact species.</p> <p><u>8.3.0.22</u> Post signage in sensitive coastal habitats (e.g., bird and Diamondback Terrapin nesting areas) to educate the boating community on responsible use of these areas.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>8.3.0.23</u> Develop an educational outreach program for coastal municipalities and residents to promote an understanding of the benefits of soft structures over hard structures for shoreline stabilization.</p> <p><u>8.3.0.24</u> Develop educational outreach programs for local decision-makers, land developers, landowners and citizens about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.</p> <p><u>8.3.0.25</u> Develop educational outreach programs for landowners, nurseries and the general public regarding the negative impacts of invasive and non-native plants on our natural communities.</p> <p><u>8.3.0.26</u> Develop educational outreach programs for private and public landowners and land managers regarding the importance of and how to manage core forests and forested corridors in a way that will be beneficial for SGCN, particularly endangered, threatened and special concern species.</p> <p><u>8.3.0.27</u> Develop educational outreach programs for public and private landowners and land managers regarding the importance of structural habitat diversity, methods to increase diversity, and/or incentive programs available to increase habitat diversity.</p> <p><u>8.3.0.28</u> Develop educational outreach programs for public and private landowners and land managers regarding the importance of managing grasslands for grassland-dependent species, methods of management, and/or incentive programs available.</p> <p><u>8.3.0.29</u> Develop educational outreach programs for local decision-makers, land developers, landowners and citizens about the importance of maintaining a vegetative buffer along riparian and aquatic habitats to intercept storm water runoff and minimize soil erosion.</p> <p><u>8.3.0.30</u> Develop educational outreach programs for private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.</p> <p><u>8.3.0.31</u> Develop an educational outreach program for landowners and citizens on the secondary impacts of rodenticides on predators and scavengers.</p> <p><u>8.3.0.32</u> Develop an educational outreach program for landowners and citizens on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.</p>

9 Planning

9.1 Land use planning: *Leading or participating in land use planning for rural, urban or agricultural lands (e.g., assist in developing county-wide zoning plans, participate in workgroup regarding low impact development siting).*

9.1.0 Land use planning strategies

- 9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and SGCN inhabiting them.
- 9.1.0.2 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.1.0.3 Develop a plan that directs the creation of impervious surfaces away from and to minimize impacts on aquatic systems and critical terrestrial habitats. The plan should also include strategies to increase the resiliency of aquatic and critical terrestrial habitats to threats and stressors that would impact the reproduction and survival of wildlife.
- 9.1.0.4 Develop a plan that directs the creation of new impoundments and/or the expansion of bogs for cranberry farming within or immediately adjacent to critical forested habitats in a manner that minimizes impacts on the natural hydrology of the watershed and subsequently, the natural wetlands in the area.
- 9.1.0.5 Develop a plan that directs the creation or expansion of energy or utility rights-of-way in a manner that minimizes the impacts on critical forested habitats and the wildlife community.

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>9.1.0.6</u> Develop a plan that directs the creation or expansion of roads and railroads or the re-establishment of abandoned railroads within and adjacent to critical forested habitats in a manner that minimizes the impacts on critical forested habitats and the wildlife community.</p> <p><u>9.1.0.7</u> Develop a plan that directs the maintenance of or new channelization of forested streams and rivers in a manner that minimizes impacts of the aquatic ecological system and adjacent forest.</p> <p><u>9.1.0.8</u> Develop a plan that focuses on strategies for oil pipelines to avoid sensitive habitats that would be highly impacted by oil spills.</p> <p><u>9.1.0.9</u> Develop a plan that focuses on strategies to minimize the creation of renewable energy farms (e.g., solar, wind) and related infrastructures within and their impacts on forested habitats and the wildlife community.</p> <p><u>9.1.0.10</u> Develop a plan that focuses on strategies to minimize the impacts of mining on critical forested habitats.</p> <p><u>9.1.0.11</u> Develop a plan that focuses on strategies to minimize the impacts of power plants on critical forested habitats and the wildlife community.</p> <p><u>9.1.0.12</u> Develop a plan to avoid freshwater tidal management.</p> <p><u>9.1.0.13</u> Develop a plan to minimize agriculture that would result in groundwater withdrawal in critical forested areas.</p> <p><u>9.1.0.14</u> Develop a plan to minimize development that would result in groundwater withdrawal in critical forested areas.</p> <p><u>9.1.0.15</u> Develop a plan to minimize fragmentation of terrestrial and aquatic habitats by roads.</p> <p><u>9.1.0.16</u> Develop a plan to minimize new lawns and preserve natural vegetation within and adjacent to critical forest areas.</p> <p><u>9.1.0.17</u> Develop a plan to minimize nutrient and effluent loads from aquaculture practices.</p> <p><u>9.1.0.18</u> Develop a plan to minimize the effects of road widening and traffic volume increases within critical wildlife habitat areas using CHANJ products.</p> <p><u>9.1.0.19</u> Develop a plan to minimize the extent of impervious surfaces as part of new construction to increase water recharge in those areas.</p> <p><u>9.1.0.20</u> Develop a plan to minimize the impacts of existing agricultural properties adjacent to and the conversion of forest habitats (terrestrial and aquatic, within or adjacent to critical forests) to agriculture, grazing areas/livestock farms, and plantations.</p> <p><u>9.1.0.21</u> Develop a plan to minimize the use of any-sized dam in critical forested areas.</p> <p><u>9.1.0.22</u> Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.</p> <p><u>9.1.0.23</u> Develop a plan to mitigate the effects of transportation barriers by using CHANJ products.</p> <p><u>9.1.0.24</u> Develop a plan to prevent livestock from entering water bodies in critical forested habitats.</p> <p><u>9.1.0.25</u> Develop a plan to prevent the conversion of forested stream buffers to pastures in critical forested habitats.</p> <p><u>9.1.0.26</u> Develop a plan to minimize any adverse impacts of aquaculture farming techniques and structures on freshwater and intertidal habitats.</p> <p><u>9.1.0.27</u> Develop a plan to use wildlife-appropriate culverts in critical forested areas.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>9.1.0.28</u> Develop and coordinate state, regional and local plans for suitable lot layout and landscaping to minimize human-wildlife conflicts that also incorporates habitat connectivity and preservation of natural areas.</p> <p><u>9.1.0.29</u> Provide GIS or related data, maps, resource inventories, as well as related training, pertaining to the SWAP and it's recommended conservation actions for use or consideration by State, County or municipal planning agencies.</p> <p><u>9.1.0.30</u> Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and other related threats associated with development.</p> <p><u>9.1.0.31</u> Develop wetland restoration plans that consider the life history and needs of wildlife occupying targeted habitats.</p> <p><u>9.1.0.32</u> Incorporate aquatic habitat connectivity and water quality/effluent standards into local and state aquaculture plans and BMPs.</p> <p><u>9.1.0.33</u> Review the species, threats, action successes, and habitats, and work with partners to revise the 2017 State Wildlife Action Plan for the 2025 resubmittal.</p> <p>9.2 Organizational strategic and CMS planning: <i>Development of agency strategic and operational plans and fish and wildlife comprehensive management systems Note: Does not include actions to implement plans.</i></p> <p>9.2.1 Organizational strategic and operational planning: <i>Development of agency strategic and operational plans Note: Does not include actions to implement plans.</i></p> <p><u>9.2.1.1</u> Identify and codify legal ORV access areas on state lands.</p> <p>9.3 Species and habitat management planning: <i>Development of management plans for fish and wildlife species and habitats.</i></p> <p>9.3.1 Species management planning: <i>Development of management plans for fish and wildlife species (e.g., interjurisdictional fisheries management planning).</i></p> <p><u>9.3.1.1</u> Develop a management plan specific to River Herring/Alewife to ensure a sustainable population in perpetuity.</p> <p><u>9.3.1.2</u> Develop a management plan to improve the availability of prey/food resources for SGCN whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources.</p> <p><u>9.3.1.3</u> Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.</p> <p><u>9.3.1.4</u> Develop town plans that avoid impacts to SGCN species and their habitats.</p> <p><u>9.3.1.5</u> Develop response plans to address disease outbreaks within wildlife populations, in particular SGCN.</p> <p><u>9.3.1.6</u> Amend NJ's current oil spill response plan to 1) expand the geographic area addressed, 2) expand the targeted species impacted and in need of recovery, and 3) revise current and integrate new actions into the plan as needed.</p> <p><u>9.3.1.7</u> Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.</p> <p><u>9.3.1.8</u> [Reserved*]</p> <p><u>9.3.1.9</u> Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.</p>

* "Reserved" indicates placeholders for future edits or additions.

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>9.3.1.10</u> Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.</p> <p><u>9.3.1.11</u> Develop a management plan using predator-control techniques aimed at improving SGCN populations and methods to minimize the impact of those species carrying parasites or diseases that may impact SGCN (e.g., raccoon roundworm kills Allegheny woodrat).</p> <p><u>9.3.1.12</u> Develop a management plan to benefit urban-associated SGCN based on research.</p> <p><u>9.3.1.13</u> Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.</p> <p><u>9.3.1.14</u> Create species management plans that will promote the protection and where appropriate, the development of old-growth forest stands with large trees, in particular those within large, contiguous forest tracts.</p> <p><u>9.3.1.15</u> Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.</p> <p><u>9.3.1.16</u> DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.</p> <p><u>9.3.1.17</u> Evaluate the potential benefits to high marsh species (such as Black Rail and Northern Harrier) by restoring salt hay farms along Delaware Bay.</p> <p><u>9.3.1.18</u> Using baseline and monitoring data, develop a plan and seek funding for the removal of horseshoe crab impingement hazards.</p> <p><u>9.3.1.19</u> Develop management strategies for freshwater SGCN fish and incorporate them into existing Freshwater Fisheries Management Plans.</p> <p><u>9.3.1.20</u> Use compiled life history information on urban-associated SGCN regarding threats, breeding, fecundity, survival, habitat needs, wintering sites/roosts, migration routes and destinations, etc. to develop wildlife management strategies to benefit such species.</p> <p><u>9.3.1.21</u> Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.</p> <p>9.3.2 Listed species recovery planning: <i>Development of recovery plans for federal or state listed species.</i></p> <p><u>9.3.2.1</u> Develop proactive species recovery plans for all endangered and threatened species including guidance and objectives pertaining to critical and supporting habitat to meet and maintain recovery goals.</p> <p>9.3.3 Habitat management planning: <i>Development of management plans for habitats and natural processes (e.g., management planning for longleaf pine habitat; Habitat Conservation Plan development).</i></p> <p><u>9.3.3.1</u> Develop a management plan to improve the availability of prey/food resources for SGCN whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources.</p> <p><u>9.3.3.2</u> Develop a management plan for using mined sand or dredged material to improve habitat for wildlife, particularly for spawning horseshoe crabs and migrating shorebirds.</p> <p><u>9.3.3.3</u> Integrate best management practices (BMPs) regarding dune and beach management into beach nesting bird management agreements with government agencies (and private landowners where necessary).</p> <p><u>9.3.3.4</u> Create habitat restoration plans to repair marshes and associated beaches damaged by salt hay farm/dike abandonment for all bay shore areas currently degraded.</p> <p><u>9.3.3.5</u> Develop a management plan using forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>9.3.3.6</u> Develop a management plan for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.</p> <p><u>9.3.3.7</u> Develop a management plan to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.</p> <p><u>9.3.3.8</u> Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.</p> <p><u>9.3.3.9</u> Develop a response plan to outbreaks using BMPs to control infestations and limit their spread in a way that avoids excessive harm to non-target species.</p> <p><u>9.3.3.10</u> Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.</p> <p><u>9.3.3.11</u> Develop town plans that avoid impacts to SGCN species and their habitats.</p> <p><u>9.3.3.12</u> Develop a management plan using engineering standards that embrace both shore protection/resiliency and habitat creation for shorebirds, horseshoe crabs and other coastal species along the Atlantic and Delaware Bay coasts.</p> <p><u>9.3.3.13</u> Develop a management plan that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas and prevents or ameliorates near-term impacts of climate change throughout the State, but in particular within the coastal and Delaware Bay areas.</p> <p><u>9.3.3.14</u> Develop a management plan using aquaculture practices in the Delaware Bay that are compatible with the recovery of SGCN.</p> <p><u>9.3.3.15</u> Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.</p> <p><u>9.3.3.16</u> Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.</p> <p><u>9.3.3.17</u> Develop a management plan for prescribed burning that will benefit Pinelands dependent species and increase or maintain habitat quality for these species in the Pinelands.</p> <p><u>9.3.3.18</u> In cooperation with species and habitat experts, develop management plans for significant natural and/or unique communities, in particular those supporting SGCN, and provide the information to the landowners/managers (federal, state and local government agencies or non-government organization) for review and implementation.</p> <p><u>9.3.3.19</u> Develop management plans for SGCN inhabiting permanently protected natural lands using available baseline and population trend data.</p> <p><u>9.3.3.20</u> Develop an action plan for immediate implementation should habitat levels fall below the minimum necessary size and/or structure within the Cape May Peninsula to sustain the avian migration.</p> <p><u>9.3.3.21</u> Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>9.3.3.22</u> Create management plans to minimize and/or prevent wildlife road mortality that will incorporate wildlife passages in conjunction with barrier fencing and, where possible, seasonal closures. Aquatic-associated passages must avoid disturbance to the natural streambeds and riparian habitat, permit high volumes of water to flow freely, and provide adequate travel corridors for terrestrial wildlife, while maintaining stream flow for fish passage. Bridges that span rivers and streambeds and include floodplain habitat on either side of the span to provide travel corridors for terrestrial wildlife are preferred over culverts.</p> <p><u>9.3.3.23</u> Create forest management plans that will promote the protection and/or development of old-growth forest stands with large trees, in particular those within large, contiguous forest tracts.</p> <p><u>9.3.3.24</u> Develop a plan to improve the enforcement of policies and/or regulations that protect wetlands, riparian and floodplain areas, and aquatic habitats (including open waters).</p> <p><u>9.3.3.25</u> Develop a habitat management plan focused on areas important to near-shore, coastal species (e.g., herring, sturgeon, terrapin, nesting birds) that prioritizes these areas to direct resources to minimize the impacts of sea-level rise, flooding and storms (including extreme rain events) such as increased erosion of beach, mudflat and marsh habitats, and the increased risk of saltwater intrusion into freshwater habitats. Gather "best information" for spatial modeling of anticipated habitat shifts from sea-level rise, flooding, etc.</p> <p><u>9.3.3.26</u> Develop a management plan for parcels of suitable size to be managed for native herbaceous plant species that support breeding grassland dependent species.</p> <p><u>9.3.3.27</u> Develop a management plan to expand breeding habitat and connectivity for tiger salamanders and other obligate vernal pool breeders.</p> <p><u>9.3.3.28</u> Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.</p> <p><u>9.3.3.29</u> Develop habitat management plans aimed at reducing or eliminating negative impacts of ORVs.</p> <p><u>9.3.3.30</u> Using baseline and monitoring data, develop a plan and seek funding for the removal of horseshoe crab impingement hazards.</p> <p><u>9.3.3.31</u> Using data from baseline inventory and monitoring of all current marsh islands and their vulnerability to inundation as a result of sea level rise, create a plan to delineate each island's ideal fit for habitat management (e.g., restoration, hasting, dredging). Planning will factor in criteria to designate which islands should be maintained or restored, and which will be passively allowed to submerge.</p> <p><u>9.3.3.32</u> DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.</p> <p><u>9.3.3.33</u> Evaluate the potential benefits to increasing high marsh habitat by restoring salt hay farms along Delaware Bay.</p> <p><u>9.3.3.34</u> Include controlled burn prescriptions in forest and stewardship plans to improve wildlife habitat.</p> <p><u>9.3.3.35</u> Incorporate habitat connectivity, preservation of natural areas, and the implementation of BMPs into state and local land-use policy environmental review process and energy development plans to minimize habitat fragmentation and related threats associated with solar farms and altered habitats.</p> <p><u>9.3.3.36</u> Integrate plans for properly located and timed habitat restoration and management along transportation, energy and service corridors to minimize risks to and benefit wildlife.</p> <p><u>9.3.3.37</u> Develop management strategies for freshwater SGCN fish and incorporate them into existing Freshwater Fisheries Management Plans.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
---------	---------	---------	---

9.3.3.38 Use compiled life history information on urban-associated SGCN regarding threats, breeding, fecundity, survival, habitat needs, wintering sites/roosts, migration routes and destinations, etc. to develop habitat management strategies to benefit such species.

11 Technical Assistance

11.1 Environmental review: *Review of agency and private sector policies, projects and plans (primarily related to development and adverse impacts to natural resources) to help ensure potential impacts to fish and wildlife are avoided, minimized and/or compensated/mitigated (e.g., review of municipal pier development, review of transmission corridor siting).*

11.1.1 Review of proposed projects: *Review of proposed development projects to help ensure that impacts to fish and wildlife are minimized and resource benefits are maximized.*

11.1.1.1 Use Biotics database and Landscape Project Mapping in regulatory reviews to ensure protection by applicable laws and regulations.

11.1.1.2 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.

11.1.1.3 Government organizations to thoroughly review wetland restoration plans, applying the most current science for wildlife, habitats and aquatic systems, to assess the impacts to resident and migratory wildlife occupying the targeted habitats.

11.1.1.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.

11.1.1.5 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.

11.1.1.6 Review all projects to be conducted in or adjacent to coastal wetlands and marshes, and provide recommendations on how to best avoid or reduce human disturbance at nesting areas (for example, timing restrictions) and actions not permitted.

11.1.1.7 Review proposed construction or other work projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.

11.1.1.8 Review proposed research projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.

11.1.1.9 Review strategies for creating or enhancing connectivity (e.g., installing appropriately-sized wildlife passages) between wetlands to allow wildlife to disperse naturally and safely.

11.1.1.10 Use CHANJ mapping in reviews of proposed energy, mining, transportation and utility service companies/agencies' projects to attempt to maintain habitat connectivity and reduce fragmentation, and identify potential impacts of the projects.

11.1.1.11 Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed offshore energy projects relating to drilling, extraction and distribution of petroleum and gas products to reduce habitat destruction and minimize impacts on wildlife.

11.1.1.12 Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed solar farm projects to reduce habitat fragmentation and minimize impacts on wildlife.

11.1.1.13 Use the best available science (species data, habitat present, wind farm layout options, wind blade impacts on migratory species, location of migration routes, etc.) when conducting regulatory reviews of proposed wind farm projects to minimize impacts on migratory and resident wildlife and reduce habitat fragmentation.

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
---------	---------	---------	---

11.1.2 Review of proposed policies and plans: *Review of non-conservation oriented policies and plans to help ensure that impacts to fish and wildlife are minimized and resource benefits are maximized (e.g., review of harbor dredging plan, review of state highway plans).*

11.1.2.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.

11.1.2.2 Government organizations to thoroughly review wetland restoration plans, applying the most current science for wildlife, habitats and aquatic systems, to assess the impacts to resident and migratory wildlife occupying the targeted habitats.

11.1.2.3 Incorporate aquatic habitat connectivity and water quality/effluent standards into the environmental review process to help establish policies and plans that minimize the impact of aquaculture on fish and wildlife.

11.1.2.4 Review strategies for creating or enhancing connectivity (e.g., installing appropriately-sized wildlife passages) between wetlands to allow wildlife to disperse naturally and safely.

11.2 Technical assistance: *Provision of professional training and technical assistance to others on fish and wildlife assessment and management.*

11.2.0 Assorted technical assistance strategies

11.2.0.1 Provide technical support to private and public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.

11.2.0.2 Provide technical support to public and private landowners and land managers for controlling invasive, native and non-native plant species in order to increase structural habitat diversity.

11.2.0.3 Develop state, regional and local BMPs that focus on minimizing habitat fragmentation and human-wildlife conflicts associated with development. Make information available to land developers and private and public landowners for implementation.

11.2.0.4 Provide educational resources, training programs, and expert guidance to private and public landowners and land managers on the secondary impacts of rodenticides on predators and scavengers.

11.2.0.5 Provide educational resources, training programs, and expert guidance to private and public landowners and land managers on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

11.2.0.6 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on habitat creation, enhancement and restoration within and adjacent to project areas, as well as away from and outside of project areas (depending on the target species), by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. Wind farms should address both terrestrial bound and low-flying species. Examples of habitat management include, but are not limited to, integrating short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.

11.2.0.7 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on the importance of maintaining habitat connectivity, minimizing fragmentation, and the use of CHANJ products to help them target areas for such planning.

11.2.0.8 Provide educational resources, training programs, and on-the-ground guidance to public and private landowners and land managers on habitat creation and enhancement strategies that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>11.2.0.9</u> Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and private landowners about the importance of leaving vegetation in place, especially along riparian areas and wildlife movement corridors.</p> <p><u>11.2.0.10</u> Provide technical support to private landowners, consultants, and land managers to create customized management plans based on location and SGCN.</p> <p><u>11.2.0.11</u> Provide educational resources, training programs, and on-the-ground guidance to private and public landowners and land managers on the benefits of and for creating young forest and early succession habitat for SGCN.</p> <p><u>11.2.0.12</u> Provide educational resources and technical support to public landowners and land managers for managing grasslands for grassland-dependent species.</p> <p><u>11.2.0.13</u> Provide educational resources and technical support to public landowners, private landowners with sufficient acreage, and land managers to promote the protection and/or development of old-growth forest stands with large trees, in particular those within large, contiguous forest tracts.</p> <p><u>11.2.0.14</u> Provide educational resources and technical support to public and private landowners and land managers to promote the protection of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters), and to enhance or restore biologically appropriate buffers.</p> <p><u>11.2.0.15</u> Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and landowners about the importance of retaining and in an effort to protect, create, enhance and/or restore vegetation along aquatic habitats.</p> <p><u>11.2.0.16</u> Provide educational resources and technical support to public and private landowners and land managers to promote the protection of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.</p> <p><u>11.2.0.17</u> Provide educational resources and technical support to public and private landowners and land managers to promote the protection of vernal pools and the protection, enhancement and/or restoration of biologically appropriate buffers.</p> <p><u>11.2.0.18</u> Provide educational resources and technical support to public and private landowners and land managers to promote the protection of lands adjacent to fish SGCN habitats and/or aquatic systems feeding into such habitats.</p> <p><u>11.2.0.19</u> Provide educational resources and technical support to public and private landowners and land managers to promote the protection and/or enhancement of scrub-shrub habitats for SGCN.</p> <p><u>11.2.0.20</u> Provide educational resources and technical support to public and private landowners and land managers to promote the protection and/or enhancement of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN.</p> <p><u>11.2.0.21</u> Provide educational resources and technical support to public and private landowners and land managers of lands adjacent to critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates to promote the protection and/or enhancement of those adjacent habitats to increase the effective size of the migratory habitat.</p> <p><u>11.2.0.22</u> Provide educational resources, training programs, and expert guidance to public and private landowners and land managers about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.</p> <p><u>11.2.0.23</u> Provide educational resources and technical support to public and private landowners and land managers of lands adjacent to SGCN habitats to promote the protection and/or enhancement of those adjacent habitats to increase the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and that connect conserved SGCN habitats.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>11.2.0.24</u> Provide educational resources, training programs, and expert guidance to public and private landowners and land managers on how to manage vegetated roadside areas (e.g., mowing, brush-hogging, etc.) on a schedule that avoids peak activity periods for wildlife and therefore, minimizes harm.</p> <p><u>11.2.0.25</u> Provide educational resources, training programs, and on-the-ground guidance to resource managers regarding the assessment of and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) related to residential and commercial development.</p> <p><u>11.2.0.26</u> Make educational resources available to the public that encourage researchers to seek out guidance prior to finalizing proposals and submitting State permit applications to reduce potential impacts on sensitive species.</p> <p><u>11.2.0.27</u> Provide educational resources and presentations to coastal municipalities and residents to promote the understanding of the benefits of soft structures over hard structures for shoreline stabilization.</p> <p><u>11.2.0.28</u> Provide educational resources, training programs, and on-the-ground guidance to Nuisance Wildlife Control Operators (NWCs) and the public to ensure that proper bat exclusion methods are followed when addressing issues of bats in buildings.</p> <p><u>11.2.0.29</u> Provide educational resources, training programs, and on-the-ground guidance to Nuisance Wildlife Control Operators (NWCs), conservation partners, and the public in conserving snake populations by advising proper removal from buildings, exclusion methods from buildings, and improving the public's understanding and acceptance of snakes.</p> <p>11.2.1 With individuals and groups involved in resource management decision making: <i>Provision of professional training and technical assistance on fish and wildlife assessment and management to individuals and groups involved in resource management decision-making (e.g., provide agency-collected data to other governmental officials, train non-governmental organizations on new trapping methods, review of conservation-oriented policies and plans).</i></p> <p><u>11.2.1.1</u> Engage partners and stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.</p> <p><u>11.2.1.2</u> Provide professional training and technical assistance tools (e.g., mapping, guidance documents, justification, etc.) to agencies/divisions/programs within and outside of the NJ DEP regarding the SWAP, and the conservation actions recommended therein to help facilitate SWAP implementation.</p> <p><u>11.2.1.3</u> Provide educational resources, training programs, and on-the-ground guidance to DOD to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop and implement forest management and other practices that minimize disturbances to SGCN (i.e., beyond their federal requirements).</p> <p><u>11.2.1.4</u> Provide educational resources, training programs, and on-the-ground guidance to dredging companies and resource managers on habitat creation and enhancement away from and outside of shipping lanes, and to identify seasonal timing of activities that would minimize impacts to wildlife and their habitats.</p> <p><u>11.2.1.5</u> Provide educational resources, training programs, and on-the-ground guidance to municipalities, state and federal agency resource managers on tasks such as writing and integrating Beach Management Plans into other management documents.</p> <p><u>11.2.1.6</u> Provide educational resources, training programs, and on-the-ground guidance to resource agencies prior to project initiation to ensure wildlife and their habitats are protected to the highest degree possible during construction, and provisions are in place for post-construction habitat use.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
---------	---------	---------	---

11.2.2 With private landowners: *Provision of technical assistance on fish and wildlife management practices to private landowners Note: Could Include development and delivery of economic incentives to private landowners to influence responsible stewardship of land/water and specific species.*

11.2.2.1 Provide technical support to farming operations and woodland landowners on ways to decrease clean farming (edge-to-edge) practices and create ecotones to benefit bobwhite and other species dependent on early successional habitat.

100 Law and Policy

100.1 Legislation: *A directive proposed by a legislative body (bills, laws, acts, statutes) within government.*

100.1.2 National Level

100.1.2.1 Create legislation to establish markets for warm-season grasses to increase the permanency of this crop on the landscape.

100.1.3 Sub-national Level

100.1.3.1 Develop laws and policies to increase protection and biological buffers of wetlands.

100.1.3.2 Develop policies for wetland restoration plans that consider life history requirements and needs of wildlife occupying targeted habitats.

100.1.3.3 Initiate legislative action to establish an annual budgetary line item designating funds to support programs focused on long-term research and monitoring of wildlife diseases.

100.1.3.4 Initiate legislative action to establish an annual budgetary line item designating funds to support programs and monitoring stations throughout Barnegat, Little Egg Harbor and Great Bay focused on long-term monitoring of submerged aquatic vegetation, both native and exotic species.

100.1.4 County and Local

100.1.4.1 Enhance critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates through the local ordinances of adjacent private lands to increase the effective size of the habitat.

100.1.4.2 Secure and increase the effective size of SGCN habitats and connect conserved SGCN habitats through local ordinances.

100.1.4.3 Expand the acreages and enhance the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN through local ordinances.

100.1.4.4 Secure wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) and biologically appropriate buffers through local ordinances.

100.1.4.5 Secure SGCN-inhabited/used freshwater wetlands and biologically appropriate buffers through local ordinances.

100.1.4.6 Secure fish SGCN habitats by protecting lands adjacent to fish SGCN habitats and/or aquatic systems feeding into such habitats through local ordinances.

100.1.4.7 Secure vernal pools and biologically appropriate buffers through local ordinances.

100.1.4.8 Secure critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through local ordinances.

100.1.4.9 Secure existing and developing old-growth forest stands with large trees, in particular those within large, contiguous forest tracts, through local ordinances.

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>100.1.4.10</u> Secure critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through local ordinances.</p> <p><u>100.1.4.11</u> Secure riparian areas through local ordinances.</p> <p><u>100.1.4.12</u> Secure scrub-shrub habitats for SGCN through local ordinances.</p> <p><u>100.1.4.13</u> Encourage municipal laws regulating domestic pets that may predate on wildlife.</p> <p><u>100.1.4.14</u> Adopt/pass local ordinances which require assessing and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.</p> <p><u>100.1.4.15</u> Incorporate habitat connectivity and the preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.</p>
		100.1.5	<u>Scale Unspecified</u> <p><u>100.1.5.1</u> Develop laws and policies to increase protection and biological buffers of wetlands.</p> <p><u>100.1.5.2</u> Develop policies for wetland restoration plans that consider life history requirements and needs of wildlife occupying targeted habitats.</p> <p><u>100.1.5.3</u> Incorporate aquatic habitat connectivity and water quality/effluent standards into state/local policy to minimize the impact of aquaculture on fish and wildlife.</p> <p><u>100.1.5.4</u> Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.</p> <p><u>100.1.5.5</u> Develop legislation to provide financial support for the New Jersey Invasive Species Strike Team.</p>
100.3	State Regulations: <i>A specific requirement within legislation which details how the legislation is enforced; standards adopted as rules to implement, interpret, or make specific the law enforced or administered by legislation.</i>		
	100.3.0	Regulatory initiatives for species and habitat protection	
			<p><u>100.3.0.1</u> Develop (and/or improve) policies and/or regulations that will promote the reduction of run-off and point and non-point source pollution into NJ's aquatic systems (streams, rivers, lakes/ponds, bays, ocean, wetlands, etc.).</p> <p><u>100.3.0.2</u> Improve policies/regulations aimed at protecting and preserving critical coastal and marsh habitats and securing mitigation for losses that create an environmental benefit.</p> <p><u>100.3.0.3</u> Develop policies that will promote the long term protection of critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates.</p> <p><u>100.3.0.4</u> Promote policies and regulations that support marine conservation zone designations in suitable areas identified through research and literature.</p> <p><u>100.3.0.5</u> Develop policies that will promote improved and secure habitat connections between conserved SGCN habitats.</p> <p><u>100.3.0.6</u> Develop policies that will promote expanding acreages and enhancing the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.</p> <p><u>100.3.0.7</u> Amend current policies and/or regulations to increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>100.3.0.8</u> Develop policies and/or regulations with the objective of protecting significant natural and/or unique communities in perpetuity.</p> <p><u>100.3.0.9</u> Secure mitigation that creates an environmental benefit for losses of SGCN and their habitats.</p> <p><u>100.3.0.10</u> Develop policies that promote protecting vernal pool habitats to benefit SGCN that rely upon them and promotes connectivity of SGCN populations.</p> <p><u>100.3.0.11</u> Develop policies that will ensure the protection and/or development of old-growth forest stands with large trees, in particular those within large, contiguous forest tracts.</p> <p><u>100.3.0.12</u> Develop policies that promote the preservation and protection of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.</p> <p><u>100.3.0.13</u> Develop policies that will promote protecting and restoring riparian areas.</p> <p><u>100.3.0.14</u> Develop policies and/or regulations that increase the protective buffers of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) to biologically appropriate distances to benefit SGCN that rely upon these habitats and improve the function of the [associated] aquatic systems.</p> <p><u>100.3.0.15</u> Develop policies that promote protecting and restoring scrub-shrub habitats to benefit shrub-dependent SGCN.</p> <p><u>100.3.0.16</u> Create regulations that restrict human activity from staging areas for red knots and other migratory shorebirds.</p> <p><u>100.3.0.17</u> Develop and implement policies and/or regulations with the objective of reducing "by-catch" of SGCN and other non-target species.</p> <p><u>100.3.0.18</u> Develop policies for conserved lands that prohibit planting and supports the control of non-native vegetation and invasive, native vegetation.</p> <p><u>100.3.0.19</u> Develop regulations for lighting of/on tall structures that will minimize harm to and/or disorientation of wildlife, in particular but not limited to migratory birds, bats and invertebrates. Implement BMPs into state, county and local permitting processes.</p> <p><u>100.3.0.20</u> Develop policies and/or regulations that prohibit the presence of managed cat colonies and trap, neuter and release programs in or near critical wildlife habitats.</p> <p><u>100.3.0.21</u> Develop policies that minimize wildlife road mortality through: 1) Requiring the integration of wildlife passages into all new and repaired roads, in particular those areas that will connect SGCN habitats, 2) Requiring current fish/wildlife passages be improved and maintained in perpetuity, 3) Supporting seasonal road closures, in particular for unimproved roads, 4) Supporting projects that work to improve connectivity of SGCN habitats such as land conservation through acquisition or other means.</p> <p><u>100.3.0.22</u> Develop regulations that will protect urban-associated SGCN (restricting human access, buffering sensitive areas with postings, noise and/or light restrictions) in sensitive areas and/or during sensitive periods such as breeding, etc.</p> <p><u>100.3.0.23</u> Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address mitigation that creates an environmental benefit for losses of SGCN and their habitats.</p> <p><u>100.3.0.24</u> Create legislation to establish markets for warm-season grasses to increase the permanency of this crop on the landscape.</p> <p><u>100.3.0.25</u> Amend the harvest quota or "bag limits" within the freshwater fish code relative to SGCN or sensitive game species' as needed.</p> <p><u>100.3.0.26</u> Adopt regulations requiring the combined sewer overflow alternative analyses required by regulation address potential impacts to wildlife in watercourses or receiving water bodies.</p> <p><u>100.3.0.27</u> Amend harvest, license and/or permit requirements to incorporate guidance regarding the use of gear and/or tackle and current best practices to minimize bycatch or entanglement of non-target species.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>100.3.0.28</u> Amend harvest, license and/or permit requirements to require mandatory reporting by permittees/licensees of lost harvest gear, by-catch and, entanglement of non-target species.</p> <p><u>100.3.0.29</u> Amend harvest, license and/or permit requirements to incorporate the exclusion devices and/or to require trap/pot designs with a quick-corrode feature which would render the device ineffective upon short-term sustained submersion.</p> <p><u>100.3.0.30</u> Amend the NJ Bureau of Marine Fisheries commercial licensing and harvest reporting system to require fishermen to report the number and location of lost pots to the appropriate state agency/agencies at the end of the harvest season.</p> <p><u>100.3.0.31</u> Create or expand tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMPs.</p> <p><u>100.3.0.32</u> Coordinate regulations across agencies to maximize availability of and enrollment in existing Forestry Stewardship Programs (e.g., "Woodland Stewards", Farm Bill, partners, etc.) to maintain and/or improve forest habitat.</p> <p><u>100.3.0.33</u> Adopt additional timing restrictions, and any necessary permit conditions, into the Administrative Code for NJ DEP-permitted projects to minimize impacts on freshwater SGCN fish, in particular, within habitats during their vulnerable periods as identified through a thorough review of available information.</p> <p><u>100.3.0.34</u> Create legislation or policy that identifies River Herring/Alewife as a stock in the fishery thereby requiring its own Atlantic State Marine Fisheries management plan.</p> <p><u>100.3.0.35</u> Incorporate Freshwater Fish Status Assessment (Delphi Technique) results pertaining to endangered and threatened species into regulations.</p> <p><u>100.3.0.36</u> Create legislation to limit the amount of plastic from shopping bags in circulation and re-instate incentives for citizens bringing their own shopping bag to grocery store.</p> <p><u>100.3.0.37</u> Develop a law and/or policy that requires NJ DEP to continue to address and correct the allowable combined sewer overflow inputs of solid waste into the marine environment to minimize harm to wildlife and their habitats.</p> <p><u>100.3.0.38</u> Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.</p> <p><u>100.3.0.39</u> Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.</p> <p><u>100.3.0.40</u> Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.</p> <p><u>100.3.0.41</u> Explore all State regulatory requirements for mitigation, restoration, habitat management, etc. to ensure they prohibit the use of specified invasive or other problematic plant species.</p> <p><u>100.3.0.42</u> Fully adopt the former Storm water Management Rules' 300ft buffer requirements into the Flood Hazard Area Control Act Rules.</p> <p><u>100.3.0.43</u> Identify and address (amend) regulatory impediments to beneficial habitat management.</p> <p><u>100.3.0.44</u> Incorporate requirements for technical support and funding for mitigation or restoration efforts so as to be consistent with existing regulations.</p> <p><u>100.3.0.45</u> Increase the controlled burn season to focus on restoring vegetative communities.</p> <p><u>100.3.0.46</u> Investigate and/or develop inter-agency Memorandum of Agreements to share common data stored or managed in program-specific databases.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>100.3.0.47</u> Investigate regulatory options available to direct the location or citing of aquaculture activities in Aquaculture development zone 4 (Delaware Bay area) in a manner which minimizes the loss of wildlife habitats and adverse impacts to the environment.</p> <p><u>100.3.0.48</u> Propose new State law or regulation mandating that a State-level "development impact fee" be assessed on all new development approved by municipalities (via the Municipal Land Use Law processes), and dedicate such monies to the development and implementation of regional Habitat Conservation Plans (or existing plans/programs serving the same regional function).</p> <p><u>100.3.0.49</u> Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address the issue of disturbance to habitat or species as a result of human activities (e.g., construction, bridge maintenance, road work, etc.).</p> <p><u>100.3.0.50</u> Retain endangered, threatened and special concern wildlife and habitat protection measures in the Water Quality Management Program Rules.</p> <p><u>100.3.0.51</u> Amend the harvest quota or "bag limits" within the marine fish code enforcement policies relative to SGCN or sensitive game species' as needed.</p> <p><u>100.3.0.52</u> Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded energy sitings and facilities.</p> <p><u>100.3.0.53</u> Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded rights-of-way corridors associated with energy transport/transmission.</p> <p><u>100.3.0.54</u> Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded surface mining areas.</p> <p><u>100.3.0.55</u> Develop regulations to address potentially adverse effects of aquaculture on SGCN species and their habitats.</p> <p><u>100.3.0.56</u> Develop regulations that when implemented will protect critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates.</p> <p><u>100.3.0.57</u> Develop regulations that when implemented will improve and secure habitat connections between conserved SGCN habitats.</p> <p><u>100.3.0.58</u> Develop regulations that when implemented will promote the expansion of acreages and enhancement of the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.</p> <p><u>100.3.0.59</u> Develop regulations that when implemented will increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.</p> <p><u>100.3.0.60</u> Develop regulations that when implemented will protect significant natural and/or unique communities in perpetuity.</p> <p><u>100.3.0.61</u> Develop regulations that when implemented will protect vernal pool habitats to benefit SGCN that rely upon them and promotes connectivity of SGCN populations.</p> <p><u>100.3.0.62</u> Develop regulations that when implemented will protect existing old-growth forest stands with large trees and/or stands that are being actively managed for old growth forests, in particular those within large, contiguous forest tracts.</p> <p><u>100.3.0.63</u> Develop regulations that when implemented will preserve and protect critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.</p> <p><u>100.3.0.64</u> Develop regulations that when implemented will protect and restore riparian areas.</p> <p><u>100.3.0.65</u> Develop regulations that when implemented will protect and restore scrub-shrub habitats to benefit shrub-dependent SGCN.</p> <p><u>100.3.0.66</u> Develop regulations with the objective of reducing "by-catch" of SGCN and other non-target species.</p> <p><u>100.3.0.67</u> Develop regulations for lighting of/on tall structures that will minimize harm to and/or disorientation of wildlife, and enforce within state, county and local permitting processes.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>100.3.0.68</u> Develop regulations that when implemented will prohibit the presence of managed cat colonies and trap, neuter and release programs in or near critical wildlife habitats.</p> <p><u>100.3.0.69</u> Develop regulations that when implemented will minimize wildlife road mortality.</p> <p><u>100.3.0.70</u> Develop regulations that when implemented will facilitate the restoration of dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.</p> <p><u>100.3.0.71</u> Develop regulations for licensing, permitting, or certification of Nuisance Wildlife Control Operators (NWCs) that handle removal/exclusion of protected wildlife, such as bats and snakes, to ensure that proper methods are followed and that occurrences are reported.</p> <p><u>100.3.0.72</u> Develop policies and/or regulations that require permit applicants and reviewers to assess the impacts of proposed projects with consideration to the cumulative and synergistic effects over time and over a larger spatial scale beyond the project site.</p> <p><u>100.3.0.73</u> Develop regulations that when implemented will render the conversion of lawns to native vegetation beneficial for wildlife exempt from local lawn ordinances.</p>
			100.3.2 State Land Acquisition Programs
			<p><u>100.3.2.1</u> Increase opportunities for habitat restoration by making any necessary policy changes to state, federal and local land acquisition programs (e.g., Green Acres, Blue Acres, etc.) to allow for acquisition within abandoned or failing bay shore communities, including mechanisms to relocate displaced people and infrastructure.</p>
			100.4 State Agency Policy Integration
			100.4.0 Policy initiatives for species and habitat protection
			<p><u>100.4.0.1</u> Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).</p> <p><u>100.4.0.2</u> Create a policy that requires the NJ DEP to incorporate scientific information regarding climate change and sea level rise (e.g., predictions, habitat management/acquisition efforts to enhance resilience to inundation) on their websites and to work with other government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.</p> <p><u>100.4.0.3</u> Develop policies for mandatory buffer strips on preserved farmlands and state-owned agricultural lands.</p> <p><u>100.4.0.4</u> Create a policy that requires the use of CHANJ mapping for both regulatory use when conducting project reviews and planning/siting new or expanded rights-of-way projects. CHANJ mapping will assist in identifying SGCN habitats to avoid and/or where impact minimization strategies will likely be required.</p> <p><u>100.4.0.5</u> Create a policy that requires an initial and subsequent updates of a comprehensive marine submerged aquatic vegetation mapping for use by NJ DEP's coastal regulatory program.</p> <p><u>100.4.0.6</u> Create legislation or policy that identifies River Herring/Alewife as a stock in the fishery thereby requiring its own Atlantic State Marine Fisheries management plan.</p> <p><u>100.4.0.7</u> Develop a law and/or policy that requires NJ DEP to continue to address and correct the allowable combined sewer overflow inputs of solid waste into the marine environment to minimize harm to wildlife and their habitats.</p> <p><u>100.4.0.8</u> Develop a white paper addressing the impacts that existing, new or expanded rights-of-way have upon wildlife, wildlife habitats and habitat connectivity.</p>

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>100.4.0.9</u> Develop and implement policies to minimize the removal of coarse, woody debris in terrestrial, aquatic and riparian habitats in order to benefit wildlife.</p> <p><u>100.4.0.10</u> Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.</p> <p><u>100.4.0.11</u> Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.</p> <p><u>100.4.0.12</u> Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.</p> <p><u>100.4.0.13</u> Develop policies for different circumstances (e.g., roadsides and medians, riparian, aquatic and terrestrial habitats) that outline appropriate habitat/vegetation management strategies and schedules to minimize risks to and benefit wildlife.</p> <p><u>100.4.0.14</u> Develop policies to facilitate agreements between eligible entities to manage appropriate conserved lands for grassland-dependent species, and to have access to/obtain restoration funds.</p> <p><u>100.4.0.15</u> [<i>Reserved*</i>]</p> <p><u>100.4.0.16</u> Develop policies to implement habitat management strategies that will increase the structural diversity surrounding areas used for energy, mining, and transportation and service corridors which include but are not limited to the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-asides.</p> <p><u>100.4.0.17</u> Develop policies to implement habitat management strategies, including prescribed burns, that will increase the structural diversity on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies to control and reduce the impacts of invasive, non-native species in order to increase structural habitat diversity.</p> <p><u>100.4.0.18</u> Develop policies to minimize the extent of infrastructure associated with energy and service corridors or areas (e.g., wind and solar farms, pipelines, utility lines) and that require the implementation of habitat management strategies that will increase the structural diversity in the area including (e.g., the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-asides).</p> <p><u>100.4.0.19</u> Develop regulations that will minimize the creation of new barriers, remove or replace current barriers with appropriately-sized systems to accommodate wildlife dispersal, and to minimize road widening and traffic volume increases within critical wildlife habitat areas.</p> <p><u>100.4.0.20</u> Develop state regulations that require energy developers and utility service companies to implement habitat management strategies that will increase the structural diversity of the habitat, minimize habitat fragmentation and commercial infrastructure, and minimize the loss, alteration and/or degradation of the habitat and adjacent lands when working on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies.</p>

* "Reserved" indicates placeholders for future edits or additions.

Level 1	Level 2	Level 3	Level 4: NJ-specific Conservation Action Statements
			<p><u>100.4.0.21</u> Ensure that Section 303(d) of the Clean Water Act and applicable State statutory/regulatory requirements for surface water pollutant budgets are being met by monitoring and enforcing regulatory Total Maximum Daily Load (TMDL) targets established within regional Water Quality Management Plans.</p> <p><u>100.4.0.22</u> Work with NJ DEP's Division of Land Use Regulation to ensure protection of listed species and their habitats during stream cleaning events.</p> <p><u>100.4.0.23</u> Adopt additional timing restrictions, and any necessary permit conditions, into the Administrative Code for NJ DEP-permitted projects to minimize impacts on freshwater SGCN fish, in particular, within habitats during their vulnerable periods as identified through a thorough review of available information.</p> <p><u>100.4.0.24</u> Develop policies to provide financial support for the New Jersey Invasive Species Strike Team.</p> <p><u>100.4.0.25</u> Develop policies and/or regulations that require permit applicants and reviewers to assess the impacts of proposed projects with consideration to the cumulative and synergistic effects over time and over a larger spatial scale beyond the project site.</p>

Introduction

New Jersey's wildlife face a multitude of threats can adversely affect their habitats, persistence, and well-being. This report provides an extensive and detailed list of such threats and action drivers, as well as the conservation actions necessary to alleviate the adverse impacts these conditions create. The report was generated using a complex database developed and maintained by the NJ Division of Fish and Wildlife.

Plan users should consider this information when developing or adapting conservation projects they wish to undertake. Conservation projects are more likely to succeed if they are developed with an understanding of the causes for species' declines and designed to take specific and meaningful actions to address the causes. To that end, partner conservation organizations have already prepared a number of species-based plans that also provide useful conservation guidance. We have referred to many of these plans in the report, *Profiles of the Focal Species of Greatest Conservation Need*, found in Appendix D.

Report Format and Information

The report is organized by taxonomic class listed in order of taxonomic sequence (i.e., mammals, birds, reptiles and amphibians, fish, and invertebrates). Within each class, New Jersey's 48 "conservation targets" are listed in alphabetical order. As described in Chapter 1, each of the 48 conservation targets consist either of an individual or a group of "focal species of greatest conservation need" (Focal SGCN) categorized as "targets" based on the species sharing common habitats, ecological requirements, and/or conservation needs. For example, because bobolinks, Eastern meadowlarks, grasshopper sparrows, and Vesper sparrows share common habitats and face common threats that can be addressed using the same conservation actions. These species are presented together as the conservation target, Grassland Birds. The same applies for many other Focal SGCN, such as Anadromous and Semi-anadromous Fish and Pinelands Moths.

As described in the Introduction, Section IV (*2017 Changes to NJ's State Wildlife Action Plan*) and Chapter 3 of this plan, threats and action drivers are defined and categorized using the three-level lexicon of threats developed by the International Union for Conservation of Nature (IUCN) and action drivers developed by the U.S. Fish & Wildlife Service for their database, Tracking and Reporting on Actions for Conservation of Species (TRACS). Conservation actions are also defined and categorized using the three-level lexicon of conservation actions developed for TRACS. In addition, New Jersey chose to develop an even finer fourth level of threats/action drivers and conservation actions that are specific to New Jersey.

This report provides the following information for New Jersey's 48 conservation targets:

1. A list of species that make up the conservation target group.
2. A listing of threat and action driver categories (levels 1 through 3 as identified by IUCN and TRACS, respectively) that apply to the conservation target. The report also provides New Jersey-specific, level 4 threat/action driver statements. Note that in association with each "level 3" threat/action driver statement, the report also provides the average threat severity score (i.e., impact rating). The threat severity score is an indicator of the impact each level 3 threat/action driver has on the Focal SGCN (more details are provided in Chapter 3). Where conservation targets consist of multiple Focal SGCN (e.g., Cave-hibernating Bats), the average severity score for the group is presented.
3. A list of conservation action categories (levels 1 through 3 as identified in TRACS). Note that in association with each level 3 threat statement, the report also provides the New Jersey-specific, level 4 conservation action statements.

This Plan explicitly focuses on the development and implementation of actions to conserve New Jersey's wildlife species of conservation need (SGCN) and the habitats on which they depend. However, New Jersey also supports an extraordinarily diverse flora, described in Chapter 3, Section VI, including natural communities that provide significant habitat for wildlife SGCN and associated rare plants.

The actions, projects, and monitoring programs presented in this plan for wildlife also provide an opportunity to contribute to the conservation of rare plants and natural communities. At the same time, without proper precautions, actions directed at enhancing wildlife, especially "on-the-ground" actions that modify habitats, may pose risks to rare native flora. As such, it is important that land and wildlife managers consider plant communities when implementing conservation actions and monitoring programs for wildlife. Additional guidance for integrating rare plants and natural communities into wildlife planning and action implementation is presented in Attachment IV.

Mammals

Allegheny Woodrat

Focal species that comprise this Conservation Target:

Allegheny Woodrat

Threats and Action Drivers associated with this Conservation Target:

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale) (Avg. Score: 2.00)

NJ Specific Threats: 1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
1.1.1.2 Loss, alteration and/or degradation of habitat.
1.1.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale) (Avg. Score: 2.00)

NJ Specific Threats: 1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
1.2.1.2 Loss, alteration and/or degradation of habitat.
1.2.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale) (Avg. Score: 1.00)

NJ Specific Threats: 1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

3 Energy Production and Mining

3.1 Oil and Gas Facilities and Pipelines

3.1.1 Distribution processes of petroleum and other liquid hydrocarbons (Avg. Score: 1.00)

NJ Specific Threats: 3.1.1.1 Fragments terrestrial and aquatic habitats.
3.1.1.2 Loss, alteration and/or degradation of habitat.
3.1.1.3 Increased risk of oil spills.
3.1.1.4 Increased noise pollution.
3.1.1.5 Increased vehicular and ship traffic associated with construction and operations, and therefore an increased risk of wildlife mortality from strikes.

3.1.2 Natural gas distribution processes (Avg. Score: 1.00)

NJ Specific Threats: 3.1.2.1 Fragments terrestrial and aquatic habitats.
3.1.2.2 Loss, alteration and/or degradation of habitat.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need
Allegheny Woodrat

- 3.1.2.3 Increased risk of gas leaks and explosions.
- 3.1.2.4 Increased noise pollution.
- 3.1.2.5 Increased vehicular and ship traffic associated with construction and operations, and therefore an increased risk of wildlife mortality from strikes.

3.2 Mining and Quarrying

3.2.2 Surface Mining - Rock Quarry (and sand quarries) (Avg. Score: 1.00)

- NJ Specific Threats:**
- 3.2.2.1 Fragments terrestrial and aquatic habitats.
 - 3.2.2.2 Loss, alteration and/or degradation of terrestrial and aquatic habitats.
 - 3.2.2.3 Increased risk of vehicle strikes/mortality to wildlife.

4 Transportation and Service Corridors

4.1 Roads and Railroads

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale) (Avg. Score: 1.00)

- NJ Specific Threats:**
- 4.1.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species and inhibiting dispersal of non-volant animals, reducing gene flow.
 - 4.1.1.2 Loss, alteration and/or degradation of habitat associated with road and railroad construction and maintenance, and degradation of adjacent habitats.

4.1.2 Movement of cars and other vehicles on roads and railroads (large and small scale) (Avg. Score: 1.00)

- NJ Specific Threats:**
- 4.1.2.1 Increased vehicle traffic increases the risk of wildlife mortality from strikes.

5 Biological Resource Use

5.1 Hunting and Collecting Terrestrial Animals

5.1.3 Persecution/Control (Avg. Score: 1.00)

- NJ Specific Threats:**
- 5.1.3.1 Wanton killing of perceived dangerous and/or undesirable animals.

5.2 Gathering Terrestrial Plants

5.2.3 Control (Avg. Score: 1.00)

- NJ Specific Threats:**
- 5.2.3.2 Clearing of scrub-shrub vegetation [and snags] diminishes cover and nesting habitat.

5.3 Logging and Wood Harvesting

5.3.1 Intentional Use (subsistence/small scale) (Avg. Score: 1.00)

- NJ Specific Threats:**
- 5.3.1.2 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may cause the loss, alteration and/or degradation of wildlife habitat.
 - 5.3.1.4 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase the risk of invasive species establishment, impacting SGCN habitats.
 - 5.3.1.5 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may decrease structural diversity and biomass leading to reduced biodiversity and ecological integrity.

5.3.4 Unintentional effects (large scale) (Avg. Score: 1.00)

NJ Specific Threats: 5.3.4.5 Lack of appropriate, sustainable forest management can lead to a decrease in forest habitat diversity, degraded habitat for many forest species, the loss of habitat for early-successional species, and/or the loss of unique habitats for species that need canopy breaks and multi-aged tree composition to fulfill various life history requirements.

6 Human Intrusions and Disturbance

6.1 Recreational Activities

6.1.6 Recreational use of cliffs, rocks and ridgelines (Avg. Score: 1.00)

NJ Specific Threats: 6.1.6.1 Recreational rock-climbing and rock-scrambling can cause reduced reproductive success or reproductive failure for wildlife by disrupting normal reproductive behaviors and/or reduce breeding success by forcing them into suboptimal habitats.

6.1.6.2 Participants may introduce wildlife diseases and invasive plant species when gear and apparel is not properly sanitized between sites.

7 Natural Systems Modifications

7.1 Fire and Fire Suppression

7.1.2 Suppression of Fire Frequency/Intensity (Avg. Score: 2.00)

NJ Specific Threats: 7.1.2.1 Shift in vegetative communities as a result of suppression of natural fires.

7.1.2.2 Lack of diversity in age structure and composition of vegetation due to the suppression of fire.

7.2 Dams and Water Management/Use

7.2.12 Culverts (Avg. Score: 1.00)

NJ Specific Threats: 7.2.12.1 Improper design, placement, installation and maintenance of culverts and other stream crossing structures can impede or prevent the movements of terrestrial organisms and can restrict or limit stream flow, impeding the movement of aquatic organisms along riparian corridors.

7.3 Other Ecosystem Modifications

7.3.4 Lack of natural disturbance patterns or ecosystem functions due to species loss (Avg. Score: 1.00)

NJ Specific Threats: 7.3.4.5 The lack of forest disturbance minimizes the diversity of herbaceous vegetation and other shrubs and trees that need a lot of sunlight to grow.

7.3.5 Poor habitat management (Avg. Score: 2.00)

NJ Specific Threats: 7.3.5.12 Lack of diversity in age structure and composition of vegetation due to lack of natural disturbances and/or vegetation management.

7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.

8 Invasive and Other Problematic Species, Genes and Diseases

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.5 Invasive non-native terrestrial/wetland plants (Avg. Score: 1.00)

NJ Specific Threats: 8.1.5.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.1.6 Invasive non-native fungal/bacterial diseases (Avg. Score: 1.00)

NJ Specific Threats: 8.1.6.1 The introduction of non-native fungal and bacterial diseases threatens native populations and ecosystems.

8.2 Problematic Native Species/Diseases

Allegheny Woodrat

8.2.2 Named Species (Avg. Score: 3.00)

NJ Specific Threats: 8.2.2.2 Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.

8.5 Viral/Prion-induced Diseases

8.5.2 Named Species (Disease) (Avg. Score: 1.00)

NJ Specific Threats: 8.5.2.1 Diseases such as West Nile Virus, arenavirus, sudden oak death, Avian Influenza, and snake fungal disease cause morbidity or mortality to native populations.

8.6 Diseases of Unknown Cause

8.6.0 Unknown Diseases (Avg. Score: 1.00)

NJ Specific Threats: 8.6.0.1 Diseases yet to be identified by pathologists and virologists cause decreased fitness or mortality to native populations.

9 **Pollution**

9.3 Agricultural and Forestry Effluents

9.3.5 Control of insect pests and plants leading to mortality of non-target species not associated with agriculture (Avg. Score: 1.00)

NJ Specific Threats: 9.3.5.5 Use of pesticides and herbicides can minimize the abundance of food sources for native wildlife populations.

9.4 Garbage and Solid Waste

9.4.1 Direct hazards to wildlife (Avg. Score: 1.00)

NJ Specific Threats: 9.4.1.1 Wildlife may ingest garbage causing choking or impingement in the digestive system, or they may become physically entangled in it (e.g., plastic or abandoned fish nets); conditions that make them unable to feed or drink, cause them to suffocate or drown, or otherwise restrict the animal's movement making them more susceptible to predators, starvation or injury.

11 **Climate Change and Severe Weather**

11.1 Habitat Shifting or Alteration

11.1.0 Macro- and Micro-Climate Alterations (Avg. Score: 1.00)

NJ Specific Threats: 11.1.0.1 Alters native terrestrial and aquatic habitats at the macro- and micro-climate levels that can affect suitability for wildlife, in particular specialist species.

11.2 Droughts

11.2.1 Droughts (Avg. Score: 1.00)

NJ Specific Threats: 11.2.1.4 Increase stress on vegetation making them more susceptible to pest damage.

11.4 Storms and Flooding

11.4.2 Increased rainfall (Avg. Score: 1.00)

NJ Specific Threats: 11.4.2.2 Extreme rain events can damage wildlife nesting and resting habitats, including impacts to avian eggs and chick and small mammal survivorship.

12 **Resource Management Needs**

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory (Avg. Score: 3.00)

NJ Specific Threats: 12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need
Allegheny Woodrat

12.1.1.2 Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.

12.1.2 Lack of up-to-date existing information (Avg. Score: 3.00)

NJ Specific Threats: 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

12.1.3 Need to answer research question (Avg. Score: 3.00)

NJ Specific Threats: 12.1.3.1 There are significant knowledge gaps regarding distribution, dispersal, diseases, population trends, etc. of SGCN.

12.1.4 Need to develop new technique (Avg. Score: 2.00)

NJ Specific Threats: 12.1.4.1 Improve and evaluate survey methods for SGCN and their habitats; alter as needed.

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms (Avg. Score: 1.00)

NJ Specific Threats: 12.3.0.1 Regulatory habitat protections within state land use regulations are spatially limited to specific geographic areas (e.g., Pinelands, Coastal Area) or geographic features (e.g., wetlands, streams) and so fail to protect critical habitats that exist outside of these regulated areas.

12.3.0.3 Lack of a licensing program and standards for NJ Nuisance Wildlife Control Operators (NWCs) leads to inadequate controls over handling of wildlife and lack of reporting of non-game/SGCN species (and all wildlife) encountered in nuisance situations.

12.3.0.7 Activities that threaten SGCN, their food sources, and/or habitats are often regulated separately and without consideration for the cumulative and synergistic effects over time or over a larger spatial scale. Therefore, regulations can fail to protect SGCN populations over time.

12.3.0.9 Prescribed burns implemented by the NJ Forest Fire Service are constrained by State air quality regulations to a timeframe where seasonal weather conditions are less than ideal for effective burning. As a result, the Forest Fire Service is limited in the number of overall prescribed burns it can implement to restore habitat for wildlife.

12.3.0.10 Land use regulatory processes pertaining to habitat creation, enhancement or restoration projects can be costly and/or burdensome, precluding or discouraging the development or implementation of conservation projects.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform (Avg. Score: 2.00)

NJ Specific Threats: 12.4.0.5 Bureau of Forest Fire Management policy has traditionally implemented prescribed burns on State lands for the sole purpose of public safety (i.e., addressing hazard fuel reduction), missing opportunities to burn in a manner that would additionally manage habitat for ecological diversity.

12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats (Avg. Score: 2.00)

NJ Specific Threats: 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.

14.1.1.3 Lack of understanding of the need to manage both natural and anthropogenic (e.g., yards, lawns, hayfields, etc.) habitats to minimize impacts or increase benefits to SGCN and their habitats.

14.2 Outreach needs

14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions (Avg. Score: 2.00)

NJ Specific Threats: 14.2.1.1 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various forest management practices.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning (Avg. Score: 3.00)

NJ Specific Threats: 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Actions to address the Threats and Action Drivers associated with this Conservation Target:

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.2 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to increase the effective size of SGCN habitats by protecting/restoring adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats.
- 1.2.1.4 Secure and promote the protection, restoration, and/or development of old-growth forest stands with large trees, in particular those within large, contiguous forest tracts through incentive programs.
- 1.2.1.8 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to municipalities, land developers, and other land managers to retain and/or enhance native vegetation adjacent to aquatic habitats, and along riparian areas and wildlife movement corridors.
- 1.2.1.9 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing Forestry Stewardship Programs.
- 1.2.1.14 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of herbicides and pesticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.15 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of rodenticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.20 Coordinate across government agencies and non-government organizations to create or expand upon tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMP's.

2 Direct Management of Natural Resources

2.3 Fire management

2.3.3 Prescribed burning

- 2.3.3.1 Evaluate different management techniques of prescribed burns that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 2.3.3.2 Conduct prescribed burning in Northern New Jersey forests to maintain and regenerate a mosaic of upland forest habitats.
- 2.3.3.3 Conduct prescribed burning to improve wildlife habitat.

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

- 2.10.0.2 Improve the availability of prey/food resources through terrestrial and aquatic plantings and habitat restoration for SGCN populations, in particular for those populations thought to be limited due wholly or in part to a lack of (or contaminated) food resources, and for migratory species (birds, bats, invertebrates).
- 2.10.0.6 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats.
- 2.10.0.7 Restore/reclaim and enhance degraded rare species habitats through strategic revegetation and management efforts for documented/target SGCN.
- 2.10.0.8 Protect significant natural and/or unique communities by implementing best management practices when conducting habitat restoration strategies.
- 2.10.0.14 Implement best management practices (BMPs), protective strategies and guidelines for restoring and enhancing healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.10.0.15 Restore and/or enhance terrestrial and aquatic habitats proximate to but not adjacent to roads and other transportation corridors for terrestrial-bound SGCN species whose behavior (i.e., dispersal across roads) may be altered by doing so, and therefore decrease road mortality of such species (e.g., amphibians, snakes, turtles, small mammals).
- 2.10.0.24 Use NJ's CHANJ mapping and guidance to establish vegetation and enhance or create corridors between fragmented habitats with similar vegetation, slope, soils, structure, etc. to ensure vegetative integrity is maintained to allow wildlife to safely disperse, and corridors are buffered with natural habitats to minimize disturbance to wildlife within the corridors.

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.
- 2.11.0.2 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas for target SGCN and/or species groups; management should complement rare species needs in a targeted area.
- 2.11.0.3 Create suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats through vegetation management.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Allegheny Woodrat

- 2.11.0.4 Implement vegetation management strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife, particularly SGCN.
- 2.11.0.5 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats through vegetation management.
- 2.11.0.6 Reclaim degraded rare species habitats by conducting vegetation management needed to restore habitat value for the documented/target SGCN.
- 2.11.0.7 Protect significant natural and/or unique communities by implementing best management practices through vegetation management.
- 2.11.0.13 Implement best management practices (BMPs), protective strategies, and guidelines for vegetation management to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.11.0.14 Conduct vegetation management adjacent to roads for SGCN species whose behavior (i.e., dispersal across roads) may be altered by doing so, and therefore decrease road mortality of such species (e.g., amphibians, snakes, turtles, small mammals).
- 2.11.0.17 Implement vegetation management strategies to improve the availability of prey/food resources for SGCN whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources.
- 2.11.0.23 Implement appropriate habitat management actions in areas where natural disturbances, such as wildfire, have been precluded.
- 2.11.0.26 Conduct vegetation management along roadsides and medians, avoiding peak activity periods for wildlife, that enhances wildlife dispersal naturally and safely across roads and similar barriers to/between terrestrial and/or aquatic habitats.
- 2.11.0.31 In areas where vegetative communities are shifting due to fire suppression and controlled burns are not feasible, manage vegetation to improve wildlife habitat.
- 2.11.0.33 Increase structural habitat diversity by implementing long-term vegetation management to minimize the potential for the establishment of invasive and/or non-native plants that may outcompete native vegetation.
- 2.11.0.37 Increase structural habitat diversity by minimizing the removal of coarse, woody debris in terrestrial, aquatic and riparian habitats which benefits wildlife.
- 2.11.0.40 Increase structural habitat diversity surrounding areas used for energy, mining, and transportation and service corridors by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides, and avoid managing habitat during the breeding seasons for ground-nesting birds, reptiles, amphibians and small mammals.
- 2.11.0.41 Increase structural habitat diversity through the implementation of a variety of vegetation management practices such as prescribed burns (either increasing or decreasing their frequency depending on the site and objective), plantings, etc. that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.43 Manage forests to increase variation in age structure and composition using BMPs that promote and maintain functioning ecological forest-based systems and biological diversity.

2.13 Wildlife damage management

2.13.0 Nuisance fish and wildlife damage

- 2.13.0.8** Implement and assess management strategies to control and reduce the impacts of detrimental species and diseases that pose threats to native wildlife or communities.

2.14 Wildlife disease management

2.14.0 Wildlife disease strategy development and investigation

- 2.14.0.1** Investigate diseases/pathogens impacting SGCN and/or their habitats.
- 2.14.0.2** Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
- 2.14.0.4** Conduct long-term monitoring of diseases in vulnerable wildlife to determine the magnitude of exposure within populations and around the State, the impacts to those species, in particular SGCN, and investigate the feasibility of mitigating for such impacts.
- 2.14.0.5** Assess the impacts of diseases on the life cycles of wildlife.
- 2.14.0.6** Distribute antihelminthic drugs targeting raccoon roundworm in raccoons proximal to Allegheny woodrat populations and/or implement a raccoon control strategy.

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

- 3.0.0.1** Conduct long-term monitoring of resident and migratory SGCN populations using standardized survey protocols to determine the variables that may impact their long-term persistence in the State (e.g., population viability, distribution, dispersal, home range and habitat use, travel corridors, food availability, vulnerability to pollutants and disease, etc.). Compile this information to determine the likely causes of population declines and to understand metapopulation dynamics. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.2** Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) where data gaps exist regarding SGCN distribution, and their critical and supportive habitats. Conduct surveys using standardized survey protocols to acquire baseline data, and provide the data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
- 3.0.0.3** Gather baseline data on SGCN inhabiting permanently protected natural lands regarding their distribution and population (e.g., abundance, dispersal, demography including productivity and survival, etc.), and identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) critical and supporting habitats within those landscapes.
- 3.0.0.4** Conduct long-term studies on SGCN inhabiting permanently protected natural lands to develop population trend data and changes in demography, and to determine if critical and/or supporting habitats are limited or changing; i.e., diminishing in value, acreage or connectivity.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need
Allegheny Woodrat

- 3.0.0.5 Gather baseline data on resident and migratory SGCN (in particular migratory species for which New Jersey habitats are significant), terrestrial, freshwater and marine species, regarding the location and condition of their critical and supporting habitats (e.g., foraging, roosting, nesting/breeding, stopover, migration paths, etc.), and population demography (e.g., productivity, survival, dispersal). Compile this information into a database that includes descriptions of the conditions of the habitats and species, and a GIS component of the locations of these important habitats. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.6 Conduct long-term studies on resident and migratory SGCN to determine if there are changes to the populations' demography (productivity, survival, dispersal) and/or to their critical and/or supporting habitats (i.e., diminishing in value, acreage or connectivity, etc.), in particular changes that would not maintain SGCN at viable levels for species populations. Update data and GIS maps; provide updated information to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.7 Collect baseline data to document species distributions, in particular SGCN, and current habitat for future analysis of possible distribution shifting as a result of habitat shifting or alteration associated with climate change impacts.
- 3.0.0.8 Conduct long-term studies and compare baseline metrics of documented species distributions and associated habitats to identify possible species and/or habitat shifting or alteration associated with climate change impacts.
- 3.0.0.9 Identify SGCN (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources, and compile/collect and evaluate data/information regarding potential management strategies to improve the availability of such SGCN's food resources.
- 3.0.0.10 Conduct long-term studies to evaluate the effectiveness of management strategies implemented to enhance food/prey availability for SGCN [whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources] through studies that investigate the populations and health of the food resources as well as the target SGCN. Revise management strategies as needed and continue to monitor the effectiveness of the efforts.
- 3.0.0.11 Develop, implement and evaluate the effectiveness of town plans that avoid impacts to SGCN species and their habitats.
- 3.0.0.13 Investigate the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats. Evaluate and modify management practices as appropriate.
- 3.0.0.14 Identify areas with invasive, aquatic plants and animals and collect a detailed baseline assessment of the species' status and distribution. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort. Researchers and contractors performing Forest Stewardship Inventories and/or Plans on state lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.

- 3.0.0.15 Conduct long-term monitoring of areas identified as having invasive, aquatic plants and animals to track the species' status/progress over time with or without the implementation of management strategies. Areas without management strategies should be assessed and prioritized for management/control. Areas where management strategies are being implemented should include an assessment of the management effort and identify/recommend and implement necessary changes to improve its success. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort.
- 3.0.0.26 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species including objectives and guidance pertaining to and the condition/status of critical and supporting habitats.
- 3.0.0.27 Evaluate the effectiveness of strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals through research and monitoring. Develop and provide NJ DEP and other appropriate governing agencies/commissions a summary of findings and recommendations to improve such efforts.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.1 Division of Fish and Wildlife should maintain a robust, up-to-date database and mapping of species occurrences.
- 3.2.0.2 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
- 3.2.0.8 Implement and conduct long-term monitoring of control measures aimed at minimizing the impacts of problematic species and/or diseases to evaluate the effectiveness of such efforts and to identify and incorporate additional strategies as appropriate.
- 3.2.0.9 Maintain an inventory of invasive insect distribution and where they exist, conduct long-term monitoring of habitat conditions to assist in developing strategies to combat the impacts to SGCN habitats. Report potential infestations to NJ DEP.

3.2.1 Abundance determination

- 3.2.1.1 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) population abundance and trends for SGCN using standardized survey protocols. Provide data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
- 3.2.1.2 Conduct wildlife surveys on resident and migratory SGCN regarding their population abundance and trends.

3.2.2 Age, size and sex structure

- 3.2.2.1 Conduct wildlife surveys on resident and migratory SGCN regarding their survivorship.

3.2.3 Baseline inventory

Allegheny Woodrat

- 3.2.3.6 Investigate the feasibility and potential for success of conducting genetic rescue through translocation and/or reintroduction of animals into suitable habitat that was historically occupied to increase genetic diversity and reconnect isolated populations. Methods of investigation should include, but are not limited to, thorough literature reviews, expert opinions, identifying potential pitfalls (e.g., species' fidelity to their range or critical areas), and an examination of historic and current SGCN population distribution and suitable habitat availability.
 - 3.2.4 Food habits
 - 3.2.4.1 Monitor and investigate the populations and health of SGCN prey/food resources for those SGCN whose populations are thought to be limited due wholly or in part to a lack of food resources or toxins in food resources.
 - 3.2.5 Genetics
 - 3.2.5.1 Investigate the feasibility and potential for success of conducting genetic rescue through translocation and/or reintroduction of animals into suitable habitat that was historically occupied to increase genetic diversity and reconnect isolated populations. Methods of investigation should include, but are not limited to, thorough literature reviews, expert opinions, identifying potential pitfalls (e.g., species' fidelity to their range or critical areas), and an examination of historic and current SGCN population distribution and suitable habitat availability.
 - 3.2.7 Population assessment
 - 3.2.7.1 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
 - 3.2.7.2 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species to meet and maintain recovery goals.
- 3.3 Research, survey or monitoring - habitat
 - 3.3.1 Baseline inventory
 - 3.3.1.1 Conduct habitat assessments of significant natural and/or unique communities to identify threats to native terrestrial and aquatic habitats through systematic monitoring, review of available data, enlistment of habitat management and/or species experts, etc. Incorporate findings into a database that includes descriptions/qualifiers of the habitats, identifies and values/qualifies the threats, and includes a GIS component of the locations of the assessed areas. Share this information with landowners/managers (e.g., federal, state and local government agencies or non-government organization).
 - 3.3.1.2 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) resident and migratory SGCN habitats. Investigate their suitability for the various life history requirements of the species that dependent upon them to determine the ability for maintaining applicable SGCN populations in perpetuity.
 - 3.3.1.4 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and investigate the suitability of corridors that connect large, contiguous tracts of similar habitats to increase their effective size (i.e., forest with forest, grassland with grassland, wetlands with wetlands, etc.) for dependent SGCN.
 - 3.3.1.5 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) where habitat restoration and/or enhancement would benefit wildlife SGCN.

Allegheny Woodrat

- 3.3.1.6 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) that could, through revegetation and/or enhancement efforts, become suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN.
- 3.3.1.9 Inventory forests throughout northern New Jersey to develop a baseline characterization of the structure and composition of habitats and identify deficient forest habitat types.
- 3.3.1.18 Conduct an assessment using available data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels.
- 3.3.1.20 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) where invasive, non-indigenous plants and animals are either already established or are becoming established. Create a system for reporting and qualifying new locations of invasive species and for prioritizing areas for control measures according to the potential level of impact on the ecosystem and SGCN and the likelihood of success. Researchers and contractors encountering invasive plant species while performing plant and/or forest inventories on state or other conserved lands and/or private lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.3.1.24 Conduct regular investigations of SGCN habitat health and biodiversity on public and private lands to identify locations in need of revegetation, reduction of over-abundant, native wildlife and/or exotic species, conservation focal areas requiring limitations on human activity, etc.

3.3.2 Monitoring

- 3.3.2.1 Evaluate the effectiveness of forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.
- 3.3.2.2 Conduct long-term monitoring of resident and migratory SGCN habitats using standardized survey protocols to determine changes in habitat quality/suitability and threats (e.g., habitat loss and degradation, increased edge habitat, water quality) and other variables that may impact their long-term persistence in the State and to provide information needed for determining causes of population declines and understanding metapopulation dynamics.
- 3.3.2.3 Continue to update wildlife and habitat databases and revise models of critical SGCN habitats using the most current data available and where lacking, develop new SGCN and/or habitat models as data on species habitat requirements and applicable GIS data layers become available.
- 3.3.2.9 Investigate the effectiveness of various silviculture techniques for enhancing forests for forest-dependent SGCN.
- 3.3.2.10 Evaluate the efficacy and success of different management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.3.2.15 Investigate the effectiveness of management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.

- 3.3.2.16 Evaluate the effectiveness of best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 3.3.2.20 Once a system is developed for reporting and qualifying new locations of invasive species, develop, implement and monitor/evaluate invasive species removal strategies at identified locations. Priority should be given to those areas critical to SGCN and/or contain unique and/or rare plant communities supporting SGCN and/or other fish/wildlife species.
- 3.3.2.24 Conduct regular inventories of forests throughout northern New Jersey to characterize the changing structure and composition of habitats and monitor forest conditions.

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.1 Work with land management agencies to determine the appropriate actions needed to restore/reclaim degraded habitat for the documented/target SGCN.
- 3.5.3.2 Develop management strategies to improve the availability of prey/food resources for SGCN whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources. Monitor and investigate the management strategies over time to determine success and/or the need to revise methods.
- 3.5.3.3 Develop/improve management techniques that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.7 Develop/improve forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.
- 3.5.3.8 Develop best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 3.5.3.9 Develop strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 3.5.3.11 Develop strategies to protect native terrestrial and aquatic habitats and dependent SGCN species from the identified threats.
- 3.5.3.14 Develop aquaculture practices in the coastal areas that are compatible with the recovery of SGCN.
- 3.5.3.15 Modify management practices based on the effects of pesticides, herbicides and other biological controls on critical and supporting SGCN habitats.

Allegheny Woodrat

- 3.5.3.16 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.
 - 3.5.3.20 Develop guidance on various silviculture techniques for enhancing forests for forest-dependent SGCN.
 - 3.5.3.21 Develop management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
 - 3.5.3.24 Based on research, modify management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
 - 3.5.3.25 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to develop the necessary management strategies to reach or maintain viable population levels.
- 3.5.4 Fish and wildlife research, survey and management techniques
 - 3.5.4.1 Develop studies to evaluate management strategies to improve the availability of prey/food resources for SGCN whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources. Monitor and investigate the management strategies over time to determine success and/or the need to revise methods.
 - 3.5.4.5 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
 - 3.5.4.7 Investigate the feasibility and potential for success of conducting genetic rescue through translocation and/or reintroduction of animals into suitable habitat that was historically occupied to increase genetic diversity and reconnect isolated populations. Methods of investigation should include, but are not limited to, thorough literature reviews, expert opinions, identifying potential pitfalls (e.g., species' fidelity to their range or critical areas), and an examination of historic and current SGCN population distribution and suitable habitat availability.
 - 3.5.4.13 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.
 - 3.5.4.14 Develop and implement agreements, and update existing agreements, with government agencies regarding the protection of critical SGCN habitats (e.g., significant breeding populations of beach nesting birds, colonial waterbird nesting areas, bat colonies, etc.).

- 3.5.4.15 Investigate the success of management strategies used to protect and/or enhance SGCN populations and when appropriate, aid in identifying failures/resource problems and issues, and developing new strategies.
- 3.5.4.16 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels and develop the necessary management strategies.
- 3.5.4.17 Investigate new, non-invasive techniques for SGCN population evaluation through literature review, expert opinion, trial studies (if low risk), etc.
- 3.5.4.18 Investigate the effectiveness of survey techniques through selected "ground truthing" and literature and peer review in order to increase efficacy of survey, minimize surveyor bias and error, and increase accuracy of trend data.
- 3.5.4.19 Develop reliable, standardized survey and monitoring protocols for SGCN species, for which none currently exist, and their habitats.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

- 6.0.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.6 Secure and protect old-growth forest stands with large trees and/or stands that are approaching or being actively managed for old growth forests, in particular those within large, contiguous forest tracts, through an appropriate combination of fee title, non-fee title and landowner agreements.

6.3 Conservation area designation

6.3.0 Conservation area designation strategies

- 6.3.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN and/or connect conserved SGCN habitats through conservation area designations.
- 6.3.0.6 Promote the protection of old-growth forest stands with large trees and/or stands that are approaching or being actively managed for old growth forests, in particular those within large, contiguous forest tracts, through conservation area designations.

6.4 Private lands agreements

6.4.0 Private land agreement strategies

- 6.4.0.1 Enter into private lands agreements to expand control burns on private lands, in particular those adjacent to conserved lands to improve SGCN habitats.

7 Law Enforcement

7.1 Law enforcement

7.1.3 Sub-national Level

- 7.1.3.2 Increase the number of law enforcement officers tending to wildlife issues to a reasonable number to sufficiently cover the State and marine waters.

7.1.4 Scale Unspecified

Allegheny Woodrat

- 7.1.4.6 Recruit law enforcement to assist in the protection and enhancement of SGCN populations, in particular endangered species, through improved awareness of species through trainings, partnerships, and other methods. Information should include but is not limited to: 1) Issues concerning illegal collection of reptiles, 2) Persecution of rare snakes, 3) Illegal recreational activities on public lands (e.g., off-road vehicles) and their impact on wildlife, 4) Identification of sensitive areas, critical sites and/or "hot-spots" for collection.
- 7.1.4.7 Increase law enforcement presence to enforce regulations governing recreational activities (e.g., the use of personal watercraft and off road vehicles, caving, rock climbing, etc.) on conserved lands and within other sensitive habitats, and discourage activities that cause harm or disturbance to vegetation, wetlands, fish and wildlife.
- 7.1.4.9 Implement policies that improve and secure habitat connections between conserved SGCN habitats.
- 7.1.4.10 Implement policies that promotes expanding acreages and enhances the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 7.1.4.12 Implement policies and/or regulations that protect significant natural and/or unique communities in perpetuity.
- 7.1.4.14 Implement policies that protect existing and developing old-growth forest stands with large trees, in particular those within large, contiguous forest tracts.
- 7.1.4.23 Implement policies that minimize wildlife road mortality.
- 7.1.4.24 Implement protective measures to benefit urban-associated SGCN such as restricting human access, buffering sensitive areas with postings, noise and/or light restrictions in sensitive areas and/or during sensitive periods such as breeding, etc.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.3 Develop an outreach team of personnel from government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 8.1.0.4 Engage government agencies, conservation partners and other stakeholders in constructive dialogues encouraging them to influence policy change and the creation of incentives through a habitat bill and/or municipal ordinances for backyard habitat.
- 8.1.0.18 Engage NJDOT, NJ Transit Authority and other road management entities, wildlife conservation organizations/agencies (e.g., Division of Fish and Wildlife, New Jersey Conservation Foundation, Conserve Wildlife Foundation of NJ), and communities and citizens in discussions regarding the importance of and methods to enhance habitat connectivity, and work together to develop feasible strategies for ensuring that wildlife can disperse naturally and safely across roads and similar barriers to terrestrial and/or aquatic habitats.
- 8.1.0.19 Engage government agencies, conservation partners and other stakeholders to collaboratively develop a list of important projects, targeting SGCN and/or their habitat, as a guide for graduate student research. Distribute the list and contact information to all State colleges and universities.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Allegheny Woodrat

- 8.1.0.24 Engage government agencies, conservation partners and other stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.25 Provide technical support to public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.26 Coordinate across federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to woodland landowners to adopt or endorse consistent best management practices concerning controlled burns to maintain and/or improve forested habitat for wildlife.
- 8.1.0.30 Encourage government agencies and conservation partners to advise members of the relevant scientific community of the need for specific studies, reports or investigations targeting the data-deficiency regarding SGCN and/or their habitats.
- 8.1.0.34 Work with the NJ Education Association and Department of Education to design curriculum and outdoor experimental learning opportunities, and provide training to teachers on implementation of these activities.
- 8.1.0.37 Enlist landowners and NJ citizens in the protection of and survey efforts for SGCN, in particular rare species, by increasing enrollment in landowner incentives, forest stewardship, backyard habitat management and wildlife-related volunteer programs.
- 8.1.0.38 Engage partners, stakeholders and land managers in constructive dialogue promoting forest stewardship for SGCN that use core forests and forested corridors.
- 8.1.0.40 Encourage researchers, land managers, naturalists and enthusiasts to follow proper procedures for the coordination and/or permitting of research/management activities involving wildlife and sensitive habitats, and discourage activities that alter vegetation or wetlands, or cause harm or disturbance to wildlife.
- 8.1.0.44 Engage conservation partners, stakeholders, government agencies and other land stewards in constructive dialogues encouraging their inclusion of controlled burns in forest and other stewardship plans.
- 8.1.0.48 Form cooperative partnerships with transportation and shipment agencies and companies to facilitate habitat creation and enhancement away from and outside of project areas and to identify seasonal timing of activities that would minimize impacts to wildlife.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.8 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate recreationists and encourage landowners to eliminate garbage in the vicinity of suitable wildlife habitat, in particular SGCN habitat. Information should include the detrimental impacts garbage may have on various wildlife species.
- 8.3.0.10 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate landowners and NJ citizens on threats to fish and wildlife (including marine animals).
- 8.3.0.12 Promote awareness of WSFR (Wildlife and Sportfish Restoration) Outreach/Awareness grants, an important funding source for conservation among hunters and anglers as well as the general public.
- 8.3.0.13 Conduct an educational campaign to encourage observer ethics and respect for wildlife and natural habitat.

- 8.3.0.31 Develop an educational outreach program for landowners and citizens on the secondary impacts of rodenticides on predators and scavengers.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

- 9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and SGCN inhabiting them.
- 9.1.0.2 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.1.0.3 Develop a plan that directs the creation of impervious surfaces away from and to minimize impacts on aquatic systems and critical terrestrial habitats. The plan should also include strategies to increase the resiliency of aquatic and critical terrestrial habitats to threats and stressors that would impact the reproduction and survival of wildlife.
- 9.1.0.5 Develop a plan that directs the creation or expansion of energy or utility rights-of-way in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.15 Develop a plan to minimize fragmentation of terrestrial and aquatic habitats by roads.
- 9.1.0.16 Develop a plan to minimize new lawns and preserve natural vegetation within and adjacent to critical forest areas.
- 9.1.0.18 Develop a plan to minimize the effects of road widening and traffic volume increases within critical wildlife habitat areas using CHANJ products.
- 9.1.0.22 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 9.1.0.23 Develop a plan to mitigate the effects of transportation barriers by using CHANJ products.
- 9.1.0.27 Develop a plan to use wildlife-appropriate culverts in critical forested areas.
- 9.1.0.28 Develop and coordinate state, regional and local plans for suitable lot layout and landscaping to minimize human-wildlife conflicts that also incorporates habitat connectivity and preservation of natural areas.
- 9.1.0.30 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and other related threats associated with development.
- 9.1.0.33 Review the species, threats, action successes, and habitats, and work with partners to revise the 2017 State Wildlife Action Plan for the 2025 resubmittal.

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.2 Develop a management plan to improve the availability of prey/food resources for SGCN whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources.
- 9.3.1.3 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.1.4 Develop town plans that avoid impacts to SGCN species and their habitats.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need
Allegheny Woodrat

- 9.3.1.5 Develop response plans to address disease outbreaks within wildlife populations, in particular SGCN.
 - 9.3.1.7 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
 - 9.3.1.9 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
 - 9.3.1.10 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
 - 9.3.1.13 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
 - 9.3.1.14 Create species management plans that will promote the protection and where appropriate, the development of old-growth forest stands with large trees, in particular those within large, contiguous forest tracts.
- 9.3.2 Listed species recovery planning
 - 9.3.2.1 Develop proactive species recovery plans for all endangered and threatened species including guidance and objectives pertaining to critical and supporting habitat to meet and maintain recovery goals.
- 9.3.3 Habitat management planning
 - 9.3.3.1 Develop a management plan to improve the availability of prey/food resources for SGCN whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources.
 - 9.3.3.5 Develop a management plan using forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.
 - 9.3.3.6 Develop a management plan for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
 - 9.3.3.8 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
 - 9.3.3.10 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
 - 9.3.3.11 Develop town plans that avoid impacts to SGCN species and their habitats.
 - 9.3.3.15 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
 - 9.3.3.16 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.

Allegheny Woodrat

- 9.3.3.18 In cooperation with species and habitat experts, develop management plans for significant natural and/or unique communities, in particular those supporting SGCN, and provide the information to the landowners/managers (federal, state and local government agencies or non-government organization) for review and implementation.
- 9.3.3.19 Develop management plans for SGCN inhabiting permanently protected natural lands using available baseline and population trend data.
- 9.3.3.21 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
- 9.3.3.22 Create management plans to minimize and/or prevent wildlife road mortality that will incorporate wildlife passages in conjunction with barrier fencing and, where possible, seasonal closures. Aquatic-associated passages must avoid disturbance to the natural streambeds and riparian habitat, permit high volumes of water to flow freely, and provide adequate travel corridors for terrestrial wildlife, while maintaining stream flow for fish passage. Bridges that span rivers and streambeds and include floodplain habitat on either side of the span to provide travel corridors for terrestrial wildlife are preferred over culverts.
- 9.3.3.34 Include controlled burn prescriptions in forest and stewardship plans to improve wildlife habitat.
- 9.3.3.35 Incorporate habitat connectivity, preservation of natural areas, and the implementation of BMPs into state and local land-use policy environmental review process and energy development plans to minimize habitat fragmentation and related threats associated with solar farms and altered habitats.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

- 11.1.1.1 Use Biotics database and Landscape Project Mapping in regulatory reviews to ensure protection by applicable laws and regulations.
- 11.1.1.2 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
- 11.1.1.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.
- 11.1.1.5 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 11.1.1.7 Review proposed construction or other work projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.8 Review proposed research projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.10 Use CHANJ mapping in reviews of proposed energy, mining, transportation and utility service companies/agencies' projects to attempt to maintain habitat connectivity and reduce fragmentation, and identify potential impacts of the projects.

11.1.2 Review of proposed policies and plans

Allegheny Woodrat

- 11.1.2.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

- 11.2.0.3 Develop state, regional and local BMPs that focus on minimizing habitat fragmentation and human-wildlife conflicts associated with development. Make information available to land developers and private and public landowners for implementation.
- 11.2.0.4 Provide educational resources, training programs, and expert guidance to private and public landowners and land managers on the secondary impacts of rodenticides on predators and scavengers.
- 11.2.0.5 Provide educational resources, training programs, and expert guidance to private and public landowners and land managers on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.
- 11.2.0.7 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on the importance of maintaining habitat connectivity, minimizing fragmentation, and the use of CHANJ products to help them target areas for such planning.
- 11.2.0.8 Provide educational resources, training programs, and on-the-ground guidance to public and private landowners and land managers on habitat creation and enhancement strategies that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 11.2.0.9 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and private landowners about the importance of leaving vegetation in place, especially along riparian areas and wildlife movement corridors.
- 11.2.0.10 Provide technical support to private landowners, consultants, and land managers to create customized management plans based on location and SGCN.
- 11.2.0.16 Provide educational resources and technical support to public and private landowners and land managers to promote the protection of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.
- 11.2.0.23 Provide educational resources and technical support to public and private landowners and land managers of lands adjacent to SGCN habitats to promote the protection and/or enhancement of those adjacent habitats to increase the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and that connect conserved SGCN habitats.
- 11.2.0.25 Provide educational resources, training programs, and on-the-ground guidance to resource managers regarding the assessment of and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) related to residential and commercial development.
- 11.2.0.26 Make educational resources available to the public that encourage researchers to seek out guidance prior to finalizing proposals and submitting State permit applications to reduce potential impacts on sensitive species.

11.2.1 With individuals and groups involved in resource management decision making

- 11.2.1.2 Provide professional training and technical assistance tools (e.g., mapping, guidance documents, justification, etc.) to agencies/divisions/programs within and outside of the NJ DEP regarding the SWAP, and the conservation actions recommended therein to help facilitate SWAP implementation.

100 Law and Policy

100. Legislation

100.1.3 Sub-national Level

- 100.1.3.3 Initiate legislative action to establish an annual budgetary line item designating funds to support programs focused on long-term research and monitoring of wildlife diseases.

100.1.4 County and Local

- 100.1.4.2 Secure and increase the effective size of SGCN habitats and connect conserved SGCN habitats through local ordinances.
- 100.1.4.3 Expand the acreages and enhance the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN through local ordinances.
- 100.1.4.13 Encourage municipal laws regulating domestic pets that may predate on wildlife.
- 100.1.4.14 Adopt/pass local ordinances which require assessing and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 100.1.4.15 Incorporate habitat connectivity and the preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.

100.1.5 Scale Unspecified

- 100.1.5.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.

100. State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.5 Develop policies that will promote improved and secure habitat connections between conserved SGCN habitats.
- 100.3.0.6 Develop policies that will promote expanding acreages and enhancing the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 100.3.0.8 Develop policies and/or regulations with the objective of protecting significant natural and/or unique communities in perpetuity.
- 100.3.0.9 Secure mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.18 Develop policies for conserved lands that prohibit planting and supports the control of non-native vegetation and invasive, native vegetation.
- 100.3.0.20 Develop policies and/or regulations that prohibit the presence of managed cat colonies and trap, neuter and release programs in or near critical wildlife habitats.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need
Allegheny Woodrat

- 100.3.0.21 Develop policies that minimize wildlife road mortality through: 1) Requiring the integration of wildlife passages into all new and repaired roads, in particular those areas that will connect SGCN habitats, 2) Requiring current fish/wildlife passages be improved and maintained in perpetuity, 3) Supporting seasonal road closures, in particular for unimproved roads, 4) Supporting projects that work to improve connectivity of SGCN habitats such as land conservation through acquisition or other means.
- 100.3.0.31 Create or expand tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMPs.
- 100.3.0.32 Coordinate regulations across agencies to maximize availability of and enrollment in existing Forestry Stewardship Programs (e.g., "Woodland Stewards", Farm Bill, partners, etc.) to maintain and/or improve forest habitat.
- 100.3.0.36 Create legislation to limit the amount of plastic from shopping bags in circulation and re-instate incentives for citizens bringing their own shopping bag to grocery store.
- 100.3.0.41 Explore all State regulatory requirements for mitigation, restoration, habitat management, etc. to ensure they prohibit the use of specified invasive or other problematic plant species.
- 100.3.0.43 Identify and address (amend) regulatory impediments to beneficial habitat management.
- 100.3.0.44 Incorporate requirements for technical support and funding for mitigation or restoration efforts so as to be consistent with existing regulations.
- 100.3.0.45 Increase the controlled burn season to focus on restoring vegetative communities.
- 100.3.0.57 Develop regulations that when implemented will improve and secure habitat connections between conserved SGCN habitats.
- 100.3.0.58 Develop regulations that when implemented will promote the expansion of acreages and enhancement of the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 100.3.0.60 Develop regulations that when implemented will protect significant natural and/or unique communities in perpetuity.
- 100.3.0.69 Develop regulations that when implemented will minimize wildlife road mortality.
- 100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

100. State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).
- 100.4.0.2 Create a policy that requires the NJ DEP to incorporate scientific information regarding climate change and sea level rise (e.g., predictions, habitat management/acquisition efforts to enhance resilience to inundation) on their websites and to work with other government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Allegheny Woodrat

- 100.4.0.13 Develop policies for different circumstances (e.g., roadsides and medians, riparian, aquatic and terrestrial habitats) that outline appropriate habitat/vegetation management strategies and schedules to minimize risks to and benefit wildlife.
- 100.4.0.19 Develop regulations that will minimize the creation of new barriers, remove or replace current barriers with appropriately-sized systems to accommodate wildlife dispersal, and to minimize road widening and traffic volume increases within critical wildlife habitat areas.
- 100.4.0.25 Develop policies that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

Cave-hibernating Bats

Focal species that comprise this Conservation Target:

Indiana Bat

Little Brown Bat

Northern Myotis

Threats and Action Drivers associated with this Conservation Target:

1 **Residential and Commercial Development**

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale) (Avg. Score: 1.67)

NJ Specific Threats: 1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.1.1.2 Loss, alteration and/or degradation of habitat.

1.1.1.3 Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.

1.1.1.5 Impervious surfaces can lead to a decrease in water recharge.

1.1.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.1.2 Residential development using materials that cause collision hazards (Avg. Score: 1.00)

NJ Specific Threats: 1.1.2.1 Collision risk to volant species (birds, bats and invertebrates).

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale) (Avg. Score: 1.67)

NJ Specific Threats: 1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.2.1.2 Loss, alteration and/or degradation of habitat.

1.2.1.3 Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.

1.2.1.5 Impervious surfaces can lead to a decrease in water recharge.

1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.2.2 Commercial development using materials that cause collision hazards (Avg. Score: 1.00)

NJ Specific Threats: 1.2.2.1 Collision risk to volant species (birds, bats and invertebrates).

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale) (Avg. Score: 1.67)

NJ Specific Threats: 1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.3.1.2 Loss, alteration and/or degradation of habitat.

1.3.1.3 Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.

1.3.1.4 Impervious surfaces can lead to a decrease in water recharge.

1.3.1.5 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

Cave-hibernating Bats

2 **Agriculture and Aquaculture**

2.1 Annual and Perennial Crops (non-timber)

2.1.3 Agro-industry (Avg. Score: 1.00)

NJ Specific Threats: 2.1.3.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.3.2 Fragments terrestrial and aquatic habitats.

2.2 Wood and Pulp Plantations

2.2.1 Small Holder (Avg. Score: 1.00)

NJ Specific Threats: 2.2.1.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.

2.2.1.2 Tree harvesting can cause direct mortality to wildlife, especially if done during peak activity periods or vulnerable life stages (e.g., denning, nesting, gestation/birthing, basking, roosting, pre-volancy, etc.).

2.2.2 Agro-industry Plantations (Avg. Score: 1.00)

NJ Specific Threats: 2.2.2.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.

2.2.2.2 Tree harvesting can cause direct mortality to wildlife, especially if done during peak activity periods or vulnerable life stages (e.g., denning, nesting, gestation/birthing, basking, roosting, pre-volancy, etc.).

2.3 Livestock Farming and Ranching

2.3.2 Small-holder Grazing (Avg. Score: 1.00)

NJ Specific Threats: 2.3.2.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.

2.3.2.3 Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

2.3.3 Agro-industry Grazing (Avg. Score: 1.00)

NJ Specific Threats: 2.3.3.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.

2.3.3.3 Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

3 **Energy Production and Mining**

3.1 Oil and Gas Facilities and Pipelines

3.1.1 Distribution processes of petroleum and other liquid hydrocarbons (Avg. Score: 1.00)

NJ Specific Threats: 3.1.1.1 Fragments terrestrial and aquatic habitats.

3.1.1.2 Loss, alteration and/or degradation of habitat.

3.1.1.4 Increased noise pollution.

3.1.2 Natural gas distribution processes (Avg. Score: 1.00)

NJ Specific Threats: 3.1.2.1 Fragments terrestrial and aquatic habitats.

3.1.2.2 Loss, alteration and/or degradation of habitat.

3.1.2.4 Increased noise pollution.

3.2 Mining and Quarrying

3.2.2 Surface Mining - Rock Quarry (and sand quarries) (Avg. Score: 1.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Cave-hibernating Bats

NJ Specific Threats: 3.2.2.1 Fragments terrestrial and aquatic habitats.

3.2.2.2 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

3.3 Renewable Energy

3.3.1 Wind Power (Avg. Score: 1.00)

NJ Specific Threats: 3.3.1.1 Turbines, blades, and structure foundations create a collision risk to volant species (birds, bats and invertebrates) and marine animals.

3.3.1.2 Fragments terrestrial habitats.

3.3.1.3 Loss, alteration and/or degradation of habitat.

3.3.2 Solar Power (Avg. Score: 1.00)

NJ Specific Threats: 3.3.2.1 Fragments terrestrial habitats.

3.3.2.2 Loss, alteration and/or degradation of habitat.

3.4 Conventional Power Plants

3.4.0 Conventional Power Plants (Avg. Score: 1.00)

NJ Specific Threats: 3.4.0.2 Loss, alteration and/or degradation of habitat due to new or the expansion of current facilities.

4 Transportation and Service Corridors

4.1 Roads and Railroads

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale) (Avg. Score: 1.00)

NJ Specific Threats: 4.1.1.2 Loss, alteration and/or degradation of habitat associated with road and railroad construction and maintenance, and degradation of adjacent habitats.

4.1.1.3 Re-establishment of abandoned railroad lines may displace wildlife, in particular, less mobile species using the area to fulfill critical life history requirements.

4.1.1.4 Re-establishment of abandoned railroad lines may increase the risk of direct mortality on wildlife.

4.1.2 Movement of cars and other vehicles on roads and railroads (large and small scale) (Avg. Score: 1.00)

NJ Specific Threats: 4.1.2.1 Increased vehicle traffic increases the risk of wildlife mortality from strikes.

4.2 Utility and Service Lines

4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads (Avg. Score: 1.00)

NJ Specific Threats: 4.2.1.2 Loss, alteration and/or degradation of habitat associated with rights-of-way construction and maintenance, and degradation of adjacent habitats.

4.2.1.5 Tall radio and utility towers with guy lines pose a strike hazard for migrant bats and birds, especially in poor visibility conditions (e.g., fog, nighttime, poor weather conditions).

4.2.2 Management of rights-of-way or communication tower facilities and/or their associated access roads (Avg. Score: 1.00)

NJ Specific Threats: 4.2.2.1 Improper or poorly scheduled vegetation management can cause direct mortality to and may reduce productivity of wildlife.

4.4 Flight Paths

4.4.1 Airplane flight paths (Avg. Score: 1.00)

NJ Specific Threats: 4.4.1.2 Increased risk of collision between airplanes and birds, bats and insects.

Cave-hibernating Bats

5 Biological Resource Use

5.1 Hunting and Collecting Terrestrial Animals

5.1.3 Persecution/Control (Avg. Score: 2.00)

NJ Specific Threats: 5.1.3.1 Wanton killing of perceived dangerous and/or undesirable animals.

5.1.3.2 Improper exclusion methods and/or timing can result in injury, death, or entrapment of bats in buildings.

5.3 Logging and Wood Harvesting

5.3.1 Intentional Use (subsistence/small scale) (Avg. Score: 1.00)

NJ Specific Threats: 5.3.1.1 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may fragment their terrestrial habitats.

5.3.1.2 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may cause the loss, alteration and/or degradation of wildlife habitat.

5.3.1.5 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may decrease structural diversity and biomass leading to reduced biodiversity and ecological integrity.

5.3.1.6 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices in Atlantic White Cedar stands may destroy a unique wildlife wetland habitat that is difficult, and takes time, to restore.

5.3.2 Intentional Use (large scale) (Avg. Score: 1.67)

NJ Specific Threats: 5.3.2.1 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may fragment their terrestrial habitats.

5.3.2.2 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may cause the loss, alteration and/or degradation of wildlife habitat.

5.3.2.5 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may decrease structural diversity and biomass leading to reduced biodiversity and ecological integrity.

5.3.2.6 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices in Atlantic White Cedar stands may destroy a unique wildlife wetland habitat that is difficult, and takes time, to restore.

5.3.3 Unintentional effects (subsistence/small scale) (Avg. Score: 1.00)

NJ Specific Threats: 5.3.3.1 Direct mortality of wildlife, direct loss of suitable habitats (roost, foraging, shelter, etc.), and can disrupt sensitive species, decreasing the likelihood of success and/or reproduction.

5.3.4 Unintentional effects (large scale) (Avg. Score: 1.00)

NJ Specific Threats: 5.3.4.1 Direct mortality of wildlife, direct loss of suitable habitats (roost, foraging, shelter, etc.), and can disrupt sensitive species, decreasing the likelihood of success and/or reproduction.

6 Human Intrusions and Disturbance

6.1 Recreational Activities

6.1.1 Off-road vehicles (motorized and non-motorized) (Avg. Score: 1.00)

NJ Specific Threats: 6.1.1.2 Inappropriate use of off-road vehicles can degrade terrestrial and aquatic habitat and reduce the suitability of adjacent habitats for wildlife.

6.1.1.3 Increased risk of harassment that results in a change in wildlife behavior and/or direct mortality from vehicle strikes.

6.1.1.4 Increased noise pollution.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Cave-hibernating Bats

6.1.4 Exploration of caves/mines (Avg. Score: 2.00)

- NJ Specific Threats:** 6.1.4.1 Poses significant threats to cave-hibernating bats as such activity forces bats to arouse from hibernation, depleting critical fat reserves needed to survive the winter.
- 6.1.4.2 Vandalism to mines and caves supporting colonies of wintering bats can lead to large-scale mortality during hibernation, and long-term habitat loss, reducing available hibernation sites, if damage goes unrepaired or uncontrolled.
- 6.1.4.3 Participants may introduce wildlife diseases when gear and apparel are not properly sanitized between sites.

6.1.7 Other (Avg. Score: 1.00)

- NJ Specific Threats:** 6.1.7.1 Use of recreational or commercial pyrotechnics may cause temporary disturbance to wildlife, in particular to nesting birds.

6.2 Military Exercises

6.2.1 Military exercises (Avg. Score: 1.00)

- NJ Specific Threats:** 6.2.1.1 Military testing and training exercises may inflict disturbance and potential physical harm to wildlife.

6.3 Work and Other Activities

6.3.1 Unauthorized research projects at significant habitats (Avg. Score: 1.00)

- NJ Specific Threats:** 6.3.1.1 Participants may introduce wildlife diseases and invasive plant species when gear and apparel is not properly sanitized between sites.
- 6.3.1.3 Activities conducted without proper precautions may disturb and disrupt normal wildlife behaviors, which may impact reproductive success or survival, cause abandonment of critical sites, etc.

6.3.2 Authorized research projects at significant habitats (Avg. Score: 1.00)

- NJ Specific Threats:** 6.3.2.2 Participants may introduce wildlife diseases and invasive plant species when gear and apparel is not properly sanitized between sites.
- 6.3.2.4 Activities conducted without proper precautions may disturb and disrupt normal wildlife behaviors, which may impact reproductive success or survival, cause abandonment of critical sites, etc.

6.3.3 Other "work" unrelated to research (Avg. Score: 1.00)

- NJ Specific Threats:** 6.3.3.1 Construction projects may disrupt normal wildlife behavior which can result in reduced reproductive success or survival, abandonment of critical sites, etc. (e.g., bridge-nesting birds).
- 6.3.3.4 Workers may introduce wildlife diseases and invasive plant species when gear and apparel is not properly sanitized between sites.

7 Natural Systems Modifications

7.1 Fire and Fire Suppression

7.1.1 Increase in Fire Frequency/Intensity (Avg. Score: 1.00)

- NJ Specific Threats:** 7.1.1.1 Increase in frequency and intensity of wild fires as a result of droughts and heat waves drying out vegetation and litter.
- 7.1.1.2 Increase in frequency of wild fires as a result of illegal activities.
- 7.1.1.3 Unnatural fire regimes occurring as a result of military exercises.
- 7.1.1.4 Lack of diversity in age structure and composition of vegetation due to expansive, frequent fires.

7.1.2 Suppression of Fire Frequency/Intensity (Avg. Score: 1.00)

- NJ Specific Threats:** 7.1.2.1 Shift in vegetative communities as a result of suppression of natural fires.
- 7.1.2.2 Lack of diversity in age structure and composition of vegetation due to the suppression of fire.

Cave-hibernating Bats

7.2 Dams and Water Management/Use

7.2.5 Abstraction of Ground Water (domestic use) (Avg. Score: 1.00)

NJ Specific Threats: 7.2.5.1 Heavy withdrawal of ground water for domestic use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.6 Abstraction of Ground Water (commercial use) (Avg. Score: 1.00)

NJ Specific Threats: 7.2.6.1 Heavy withdrawal of ground water for industrial and commercial use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.7 Abstraction of Ground Water (agricultural use) (Avg. Score: 1.00)

NJ Specific Threats: 7.2.7.1 Heavy withdrawal of ground water for agricultural use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.10 Large Dams (Avg. Score: 1.67)

NJ Specific Threats: 7.2.10.1 Alter the physical, chemical and biological stream environment, causing changes in substrate composition, flow rates, dissolved oxygen, and water temperatures.

7.2.11 Dams (size unknown) (Avg. Score: 1.00)

NJ Specific Threats: 7.2.11.1 Alter the physical, chemical and biological stream environment, causing changes in substrate composition, flow rates, dissolved oxygen, and water temperatures.

7.2.13 Stream Burial (Avg. Score: 1.00)

NJ Specific Threats: 7.2.13.1 Eliminates riparian habitats.

7.2.13.2 Eliminates in-stream habitat and water resources for wildlife.

7.3 Other Ecosystem Modifications

7.3.4 Lack of natural disturbance patterns or ecosystem functions due to species loss (Avg. Score: 1.00)

NJ Specific Threats: 7.3.4.5 The lack of forest disturbance minimizes the diversity of herbaceous vegetation and other shrubs and trees that need a lot of sunlight to grow.

7.3.5 Poor habitat management (Avg. Score: 1.00)

NJ Specific Threats: 7.3.5.3 Vegetation clearing removes terrestrial and riparian corridors for animal movement, shelter, and resting areas.

7.3.5.6 Habitat management, including that which occurs on public and private lands, that does not consider timing and species' behaviors can result in the direct mortality and/or alteration or loss of habitat.

7.3.5.10 Ditching, draining and filling of marshes and wetlands eliminates habitat and degrades the remaining surrounding areas for wildlife.

7.3.5.12 Lack of diversity in age structure and composition of vegetation due to lack of natural disturbances and/or vegetation management.

7.3.5.14 Intentional felling and removal of dead standing trees or snags eliminates resting, nesting or feeding habitat, and precludes the snags eventual contribution to coarse woody debris and forest floor structure and habitat.

7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.

8 Invasive and Other Problematic Species, Genes and Diseases

8.1 Invasive Non-native/ Alien Species/ Diseases

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Cave-hibernating Bats

8.1.5 Invasive non-native terrestrial/wetland plants (Avg. Score: 1.00)

NJ Specific Threats: 8.1.5.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.1.6 Invasive non-native fungal/bacterial diseases (Avg. Score: 3.00)

NJ Specific Threats: 8.1.6.1 The introduction of non-native fungal and bacterial diseases threatens native populations and ecosystems.

8.2 Problematic Native Species/Diseases

8.2.1 Unspecified Species (Avg. Score: 1.00)

NJ Specific Threats: 8.2.1.2 Invasive pathogens and insects may increase in range and abundance as limiting factors (such as temperature) are altered as a result of climate change.

8.5 Viral/Prion-induced Diseases

8.5.2 Named Species (Disease) (Avg. Score: 1.00)

NJ Specific Threats: 8.5.2.1 Diseases such as West Nile Virus, arenavirus, sudden oak death, Avian Influenza, and snake fungal disease cause morbidity or mortality to native populations.

8.6 Diseases of Unknown Cause

8.6.0 Unknown Diseases (Avg. Score: 1.00)

NJ Specific Threats: 8.6.0.1 Diseases yet to be identified by pathologists and virologists cause decreased fitness or mortality to native populations.

9 Pollution

9.1 Domestic and Urban Waste Water

9.1.2 Run-off (Avg. Score: 1.00)

NJ Specific Threats: 9.1.2.2 Contaminants degrade aquatic and marine water quality and can bioaccumulate in benthic organisms, threatening wildlife by causing developmental and behavioral abnormalities and reproductive failure.

9.2 Industrial and Military Effluents

9.2.1 Oil Spills (Avg. Score: 1.00)

NJ Specific Threats: 9.2.1.1 Oil spills render resting, breeding and foraging habitats temporarily unavailable to wildlife, altering normal wildlife behavior.

9.2.1.2 Oil spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.

9.2.1.3 Oil spills cause external oiling of wildlife and ingestion of oil, both of which can injure or kill wildlife.

9.2.2 Seepage from Mining (Avg. Score: 1.00)

NJ Specific Threats: 9.2.2.1 Contaminants from mining degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.

9.2.3 Other (Avg. Score: 1.00)

NJ Specific Threats: 9.2.3.1 Point and nonpoint source pollution such as polychlorinated biphenyls (PCBs), pesticides, heavy metals, and endocrine disrupting compounds (EDC's) into freshwater and marine systems pose threats to wildlife through direct contact and/or ingestion, and to aquatic species and their predators through bioaccumulation, impacting the reproductive success and neurological function of many avian and fish species.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Cave-hibernating Bats

9.2.3.2 Chemical spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.

9.2.4 Other: Hydrofracturing (Avg. Score: 1.00)

NJ Specific Threats: 9.2.4.1 Contaminants from hydrofracturing degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.

9.2.4.2 Uncontrolled effluents escaping from hydrofracturing facilities can cause injury to wildlife and alter normal behaviors.

9.2.5 Other: Industrial toxic settling ponds (Avg. Score: 1.00)

NJ Specific Threats: 9.2.5.1 Surficial or open industrial effluent ponds can cause injury or death to wildlife that become exposed through ingestion or submersion.

9.3 Agricultural and Forestry Effluents

9.3.3 Herbicides and Pesticides (Avg. Score: 1.00)

NJ Specific Threats: 9.3.3.3 Use of pesticides can directly harm non-target species through direct contact and/or by reducing and/or contaminating their food supply.

9.3.5 Control of insect pests and plants leading to mortality of non-target species not associated with agriculture (Avg. Score: 1.00)

NJ Specific Threats: 9.3.5.4 Improper use of current insecticides, such as those containing esfenvalerate, prallethrin, or piperonyl butoxide, or past use of pesticides containing chlordane still present in the soils, are toxic to various wildlife species, and can cause injury, mortality, or other effects that impair population viability.

9.3.5.5 Use of pesticides and herbicides can minimize the abundance of food sources for native wildlife populations.

9.5 Air-Bourne Pollutants

9.5.6 Herbicides and Pesticides (Avg. Score: 1.00)

NJ Specific Threats: 9.5.6.1 May result in injury or direct mortality of non-target species.

9.6 Excess Energy

9.6.1 Light Pollution (Avg. Score: 1.00)

NJ Specific Threats: 9.6.1.1 Artificial lighting can reduce suitability of adjacent habitat for species sensitive to artificial lights by disorienting wildlife, reducing foraging suitability or success, or increasing visibility to predators, resulting in reduced diversity and/or productivity of species in adjacent habitat.

9.6.3 Noise Pollution (Avg. Score: 1.00)

NJ Specific Threats: 9.6.3.1 Acute and chronic noise pollution in and adjacent to terrestrial and aquatic (marine and freshwater) environments could disrupt normal behaviors of wildlife such as migration, communication, feeding, eluding predators, resting and breeding, etc.

11 Climate Change and Severe Weather

11.1 Habitat Shifting or Alteration

11.1.0 Macro- and Micro-Climate Alterations (Avg. Score: 1.00)

NJ Specific Threats: 11.1.0.1 Alters native terrestrial and aquatic habitats at the macro- and micro-climate levels that can affect suitability for wildlife, in particular specialist species.

11.2 Droughts

11.2.1 Droughts (Avg. Score: 1.00)

NJ Specific Threats: 11.2.1.1 Contribute to hardened soils, decreasing water recharge during rains and increasing the likelihood of flash floods during storms.

Cave-hibernating Bats

11.2.1.2 Lead to lower groundwater levels and therefore, less available water for people and habitats.

11.3 Temperature Extremes

11.3.1 Temperature extremes (Avg. Score: 1.00)

NJ Specific Threats: 11.3.1.2 Increased temperatures can negatively impact wetland, riverine, lacustrine and vernal pool-associated or -dependent wildlife by reducing flows, increasing water temperatures, lowering water levels and causing premature drying of vernal habitats.

11.3.1.4 Extremely low temperatures and/or extensive periods of unseasonably low temperatures during critical life history stages (e.g., hibernation, gestation/nesting) can alter animals' behaviors and decrease survivorship.

11.4 Storms and Flooding

11.4.2 Increased rainfall (Avg. Score: 1.00)

NJ Specific Threats: 11.4.2.2 Extreme rain events can damage wildlife nesting and resting habitats, including impacts to avian eggs and chick and small mammal survivorship.

11.6 Phenology Shifting or Alteration

11.6.2 Phenology shifts related to predator-prey ecology (Avg. Score: 1.00)

NJ Specific Threats: 11.6.2.2 Shifts timing of species migration, breeding and hibernation, and available food resources, causes redistribution of species, or mortality for species that are unable to relocate due to their already isolated habitat or limited mobility.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory (Avg. Score: 2.00)

NJ Specific Threats: 12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.1.2 Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.

12.1.2 Lack of up-to-date existing information (Avg. Score: 2.00)

NJ Specific Threats: 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

12.1.2.2 Lack of wildlife monitoring at sites with structures that pose high risk of mortality to SGCN wildlife.

12.1.3 Need to answer research question (Avg. Score: 3.00)

NJ Specific Threats: 12.1.3.1 There are significant knowledge gaps regarding distribution, dispersal, diseases, population trends, etc. of SGCN.

12.1.3.2 There is an urgent need to answer questions about the future vulnerability or resiliency of NJ's cave-hibernating bats to White-nose Syndrome, and about the potential for an effective treatment to the disease.

12.1.4 Need to develop new technique (Avg. Score: 2.00)

NJ Specific Threats: 12.1.4.1 Improve and evaluate survey methods for SGCN and their habitats; alter as needed.

12.1.4.2 Improve and evaluate survey methods for species not easily detected through standard survey methods.

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms (Avg. Score: 2.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Cave-hibernating Bats

- NJ Specific Threats:** 12.3.0.1 Regulatory habitat protections within state land use regulations are spatially limited to specific geographic areas (e.g., Pinelands, Coastal Area) or geographic features (e.g., wetlands, streams) and so fail to protect critical habitats that exist outside of these regulated areas.
- 12.3.0.3 Lack of a licensing program and standards for NJ Nuisance Wildlife Control Operators (NWCs) leads to inadequate controls over handling of wildlife and lack of reporting of non-game/SGCN species (and all wildlife) encountered in nuisance situations.
- 12.3.0.7 Activities that threaten SGCN, their food sources, and/or habitats are often regulated separately and without consideration for the cumulative and synergistic effects over time or over a larger spatial scale. Therefore, regulations can fail to protect SGCN populations over time.
- 12.3.0.10 Land use regulatory processes pertaining to habitat creation, enhancement or restoration projects can be costly and/or burdensome, precluding or discouraging the development or implementation of conservation projects.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform

(Avg. Score: 1.00)

- NJ Specific Threats:** 12.4.0.1 A species-by-species management focus as opposed to ecological systems and biodiversity generally has greater opportunity for unintended consequences for other species and may be less efficient in developing appropriate management actions.
- 12.4.0.2 Policies and procedures for lands management that lack consideration of the impacts of activity timing can result in unintended impacts to wildlife during vulnerable periods.
- 12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats

(Avg. Score: 2.00)

- NJ Specific Threats:** 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.
- 14.1.1.2 Lack of general knowledge of SGCN life histories and vulnerabilities as they relate to land management practices.
- 14.1.1.3 Lack of understanding of the need to manage both natural and anthropogenic (e.g., yards, lawns, hayfields, etc.) habitats to minimize impacts or increase benefits to SGCN and their habitats.

14.2 Outreach needs

14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions

(Avg. Score: 1.00)

- NJ Specific Threats:** 14.2.1.1 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various forest management practices.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

(Avg. Score: 1.00)

- NJ Specific Threats:** 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Actions to address the Threats and Action Drivers associated with this Conservation Target:

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.2** Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to increase the effective size of SGCN habitats by protecting/restoring adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats.
- 1.2.1.4** Secure and promote the protection, restoration, and/or development of old-growth forest stands with large trees, in particular those within large, contiguous forest tracts through incentive programs.
- 1.2.1.6** Secure and promote the protection/restoration of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers through incentive programs.
- 1.2.1.8** Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to municipalities, land developers, and other land managers to retain and/or enhance native vegetation adjacent to aquatic habitats, and along riparian areas and wildlife movement corridors.
- 1.2.1.9** Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing Forestry Stewardship Programs.
- 1.2.1.10** Coordinate across government agencies and non-government organizations to maximize the availability of and enrollment in existing landowner incentive programs (e.g., "farm bill," partners, etc.) to maintain and/or improve habitat.
- 1.2.1.11** Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 1.2.1.12** Create incentives (non-monetary and/or monetary) for land developers to redevelop abandoned areas (e.g., shopping centers, office complexes) to minimize the loss of natural habitats and reduce the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 1.2.1.13** Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to land developers to minimize the impacts of new residential and commercial developments on SGCN and their habitats.
- 1.2.1.14** Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of herbicides and pesticides, and implementing more ecologically safe strategies when using such products.

Cave-hibernating Bats

- 1.2.1.19 Create incentives for federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to farmers, woodland landowners, and private landowners to adopt and/or endorse consistent BMPs concerning controlled burns to maintain and/or improve wildlife habitat.
- 1.2.1.20 Coordinate across government agencies and non-government organizations to create or expand upon tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMP's.
- 1.2.1.21 Create and/or support market-based programs that subsidize or create branding for products derived sustainably from managed wildlife habitats.
- 1.2.1.23 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to provide cost shares and/or plan approvals for management based on management approaches and prescriptions.
- 1.2.1.26 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing landowner incentive programs.
- 1.2.1.28 Create incentives to implement dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.

2 Direct Management of Natural Resources

2.3 Fire management

2.3.3 Prescribed burning

- 2.3.3.1 Evaluate different management techniques of prescribed burns that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 2.3.3.2 Conduct prescribed burning in Northern New Jersey forests to maintain and regenerate a mosaic of upland forest habitats.
- 2.3.3.3 Conduct prescribed burning to improve wildlife habitat.

2.4 Fish and wildlife habitat structures

2.4.2 Hibernacula

- 2.4.2.1 Investigate the need to stabilize important bat hibernacula to ensure structural soundness and install the necessary supports.

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

- 2.10.0.3 Restore and/or enhance habitats to benefit urban-associated SGCN.
- 2.10.0.4 Restore and/or enhance suitable travel corridors connecting conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats.
- 2.10.0.5 Implement habitat restoration and/or enhancement activities that include the creation of vegetative buffers between sensitive habitats (e.g., aquatic systems) and human-inhabited areas (e.g., residences, parks, etc.) and that is conducted during appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity
- 2.10.0.6 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats.

Cave-hibernating Bats

- 2.10.0.7 Restore/reclaim and enhance degraded rare species habitats through strategic revegetation and management efforts for documented/target SGCN.
- 2.10.0.9 Restore and/or enhance riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation, alteration and/or changes in hydrology and subsequent disturbances to and behavioral changes of wildlife (e.g., restoring biologically appropriate buffers, revegetation or restoration efforts, etc.).
- 2.10.0.11 Restore and/or enhance critical migratory terrestrial and aquatic habitats (e.g., beach, grasslands, forest, scrub-shrub, etc.) for songbirds, raptors, shorebirds, waterfowl, bats and invertebrates through habitat restoration efforts and expand habitat restoration to adjacent private lands to increase the effective size of the habitat.
- 2.10.0.14 Implement best management practices (BMPs), protective strategies and guidelines for restoring and enhancing healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.10.0.22 Restore and/or enhance terrestrial and aquatic habitats to promote the regeneration of native vegetation and enhance structural diversity to benefit SGCN (e.g., vegetative buffers of aquatic systems, allow coarse, woody debris to remain in terrestrial, aquatic and riparian habitats to provide shelter, riparian stabilization and necessary microclimates, plant native trees, shrubs and grasses, etc.).
- 2.10.0.23 Restore and/or enhance roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.
- 2.10.0.24 Use NJ's CHANJ mapping and guidance to establish vegetation and enhance or create corridors between fragmented habitats with similar vegetation, slope, soils, structure, etc. to ensure vegetative integrity is maintained to allow wildlife to safely disperse, and corridors are buffered with natural habitats to minimize disturbance to wildlife within the corridors.

2.11 Vegetation management

- 2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration
 - 2.11.0.4 Implement vegetation management strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife, particularly SGCN.
 - 2.11.0.13 Implement best management practices (BMPs), protective strategies, and guidelines for vegetation management to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
 - 2.11.0.18 Implement forest management/silvicultural strategies that promote the development of new old-growth forests and/or minimize the loss of old-growth forest stands with large trees and within large, contiguous tracts.
 - 2.11.0.19 Implement forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN.

Cave-hibernating Bats

- 2.11.0.21 Minimize the degradation, alteration and/or changes in hydrology of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) and subsequent disturbances to and behavioral changes of wildlife by maintaining or enhancing these areas and biologically appropriate buffers through habitat management and/or revegetation or restoration efforts.
- 2.11.0.24 Conduct vegetation management adjacent to aquatic habitats following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.25 Conduct vegetation management along access roads following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.28 Conduct vegetation management in agricultural areas following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.29 Conduct vegetation management on transportation and service corridors (i.e., rights-of-way) following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.32 Increase structural habitat diversity around and when feasible, within agricultural landscapes by managing vegetation for a variety of species, in particular, those farms that have removed scrub-shrub habitat and/or fragmented forests, and by implementing ecologically best practices (e.g., no-till farming, maintaining hedgerows, buffer set-asides, etc.).
- 2.11.0.34 Increase structural habitat diversity by managing residential, commercial and recreational areas' landscapes for a variety of species. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.35 Increase structural habitat diversity by managing vegetation adjacent to aquatic habitats in a manner that provides a buffer from runoff and erosion and a microclimate to stabilize seasonal temperatures to benefit a variety of aquatic and semi-aquatic species.
- 2.11.0.36 Increase structural habitat diversity by managing vegetation for a variety of species and considering their life history requirements (e.g., travel corridors, shelter, resting and breeding areas) to minimize the risk of harm.
- 2.11.0.38 Increase structural habitat diversity in and around horse/livestock farms by managing vegetation for a variety of species, in particular, in and around farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 2.11.0.40 Increase structural habitat diversity surrounding areas used for energy, mining, and transportation and service corridors by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides, and avoid managing habitat during the breeding seasons for ground-nesting birds, reptiles, amphibians and small mammals.
- 2.11.0.41 Increase structural habitat diversity through the implementation of a variety of vegetation management practices such as prescribed burns (either increasing or decreasing their frequency depending on the site and objective), plantings, etc. that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.

Cave-hibernating Bats

- 2.11.0.43 Manage forests to increase variation in age structure and composition using BMPs that promote and maintain functioning ecological forest-based systems and biological diversity.

2.12 Water management

2.12.1 Ditch plugs

- 2.12.1.1 Implement best management practices (BMPs), protective strategies, and guidelines for ditch plugging to maintain and enhance healthy, resident and migratory SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

2.12.3 Drainage

- 2.12.3.4 Expand the acreages and enhance the effective size of SGCN habitats by reclaiming/restoring adjacent, degraded habitats by removing tile drains and drainage ditches.
- 2.12.3.9 Implement drain removal on state and other conservation lands to enhance food availability for migratory species (birds, bats, invertebrates).
- 2.12.3.10 Use tile drain and drainage ditch removal to create feeding and roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.
- 2.12.3.11 Implement best management practices (BMPs), protective strategies, and guidelines when removing tile drains and drainage ditches to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

2.12.7 Waterfowl impoundment maintenance

- 2.12.7.3 Implement best management practices (BMPs), protective strategies, and guidelines for impoundment management to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

2.13 Wildlife damage management

2.13.0 Nuisance fish and wildlife damage

- 2.13.0.1 Investigate the impacts of mosquito control methods on predator SGCN (bats, insectivorous birds). Develop, implement and evaluate the effectiveness of mosquito control-BMPs designed to avoid depletion or contamination of SGCN's insect prey base and drinking sources with pyrethroids, organophosphates, or other chemicals.

2.14 Wildlife disease management

2.14.0 Wildlife disease strategy development and investigation

- 2.14.0.1 Investigate diseases/pathogens impacting SGCN and/or their habitats.
- 2.14.0.2 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
- 2.14.0.3 Protect SGCN from exotic pathogen introduction or incident through implementation of a "rapid response plan"; DFW to give priority attention to these species in planning and/or implementing a response.

Cave-hibernating Bats

- 2.14.0.4 Conduct long-term monitoring of diseases in vulnerable wildlife to determine the magnitude of exposure within populations and around the State, the impacts to those species, in particular SGCN, and investigate the feasibility of mitigating for such impacts.
- 2.14.0.5 Assess the impacts of diseases on the life cycles of wildlife.

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

- 3.0.0.1 Conduct long-term monitoring of resident and migratory SGCN populations using standardized survey protocols to determine the variables that may impact their long-term persistence in the State (e.g., population viability, distribution, dispersal, home range and habitat use, travel corridors, food availability, vulnerability to pollutants and disease, etc.). Compile this information to determine the likely causes of population declines and to understand metapopulation dynamics. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.2 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) where data gaps exist regarding SGCN distribution, and their critical and supportive habitats. Conduct surveys using standardized survey protocols to acquire baseline data, and provide the data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
- 3.0.0.3 Gather baseline data on SGCN inhabiting permanently protected natural lands regarding their distribution and population (e.g., abundance, dispersal, demography including productivity and survival, etc.), and identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) critical and supporting habitats within those landscapes.
- 3.0.0.4 Conduct long-term studies on SGCN inhabiting permanently protected natural lands to develop population trend data and changes in demography, and to determine if critical and/or supporting habitats are limited or changing; i.e., diminishing in value, acreage or connectivity.
- 3.0.0.5 Gather baseline data on resident and migratory SGCN (in particular migratory species for which New Jersey habitats are significant), terrestrial, freshwater and marine species, regarding the location and condition of their critical and supporting habitats (e.g., foraging, roosting, nesting/breeding, stopover, migration paths, etc.), and population demography (e.g., productivity, survival, dispersal). Compile this information into a database that includes descriptions of the conditions of the habitats and species, and a GIS component of the locations of these important habitats. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.6 Conduct long-term studies on resident and migratory SGCN to determine if there are changes to the populations' demography (productivity, survival, dispersal) and/or to their critical and/or supporting habitats (i.e., diminishing in value, acreage or connectivity, etc.), in particular changes that would not maintain SGCN at viable levels for species populations. Update data and GIS maps; provide updated information to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.7 Collect baseline data to document species distributions, in particular SGCN, and current habitat for future analysis of possible distribution shifting as a result of habitat shifting or alteration associated with climate change impacts.
- 3.0.0.8 Conduct long-term studies and compare baseline metrics of documented species distributions and associated habitats to identify possible species and/or habitat shifting or alteration associated with climate change impacts.

Cave-hibernating Bats

- 3.0.0.11 Develop, implement and evaluate the effectiveness of town plans that avoid impacts to SGCN species and their habitats.
- 3.0.0.12 Compile available life history information on urban-associated SGCN (e.g., predators, levels of nest/young depredation, breeding longevity and reproductive effort over time, preferred nesting/reproductive requirements, fidelity to breeding and wintering sites, comprehensive assessment of migration routes and destinations) for future development of management strategies to benefit such species.
- 3.0.0.13 Investigate the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats. Evaluate and modify management practices as appropriate.
- 3.0.0.24 Identify (through aerial and topographic maps), and confirm through field surveys, potential vernal pools using standard protocols. Provide confirmed vernal pool locations (and when possible, a description of the pools condition) and species' presence data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.26 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species including objectives and guidance pertaining to and the condition/status of critical and supporting habitats.
- 3.0.0.27 Evaluate the effectiveness of strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals through research and monitoring. Develop and provide NJ DEP and other appropriate governing agencies/commissions a summary of findings and recommendations to improve such efforts.
- 3.0.0.30 Conduct research to investigate the feasibility of managing and/or creating roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.
- 3.0.0.31 Conduct short- and long-term studies (e.g., wildlife surveys and habitat assessments) to evaluate the effectiveness of vegetation management efforts to maintain, enhance and/or create roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.1 Division of Fish and Wildlife should maintain a robust, up-to-date database and mapping of species occurrences.
- 3.2.0.2 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
- 3.2.0.4 Conduct long-term monitoring of the impacts of contaminants to vulnerable wildlife to determine the magnitude of exposure within populations and around the State, the impacts to those species, in particular SGCN, and investigate the feasibility of mitigating for such impacts. Maintain records on exposure of vulnerable wildlife to environmental toxins (such as flame retardants and endocrine disruptors), so that sources may be identified and controlled or eliminated.
- 3.2.0.7 Track (via a database that includes a GIS component) and research problematic species and diseases to determine their distribution, impacts on SGCN wildlife/wildlife communities, and develop potential control measures.

Cave-hibernating Bats

- 3.2.0.8 Implement and conduct long-term monitoring of control measures aimed at minimizing the impacts of problematic species and/or diseases to evaluate the effectiveness of such efforts and to identify and incorporate additional strategies as appropriate.
 - 3.2.0.9 Maintain an inventory of invasive insect distribution and where they exist, conduct long-term monitoring of habitat conditions to assist in developing strategies to combat the impacts to SGCN habitats. Report potential infestations to NJ DEP.
 - 3.2.0.10 Evaluate the effectiveness of sanitation/decontamination protocols in minimizing the transference of wildlife diseases and invasive plant species.
 - 3.2.0.12 Investigate the impacts of ORV use and ORV-created noise on terrestrial and aquatic wildlife behavior and the impact of direct mortality from vehicle strikes. Integrate this information when mapping undeveloped roads and trails to identify potentially sensitive areas in northern NJ forests.
 - 3.2.0.17 Conduct monitoring at constructed wind farms (within or outside of NJ) to assess the impacts on migratory species (birds, bats, insects) and determine if NJ's land use planning efforts and/or smart-growth plans need to be revised.
 - 3.2.0.25 Conduct short- and long-term evaluations of structural stabilization strategies implemented at bat hibernacula and identify needed improvements to ensure structural soundness and of the potential impacts on bat hibernacula (i.e., the bats and internal conditions) when hibernacula are gated.
 - 3.2.1 Abundance determination
 - 3.2.1.1 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) population abundance and trends for SGCN using standardized survey protocols. Provide data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
 - 3.2.1.2 Conduct wildlife surveys on resident and migratory SGCN regarding their population abundance and trends.
 - 3.2.2 Age, size and sex structure
 - 3.2.2.1 Conduct wildlife surveys on resident and migratory SGCN regarding their survivorship.
 - 3.2.3 Baseline inventory
 - 3.2.3.8 Investigate the need to stabilize important bat hibernacula (e.g., structural soundness) and install the necessary supports.
 - 3.2.7 Population assessment
 - 3.2.7.1 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
 - 3.2.7.2 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species to meet and maintain recovery goals.
- 3.3 Research, survey or monitoring - habitat
 - 3.3.1 Baseline inventory

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Cave-hibernating Bats

- 3.3.1.1 Conduct habitat assessments of significant natural and/or unique communities to identify threats to native terrestrial and aquatic habitats through systematic monitoring, review of available data, enlistment of habitat management and/or species experts, etc. Incorporate findings into a database that includes descriptions/qualifiers of the habitats, identifies and values/qualifies the threats, and includes a GIS component of the locations of the assessed areas. Share this information with landowners/managers (e.g., federal, state and local government agencies or non-government organization).
- 3.3.1.2 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) resident and migratory SGCN habitats. Investigate their suitability for the various life history requirements of the species that dependent upon them to determine the ability for maintaining applicable SGCN populations in perpetuity.
- 3.3.1.4 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and investigate the suitability of corridors that connect large, contiguous tracts of similar habitats to increase their effective size (i.e., forest with forest, grassland with grassland, wetlands with wetlands, etc.) for dependent SGCN.
- 3.3.1.5 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) where habitat restoration and/or enhancement would benefit wildlife SGCN.
- 3.3.1.6 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) that could, through revegetation and/or enhancement efforts, become suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN.
- 3.3.1.14 Compile information (obtained through literature reviews, communication with other States along the Atlantic coast, academia, etc.) regarding the impacts of above water operation of wind turbines on migratory marine birds and bats. Provide data to appropriate governing agencies and/or State commissions for integration into permitting review processes.
- 3.3.1.18 Conduct an assessment using available data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels.
- 3.3.1.24 Conduct regular investigations of SGCN habitat health and biodiversity on public and private lands to identify locations in need of revegetation, reduction of over-abundant, native wildlife and/or exotic species, conservation focal areas requiring limitations on human activity, etc.

3.3.2 **Monitoring**

- 3.3.2.1 Evaluate the effectiveness of forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.
- 3.3.2.2 Conduct long-term monitoring of resident and migratory SGCN habitats using standardized survey protocols to determine changes in habitat quality/suitability and threats (e.g., habitat loss and degradation, increased edge habitat, water quality) and other variables that may impact their long-term persistence in the State and to provide information needed for determining causes of population declines and understanding metapopulation dynamics.
- 3.3.2.3 Continue to update wildlife and habitat databases and revise models of critical SGCN habitats using the most current data available and where lacking, develop new SGCN and/or habitat models as data on species habitat requirements and applicable GIS data layers become available.

Cave-hibernating Bats

- 3.3.2.9 Investigate the effectiveness of various silviculture techniques for enhancing forests for forest-dependent SGCN.
- 3.3.2.10 Evaluate the efficacy and success of different management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.3.2.16 Evaluate the effectiveness of best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.1 Work with land management agencies to determine the appropriate actions needed to restore/reclaim degraded habitat for the documented/target SGCN.
- 3.5.3.7 Develop/improve forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.
- 3.5.3.8 Develop best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 3.5.3.9 Develop strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 3.5.3.11 Develop strategies to protect native terrestrial and aquatic habitats and dependent SGCN species from the identified threats.
- 3.5.3.14 Develop aquaculture practices in the coastal areas that are compatible with the recovery of SGCN.
- 3.5.3.15 Modify management practices based on the effects of pesticides, herbicides and other biological controls on critical and supporting SGCN habitats.
- 3.5.3.16 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.
- 3.5.3.20 Develop guidance on various silviculture techniques for enhancing forests for forest-dependent SGCN.
- 3.5.3.25 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to develop the necessary management strategies to reach or maintain viable population levels.

Cave-hibernating Bats

- 3.5.3.26 Amend management strategies of gating bat hibernacula and/or installing additional supports for structural soundness based on the effectiveness and potential impacts on bat hibernacula (bats and internal conditions).

3.5.4 Fish and wildlife research, survey and management techniques

- 3.5.4.5 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
- 3.5.4.6 Investigate the feasibility of mitigating for the impacts of contaminants to vulnerable wildlife, particularly SGCN. Maintain records on exposure of vulnerable wildlife to environmental toxins (such as flame retardants and endocrine disruptors), so that sources may be identified and controlled or eliminated.
- 3.5.4.13 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.
- 3.5.4.15 Investigate the success of management strategies used to protect and/or enhance SGCN populations and when appropriate, aid in identifying failures/resource problems and issues, and developing new strategies.
- 3.5.4.16 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels and develop the necessary management strategies.
- 3.5.4.17 Investigate new, non-invasive techniques for SGCN population evaluation through literature review, expert opinion, trial studies (if low risk), etc.
- 3.5.4.18 Investigate the effectiveness of survey techniques through selected “ground truthing” and literature and peer review in order to increase efficacy of survey, minimize surveyor bias and error, and increase accuracy of trend data.
- 3.5.4.20 Evaluate the effectiveness and potential impacts on bat hibernacula (bats and internal conditions) of gating bat hibernacula and/or installing additional supports for structural soundness. Amend management strategies as needed.
- 3.5.4.21 Develop BMPs to address problematic species and diseases of unknown origin.
- 3.5.4.22 Investigate the efficacy of implementing strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities.

4 Education

4.1 Educator/Instructor training

4.1.0 Public education

- 4.1.0.1 Provide educational resources and training programs to private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

Cave-hibernating Bats

6.0.0 Combined acquisition and protection strategies

- 6.0.0.1** Enhance and increase the effective size of critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates by securing adjacent habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.2** Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.3** Secure and protect riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.5** Secure and protect critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.6** Secure and protect old-growth forest stands with large trees and/or stands that are approaching or being actively managed for old growth forests, in particular those within large, contiguous forest tracts, through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.7** Secure and protect critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

6.3 Conservation area designation

6.3.0 Conservation area designation strategies

- 6.3.0.1** Promote the protection of critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates and enhance these lands by increasing the effective size through conservation area designations of stopover habitats and adjacent private lands.
- 6.3.0.2** Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN and/or connect conserved SGCN habitats through conservation area designations.
- 6.3.0.3** Increase the protection of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through conservation area designations.
- 6.3.0.5** Promote the protection of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through conservation area designations.
- 6.3.0.6** Promote the protection of old-growth forest stands with large trees and/or stands that are approaching or being actively managed for old growth forests, in particular those within large, contiguous forest tracts, through conservation area designations.
- 6.3.0.7** Promote the protection of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through conservation area designations.

7 Law Enforcement

Cave-hibernating Bats

7.1 Law enforcement

7.1.3 Sub-national Level

- 7.1.3.2** Increase the number of law enforcement officers tending to wildlife issues to a reasonable number to sufficiently cover the State and marine waters.

7.1.4 Scale Unspecified

- 7.1.4.1** Improve enforcement of policies and/or regulations that promote the reduction of run-off and point and non-point source pollution into NJ's aquatic systems (streams, rivers, lakes/ponds, bays, ocean, wetlands, etc.).
- 7.1.4.3** Increase law enforcement presence proximate to sensitive areas [e.g., avian nesting sites, in particular rookeries, and reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively)] to deter human activity and subsequent disturbance to SGCN.
- 7.1.4.6** Recruit law enforcement to assist in the protection and enhancement of SGCN populations, in particular endangered species, through improved awareness of species through trainings, partnerships, and other methods. Information should include but is not limited to: 1) Issues concerning illegal collection of reptiles, 2) Persecution of rare snakes, 3) Illegal recreational activities on public lands (e.g., off-road vehicles) and their impact on wildlife, 4) Identification of sensitive areas, critical sites and/or "hot-spots" for collection.
- 7.1.4.7** Increase law enforcement presence to enforce regulations governing recreational activities (e.g., the use of personal watercraft and off road vehicles, caving, rock climbing, etc.) on conserved lands and within other sensitive habitats, and discourage activities that cause harm or disturbance to vegetation, wetlands, fish and wildlife.
- 7.1.4.8** Implement policies that protect critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates.
- 7.1.4.9** Implement policies that improve and secure habitat connections between conserved SGCN habitats.
- 7.1.4.10** Implement policies that promotes expanding acreages and enhances the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 7.1.4.11** Implement and enforce policies/regulations that will increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.
- 7.1.4.13** Implement policies that protect vernal pool habitats to benefit SGCN that rely upon them and promotes connectivity of SGCN populations.
- 7.1.4.14** Implement policies that protect existing and developing old-growth forest stands with large trees, in particular those within large, contiguous forest tracts.
- 7.1.4.15** Implement policies that preserve and protect critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.
- 7.1.4.16** Implement policies that protect and restore riparian areas.
- 7.1.4.17** Improve the enforcement of policies and/or regulations that protect wetlands, riparian and floodplain areas, and aquatic habitats (including open waters).

8 Outreach

8.1 Partner/stakeholder engagement

Cave-hibernating Bats

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.3** Develop an outreach team of personnel from government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 8.1.0.4** Engage government agencies, conservation partners and other stakeholders in constructive dialogues encouraging them to influence policy change and the creation of incentives through a habitat bill and/or municipal ordinances for backyard habitat.
- 8.1.0.13** Engage DOD in a constructive dialogue regarding strategies to minimize disturbances to all SGCN (i.e., beyond their federal requirements) from forest management and other practices on their lands.
- 8.1.0.14** Engage DOD in a constructive dialogue regarding strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities.
- 8.1.0.15** Engage government agencies, conservation partners and other stakeholders in discussions encouraging and supporting the creation of laws and policies requiring vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 8.1.0.16** Engage local governments in discussions regarding the importance of them adopting/passing ordinances which require assessing and addressing secondary impacts (i.e., ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 8.1.0.18** Engage NJDOT, NJ Transit Authority and other road management entities, wildlife conservation organizations/agencies (e.g., Division of Fish and Wildlife, New Jersey Conservation Foundation, Conserve Wildlife Foundation of NJ), and communities and citizens in discussions regarding the importance of and methods to enhance habitat connectivity, and work together to develop feasible strategies for ensuring that wildlife can disperse naturally and safely across roads and similar barriers to terrestrial and/or aquatic habitats.
- 8.1.0.19** Engage government agencies, conservation partners and other stakeholders to collaboratively develop a list of important projects, targeting SGCN and/or their habitat, as a guide for graduate student research. Distribute the list and contact information to all State colleges and universities.
- 8.1.0.24** Engage government agencies, conservation partners and other stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.25** Provide technical support to public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.26** Coordinate across federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to woodland landowners to adopt or endorse consistent best management practices concerning controlled burns to maintain and/or improve forested habitat for wildlife.
- 8.1.0.30** Encourage government agencies and conservation partners to advise members of the relevant scientific community of the need for specific studies, reports or investigations targeting the data-deficiency regarding SGCN and/or their habitats.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Cave-hibernating Bats

- 8.1.0.33 Engage government agencies, conservation partners and other land managers, communities, landowners, and commercial and industrial stakeholders in discussions regarding the importance of protecting and methods to protect priority wetlands beyond the levels afforded through regulation by maintaining and/or restoring optimal biological buffers around wetlands.
- 8.1.0.34 Work with the NJ Education Association and Department of Education to design curriculum and outdoor experimental learning opportunities, and provide training to teachers on implementation of these activities.
- 8.1.0.35 Promote backyard habitat management to create and/or enhance food availability for migratory species (birds, bats, invertebrates) on private lands.
- 8.1.0.37 Enlist landowners and NJ citizens in the protection of and survey efforts for SGCN, in particular rare species, by increasing enrollment in landowner incentives, forest stewardship, backyard habitat management and wildlife-related volunteer programs.
- 8.1.0.38 Engage partners, stakeholders and land managers in constructive dialogue promoting forest stewardship for SGCN that use core forests and forested corridors.
- 8.1.0.40 Encourage researchers, land managers, naturalists and enthusiasts to follow proper procedures for the coordination and/or permitting of research/management activities involving wildlife and sensitive habitats, and discourage activities that alter vegetation or wetlands, or cause harm or disturbance to wildlife.
- 8.1.0.43 Engage Nuisance Wildlife Control Operators (NWCs), conservation partners, and the public in conserving bat populations by advising proper exclusion methods from buildings, offering bat houses where roosting habitat is needed, and improving the public's understanding and acceptance of bats.
- 8.1.0.47 Form cooperative partnerships with energy companies to facilitate habitat creation and enhancement away from and outside of project areas, the restoration of appropriate habitats within project areas (e.g., rights-of-way could benefit butterflies and some bird species), and to identify seasonal timing of activities that would minimize impacts to wildlife.
- 8.1.0.48 Form cooperative partnerships with transportation and shipment agencies and companies to facilitate habitat creation and enhancement away from and outside of project areas and to identify seasonal timing of activities that would minimize impacts to wildlife.

8.2 Recruitment and retention activities

8.2.3 For wildlife watching

- 8.2.3.1 Develop and implement nature-focused tourism opportunities including wildlife viewing sites, interpretive signage highlighting unique ecosystems/habitats, and wildlife-related recreational opportunities that do not negatively impact SGCN or their habitats.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.5 Develop and provide (or otherwise make publicly available) educational programs and/or materials that provide homeowners information on how to design dwellings and other structures in a manner that is wildlife friendly (e.g., using bird-safe glass on windows).
- 8.3.0.10 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate landowners and NJ citizens on threats to fish and wildlife (including marine animals).

Cave-hibernating Bats

- 8.3.0.11 Develop and provide (or otherwise make publicly available) educational programs and/or materials to the public, wildlife-related professionals, foresters, etc., that describe the value of species that are often feared (e.g., snakes, bats, spiders, Allegheny woodrat) and/or deemed a "nuisance" (e.g., squirrel, deer, snapping turtle), and therefore, persecuted by people. Include information on tolerance, proper identification, eviction from human dwellings, how to minimize the animal's presence on the property, and/or how to live in harmony with the animal.
- 8.3.0.12 Promote awareness of WSFR (Wildlife and Sportfish Restoration) Outreach/Awareness grants, an important funding source for conservation among hunters and anglers as well as the general public.
- 8.3.0.13 Conduct an educational campaign to encourage observer ethics and respect for wildlife and natural habitat.
- 8.3.0.24 Develop educational outreach programs for local decision-makers, land developers, landowners and citizens about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
- 8.3.0.26 Develop educational outreach programs for private and public landowners and land managers regarding the importance of and how to manage core forests and forested corridors in a way that will be beneficial for SGCN, particularly endangered, threatened and special concern species.
- 8.3.0.27 Develop educational outreach programs for public and private landowners and land managers regarding the importance of structural habitat diversity, methods to increase diversity, and/or incentive programs available to increase habitat diversity.
- 8.3.0.29 Develop educational outreach programs for local decision-makers, land developers, landowners and citizens about the importance of maintaining a vegetative buffer along riparian and aquatic habitats to intercept storm water runoff and minimize soil erosion.
- 8.3.0.30 Develop educational outreach programs for private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.
- 8.3.0.32 Develop an educational outreach program for landowners and citizens on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

- 9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and SGCN inhabiting them.
- 9.1.0.2 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.1.0.3 Develop a plan that directs the creation of impervious surfaces away from and to minimize impacts on aquatic systems and critical terrestrial habitats. The plan should also include strategies to increase the resiliency of aquatic and critical terrestrial habitats to threats and stressors that would impact the reproduction and survival of wildlife.
- 9.1.0.4 Develop a plan that directs the creation of new impoundments and/or the expansion of bogs for cranberry farming within or immediately adjacent to critical forested habitats in a manner that minimizes impacts on the natural hydrology of the watershed and subsequently, the natural wetlands in the area.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Cave-hibernating Bats

- 9.1.0.5 Develop a plan that directs the creation or expansion of energy or utility rights-of-way in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.6 Develop a plan that directs the creation or expansion of roads and railroads or the re-establishment of abandoned railroads within and adjacent to critical forested habitats in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.7 Develop a plan that directs the maintenance of or new channelization of forested streams and rivers in a manner that minimizes impacts of the aquatic ecological system and adjacent forest
- 9.1.0.9 Develop a plan that focuses on strategies to minimize the creation of renewable energy farms (e.g., solar, wind) and related infrastructures within and their impacts on forested habitats and the wildlife community.
- 9.1.0.10 Develop a plan that focuses on strategies to minimize the impacts of mining on critical forested habitats.
- 9.1.0.11 Develop a plan that focuses on strategies to minimize the impacts of power plants on critical forested habitats and the wildlife community.
- 9.1.0.13 Develop a plan to minimize agriculture that would result in groundwater withdrawal in critical forested areas.
- 9.1.0.14 Develop a plan to minimize development that would result in groundwater withdrawal in critical forested areas.
- 9.1.0.16 Develop a plan to minimize new lawns and preserve natural vegetation within and adjacent to critical forest areas.
- 9.1.0.19 Develop a plan to minimize the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 9.1.0.20 Develop a plan to minimize the impacts of existing agricultural properties adjacent to and the conversion of forest habitats (terrestrial and aquatic, within or adjacent to critical forests) to agriculture, grazing areas/livestock farms, and plantations.
- 9.1.0.22 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 9.1.0.24 Develop a plan to prevent livestock from entering water bodies in critical forested habitats.
- 9.1.0.25 Develop a plan to prevent the conversion of forested stream buffers to pastures in critical forested habitats.
- 9.1.0.28 Develop and coordinate state, regional and local plans for suitable lot layout and landscaping to minimize human-wildlife conflicts that also incorporates habitat connectivity and preservation of natural areas.
- 9.1.0.29 Provide GIS or related data, maps, resource inventories, as well as related training, pertaining to the SWAP and its recommended conservation actions for use or consideration by State, County or municipal planning agencies.
- 9.1.0.30 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and other related threats associated with development.
- 9.1.0.31 Develop wetland restoration plans that consider the life history and needs of wildlife occupying targeted habitats.
- 9.1.0.33 Review the species, threats, action successes, and habitats, and work with partners to revise the 2017 State Wildlife Action Plan for the 2025 resubmittal.

Cave-hibernating Bats

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.3 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.1.4 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.3.1.5 Develop response plans to address disease outbreaks within wildlife populations, in particular SGCN.
- 9.3.1.7 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
- 9.3.1.9 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
- 9.3.1.10 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 9.3.1.13 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
- 9.3.1.14 Create species management plans that will promote the protection and where appropriate, the development of old-growth forest stands with large trees, in particular those within large, contiguous forest tracts.
- 9.3.1.16 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.
- 9.3.1.20 Use compiled life history information on urban-associated SGCN regarding threats, breeding, fecundity, survival, habitat needs, wintering sites/roosts, migration routes and destinations, etc. to develop wildlife management strategies to benefit such species.

9.3.2 Listed species recovery planning

- 9.3.2.1 Develop proactive species recovery plans for all endangered and threatened species including guidance and objectives pertaining to critical and supporting habitat to meet and maintain recovery goals.

9.3.3 Habitat management planning

- 9.3.3.5 Develop a management plan using forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.
- 9.3.3.6 Develop a management plan for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 9.3.3.8 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.

Cave-hibernating Bats

- 9.3.3.9 Develop a response plan to outbreaks using BMPs to control infestations and limit their spread in a way that avoids excessive harm to non-target species.
- 9.3.3.10 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
- 9.3.3.11 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.3.3.15 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
- 9.3.3.16 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.3.19 Develop management plans for SGCN inhabiting permanently protected natural lands using available baseline and population trend data.
- 9.3.3.21 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
- 9.3.3.23 Create forest management plans that will promote the protection and/or development of old-growth forest stands with large trees, in particular those within large, contiguous forest tracts.
- 9.3.3.24 Develop a plan to improve the enforcement of policies and/or regulations that protect wetlands, riparian and floodplain areas, and aquatic habitats (including open waters).
- 9.3.3.32 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.
- 9.3.3.35 Incorporate habitat connectivity, preservation of natural areas, and the implementation of BMPs into state and local land-use policy environmental review process and energy development plans to minimize habitat fragmentation and related threats associated with solar farms and altered habitats.
- 9.3.3.36 Integrate plans for properly located and timed habitat restoration and management along transportation, energy and service corridors to minimize risks to and benefit wildlife.
- 9.3.3.38 Use compiled life history information on urban-associated SGCN regarding threats, breeding, fecundity, survival, habitat needs, wintering sites/roosts, migration routes and destinations, etc. to develop habitat management strategies to benefit such species.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

- 11.1.1.1 Use Biotics database and Landscape Project Mapping in regulatory reviews to ensure protection by applicable laws and regulations.
- 11.1.1.2 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
- 11.1.1.3 Government organizations to thoroughly review wetland restoration plans, applying the most current science for wildlife, habitats and aquatic systems, to assess the impacts to resident and migratory wildlife occupying the targeted habitats.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Cave-hibernating Bats

- 11.1.1.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.
- 11.1.1.5 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 11.1.1.7 Review proposed construction or other work projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.8 Review proposed research projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.10 Use CHANJ mapping in reviews of proposed energy, mining, transportation and utility service companies/agencies' projects to attempt to maintain habitat connectivity and reduce fragmentation, and identify potential impacts of the projects.
- 11.1.1.11 Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed offshore energy projects relating to drilling, extraction and distribution of petroleum and gas products to reduce habitat destruction and minimize impacts on wildlife.
- 11.1.1.12 Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed solar farm projects to reduce habitat fragmentation and minimize impacts on wildlife.
- 11.1.1.13 Use the best available science (species data, habitat present, wind farm layout options, wind blade impacts on migratory species, location of migration routes, etc.) when conducting regulatory reviews of proposed wind farm projects to minimize impacts on migratory and resident wildlife and reduce habitat fragmentation.

11.1.2 Review of proposed policies and plans

- 11.1.2.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
- 11.1.2.2 Government organizations to thoroughly review wetland restoration plans, applying the most current science for wildlife, habitats and aquatic systems, to assess the impacts to resident and migratory wildlife occupying the targeted habitats.

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

- 11.2.0.1 Provide technical support to private and public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 11.2.0.3 Develop state, regional and local BMPs that focus on minimizing habitat fragmentation and human-wildlife conflicts associated with development. Make information available to land developers and private and public landowners for implementation.
- 11.2.0.5 Provide educational resources, training programs, and expert guidance to private and public landowners and land managers on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

Cave-hibernating Bats

- 11.2.0.6 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on habitat creation, enhancement and restoration within and adjacent to project areas, as well as away from and outside of project areas (depending on the target species), by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. Wind farms should address both terrestrial bound and low-flying species. Examples of habitat management include, but are not limited to, integrating short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 11.2.0.7 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on the importance of maintaining habitat connectivity, minimizing fragmentation, and the use of CHANJ products to help them target areas for such planning.
- 11.2.0.8 Provide educational resources, training programs, and on-the-ground guidance to public and private landowners and land managers on habitat creation and enhancement strategies that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 11.2.0.9 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and private landowners about the importance of leaving vegetation in place, especially along riparian areas and wildlife movement corridors.
- 11.2.0.10 Provide technical support to private landowners, consultants, and land managers to create customized management plans based on location and SGCN.
- 11.2.0.13 Provide educational resources and technical support to public landowners, private landowners with sufficient acreage, and land managers to promote the protection and/or development of old-growth forest stands with large trees, in particular those within large, contiguous forest tracts.
- 11.2.0.14 Provide educational resources and technical support to public and private landowners and land managers to promote the protection of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters), and to enhance or restore biologically appropriate buffers.
- 11.2.0.15 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and landowners about the importance of retaining and in an effort to protect, create, enhance and/or restore vegetation along aquatic habitats.
- 11.2.0.16 Provide educational resources and technical support to public and private landowners and land managers to promote the protection of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.
- 11.2.0.17 Provide educational resources and technical support to public and private landowners and land managers to promote the protection of vernal pools and the protection, enhancement and/or restoration of biologically appropriate buffers.
- 11.2.0.20 Provide educational resources and technical support to public and private landowners and land managers to promote the protection and/or enhancement of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN.

Cave-hibernating Bats

- 11.2.0.21 Provide educational resources and technical support to public and private landowners and land managers of lands adjacent to critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates to promote the protection and/or enhancement of those adjacent habitats to increase the effective size of the migratory habitat.
- 11.2.0.22 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
- 11.2.0.23 Provide educational resources and technical support to public and private landowners and land managers of lands adjacent to SGCN habitats to promote the protection and/or enhancement of those adjacent habitats to increase the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and that connect conserved SGCN habitats.
- 11.2.0.26 Make educational resources available to the public that encourage researchers to seek out guidance prior to finalizing proposals and submitting State permit applications to reduce potential impacts on sensitive species.
- 11.2.0.28 Provide educational resources, training programs, and on-the-ground guidance to Nuisance Wildlife Control Operators (NWCs) and the public to ensure that proper bat exclusion methods are followed when addressing issues of bats in buildings.
- 11.2.1 With individuals and groups involved in resource management decision making
 - 11.2.1.1 Engage partners and stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
 - 11.2.1.2 Provide professional training and technical assistance tools (e.g., mapping, guidance documents, justification, etc.) to agencies/divisions/programs within and outside of the NJ DEP regarding the SWAP, and the conservation actions recommended therein to help facilitate SWAP implementation.
 - 11.2.1.3 Provide educational resources, training programs, and on-the-ground guidance to DOD to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop and implement forest management and other practices that minimize disturbances to SGCN (i.e., beyond their federal requirements).
 - 11.2.1.6 Provide educational resources, training programs, and on-the-ground guidance to resource agencies prior to project initiation to ensure wildlife and their habitats are protected to the highest degree possible during construction, and provisions are in place for post-construction habitat use.

100 Law and Policy

100. Legislation

100.1.3 Sub-national Level

- 100.1.3.1 Develop laws and policies to increase protection and biological buffers of wetlands.
- 100.1.3.2 Develop policies for wetland restoration plans that consider life history requirements and needs of wildlife occupying targeted habitats.
- 100.1.3.3 Initiate legislative action to establish an annual budgetary line item designating funds to support programs focused on long-term research and monitoring of wildlife diseases.

100.1.4 County and Local

Cave-hibernating Bats

- 100.1.4.1 Enhance critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates through the local ordinances of adjacent private lands to increase the effective size of the habitat.
- 100.1.4.2 Secure and increase the effective size of SGCN habitats and connect conserved SGCN habitats through local ordinances.
- 100.1.4.3 Expand the acreages and enhance the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN through local ordinances.
- 100.1.4.4 Secure wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) and biologically appropriate buffers through local ordinances.
- 100.1.4.5 Secure SGCN-inhabited/used freshwater wetlands and biologically appropriate buffers through local ordinances.
- 100.1.4.7 Secure vernal pools and biologically appropriate buffers through local ordinances.
- 100.1.4.8 Secure critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through local ordinances.
- 100.1.4.9 Secure existing and developing old-growth forest stands with large trees, in particular those within large, contiguous forest tracts, through local ordinances.
- 100.1.4.10 Secure critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through local ordinances.
- 100.1.4.11 Secure riparian areas through local ordinances.
- 100.1.4.15 Incorporate habitat connectivity and the preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.

100.1.5 Scale Unspecified

- 100.1.5.1 Develop laws and policies to increase protection and biological buffers of wetlands.
- 100.1.5.2 Develop policies for wetland restoration plans that consider life history requirements and needs of wildlife occupying targeted habitats.
- 100.1.5.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.

100. State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.1 Develop (and/or improve) policies and/or regulations that will promote the reduction of run-off and point and non-point source pollution into NJ's aquatic systems (streams, rivers, lakes/ponds, bays, ocean, wetlands, etc.).
- 100.3.0.3 Develop policies that will promote the long term protection of critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates.
- 100.3.0.5 Develop policies that will promote improved and secure habitat connections between conserved SGCN habitats.
- 100.3.0.6 Develop policies that will promote expanding acreages and enhancing the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Cave-hibernating Bats

- 100.3.0.7 Amend current policies and/or regulations to increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.
- 100.3.0.9 Secure mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.10 Develop policies that promote protecting vernal pool habitats to benefit SGCN that rely upon them and promotes connectivity of SGCN populations.
- 100.3.0.11 Develop policies that will ensure the protection and/or development of old-growth forest stands with large trees, in particular those within large, contiguous forest tracts.
- 100.3.0.12 Develop policies that promote the preservation and protection of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.
- 100.3.0.13 Develop policies that will promote protecting and restoring riparian areas.
- 100.3.0.14 Develop policies and/or regulations that increase the protective buffers of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) to biologically appropriate distances to benefit SGCN that rely upon these habitats and improve the function of the [associated] aquatic systems.
- 100.3.0.23 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.31 Create or expand tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMPs.
- 100.3.0.32 Coordinate regulations across agencies to maximize availability of and enrollment in existing Forestry Stewardship Programs (e.g., "Woodland Stewards", Farm Bill, partners, etc.) to maintain and/or improve forest habitat.
- 100.3.0.40 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.3.0.42 Fully adopt the former Storm water Management Rules' 300ft buffer requirements into the Flood Hazard Area Control Act Rules.
- 100.3.0.43 Identify and address (amend) regulatory impediments to beneficial habitat management.
- 100.3.0.44 Incorporate requirements for technical support and funding for mitigation or restoration efforts so as to be consistent with existing regulations.
- 100.3.0.46 Investigate and/or develop inter-agency Memorandum of Agreements to share common data stored or managed in program-specific databases.
- 100.3.0.48 Propose new State law or regulation mandating that a State-level "development impact fee" be assessed on all new development approved by municipalities (via the Municipal Land Use Law processes), and dedicate such monies to the development and implementation of regional Habitat Conservation Plans (or existing plans/programs serving the same regional function).
- 100.3.0.49 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address the issue of disturbance to habitat or species as a result of human activities (e.g., construction, bridge maintenance, road work, etc.).

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Cave-hibernating Bats

- 100.3.0.50 Retain endangered, threatened and special concern wildlife and habitat protection measures in the Water Quality Management Program Rules.
- 100.3.0.52 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded energy sitings and facilities.
- 100.3.0.53 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded rights-of-way corridors associated with energy transport/transmission.
- 100.3.0.54 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded surface mining areas.
- 100.3.0.56 Develop regulations that when implemented will protect critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates.
- 100.3.0.57 Develop regulations that when implemented will improve and secure habitat connections between conserved SGCN habitats.
- 100.3.0.58 Develop regulations that when implemented will promote the expansion of acreages and enhancement of the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 100.3.0.59 Develop regulations that when implemented will increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.
- 100.3.0.61 Develop regulations that when implemented will protect vernal pool habitats to benefit SGCN that rely upon them and promotes connectivity of SGCN populations.
- 100.3.0.62 Develop regulations that when implemented will protect existing old-growth forest stands with large trees and/or stands that are being actively managed for old growth forests, in particular those within large, contiguous forest tracts.
- 100.3.0.63 Develop regulations that when implemented will preserve and protect critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.
- 100.3.0.64 Develop regulations that when implemented will protect and restore riparian areas.
- 100.3.0.71 Develop regulations for licensing, permitting, or certification of Nuisance Wildlife Control Operators (NWCOS) that handle removal/exclusion of protected wildlife, such as bats and snakes, to ensure that proper methods are followed and that occurrences are reported.
- 100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

100. State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).
- 100.4.0.3 Develop policies for mandatory buffer strips on preserved farmlands and state-owned agricultural lands.
- 100.4.0.4 Create a policy that requires the use of wildlife habitat and corridor mapping products for both regulatory use when conducting project reviews and planning/siting new or expanded rights-of-way projects.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Cave-hibernating Bats

- 100.4.0.8 Develop a white paper addressing the impacts that existing, new or expanded rights-of-way have upon wildlife, wildlife habitats and habitat connectivity.
- 100.4.0.12 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.4.0.13 Develop policies for different circumstances (e.g., roadsides and medians, riparian, aquatic and terrestrial habitats) that outline appropriate habitat/vegetation management strategies and schedules to minimize risks to and benefit wildlife.
- 100.4.0.16 Develop policies to implement habitat management strategies that will increase the structural diversity surrounding areas used for energy, mining, and transportation and service corridors which include but are not limited to the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-
- 100.4.0.17 Develop policies to implement habitat management strategies, including prescribed burns, that will increase the structural diversity on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies to control and reduce the impacts of invasive, non-native species in order to increase structural habitat diversity.
- 100.4.0.18 Develop policies to minimize the extent of infrastructure associated with energy and service corridors or areas (e.g., wind and solar farms, pipelines, utility lines) and that require the implementation of habitat management strategies that will increase the structural diversity in the area including (e.g., the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-asides).
- 100.4.0.20 Develop state regulations that require energy developers and utility service companies to implement habitat management strategies that will increase the structural diversity of the habitat, minimize habitat fragmentation and commercial infrastructure, and minimize the loss, alteration and/or degradation of the habitat and adjacent lands when working on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies.
- 100.4.0.25 Develop policies that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

North Atlantic Right Whale

Focal species that comprise this Conservation Target:

North Atlantic Right Whale

Threats and Action Drivers associated with this Conservation Target:

2 Agriculture and Aquaculture

2.4 Marine and Freshwater Aquaculture

2.4.1 Subsistence/Artisinal Aquaculture (Avg. Score: 1.00)

NJ Specific Threats: 2.4.1.2 Increased risk of parasite introduction into marine environments.

2.4.1.3 Potential for increased nutrient and effluent loads.

2.4.2 Industrial Aquaculture (Avg. Score: 1.00)

NJ Specific Threats: 2.4.2.2 Increased risk of parasite introduction into marine environments.

2.4.2.3 Potential for increased nutrient and effluent loads.

3 Energy Production and Mining

3.1 Oil and Gas Facilities and Pipelines

3.1.1 Distribution processes of petroleum and other liquid hydrocarbons (Avg. Score: 3.00)

NJ Specific Threats: 3.1.1.2 Loss, alteration and/or degradation of habitat.

3.1.1.3 Increased risk of oil spills.

3.1.1.4 Increased noise pollution.

3.1.1.5 Increased vehicular and ship traffic associated with construction and operations, and therefore an increased risk of wildlife mortality from strikes.

3.1.1.6 Increased risk of collision between marine mammals, sea turtles and fish and the marine-based structures/facilities.

3.1.2 Natural gas distribution processes (Avg. Score: 3.00)

NJ Specific Threats: 3.1.2.2 Loss, alteration and/or degradation of habitat.

3.1.2.3 Increased risk of gas leaks and explosions.

3.1.2.4 Increased noise pollution.

3.1.2.5 Increased vehicular and ship traffic associated with construction and operations, and therefore an increased risk of wildlife mortality from strikes.

3.1.2.6 Increased risk of collision between marine mammals, sea turtles and fish and the marine-based structures/facilities.

3.2 Mining and Quarrying

3.2.4 Sand Dredging (outside shipping lanes) (Avg. Score: 2.00)

NJ Specific Threats: 3.2.4.1 Loss, alteration and/or degradation of benthic marine habitats.

3.2.4.2 Increased noise pollution.

3.2.4.3 Potential for direct mortality of benthic organisms.

3.3 Renewable Energy

3.3.1 Wind Power (Avg. Score: 2.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

North Atlantic Right Whale

- NJ Specific Threats:** 3.3.1.1 Turbines, blades, and structure foundations create a collision risk to volant species (birds, bats and invertebrates) and marine animals.
- 3.3.1.3 Loss, alteration and/or degradation of habitat.
- 3.3.1.4 Increased commercial infrastructure.

3.4 Conventional Power Plants

3.4.0 Conventional Power Plants (Avg. Score: 1.00)

- NJ Specific Threats:** 3.4.0.3 Alteration of the temperature, pH and/or hydrology of aquatic ecosystems change plant communities and can harm wildlife and/or impact their behavior and survivorship.

4 Transportation and Service Corridors

4.3 Shipping Lanes

4.3.1 Movement of large ships in shipping lanes (Avg. Score: 3.00)

- NJ Specific Threats:** 4.3.1.1 Increased ship traffic increases the risk of wildlife mortality from strikes.
- 4.3.1.2 May disturb nesting and foraging of shoreline birds and aquatic animals, and/or alter migratory patterns of aquatic and marine wildlife.

4.4 Flight Paths

4.4.1 Airplane flight paths (Avg. Score: 1.00)

- NJ Specific Threats:** 4.4.1.1 Increased noise disturbance to wildlife, disrupting their normal behaviors.

5 Biological Resource Use

5.4 Fishing and Harvesting of Aquatic Resources

5.4.3 Unintentional effects (subsistence/small scale) (Avg. Score: 3.00)

- NJ Specific Threats:** 5.4.3.1 Abandoned fishing tackle and gear, crab pots without excluders and ghost crab pots increase the risk of injury and death to marine mammals, sea turtles, sea birds, pinnipeds and fish species as well as terrestrial and semi-aquatic species as a result of consuming tackle or gear, entrapment and entanglement in gear.
- 5.4.3.2 Commercial/recreational shellfish dredging may impact marine ecosystems by uprooting submerged aquatic vegetation, disrupting substrates, increasing turbidity, and increasing predator species in localized areas.
- 5.4.3.5 Trawling disrupts habitat and threatens marine species including benthic/bottom feeding fishes, invertebrates and other benthic organisms as it disrupts and homogenizes the substratum, can lead to species decline and reduced species diversity.
- 5.4.3.6 Fishing gear used by commercial fisheries results in bycatch or entanglement of non-targeted wildlife leading to injury and/or mortality.
- 5.4.3.7 Improperly sanitized equipment, relocation of fish, importation and release of non-native species, and the use of bait from a different location can spread invasive species and diseases from one waterbody to another.
- 5.4.3.8 Lead in fishing tackle is consumed by wildlife in the course of foraging and scavenging, causing injury and death.

5.4.4 Unintentional effects (large scale) (Avg. Score: 3.00)

- NJ Specific Threats:** 5.4.4.2 Commercial/recreational shellfish dredging may impact marine ecosystems by uprooting submerged aquatic vegetation, disrupting substrates, increasing turbidity, and increasing predator species in localized areas.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

North Atlantic Right Whale

- 5.4.4.4 Trawling disrupts habitat and threatens marine species including benthic/bottom feeding fishes, invertebrates and other benthic organisms as it disrupts and homogenizes the substratum, can lead to species decline and reduced species diversity.
- 5.4.4.5 Fishing gear used by commercial fisheries results in bycatch or entanglement of non-targeted wildlife leading to injury and/or mortality.
- 5.4.4.6 Overexploitation of riparian, estuarine, and marine fisheries may deplete food resources required by marine mammals, sea turtles, marine fish and piscivorous birds, in turn resulting lower reproduction and survival.
- 5.4.4.7 Improperly sanitized equipment, relocation of fish, use of bait from a different location, can spread invasive species and diseases from one waterbody to another.

6 Human Intrusions and Disturbance

6.1 Recreational Activities

6.1.2 Boating (Avg. Score: 1.00)

- NJ Specific Threats:**
- 6.1.2.1 Alteration and/or degradation of aquatic habitat.
 - 6.1.2.2 Increased disturbance to marine animals and ocean-, bay- and marsh-associated birds which can alter their behavior decreasing the likelihood of their success and/or reproduction.
 - 6.1.2.3 Motorized boat propellers can inflict physical harm aquatic wildlife species.
 - 6.1.2.4 A lack of law enforcement staff limits NJ's ability to enforce the Marine Mammal Protection Act which restricts approach distances to marine mammals.

6.1.5 Wildlife observation and photography (Avg. Score: 1.00)

- NJ Specific Threats:**
- 6.1.5.1 Improperly conducted recreational activities may disrupt normal wildlife behaviors which can result in reduced reproductive success or survival, abandonment of critical sites, etc.

6.1.7 Other (Avg. Score: 1.00)

- NJ Specific Threats:**
- 6.1.7.1 Use of recreational or commercial pyrotechnics may cause temporary disturbance to wildlife, in particular to nesting birds.
 - 6.1.7.3 Drone use in areas with sensitive wildlife (e.g., nesting and foraging birds, migrating and foraging/feeding whales) can alter their behavior and can cause disturbance that impacts their reproductive and/or foraging success.

6.2 Military Exercises

6.2.1 Military exercises (Avg. Score: 3.00)

- NJ Specific Threats:**
- 6.2.1.1 Military testing and training exercises may inflict disturbance and potential physical harm to wildlife.
 - 6.2.1.2 Low to mid-frequency active sonar threaten marine mammals by disrupting navigation, foraging and communications ability, and activities may disrupt normal behaviors of nesting birds and other wildlife.

6.3 Work and Other Activities

6.3.2 Authorized research projects at significant habitats (Avg. Score: 3.00)

- NJ Specific Threats:**
- 6.3.2.1 Seismic air guns used during scientific marine research threatens spawning, feeding and breeding marine fishes in essential fish habitat areas off the NJ coast and may cause disturbance and physical harm to whales, dolphins, pinnipeds and sea turtles. Seismic surveys may also disturb marine mammals by disrupting navigation, foraging and communications ability.

7 Natural Systems Modifications

7.3 Other Ecosystem Modifications

7.3.1 Shoreline Stabilization (Avg. Score: 1.00)

North Atlantic Right Whale

NJ Specific Threats: 7.3.1.3 Efforts to stabilize barrier islands and shorelines, including jetties, groins, and bulkheads, degrade foraging areas for migrating whales and sea turtles.

8 Invasive and Other Problematic Species, Genes and Diseases

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.1 Unspecified Species (Avg. Score: 1.00)

NJ Specific Threats: 8.1.1.5 Invasive, non-native animals and plants increase the risk of introduction and transference of diseases

8.1.2 Invasive non-native aquatic animals (Avg. Score: 1.00)

NJ Specific Threats: 8.1.2.1 Parasites introduced into the marine environment can alter the reproductive and feeding behavior of native wildlife, leading to their decline.

8.1.3 Invasive non-native aquatic plants (Avg. Score: 1.00)

NJ Specific Threats: 8.1.3.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.1.6 Invasive non-native fungal/bacterial diseases (Avg. Score: 1.00)

NJ Specific Threats: 8.1.6.1 The introduction of non-native fungal and bacterial diseases threatens native populations and ecosystems.

8.2 Problematic Native Species/Diseases

8.2.1 Unspecified Species (Avg. Score: 1.00)

NJ Specific Threats: 8.2.1.2 Invasive pathogens and insects may increase in range and abundance as limiting factors (such as temperature) are altered as a result of climate change.

8.4 Problematic Species/Diseases of Unknown Origin

8.4.1 Unspecified Species (Avg. Score: 1.00)

NJ Specific Threats: 8.4.1.1 Non-native or poorly understood diseases and parasites could potentially impact native animals.

8.5 Viral/Prion-induced Diseases

8.5.1 Unspecified Species (Disease) (Avg. Score: 1.00)

NJ Specific Threats: 8.5.1.1 There is a large knowledge gap regarding the existence of, or potential for, other diseases impacting native wildlife.

8.6 Diseases of Unknown Cause

8.6.0 Unknown Diseases (Avg. Score: 1.00)

NJ Specific Threats: 8.6.0.1 Diseases yet to be identified by pathologists and virologists cause decreased fitness or mortality to native populations.

9 Pollution

9.1 Domestic and Urban Waste Water

9.1.1 Sewage (Avg. Score: 2.00)

NJ Specific Threats: 9.1.1.1 Degradation of aquatic and marine water quality and habitats by changing turbidity, flow and water chemistry.

9.1.1.2 Leads to increased eutrophication and algae blooms that result in oxygen depletion.

9.1.1.3 Contaminants in sewage treatment effluents and Combined Sewer Overflows can cause developmental and behavioral abnormalities and reproductive failure in wildlife.

9.1.2 Run-off (Avg. Score: 2.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

North Atlantic Right Whale

NJ Specific Threats: 9.1.2.1 Chemical fertilizers and nutrient run-off changes the pH in streams and ponds and causes eutrophication in inland waters and estuaries, which can make habitat unsuitable for specialist species and increase the risk of invasive and generalist species.

9.1.2.2 Contaminants degrade aquatic and marine water quality and can bioaccumulate in benthic organisms, threatening wildlife by causing developmental and behavioral abnormalities and reproductive failure.

9.2 Industrial and Military Effluents

9.2.1 Oil Spills (Avg. Score: 3.00)

NJ Specific Threats: 9.2.1.1 Oil spills render resting, breeding and foraging habitats temporarily unavailable to wildlife, altering normal wildlife behavior.

9.2.1.2 Oil spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.

9.2.1.3 Oil spills cause external oiling of wildlife and ingestion of oil, both of which can injure or kill wildlife.

9.2.3 Other (Avg. Score: 3.00)

NJ Specific Threats: 9.2.3.1 Point and nonpoint source pollution such as polychlorinated biphenyls (PCBs), pesticides, heavy metals, and endocrine disrupting compounds (EDC's) into freshwater and marine systems pose threats to wildlife through direct contact and/or ingestion, and to aquatic species and their predators through bioaccumulation, impacting the reproductive success and neurological function of many avian and fish species.

9.2.3.2 Chemical spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.

9.2.3.3 Chemical spills may render resting, breeding and foraging habitats temporarily unavailable to wildlife, altering normal wildlife behavior.

9.3 Agricultural and Forestry Effluents

9.3.3 Herbicides and Pesticides (Avg. Score: 1.00)

NJ Specific Threats: 9.3.3.1 Pesticides degrade terrestrial and aquatic habitats, especially streams, ponds and wetlands. Aquatic wildlife are particularly sensitive to these contaminants, which can cause developmental and behavioral abnormalities and reproductive failure. Some contaminants may bioaccumulate in predatory fish and birds and disrupt reproduction.

9.4 Garbage and Solid Waste

9.4.1 Direct hazards to wildlife (Avg. Score: 3.00)

NJ Specific Threats: 9.4.1.1 Wildlife may ingest garbage causing choking or impingement in the digestive system, or they may become physically entangled in it (e.g., plastic or abandoned fish nets); conditions that make them unable to feed or drink, cause them to suffocate or drown, or otherwise restrict the animal's movement making them more susceptible to predators, starvation or injury.

9.5 Air-Bourne Pollutants

9.5.1 Acid Rain (Avg. Score: 2.00)

NJ Specific Threats: 9.5.1.1 Causes acidification of water bodies, resulting in changes to aquatic and marine communities and reducing biodiversity, and creating conditions that are unsuitable for some aquatic (freshwater and marine) and semi-aquatic species that are sensitive to pH shifts.

9.5.6 Herbicides and Pesticides (Avg. Score: 1.00)

NJ Specific Threats: 9.5.6.1 May result in injury or direct mortality of non-target species.

9.6 Excess Energy

9.6.1 Light Pollution (Avg. Score: 1.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

North Atlantic Right Whale

NJ Specific Threats: 9.6.1.1 Artificial lighting can reduce suitability of adjacent habitat for species sensitive to artificial lights by disorienting wildlife, reducing foraging suitability or success, or increasing visibility to predators, resulting in reduced diversity and/or productivity of species in adjacent habitat.

9.6.3 Noise Pollution (Avg. Score: 3.00)

NJ Specific Threats: 9.6.3.1 Acute and chronic noise pollution in and adjacent to terrestrial and aquatic (marine and freshwater) environments could disrupt normal behaviors of wildlife such as migration, communication, feeding, eluding predators, resting and breeding, etc.

11 Climate Change and Severe Weather

11.1 Habitat Shifting or Alteration

11.1.0 Macro- and Micro-Climate Alterations (Avg. Score: 1.00)

NJ Specific Threats: 11.1.0.1 Alters native terrestrial and aquatic habitats at the macro- and micro-climate levels that can affect suitability for wildlife, in particular specialist species.

11.3 Temperature Extremes

11.3.1 Temperature extremes (Avg. Score: 2.00)

NJ Specific Threats: 11.3.1.3 Temperature extremes of surface water and air degrades marine habitats and ecosystems, threatening marine wildlife. Such extremes also disrupt offshore currents and migratory patterns, species' ranges, and/or impact communities/food chains, all of which further impact the ecosystem.

11.3.1.4 Extremely low temperatures and/or extensive periods of unseasonably low temperatures during critical life history stages (e.g., hibernation, gestation/nesting) can alter animals' behaviors and decrease survivorship.

11.4 Storms and Flooding

11.4.1 Storms and flooding (Avg. Score: 1.00)

NJ Specific Threats: 11.4.1.1 Extreme storms and flooding events threaten aquatic and marine wildlife through habitat degradation and alteration, including alterations to off-shore or back-bay benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic and marine wildlife.

11.6 Phenology Shifting or Alteration

11.6.2 Phenology shifts related to predator-prey ecology (Avg. Score: 1.00)

NJ Specific Threats: 11.6.2.2 Shifts timing of species migration, breeding and hibernation, and available food resources, causes redistribution of species, or mortality for species that are unable to relocate due to their already isolated habitat or limited mobility.

11.6.3 Phenology shifts related to species redistribution (Avg. Score: 1.00)

NJ Specific Threats: 11.6.3.1 Shifts in timing of species migration, breeding and hibernation, and available food resources, as a result of wildlife range shifts driven by climate change.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory (Avg. Score: 2.00)

NJ Specific Threats: 12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.1.2 Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.

12.1.1.6 Lack of information regarding migratory pathways and response of wildlife to lights and noise associated with offshore wind turbines.

12.1.2 Lack of up-to-date existing information (Avg. Score: 2.00)

NJ Specific Threats: 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

12.1.3 Need to answer research question (Avg. Score: 1.00)

NJ Specific Threats: 12.1.3.1 There are significant knowledge gaps regarding distribution, dispersal, diseases, population trends, etc. of SGCN.

12.1.4 Need to develop new technique (Avg. Score: 1.00)

NJ Specific Threats: 12.1.4.1 Improve and evaluate survey methods for SGCN and their habitats; alter as needed.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform (Avg. Score: 1.00)

NJ Specific Threats: 12.4.0.1 A species-by-species management focus as opposed to ecological systems and biodiversity generally has greater opportunity for unintended consequences for other species and may be less efficient in developing appropriate management actions.

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats (Avg. Score: 2.00)

NJ Specific Threats: 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.

14.2 Outreach needs

14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions (Avg. Score: 1.00)

NJ Specific Threats: 14.2.1.2 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various aquatic and riparian management practices.

14.2.1.3 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various coastal management practices.

14.2.1.4 Need to develop greater understanding of and support for efforts implemented to maintain disturbance-free habitats that allow coastal wildlife populations to thrive alongside human residential and recreational uses.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning (Avg. Score: 2.00)

NJ Specific Threats: 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Actions to address the Threats and Action Drivers associated with this Conservation Target:

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

1.2.1.27 Create legislation to re-instate incentives for citizens bringing their own shopping bag(s) to grocery stores in an effort to decrease the amount of plastic shopping bags in circulation.

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

- 3.0.0.5** Gather baseline data on resident and migratory SGCN (in particular migratory species for which New Jersey habitats are significant), terrestrial, freshwater and marine species, regarding the location and condition of their critical and supporting habitats (e.g., foraging, roosting, nesting/breeding, stopover, migration paths, etc.), and population demography (e.g., productivity, survival, dispersal). Compile this information into a database that includes descriptions of the conditions of the habitats and species, and a GIS component of the locations of these important habitats. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.7** Collect baseline data to document species distributions, in particular SGCN, and current habitat for future analysis of possible distribution shifting as a result of habitat shifting or alteration associated with climate change impacts.
- 3.0.0.23** Identify (through wildlife and aquatic system surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and research water quality parameters for all [types of] aquatic systems for various SGCN populations.
- 3.0.0.25** Identify pathways of migratory SGCN in the Atlantic Coastal and Marine Regions (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and use the data to help evaluate the potential short- and long-term impacts of wind turbines, radio towers, utility guy lines, and other tall coastal structures on migratory populations.
- 3.0.0.27** Evaluate the effectiveness of strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals through research and monitoring. Develop and provide NJ DEP and other appropriate governing agencies/commissions a summary of findings and recommendations to improve such efforts.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.1** Division of Fish and Wildlife should maintain a robust, up-to-date database and mapping of species occurrences.
- 3.2.0.2** Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
- 3.2.0.16** Conduct long-term monitoring to evaluate the success of marine conservation zone designations on marine SGCN.
- 3.2.0.17** Conduct monitoring at constructed wind farms (within or outside of NJ) to assess the impacts on migratory species (birds, bats, insects) and determine if NJ's land use planning efforts and/or smart-growth plans need to be revised.

3.2.1 Abundance determination

- 3.2.1.1** Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) population abundance and trends for SGCN using standardized survey protocols. Provide data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.

North Atlantic Right Whale

3.2.3 Baseline inventory

- 3.2.3.2** Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) suitable areas for marine conservation zone designation and promote policies and regulations that support the designation of such areas.

3.2.7 Population assessment

- 3.2.7.1** Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

- 3.3.1.15** Conduct a literature review to determine the potential impacts of underwater vibrational noise on marine mammals, sea turtles and fishes emanating from offshore wind turbines during routine operations.
- 3.3.1.16** Gather "best information" for spatial modeling and update/create a current model/depiction of anticipated habitat shifts from sea-level rise, flooding, etc.
- 3.3.1.27** Develop a matrix that lists every commercial and recreational fishery and aquaculture facility that operates in state waters and for each fishery listed, provide details regarding their fishing seasons, gear descriptions, locations and number of fishers. Add a GIS component to overlay species of concern and sensitive areas.

3.3.2 Monitoring

- 3.3.2.2** Conduct long-term monitoring of resident and migratory SGCN habitats using standardized survey protocols to determine changes in habitat quality/suitability and threats (e.g., habitat loss and degradation, increased edge habitat, water quality) and other variables that may impact their long-term persistence in the State and to provide information needed for determining causes of population declines and understanding metapopulation dynamics.
- 3.3.2.3** Continue to update wildlife and habitat databases and revise models of critical SGCN habitats using the most current data available and where lacking, develop new SGCN and/or habitat models as data on species habitat requirements and applicable GIS data layers become available.
- 3.3.2.5** Conduct long-term monitoring of water quality of SGCN aquatic habitats (and aquatic systems feeding into those habitats) to evaluate protection and management efforts to reduce, if not eliminate, chemical contamination, siltation, eutrophication, and other forms of pollution/contamination of aquatic systems.

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.8** Develop best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 3.5.3.11** Develop strategies to protect native terrestrial and aquatic habitats and dependent SGCN species from the identified threats.
- 3.5.3.14** Develop aquaculture practices in the coastal areas that are compatible with the recovery of SGCN.

North Atlantic Right Whale

- 3.5.3.16 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.
- 3.5.3.27 Conduct an assessment and develop a location list of available equipment for boom deployment during oil spills.

3.5.4 Fish and wildlife research, survey and management techniques

- 3.5.4.13 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.
- 3.5.4.15 Investigate the success of management strategies used to protect and/or enhance SGCN populations and when appropriate, aid in identifying failures/resource problems and issues, and developing new strategies.
- 3.5.4.19 Develop reliable, standardized survey and monitoring protocols for SGCN species, for which none currently exist, and their habitats.
- 3.5.4.22 Investigate the efficacy of implementing strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities.

4 Education

4.1 Educator/Instructor training

4.1.1 Aquatic resource education

- 4.1.1.1 Provide educational resources and training programs to teachers in aquatic resource education that includes information regarding climate change and sea-level rise for incorporation into the class curriculum and/or as the focus of school field trips.
- 4.1.1.2 Provide educational resources and training programs to teachers in aquatic resource education that includes information regarding how coastal stabilization negatively impacts wildlife by preventing natural processes for incorporation into the class curriculum and/or as the focus of school field trips.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

- 6.0.0.5 Secure and protect critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

6.3 Conservation area designation

6.3.0 Conservation area designation strategies

- 6.3.0.5** Promote the protection of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through conservation area designations.
- 6.3.0.9** Promote the protection of critical marine habitats for SGCN through conservation area designations.

7 Law Enforcement

7.1 Law enforcement

7.1.3 Sub-national Level

- 7.1.3.1** Enforce slow wake zones and marine conservation area regulations to protect aquatic vegetation.
- 7.1.3.2** Increase the number of law enforcement officers tending to wildlife issues to a reasonable number to sufficiently cover the State and marine waters.

7.1.4 Scale Unspecified

- 7.1.4.1** Improve enforcement of policies and/or regulations that promote the reduction of run-off and point and non-point source pollution into NJ's aquatic systems (streams, rivers, lakes/ponds, bays, ocean, wetlands, etc.).
- 7.1.4.4** Improve enforcement of policies/regulations aimed at protecting and preserving critical coastal and marsh habitats, and secure mitigation for losses that create an environmental benefit.
- 7.1.4.5** Enforce current policies and/or regulations to increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal SGCN, and implement and enforce amended policies/regulations.
- 7.1.4.7** Increase law enforcement presence to enforce regulations governing recreational activities (e.g., the use of personal watercraft and off road vehicles, caving, rock climbing, etc.) on conserved lands and within other sensitive habitats, and discourage activities that cause harm or disturbance to vegetation, wetlands, fish and wildlife.
- 7.1.4.11** Implement and enforce policies/regulations that will increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.
- 7.1.4.12** Implement policies and/or regulations that protect significant natural and/or unique communities in perpetuity.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.2** Develop a team of personnel from government entities, conservation organizations and other stakeholders engaged in oil/gas spill response for marine and freshwater habitats to develop a feasible plan for oil spill response and/or to amend NJ's current oil spill response plan that clearly outlines each organizations responsibilities and an assessment and location list of available equipment for boom deployment during oil spills.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need
North Atlantic Right Whale

- 8.1.0.3 Develop an outreach team of personnel from government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 8.1.0.6 Engage government agencies, conservation partners and other stakeholders in discussions focused on sharing information regarding coastal and marine critical wildlife habitats, developing comprehensive mapping to assist in reducing impacts of energy production activities, and establishing a long-term monitoring program to update the data. Ensure this information is available to appropriate personnel for planning or response measures.
- 8.1.0.11 Engage government agencies, conservation partners and other stakeholders to collaboratively develop and implement an extensive educational/outreach program targeting sportsmen's organizations and fisheries, as well as public constituents, addressing the unintended effects abandoned fishing gear, tackle and crab pots can have on wildlife, and promote the collection and/or reporting of abandoned items and their locations.
- 8.1.0.12 Engage government agencies, conservation partners and other stakeholders to collaboratively develop and implement an extensive educational/outreach program targeting sportsmen's organizations and fisheries, as well as public constituents, addressing the unintended effects fishing gear and tackle can have on wildlife.
- 8.1.0.14 Engage DOD in a constructive dialogue regarding strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities.
- 8.1.0.19 Engage government agencies, conservation partners and other stakeholders to collaboratively develop a list of important projects, targeting SGCN and/or their habitat, as a guide for graduate student research. Distribute the list and contact information to all State colleges and universities.
- 8.1.0.23 Work with the NJ Division of Fish and Wildlife's Bureau of Marine Fisheries, local recreational and commercial fisheries associations, and fishers to develop a process that encourages fishermen to report the number and location of lost pots to the appropriate state agency/agencies at the end of the harvest season.
- 8.1.0.30 Encourage government agencies and conservation partners to advise members of the relevant scientific community of the need for specific studies, reports or investigations targeting the data-deficiency regarding SGCN and/or their habitats.
- 8.1.0.31 Encourage government agencies, conservation partners and other stakeholders to work together to create GIS mapping for marine wildlife and habitat to assist in reducing impacts of energy production activities. Ensure this information is available to appropriate personnel for planning or response measures.
- 8.1.0.40 Encourage researchers, land managers, naturalists and enthusiasts to follow proper procedures for the coordination and/or permitting of research/management activities involving wildlife and sensitive habitats, and discourage activities that alter vegetation or wetlands, or cause harm or disturbance to wildlife.
- 8.1.0.42 Engage citizens, wildlife observers and photographers through discussions and distributable information regarding the importance of and encouraging implementing responsible and ethical behavior when observing wildlife by developing an alliance of wildlife photographers and widely circulating recommendations on how to reduce impact.
- 8.1.0.46 Form cooperative partnerships with dredging companies to facilitate habitat creation and enhancement within project areas, and to identify seasonal timing of activities that would minimize impacts to wildlife and their habitats.

North Atlantic Right Whale

8.1.0.47 Form cooperative partnerships with energy companies to facilitate habitat creation and enhancement away from and outside of project areas, the restoration of appropriate habitats within project areas (e.g., rights-of-way could benefit butterflies and some bird species), and to identify seasonal timing of activities that would minimize impacts to wildlife.

8.1.0.48 Form cooperative partnerships with transportation and shipment agencies and companies to facilitate habitat creation and enhancement away from and outside of project areas and to identify seasonal timing of activities that would minimize impacts to wildlife.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

8.3.0.2 Utilize WSFR grant funds, in combination with alternate funding sources as needed, to implement an extensive educational/outreach program consisting of displays, fliers, list-serve mailings, Facebook posts and speaking engagements with sportsmen's organizations and fisheries, as well as public constituents, addressing the unintended effects fishing gear and tackle can have on non-target species.

8.3.0.4 Utilize WSFR grant funds, in combination with alternate funding sources as needed, to implement an extensive educational/outreach program consisting of displays, fliers, list-serve mailings, Facebook posts and speaking engagements with sportsmen's organizations and fisheries addressing the unintended effects abandoned fishing gear, tackle and crab pots can have on wildlife.

8.3.0.8 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate recreationists and encourage landowners to eliminate garbage in the vicinity of suitable wildlife habitat, in particular SGCN habitat. Information should include the detrimental impacts garbage may have on various wildlife species.

8.3.0.10 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate landowners and NJ citizens on threats to fish and wildlife (including marine animals).

8.3.0.12 Promote awareness of WSFR (Wildlife and Sportfish Restoration) Outreach/Awareness grants, an important funding source for conservation among hunters and anglers as well as the general public.

8.3.0.13 Conduct an educational campaign to encourage observer ethics and respect for wildlife and natural habitat.

8.3.0.14 Develop an educational outreach program using a variety of media to ensure maximizing the distribution of information, in particular targeting sportsmen's organizations and fisheries, regarding the unintended effects abandoned fishing gear, tackle and crab pots can have on wildlife, including non-target species.

8.3.0.15 Develop an educational outreach program for citizens regarding: 1) The impacts to wildlife as a result of plastic bags entering aquatic and marine systems, 2) The importance of decreasing the amount of plastic shopping bags in circulation, 3) The need for businesses to voluntarily charge for bags or reimburse people for using their own non-plastic bags, and 4) The need for their assistance through public pressure on legislators and government to pass legislation that limits the amount of plastic shopping bags in circulation.

8.3.0.20 Develop an educational outreach program for landowners, particularly those in the coastal and bay areas, boaters, and the general public with information about the negative impacts on marine wildlife and habitats, and steps they can implement to reduce these impacts.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

- 9.1.0.1** Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and SGCN inhabiting them.
- 9.1.0.3** Develop a plan that directs the creation of impervious surfaces away from and to minimize impacts on aquatic systems and critical terrestrial habitats. The plan should also include strategies to increase the resiliency of aquatic and critical terrestrial habitats to threats and stressors that would impact the reproduction and survival of wildlife.
- 9.1.0.8** Develop a plan that focuses on strategies for oil pipelines to avoid sensitive habitats that would be highly impacted by oil spills.
- 9.1.0.29** Provide GIS or related data, maps, resource inventories, as well as related training, pertaining to the SWAP and it's recommended conservation actions for use or consideration by State, County or municipal planning agencies.
- 9.1.0.33** Review the species, threats, action successes, and habitats, and work with partners to revise the 2017 State Wildlife Action Plan for the 2025 resubmittal.

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.3** Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.1.6** Amend NJ's current oil spill response plan to 1) expand the geographic area addressed, 2) expand the targeted species impacted and in need of recovery, and 3) revise current and integrate new actions into the plan as needed.
- 9.3.1.15** Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.
- 9.3.1.16** DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.

9.3.2 Listed species recovery planning

- 9.3.2.1** Develop proactive species recovery plans for all endangered and threatened species including guidance and objectives pertaining to critical and supporting habitat to meet and maintain recovery goals.

9.3.3 Habitat management planning

- 9.3.3.10** Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
- 9.3.3.12** Develop a management plan using engineering standards that embrace both shore protection/resiliency and habitat creation for shorebirds, horseshoe crabs and other coastal species along the Atlantic and Delaware Bay coasts.
- 9.3.3.16** Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.

- 9.3.3.18 In cooperation with species and habitat experts, develop management plans for significant natural and/or unique communities, in particular those supporting SGCN, and provide the information to the landowners/managers (federal, state and local government agencies or non-government organization) for review and implementation.
- 9.3.3.24 Develop a plan to improve the enforcement of policies and/or regulations that protect wetlands, riparian and floodplain areas, and aquatic habitats (including open waters).
- 9.3.3.25 Develop a habitat management plan focused on areas important to near-shore, coastal species (e.g., herring, sturgeon, terrapin, nesting birds) that prioritizes these areas to direct resources to minimize the impacts of sea-level rise, flooding and storms (including extreme rain events) such as increased erosion of beach, mudflat and marsh habitats, and the increased risk of saltwater intrusion into freshwater habitats. Gather "best information" for spatial modeling of anticipated habitat shifts from sea-level rise, flooding, etc.
- 9.3.3.28 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.
- 9.3.3.32 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

- 11.1.1.1 Use Biotics database and Landscape Project Mapping in regulatory reviews to ensure protection by applicable laws and regulations.
- 11.1.1.2 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
- 11.1.1.7 Review proposed construction or other work projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.8 Review proposed research projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.11 Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed offshore energy projects relating to drilling, extraction and distribution of petroleum and gas products to reduce habitat destruction and minimize impacts on wildlife.
- 11.1.1.13 Use the best available science (species data, habitat present, wind farm layout options, wind blade impacts on migratory species, location of migration routes, etc.) when conducting regulatory reviews of proposed wind farm projects to minimize impacts on migratory and resident wildlife and reduce habitat fragmentation.

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

- 11.2.0.20 Provide educational resources and technical support to public and private landowners and land managers to promote the protection and/or enhancement of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN.

North Atlantic Right Whale

11.2.0.26 Make educational resources available to the public that encourage researchers to seek out guidance prior to finalizing proposals and submitting State permit applications to reduce potential impacts on sensitive species.

11.2.1 With individuals and groups involved in resource management decision making

11.2.1.2 Provide professional training and technical assistance tools (e.g., mapping, guidance documents, justification, etc.) to agencies/divisions/programs within and outside of the NJ DEP regarding the SWAP, and the conservation actions recommended therein to help facilitate SWAP implementation.

11.2.1.4 Provide educational resources, training programs, and on-the-ground guidance to dredging companies and resource managers on habitat creation and enhancement away from and outside of shipping lanes, and to identify seasonal timing of activities that would minimize impacts to wildlife and their habitats.

11.2.1.6 Provide educational resources, training programs, and on-the-ground guidance to resource agencies prior to project initiation to ensure wildlife and their habitats are protected to the highest degree possible during construction, and provisions are in place for post-construction habitat use.

100 Law and Policy

100. Legislation

100.1.3 Sub-national Level

100.1.3.4 Initiate legislative action to establish an annual budgetary line item designating funds to support programs and monitoring stations throughout Barnegat, Little Egg Harbor and Great Bay focused on long-term monitoring of submerged aquatic vegetation, both native and exotic species.

100.1.4 County and Local

100.1.4.8 Secure critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through local ordinances.

100.1.5 Scale Unspecified

100.1.5.3 Incorporate aquatic habitat connectivity and water quality/effluent standards into state/local policy to minimize the impact of aquaculture on fish and wildlife.

100. State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

100.3.0.1 Develop (and/or improve) policies and/or regulations that will promote the reduction of run-off and point and non-point source pollution into NJ's aquatic systems (streams, rivers, lakes/ponds, bays, ocean, wetlands, etc.).

100.3.0.2 Improve policies/regulations aimed at protecting and preserving critical coastal and marsh habitats and securing mitigation for losses that create an environmental benefit.

100.3.0.4 Promote policies and regulations that support marine conservation zone designations in suitable areas identified through research and literature.

100.3.0.7 Amend current policies and/or regulations to increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need
North Atlantic Right Whale

- 100.3.0.8 Develop policies and/or regulations with the objective of protecting significant natural and/or unique communities in perpetuity.
- 100.3.0.9 Secure mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.23 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.26 Adopt regulations requiring the combined sewer overflow alternative analyses required by regulation address potential impacts to wildlife in watercourses or receiving water bodies.
- 100.3.0.27 Amend harvest, license and/or permit requirements to incorporate guidance regarding the use of gear and/or tackle and current best practices to minimize bycatch or entanglement of non-target species.
- 100.3.0.28 Amend harvest, license and/or permit requirements to require mandatory reporting by permittees/licensees of lost harvest gear, by-catch and, entanglement of non-target species.
- 100.3.0.30 Amend the NJ Bureau of Marine Fisheries commercial licensing and harvest reporting system to require fishermen to report the number and location of lost pots to the appropriate state agency/agencies at the end of the harvest season.
- 100.3.0.37 Develop a law and/or policy that requires NJ DEP to continue to address and correct the allowable combined sewer overflow inputs of solid waste into the marine environment to minimize harm to wildlife and their habitats.
- 100.3.0.38 Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.
- 100.3.0.39 Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.3.0.44 Incorporate requirements for technical support and funding for mitigation or restoration efforts so as to be consistent with existing regulations.
- 100.3.0.46 Investigate and/or develop inter-agency Memorandum of Agreements to share common data stored or managed in program-specific databases.
- 100.3.0.49 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address the issue of disturbance to habitat or species as a result of human activities (e.g., construction, bridge maintenance, road work, etc.).
- 100.3.0.50 Retain endangered, threatened and special concern wildlife and habitat protection measures in the Water Quality Management Program Rules.
- 100.3.0.52 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded energy sitings and facilities.
- 100.3.0.59 Develop regulations that when implemented will increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.
- 100.3.0.60 Develop regulations that when implemented will protect significant natural and/or unique communities in perpetuity.

100. State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.1** Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).
- 100.4.0.7** Develop a law and/or policy that requires NJ DEP to continue to address and correct the allowable combined sewer overflow inputs of solid waste into the marine environment to minimize harm to wildlife and their habitats.
- 100.4.0.10** Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.
- 100.4.0.11** Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.4.0.21** Ensure that Section 303(d) of the Clean Water Act and applicable State statutory/regulatory requirements for surface water pollutant budgets are being met by monitoring and enforcing regulatory Total Maximum Daily Load (TMDL) targets established within regional Water Quality Management Plans.

Birds

Beach nesting Birds

Focal species that comprise this Conservation Target:

American Oystercatcher
Piping Plover

Black Skimmer

Least Tern

Threats and Action Drivers associated with this Conservation Target:

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale) (Avg. Score: 1.00)

NJ Specific Threats: 1.1.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.1.2 Residential development using materials that cause collision hazards (Avg. Score: 1.00)

NJ Specific Threats: 1.1.2.1 Collision risk to volant species (birds, bats and invertebrates).

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale) (Avg. Score: 1.00)

NJ Specific Threats: 1.2.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.

1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.2.2 Commercial development using materials that cause collision hazards (Avg. Score: 2.00)

NJ Specific Threats: 1.2.2.1 Collision risk to volant species (birds, bats and invertebrates).

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale) (Avg. Score: 2.00)

NJ Specific Threats: 1.3.1.2 Loss, alteration and/or degradation of habitat.

1.3.1.5 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

3 Energy Production and Mining

3.1 Oil and Gas Facilities and Pipelines

3.1.1 Distribution processes of petroleum and other liquid hydrocarbons (Avg. Score: 1.00)

NJ Specific Threats: 3.1.1.1 Fragments terrestrial and aquatic habitats.

3.1.1.2 Loss, alteration and/or degradation of habitat.

3.1.1.3 Increased risk of oil spills.

3.1.1.4 Increased noise pollution.

3.1.1.5 Increased vehicular and ship traffic associated with construction and operations, and therefore an increased risk of wildlife mortality from strikes.

Beach nesting Birds

3.1.2 Natural gas distribution processes

(Avg. Score: 1.00)

NJ Specific Threats: 3.1.2.2 Loss, alteration and/or degradation of habitat.

3.1.2.3 Increased risk of gas leaks and explosions.

3.1.2.5 Increased vehicular and ship traffic associated with construction and operations, and therefore an increased risk of wildlife mortality from strikes.

3.2 Mining and Quarrying

3.2.4 Sand Dredging (outside shipping lanes)

(Avg. Score: 1.00)

NJ Specific Threats: 3.2.4.1 Loss, alteration and/or degradation of benthic marine habitats.

3.2.4.2 Increased noise pollution.

3.2.4.3 Potential for direct mortality of benthic organisms.

3.3 Renewable Energy

3.3.1 Wind Power

(Avg. Score: 1.25)

NJ Specific Threats: 3.3.1.1 Turbines, blades, and structure foundations create a collision risk to volant species (birds, bats and invertebrates) and marine animals.

3.3.1.2 Fragments terrestrial habitats.

3.3.1.3 Loss, alteration and/or degradation of habitat.

3.3.1.4 Increased commercial infrastructure.

3.3.2 Solar Power

(Avg. Score: 1.00)

NJ Specific Threats: 3.3.2.2 Loss, alteration and/or degradation of habitat.

4 Transportation and Service Corridors

4.1 Roads and Railroads

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale) (Avg. Score: 1.00)

NJ Specific Threats: 4.1.1.2 Loss, alteration and/or degradation of habitat associated with road and railroad construction and maintenance, and degradation of adjacent habitats.

4.1.2 Movement of cars and other vehicles on roads and railroads (large and small scale) (Avg. Score: 1.00)

NJ Specific Threats: 4.1.2.1 Increased vehicle traffic increases the risk of wildlife mortality from strikes.

4.2 Utility and Service Lines

4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads (Avg. Score: 1.00)

NJ Specific Threats: 4.2.1.5 Tall radio and utility towers with guy lines pose a strike hazard for migrant bats and birds, especially in poor visibility conditions (e.g., fog, nighttime, poor weather conditions).

4.3 Shipping Lanes

4.3.2 Dredging impacts

(Avg. Score: 1.25)

NJ Specific Threats: 4.3.2.2 Historic and current reuse of containment facilities over time may disrupt/displace nesting birds.

4.3.2.3 Transportation of materials to and from disposal facilities may pose temporary disturbance to wildlife impacting foraging and nesting success.

4.4 Flight Paths

Beach nesting Birds

4.4.1 Airplane flight paths (Avg. Score: 1.00)

NJ Specific Threats: 4.4.1.1 Increased noise disturbance to wildlife, disrupting their normal behaviors.

4.4.1.2 Increased risk of collision between airplanes and birds, bats and insects.

5 Biological Resource Use

5.4 Fishing and Harvesting of Aquatic Resources

5.4.2 Intentional Use (large scale) (Avg. Score: 0.50)

NJ Specific Threats: 5.4.2.1 Overharvesting of one species may lead to detrimental impacts on another; e.g., overharvest of menhaden affecting piscivorous birds.

5.4.3 Unintentional effects (subsistence/small scale) (Avg. Score: 1.00)

NJ Specific Threats: 5.4.3.1 Abandoned fishing tackle and gear, crab pots without excluders and ghost crab pots increase the risk of injury and death to marine mammals, sea turtles, sea birds, pinnipeds and fish species as well as terrestrial and semi-aquatic species as a result of consuming tackle or gear, entrapment and entanglement in gear.

5.4.3.2 Commercial/recreational shellfish dredging may impact marine ecosystems by uprooting submerged aquatic vegetation, disrupting substrates, increasing turbidity, and increasing predator species in localized areas.

5.4.3.3 Heavy fishing pressure in localized areas can prevent foraging birds from hunting prime areas decreasing their likelihood of success and reproduction.

5.4.3.6 Fishing gear used by commercial fisheries results in bycatch or entanglement of non-targeted wildlife leading to injury and/or mortality.

5.4.4 Unintentional effects (large scale) (Avg. Score: 0.75)

NJ Specific Threats: 5.4.4.2 Commercial/recreational shellfish dredging may impact marine ecosystems by uprooting submerged aquatic vegetation, disrupting substrates, increasing turbidity, and increasing predator species in localized areas.

5.4.4.3 Heavy fishing pressure in localized areas can prevent foraging birds from hunting prime areas decreasing their likelihood of success and reproduction.

5.4.4.5 Fishing gear used by commercial fisheries results in bycatch or entanglement of non-targeted wildlife leading to injury and/or mortality.

5.4.4.6 Overexploitation of riparian, estuarine, and marine fisheries may deplete food resources required by marine mammals, sea turtles, marine fish and piscivorous birds, in turn resulting lower reproduction and survival.

6 Human Intrusions and Disturbance

6.1 Recreational Activities

6.1.1 Off-road vehicles (motorized and non-motorized) (Avg. Score: 3.00)

NJ Specific Threats: 6.1.1.1 Inappropriate use of off-road vehicles creates new roads/trails which fragments habitat.

6.1.1.2 Inappropriate use of off-road vehicles can degrade terrestrial and aquatic habitat and reduce the suitability of adjacent habitats for wildlife.

6.1.1.3 Increased risk of harassment that results in a change in wildlife behavior and/or direct mortality from vehicle strikes.

6.1.1.4 Increased noise pollution.

6.1.1.5 Vehicle use on beaches can cause disturbance, harms breeding and foraging habitats, and can cause direct mortality of beach-nesting birds.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Beach nesting Birds

6.1.1.6 Off-road vehicles can be a mechanism of transference of wildlife diseases and invasive plant species if gear and apparel are not properly sanitized between sites.

6.1.2 Boating (Avg. Score: 2.25)

NJ Specific Threats: 6.1.2.1 Alteration and/or degradation of aquatic habitat.

6.1.2.2 Increased disturbance to marine animals and ocean-, bay- and marsh-associated birds which can alter their behavior decreasing the likelihood of their success and/or reproduction.

6.1.3 Use of beaches (Avg. Score: 3.00)

NJ Specific Threats: 6.1.3.1 Increases disturbance to beach nesting birds that reduces nesting success, and reduces foraging and resting opportunities for a wide range of nesting and migrating shorebirds.

6.1.5 Wildlife observation and photography (Avg. Score: 2.00)

NJ Specific Threats: 6.1.5.1 Improperly conducted recreational activities may disrupt normal wildlife behaviors which can result in reduced reproductive success or survival, abandonment of critical sites, etc.

6.1.7 Other (Avg. Score: 1.00)

NJ Specific Threats: 6.1.7.1 Use of recreational or commercial pyrotechnics may cause temporary disturbance to wildlife, in particular to nesting birds.

6.1.7.3 Drone use in areas with sensitive wildlife (e.g., nesting and foraging birds, migrating and foraging/feeding whales) can alter their behavior and can cause disturbance that impacts their reproductive and/or foraging success.

6.2 Military Exercises

6.2.1 Military exercises (Avg. Score: 1.00)

NJ Specific Threats: 6.2.1.1 Military testing and training exercises may inflict disturbance and potential physical harm to wildlife.

6.3 Work and Other Activities

6.3.1 Unauthorized research projects at significant habitats (Avg. Score: 2.00)

NJ Specific Threats: 6.3.1.2 Accidental trampling of nests, eggs/egg masses, and unseen individuals may impact reproductive success or cause direct mortality to SGCN.

6.3.1.3 Activities conducted without proper precautions may disturb and disrupt normal wildlife behaviors, which may impact reproductive success or survival, cause abandonment of critical sites, etc.

6.3.2 Authorized research projects at significant habitats (Avg. Score: 1.00)

NJ Specific Threats: 6.3.2.3 Accidental trampling of nests, eggs/egg masses, and unseen individuals may impact reproductive success or cause direct mortality to SGCN.

6.3.2.4 Activities conducted without proper precautions may disturb and disrupt normal wildlife behaviors, which may impact reproductive success or survival, cause abandonment of critical sites, etc.

6.3.3 Other "work" unrelated to research (Avg. Score: 3.00)

NJ Specific Threats: 6.3.3.1 Construction projects may disrupt normal wildlife behavior which can result in reduced reproductive success or survival, abandonment of critical sites, etc. (e.g., bridge-nesting birds).

6.3.3.2 Intensive dune and beach management (including overuse of dune fencing, sand mining, mechanical beach raking, storm clean up), reduces foraging habitat for beach nesting and migratory shorebirds, and poses risks of injury and mortality to unfledged chicks.

6.3.3.3 Beach nourishment projects create suitable habitat for beach-nesting birds in areas of high human use, increasing the likelihood of disturbance to the birds, harm to the eggs, and injury and/or mortality to chicks.

7 Natural Systems Modifications

Beach nesting Birds

7.3 Other Ecosystem Modifications

7.3.1 Shoreline Stabilization (Avg. Score: 3.00)

NJ Specific Threats: 7.3.1.1 Efforts to stabilize barrier islands and shorelines, including jetties, groins, bulkheads, interfere with the natural geological processes needed to create and maintain high quality habitat for beach strand species.

7.3.4 Lack of natural disturbance patterns or ecosystem functions due to species loss (Avg. Score: 2.00)

NJ Specific Threats: 7.3.4.4 Human interference in natural processes such as clean up (e.g., beach-filling, shoreline hardening, tree/log removal from forests) after storms, in particular those causing post-hurricane washover and/or barrier island westward movement, and tree felling limits the disturbance needed to maintain appropriate habitats for wildlife.

7.3.5 Poor habitat management (Avg. Score: 3.00)

NJ Specific Threats: 7.3.5.5 Habitat management that alters or removes vegetation without implementing long-term management increases the risk of invasive and exotic plants establishing themselves, outcompeting native vegetation.

7.3.5.6 Habitat management, including that which occurs on public and private lands, that does not consider timing and species' behaviors can result in the direct mortality and/or alteration or loss of habitat.

7.3.5.13 Private landowners with rare species on their properties are not always cooperative in the protection and management of the species' habitats. Landowners may be held accountable for their actions when they cause harm to the species or destroy the habitat, but it is often too late for the species' population.

7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.

7.3.5.16 Lack of proactive management to preserve or maintain viable and functioning marshes for SGCN wildlife.

8 Invasive and Other Problematic Species, Genes and Diseases

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.1 Unspecified Species (Avg. Score: 3.00)

NJ Specific Threats: 8.1.1.2 Alters, degrades and/or reduces the structural diversity of the natural composition of the landscape, including aquatic systems.

8.1.1.4 Invasive, non-native animals increase the risk of predation on native animals and/or herbivory on native vegetation.

8.1.1.6 Invasive, non-native plants may create physical barriers for some species.

8.1.4 Invasive non-native terrestrial/wetland animals (Avg. Score: 3.00)

NJ Specific Threats: 8.1.4.2 Free-roaming and feral domestic animals such as cats and dogs causes direct mortality of wildlife and disturbance to wildlife breeding and resting areas.

8.1.5 Invasive non-native terrestrial/wetland plants (Avg. Score: 2.00)

NJ Specific Threats: 8.1.5.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.2 Problematic Native Species/Diseases

8.2.1 Unspecified Species (Avg. Score: 3.00)

NJ Specific Threats: 8.2.1.4 Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.

Beach nesting Birds

8.2.2 Named Species

(Avg. Score: 3.00)

- NJ Specific Threats:** 8.2.2.1 Dogs on beaches create severe disturbance to beach nesting birds and reduce their nesting success.
- 8.2.2.2 Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.

8.5 Viral/Prion-induced Diseases

8.5.2 Named Species (Disease)

(Avg. Score: 1.00)

- NJ Specific Threats:** 8.5.2.1 Diseases such as West Nile Virus, arenavirus, sudden oak death, Avian Influenza, and snake fungal disease cause morbidity or mortality to native populations.

8.6 Diseases of Unknown Cause

8.6.0 Unknown Diseases

(Avg. Score: 1.00)

- NJ Specific Threats:** 8.6.0.1 Diseases yet to be identified by pathologists and virologists cause decreased fitness or mortality to native populations.

9 Pollution

9.1 Domestic and Urban Waste Water

9.1.1 Sewage

(Avg. Score: 1.00)

- NJ Specific Threats:** 9.1.1.1 Degradation of aquatic and marine water quality and habitats by changing turbidity, flow and water chemistry.

9.1.2 Run-off

(Avg. Score: 1.00)

- NJ Specific Threats:** 9.1.2.2 Contaminants degrade aquatic and marine water quality and can bioaccumulate in benthic organisms, threatening wildlife by causing developmental and behavioral abnormalities and reproductive failure.
- 9.1.2.3 Contaminants from road runoff (oil, sediment, salt, etc.) impact native vegetation and the species that rely upon them, degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.

9.2 Industrial and Military Effluents

9.2.1 Oil Spills

(Avg. Score: 1.00)

- NJ Specific Threats:** 9.2.1.1 Oil spills render resting, breeding and foraging habitats temporarily unavailable to wildlife, altering normal wildlife behavior.
- 9.2.1.2 Oil spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.
- 9.2.1.3 Oil spills cause external oiling of wildlife and ingestion of oil, both of which can injure or kill wildlife.

9.2.3 Other

(Avg. Score: 1.00)

- NJ Specific Threats:** 9.2.3.1 Point and nonpoint source pollution such as polychlorinated biphenyls (PCBs), pesticides, heavy metals, and endocrine disrupting compounds (EDC's) into freshwater and marine systems pose threats to wildlife through direct contact and/or ingestion, and to aquatic species and their predators through bioaccumulation, impacting the reproductive success and neurological function of many avian and fish species.
- 9.2.3.2 Chemical spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.
- 9.2.3.3 Chemical spills may render resting, breeding and foraging habitats temporarily unavailable to wildlife, altering normal wildlife behavior.

9.3 Agricultural and Forestry Effluents

9.3.3 Herbicides and Pesticides

(Avg. Score: 1.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Beach nesting Birds

NJ Specific Threats: 9.3.3.1 Pesticides degrade terrestrial and aquatic habitats, especially streams, ponds and wetlands. Aquatic wildlife are particularly sensitive to these contaminants, which can cause developmental and behavioral abnormalities and reproductive failure. Some contaminants may bioaccumulate in predatory fish and birds and disrupt reproduction.

9.3.5 Control of insect pests and plants leading to mortality of non-target species (Avg. Score: 1.00)
not associated with agriculture

NJ Specific Threats: 9.3.5.5 Use of pesticides and herbicides can minimize the abundance of food sources for native wildlife populations.

9.4 Garbage and Solid Waste

9.4.1 Direct hazards to wildlife (Avg. Score: 2.00)

NJ Specific Threats: 9.4.1.1 Wildlife may ingest garbage causing choking or impingement in the digestive system, or they may become physically entangled in it (e.g., plastic or abandoned fish nets); conditions that make them unable to feed or drink, cause them to suffocate or drown, or otherwise restrict the animal's movement making them more susceptible to predators, starvation or injury.

9.5 Air-Bourne Pollutants

9.5.1 Acid Rain (Avg. Score: 1.00)

NJ Specific Threats: 9.5.1.1 Causes acidification of water bodies, resulting in changes to aquatic and marine communities and reducing biodiversity, and creating conditions that are unsuitable for some aquatic (freshwater and marine) and semi-aquatic species that are sensitive to pH shifts.

9.5.6 Herbicides and Pesticides (Avg. Score: 1.00)

NJ Specific Threats: 9.5.6.1 May result in injury or direct mortality of non-target species.

9.6 Excess Energy

9.6.1 Light Pollution (Avg. Score: 2.00)

NJ Specific Threats: 9.6.1.1 Artificial lighting can reduce suitability of adjacent habitat for species sensitive to artificial lights by disorienting wildlife, reducing foraging suitability or success, or increasing visibility to predators, resulting in reduced diversity and/or productivity of species in adjacent habitat.

9.6.3 Noise Pollution (Avg. Score: 2.00)

NJ Specific Threats: 9.6.3.1 Acute and chronic noise pollution in and adjacent to terrestrial and aquatic (marine and freshwater) environments could disrupt normal behaviors of wildlife such as migration, communication, feeding, eluding predators, resting and breeding, etc.

11 Climate Change and Severe Weather

11.1 Habitat Shifting or Alteration

11.1.0 Macro- and Micro-Climate Alterations (Avg. Score: 1.00)

NJ Specific Threats: 11.1.0.1 Alters native terrestrial and aquatic habitats at the macro- and micro-climate levels that can affect suitability for wildlife, in particular specialist species.

11.2 Droughts

11.2.1 Droughts (Avg. Score: 1.00)

NJ Specific Threats: 11.2.1.3 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

11.3 Temperature Extremes

11.3.1 Temperature extremes (Avg. Score: 2.00)

NJ Specific Threats: 11.3.1.1 Increasing temperatures may cause habitat loss and degradation by desiccating and/or raising the temperatures of small wetlands and streams leading to the loss of freshwater mussels and other aquatic species and species reliant upon these habitats.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Beach nesting Birds

- 11.3.1.2 Increased temperatures can negatively impact wetland, riverine, lacustrine and vernal pool-associated or -dependent wildlife by reducing flows, increasing water temperatures, lowering water levels and causing premature drying of vernal habitats.
- 11.3.1.3 Temperature extremes of surface water and air degrades marine habitats and ecosystems, threatening marine wildlife. Such extremes also disrupt offshore currents and migratory patterns, species' ranges, and/or impact communities/food chains, all of which further impact the ecosystem.
- 11.3.1.4 Extremely low temperatures and/or extensive periods of unseasonably low temperatures during critical life history stages (e.g., hibernation, gestation/nesting) can alter animals' behaviors and decrease survivorship.

11.4 Storms and Flooding

11.4.1 Storms and flooding (Avg. Score: 3.00)

- NJ Specific Threats:** 11.4.1.1 Extreme storms and flooding events threaten aquatic and marine wildlife through habitat degradation and alteration, including alterations to off-shore or back-bay benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic and marine wildlife.
- 11.4.1.2 Potentially damage coastal habitats, including beach- and marsh-nesting bird habitats and interdunal wetlands, and can increase marsh erosion.
- 11.4.1.6 Increased storms and flooding reduce nesting success, especially for ground-nesting birds.
- 11.4.1.7 Potentially damage coastal habitats, including beach and marsh habitats used by spawning horseshoe crabs, nesting diamondback terrapins, and resting and foraging birds.

11.4.2 Increased rainfall (Avg. Score: 2.00)

- NJ Specific Threats:** 11.4.2.1 Extreme rain events threaten aquatic wildlife through habitat degradation and alteration, including alterations to benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic wildlife.
- 11.4.2.2 Extreme rain events can damage wildlife nesting and resting habitats, including impacts to avian eggs and chick and small mammal survivorship.
- 11.4.2.3 More frequent rain events can alter terrestrial and wetland vegetation communities as well as wetland hydrology, shifting wildlife community use.

11.6 Phenology Shifting or Alteration

11.6.2 Phenology shifts related to predator-prey ecology (Avg. Score: 2.00)

- NJ Specific Threats:** 11.6.2.1 Alters inter-specific relationships (e.g., competition, parasitism, predation) of wildlife, ultimately leads to detrimental impacts on the ecological system.
- 11.6.2.2 Shifts timing of species migration, breeding and hibernation, and available food resources, causes redistribution of species, or mortality for species that are unable to relocate due to their already isolated habitat or limited mobility.

11.6.3 Phenology shifts related to species redistribution (Avg. Score: 1.00)

- NJ Specific Threats:** 11.6.3.1 Shifts in timing of species migration, breeding and hibernation, and available food resources, as a result of wildlife range shifts driven by climate change.
- 11.6.3.2 Shifts in nesting times or egg incubation durations can limit nest success and longterm populations.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory (Avg. Score: 1.75)

- NJ Specific Threats:** 12.1.1.4 Lack of information on the morphometrics and trends of coastal salt marshes and salt marsh islands.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Beach nesting Birds

12.1.1.5 Lack of information regarding the SGCN populations that use managed salt marshes and the best techniques for making improvements for marsh-dependent SGCN wildlife.

12.1.1.6 Lack of information regarding migratory pathways and response of wildlife to lights and noise associated with offshore wind turbines.

12.1.3 Need to answer research question (Avg. Score: 3.00)

NJ Specific Threats: 12.1.3.1 There are significant knowledge gaps regarding distribution, dispersal, diseases, population trends, etc. of SGCN.

12.1.3.4 Lack of information regarding the potential short- and long-term impacts of wind turbines and other tall coastal structures on migratory populations.

12.1.4 Need to develop new technique (Avg. Score: 1.50)

NJ Specific Threats: 12.1.4.1 Improve and evaluate survey methods for SGCN and their habitats; alter as needed.

12.1.4.3 Lack of techniques for high marsh preservation that includes impoundments and elevated islands.

12.1.4.4 Lack of consideration of habitat management opportunities in the course of salt marsh management for mosquito control.

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms (Avg. Score: 2.00)

NJ Specific Threats: 12.3.0.7 Activities that threaten SGCN, their food sources, and/or habitats are often regulated separately and without consideration for the cumulative and synergistic effects over time or over a larger spatial scale. Therefore, regulations can fail to protect SGCN populations over time.

12.3.0.10 Land use regulatory processes pertaining to habitat creation, enhancement or restoration projects can be costly and/or burdensome, precluding or discouraging the development or implementation of conservation projects.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform (Avg. Score: 1.00)

NJ Specific Threats: 12.4.0.1 A species-by-species management focus as opposed to ecological systems and biodiversity generally has greater opportunity for unintended consequences for other species and may be less efficient in developing appropriate management actions.

12.4.0.2 Policies and procedures for lands management that lack consideration of the impacts of activity timing can result in unintended impacts to wildlife during vulnerable periods.

12.4.0.3 Lack of internal understanding regarding beneficial habitat impacts of storm events leads to policies and practices that reverse or decrease such beneficial effects (e.g., beach-filling, shoreline hardening, "hazard" tree and log removal from forests, etc.

12.4.0.6 Techniques for ecological management or restoration of shorelines are not fully developed or evaluated for effectiveness for target and non-target SGCN in coastal areas.

12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats (Avg. Score: 3.00)

NJ Specific Threats: 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.

14.1.1.2 Lack of general knowledge of SGCN life histories and vulnerabilities as they relate to land management practices.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Beach nesting Birds

- 14.1.1.3 Lack of understanding of the need to manage both natural and anthropogenic (e.g., yards, lawns, hayfields, etc.) habitats to minimize impacts or increase benefits to SGCM and their habitats.

14.2 Outreach needs

- 14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions** (Avg. Score: 3.00)

NJ Specific Threats: 14.2.1.3 Need to develop greater understanding of and support for efforts implemented to enhance SGCM habitat and biodiversity through various coastal management practices.

14.2.1.4 Need to develop greater understanding of and support for efforts implemented to maintain disturbance-free habitats that allow coastal wildlife populations to thrive alongside human residential and recreational uses.

14.2.1.5 Need to develop greater understanding of and support for efforts implemented to enhance SGCM habitat and biodiversity through various wetland management practices.

15 Administrative Needs

15.2 Organizational/program planning needs

- 15.2.3 Need for multi-state, regional and landscape scale planning** (Avg. Score: 2.00)

NJ Specific Threats: 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Actions to address the Threats and Action Drivers associated with this Conservation Target:

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.1 Enhance critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates through incentive programs with adjacent private landowners to increase the effective size of the habitat.
- 1.2.1.2 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to increase the effective size of SGCM habitats by protecting/restoring adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCM, and/or connect conserved SGCM habitats.
- 1.2.1.3 Secure and promote the protection/restoration of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCM birds, fish and other coastal SGCM through incentive programs.
- 1.2.1.10 Coordinate across government agencies and non-government organizations to maximize the availability of and enrollment in existing landowner incentive programs (e.g., "farm bill," partners, etc.) to maintain and/or improve habitat.

Beach nesting Birds

- 1.2.1.11 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 1.2.1.13 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to land developers to minimize the impacts of new residential and commercial developments on SGCN and their habitats.
- 1.2.1.14 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of herbicides and pesticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.16 Create incentives (non-monetary and/or monetary) within State regulations (mitigations requirements or credit, BMP satisfaction, etc.) to promote the use of retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.17 Develop a public-relations oriented certification program for private retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.18 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and land managers to control and reduce the impacts of invasive, native and non-native species in order to increase structural habitat diversity.
- 1.2.1.20 Coordinate across government agencies and non-government organizations to create or expand upon tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMP's.
- 1.2.1.23 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to provide cost shares and/or plan approvals for management based on management approaches and prescriptions.
- 1.2.1.26 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing landowner incentive programs.
- 1.2.1.27 Create legislation to re-instate incentives for citizens bringing their own shopping bag(s) to grocery stores in an effort to decrease the amount of plastic shopping bags in circulation.

2 Direct Management of Natural Resources

2.1 Create new habitat or natural processes

2.1.1 Habitat conversion

- 2.1.1.2 Utilize dredged materials to create marsh islands to provide nesting habitat for birds and marine turtles.

2.6 Hazard or infrastructure removal

Beach nesting Birds

2.6.6 Shoreline armoring removal

2.6.6.1 Remove shoreline armoring to reduce its impacts on aquatic habitats.

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

2.8.0.2 Develop, implement, monitor and evaluate pest control/management strategies to reduce the impacts of over-abundant wildlife species (native and/or native, invasive species) on native vegetation and the degradation of habitats supporting SGCN. Over-abundant wildlife species include but are not limited to mute swans, Canada geese, beaver and white-tailed deer.

2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.

2.8.0.5 Implement biologically safe and appropriate control/management strategies, and where appropriate, eradication strategies to reduce the impacts and/or limit the distribution of invasive and/or non-native plant species within or near aquatic systems using methods that will provide the most protection to the aquatic and riparian ecological system, and minimize disturbance to the soil and wildlife. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.

2.8.0.6 Implement long-term management of invasive and/or non-native plants to help maintain functioning ecological systems and biological diversity, and to enhance travel corridors. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.

2.9 Living shorelines

2.9.1 Beach renourishment

2.9.1.1 Implement best management practices for using mined sand or dredged material to improve habitat for wildlife, particularly for spawning horseshoe crabs and migrating shorebirds.

2.9.1.3 Where beach renourishment projects are deemed necessary, implement such projects with a design to increase availability of nesting and foraging habitat for beach nesting birds.

2.9.1.4 Implement beach renourishment strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimizes harm to wildlife, particularly SGCN.

2.9.1.5 Expand the acreages and enhance the effective size of SGCN habitats by utilizing beach renourishment to restore adjacent, less optimal or unsuitable, habitats.

2.9.1.6 Reclaim degraded rare species habitats using beach renourishment, when appropriate, to restore habitat value for the documented/target SGCN.

2.9.1.7 Protect significant natural and/or unique communities by implementing best management practices for beach renourishment, when applicable.

2.9.1.8 Minimize habitat loss of critical coastal beach habitats that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas through beach renourishment.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Beach nesting Birds

- 2.9.1.11 Enhance critical migratory stopover beach habitats for songbirds, raptors, shorebirds, bats and invertebrates through beach renourishment and expand management to adjacent private lands to increase the effective size of the habitat.
 - 2.9.1.12 Implement beach habitat management on state and other conservation lands to enhance food availability for migratory species (birds, bats, invertebrates).
 - 2.9.1.13 Conduct beach renourishment to maintain, enhance and/or create feeding and roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.
 - 2.9.1.14 Implement best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated beach habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
 - 2.9.1.15 Implement beach management strategies to benefit urban-associated SGCN.
 - 2.9.1.16 Prevent or ameliorate near-term impacts of climate change throughout the State but in particular within the coastal and Delaware Bay areas by implementing habitat management strategies that will establish/improve habitat resilience, such as beach renourishment, that benefits wildlife inhabiting these areas.
- 2.9.2 Erosion control structures
 - 2.9.2.1 Install breakwaters in the form of living shorelines to reduce the impact of wave erosion while preserving the natural character of the site.
- 2.9.3 Sand dune restoration
 - 2.9.3.1 Prevent or ameliorate near-term impacts of climate change throughout the State but in particular within the coastal and Delaware Bay areas by implementing habitat management strategies that will establish/improve habitat resilience, such as sand dune restoration, that benefits wildlife inhabiting these areas.
 - 2.9.3.2 Implement sand dune restoration strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimizes harm to wildlife, particularly SGCN.
 - 2.9.3.3 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats through sand dune restoration.
 - 2.9.3.4 Reclaim degraded rare species habitats using sand dune restoration needed to restore habitat value for the documented/target SGCN.
 - 2.9.3.5 Protect significant natural and/or unique communities by implementing best management practices for sand dune restoration.
 - 2.9.3.6 Minimize habitat loss of critical coastal dune habitats that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas through sand dune restoration.
 - 2.9.3.9 Enhance critical migratory stopover sand dune habitats for songbirds, raptors, shorebirds, bats and invertebrates through sand dune restoration and expand management to adjacent private lands to increase the effective size of the habitat.
 - 2.9.3.10 Implement sand dune restoration strategies on state and other conservation lands to enhance food availability for migratory species (birds, bats, invertebrates).

Beach nesting Birds

- 2.9.3.11 Conduct sand dune restoration to maintain, enhance and/or create feeding and roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State and evaluate the effectiveness of such management.
- 2.9.3.12 Implement best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated sand dune habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

- 2.10.0.1 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 2.10.0.5 Implement habitat restoration and/or enhancement activities that include the creation of vegetative buffers between sensitive habitats (e.g., aquatic systems) and human-inhabited areas (e.g., residences, parks, etc.) and that is conducted during appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.10.0.6 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats.
- 2.10.0.7 Restore/reclaim and enhance degraded rare species habitats through strategic revegetation and management efforts for documented/target SGCN.
- 2.10.0.10 Minimize the loss of important habitats (e.g., coastal scrub-shrub and grassy habitats, high and low marsh habitats, etc.) that provide nesting, migrating, and wintering areas for SGCN birds and other coastal and marsh-dependent species through habitat restoration efforts.
- 2.10.0.11 Restore and/or enhance critical migratory terrestrial and aquatic habitats (e.g., beach, grasslands, forest, scrub-shrub, etc.) for songbirds, raptors, shorebirds, waterfowl, bats and invertebrates through habitat restoration efforts and expand habitat restoration to adjacent private lands to increase the effective size of the habitat.
- 2.10.0.14 Implement best management practices (BMPs), protective strategies and guidelines for restoring and enhancing healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.10.0.23 Restore and/or enhance roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Beach nesting Birds

- 2.11.0.2 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas for target SGCN and/or species groups; management should complement rare species needs in a targeted area.
- 2.11.0.4 Implement vegetation management strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife, particularly SGCN.
- 2.11.0.5 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats through vegetation management.
- 2.11.0.6 Reclaim degraded rare species habitats by conducting vegetation management needed to restore habitat value for the documented/target SGCN.
- 2.11.0.7 Protect significant natural and/or unique communities by implementing best management practices through vegetation management.
- 2.11.0.9 Minimize habitat loss of critical coastal habitats that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas through vegetation management.
- 2.11.0.10 Enhance critical migratory stopover beach habitats for songbirds, raptors, shorebirds, bats and invertebrates through vegetation management and expand management to adjacent private lands to increase the effective size of the habitat.
- 2.11.0.13 Implement best management practices (BMPs), protective strategies, and guidelines for vegetation management to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.11.0.16 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 2.11.0.23 Implement appropriate habitat management actions in areas where natural disturbances, such as wildfire, have been precluded.
- 2.11.0.30 Identify and prioritize areas where various management tools (such as increasing salinity through the management of water levels or chemical applications) may be effective in reducing phragmites within and restoring marsh habitat.
- 2.11.0.33 Increase structural habitat diversity by implementing long-term vegetation management to minimize the potential for the establishment of invasive and/or non-native plants that may outcompete native vegetation.
- 2.11.0.35 Increase structural habitat diversity by managing vegetation adjacent to aquatic habitats in a manner that provides a buffer from runoff and erosion and a microclimate to stabilize seasonal temperatures to benefit a variety of aquatic and semi-aquatic species.
- 2.11.0.36 Increase structural habitat diversity by managing vegetation for a variety of species and considering their life history requirements (e.g., travel corridors, shelter, resting and breeding areas) to minimize the risk of harm.

Beach nesting Birds

- 2.11.0.41 Increase structural habitat diversity through the implementation of a variety of vegetation management practices such as prescribed burns (either increasing or decreasing their frequency depending on the site and objective), plantings, etc. that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.44 Manage phragmites adjacent to coastal marshes of interest, in particular those that are within underdeveloped areas and are unprotected, through herbicide application and water management to improve resiliency of the marshes to sea level rise.

2.12 Water management

2.12.1 Ditch plugs

- 2.12.1.1 Implement best management practices (BMPs), protective strategies, and guidelines for ditch plugging to maintain and enhance healthy, resident and migratory SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

2.12.2 Diversion/headgate

- 2.12.2.1 Prevent or ameliorate near-term impacts of climate change throughout the State but in particular within the coastal and Delaware Bay areas by implementing habitat management strategies that will establish/improve habitat resilience, such as using diversions, that benefits wildlife inhabiting these areas.

2.12.3 Drainage

- 2.12.3.3 Remove tile drains and drainage ditches to improve wetland hydrology and restore natural stream flows during appropriate times to avoid sensitive periods (e.g., nesting, denning, roosting) and minimizes harm to wildlife, particularly SGCN.
- 2.12.3.4 Expand the acreages and enhance the effective size of SGCN habitats by reclaiming/restoring adjacent, degraded habitats by removing tile drains and drainage ditches.
- 2.12.3.6 Protect significant natural and/or unique communities by and when removing tile drains and drainage ditches.
- 2.12.3.7 Minimize habitat loss of critical coastal habitats that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas by removing drainage ditches.
- 2.12.3.8 Enhance critical migratory stopover beach habitats for songbirds, raptors, shorebirds, bats and invertebrates by removing drainage ditches and expanding management to adjacent private lands to increase the effective size of the habitat.
- 2.12.3.9 Implement drain removal on state and other conservation lands to enhance food availability for migratory species (birds, bats, invertebrates).
- 2.12.3.11 Implement best management practices (BMPs), protective strategies, and guidelines when removing tile drains and drainage ditches to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

2.12.6 Tide gate

Beach nesting Birds

- 2.12.6.1 Prevent or ameliorate near-term impacts of climate change throughout the State but in particular within the coastal and Delaware Bay areas by implementing habitat management strategies that will establish/improve habitat resilience, such as tide gates, that benefits wildlife inhabiting these areas.

2.12.8 Watering facilities

- 2.12.8.2 Manage water levels in impoundments to improve coastal marsh habitat availability to wildlife and improve resiliency of the marshes to sea level rise.

2.13 Wildlife damage management

2.13.0 Nuisance fish and wildlife damage

- 2.13.0.3 Investigate alternative saltmarsh mosquito control methods that may produce benefits for coastal marsh dependent SGCN wildlife, including but not limited to high-marsh nesting birds and migrating shorebirds and landbirds.
- 2.13.0.5 Investigate the impacts of human-subsidized and/or naturally occurring predator species on SGCN to assess the need for integrated wildlife damage management techniques (e.g., predator exclosures, fish blockages, electric fence, culls) and/or policy changes on state land management that minimize the impacts of human-subsidized predators.
- 2.13.0.8 Implement and assess management strategies to control and reduce the impacts of detrimental species and diseases that pose threats to native wildlife or communities.

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

- 3.0.0.1 Conduct long-term monitoring of resident and migratory SGCN populations using standardized survey protocols to determine the variables that may impact their long-term persistence in the State (e.g., population viability, distribution, dispersal, home range and habitat use, travel corridors, food availability, vulnerability to pollutants and disease, etc.). Compile this information to determine the likely causes of population declines and to understand metapopulation dynamics. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.2 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) where data gaps exist regarding SGCN distribution, and their critical and supportive habitats. Conduct surveys using standardized survey protocols to acquire baseline data, and provide the data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
- 3.0.0.4 Conduct long-term studies on SGCN inhabiting permanently protected natural lands to develop population trend data and changes in demography, and to determine if critical and/or supporting habitats are limited or changing; i.e., diminishing in value, acreage or connectivity.
- 3.0.0.5 Gather baseline data on resident and migratory SGCN (in particular migratory species for which New Jersey habitats are significant), terrestrial, freshwater and marine species, regarding the location and condition of their critical and supporting habitats (e.g., foraging, roosting, nesting/breeding, stopover, migration paths, etc.), and population demography (e.g., productivity, survival, dispersal). Compile this information into a database that includes descriptions of the conditions of the habitats and species, and a GIS component of the locations of these important habitats. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Beach nesting Birds

- 3.0.0.6 Conduct long-term studies on resident and migratory SGCN to determine if there are changes to the populations' demography (productivity, survival, dispersal) and/or to their critical and/or supporting habitats (i.e., diminishing in value, acreage or connectivity, etc.), in particular changes that would not maintain SGCN at viable levels for species populations. Update data and GIS maps; provide updated information to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.7 Collect baseline data to document species distributions, in particular SGCN, and current habitat for future analysis of possible distribution shifting as a result of habitat shifting or alteration associated with climate change impacts.
- 3.0.0.8 Conduct long-term studies and compare baseline metrics of documented species distributions and associated habitats to identify possible species and/or habitat shifting or alteration associated with climate change impacts.
- 3.0.0.9 Identify SGCN (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources, and compile/collect and evaluate data/information regarding potential management strategies to improve the availability of such SGCN's food resources.
- 3.0.0.10 Conduct long-term studies to evaluate the effectiveness of management strategies implemented to enhance food/prey availability for SGCN [whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources] through studies that investigate the populations and health of the food resources as well as the target SGCN. Revise management strategies as needed and continue to monitor the effectiveness of the efforts.
- 3.0.0.11 Develop, implement and evaluate the effectiveness of town plans that avoid impacts to SGCN species and their habitats.
- 3.0.0.14 Identify areas with invasive, aquatic plants and animals and collect a detailed baseline assessment of the species' status and distribution. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort. Researchers and contractors performing Forest Stewardship Inventories and/or Plans on state lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.0.0.15 Conduct long-term monitoring of areas identified as having invasive, aquatic plants and animals to track the species' status/progress over time with or without the implementation of management strategies. Areas without management strategies should be assessed and prioritized for management/control. Areas where management strategies are being implemented should include an assessment of the management effort and identify/recommend and implement necessary changes to improve its success. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort.
- 3.0.0.21 Conduct long-term monitoring to determine the impacts of the fish and shellfish aquaculture industries on focal and non-focal SGCN and their habitats (i.e., NJ bays, estuaries, ocean areas). Assess the success of management actions implemented to minimize these impacts and make specific recommendations to the NJ DEP regarding how such management efforts may be improved to minimize harm to wildlife and their habitats.

Beach nesting Birds

- 3.0.0.25 Identify pathways of migratory SGCN in the Atlantic Coastal and Marine Regions (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and use the data to help evaluate the potential short- and long-term impacts of wind turbines, radio towers, utility guy lines, and other tall coastal structures on migratory populations.
- 3.0.0.28 Evaluate best management practices for using mined sand or dredged material to improve habitat for wildlife, particularly for spawning horseshoe crabs and migrating shorebirds.
- 3.0.0.30 Conduct research to investigate the feasibility of managing and/or creating roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.
- 3.0.0.31 Conduct short- and long-term studies (e.g., wildlife surveys and habitat assessments) to evaluate the effectiveness of vegetation management efforts to maintain, enhance and/or create roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.1 Division of Fish and Wildlife should maintain a robust, up-to-date database and mapping of species occurrences.
- 3.2.0.2 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
- 3.2.0.5 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 3.2.0.8 Implement and conduct long-term monitoring of control measures aimed at minimizing the impacts of problematic species and/or diseases to evaluate the effectiveness of such efforts and to identify and incorporate additional strategies as appropriate.
- 3.2.0.17 Conduct monitoring at constructed wind farms (within or outside of NJ) to assess the impacts on migratory species (birds, bats, insects) and determine if NJ's land use planning efforts and/or smart-growth plans need to be revised.
- 3.2.0.19 Develop, implement and evaluate aquaculture practices in coastal areas that are compatible with the recovery of SGCNs and industry needs.
- 3.2.0.20 Evaluate the effectiveness of BMPs for mosquito control methods that may produce benefits for coastal marsh dependent SGCN wildlife, including but not limited to high-marsh nesting birds and migrating shorebirds and landbirds.
- 3.2.0.24 Develop, implement and evaluate the effectiveness of BMPs for lighting of/on tall structures that minimize harm to and/or disorient wildlife, in particular but not limited to migratory birds, bats and invertebrates. Implement BMPs into state, county and local permitting processes.

3.2.1 Abundance determination

- 3.2.1.1 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) population abundance and trends for SGCN using standardized survey protocols. Provide data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Beach nesting Birds

- 3.2.1.2 Conduct wildlife surveys on resident and migratory SGCN regarding their population abundance and trends.
 - 3.2.2 Age, size and sex structure
 - 3.2.2.1 Conduct wildlife surveys on resident and migratory SGCN regarding their survivorship.
 - 3.2.4 Food habits
 - 3.2.4.1 Monitor and investigate the populations and health of SGCN prey/food resources for those SGCN whose populations are thought to be limited due wholly or in part to a lack of food resources or toxins in food resources.
 - 3.2.7 Population assessment
 - 3.2.7.1 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
 - 3.2.7.2 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species to meet and maintain recovery goals.
- 3.3 Research, survey or monitoring - habitat
 - 3.3.1 Baseline inventory
 - 3.3.1.1 Conduct habitat assessments of significant natural and/or unique communities to identify threats to native terrestrial and aquatic habitats through systematic monitoring, review of available data, enlistment of habitat management and/or species experts, etc. Incorporate findings into a database that includes descriptions/qualifiers of the habitats, identifies and values/qualifies the threats, and includes a GIS component of the locations of the assessed areas. Share this information with landowners/managers (e.g., federal, state and local government agencies or non-government organization).
 - 3.3.1.2 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) resident and migratory SGCN habitats. Investigate their suitability for the various life history requirements of the species that dependent upon them to determine the ability for maintaining applicable SGCN populations in perpetuity.
 - 3.3.1.5 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) where habitat restoration and/or enhancement would benefit wildlife SGCN.
 - 3.3.1.14 Compile information (obtained through literature reviews, communication with other States along the Atlantic coast, academia, etc.) regarding the impacts of above water operation of wind turbines on migratory marine birds and bats. Provide data to appropriate governing agencies and/or State commissions for integration into permitting review processes.
 - 3.3.1.16 Gather "best information" for spatial modeling and update/create a current model/depiction of anticipated habitat shifts from sea-level rise, flooding, etc.
 - 3.3.1.19 Identify and codify legal ORV access areas on state (and if appropriate, other conserved) lands. Provide GIS mapping to the landowner for potential use in directing such recreational activities.

Beach nesting Birds

- 3.3.1.20 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) where invasive, non-indigenous plants and animals are either already established or are becoming established. Create a system for reporting and qualifying new locations of invasive species and for prioritizing areas for control measures according to the potential level of impact on the ecosystem and SGCN and the likelihood of success. Researchers and contractors encountering invasive plant species while performing plant and/or forest inventories on state or other conserved lands and/or private lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.3.1.22 Identify, assess and prioritize marsh habitats for restoration where various management tools (such as increasing salinity through the management of water levels or chemical applications) may be effective in reducing the presence of phragmites.
- 3.3.1.23 Identify areas (through surveys/studies, predictive modeling, review of available data, enlistment of habitat management and/or species experts, etc.) where the State can allow coastal marsh migration due to sea level rise, and target these areas for land acquisition and/or land management to accommodate this transition. Targeted areas should include underdeveloped areas adjacent to unprotected coastal marshes.
- 3.3.1.24 Conduct regular investigations of SGCN habitat health and biodiversity on public and private lands to identify locations in need of revegetation, reduction of over-abundant, native wildlife and/or exotic species, conservation focal areas requiring limitations on human activity, etc.
- 3.3.1.28 Identify key habitats for the potential allowance of natural coastal processes without interfering through shoreline stabilization, etc. and evaluate the risks and benefits if coastal migration was permitted to occur naturally. Create a GIS map of the identified areas; provide the assessment and mapping to local towns and other appropriate governing agencies.
- 3.3.1.29 Identify coastal wildlife habitats unimpacted by development and/or at greatest risk of habitat loss to help guide enlightened coastal stabilization efforts (i.e., use of soft stabilization) to reduce the impacts on wildlife and their habitats.

3.3.2 Monitoring

- 3.3.2.2 Conduct long-term monitoring of resident and migratory SGCN habitats using standardized survey protocols to determine changes in habitat quality/suitability and threats (e.g., habitat loss and degradation, increased edge habitat, water quality) and other variables that may impact their long-term persistence in the State and to provide information needed for determining causes of population declines and understanding metapopulation dynamics.
- 3.3.2.3 Continue to update wildlife and habitat databases and revise models of critical SGCN habitats using the most current data available and where lacking, develop new SGCN and/or habitat models as data on species habitat requirements and applicable GIS data layers become available.
- 3.3.2.10 Evaluate the efficacy and success of different management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.3.2.15 Investigate the effectiveness of management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.

Beach nesting Birds

- 3.3.2.16 Evaluate the effectiveness of best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 3.3.2.19 Once baseline data on the marsh islands' and associated SGCN species' vulnerability to inundation is completed, continue to conduct long-term monitoring the islands to determine sustainability for wildlife dependent on these areas.
- 3.3.2.20 Once a system is developed for reporting and qualifying new locations of invasive species, develop, implement and monitor/evaluate invasive species removal strategies at identified locations. Priority should be given to those areas critical to SGCN and/or contain unique and/or rare plant communities supporting SGCN and/or other fish/wildlife species.
- 3.3.2.22 Conduct short- and long-term monitoring of the current natural processes affecting sediment transport along the coast. Share findings with organizations/agencies attempting to design beach nourishment projects in a manner that will be beneficial to wildlife.

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.1 Work with land management agencies to determine the appropriate actions needed to restore/reclaim degraded habitat for the documented/target SGCN.
- 3.5.3.2 Develop management strategies to improve the availability of prey/food resources for SGCN whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources. Monitor and investigate the management strategies over time to determine success and/or the need to revise methods.
- 3.5.3.5 Develop best management practices for using mined sand or dredged material to improve habitat for wildlife, particularly for spawning horseshoe crabs and migrating shorebirds.
- 3.5.3.8 Develop best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 3.5.3.11 Develop strategies to protect native terrestrial and aquatic habitats and dependent SGCN species from the identified threats.
- 3.5.3.13 Developing engineering standards that embrace both shore protection/resiliency and habitat creation for shorebirds, horseshoe crabs and other coastal species along the Atlantic and Delaware Bay coasts.
- 3.5.3.14 Develop aquaculture practices in the coastal areas that are compatible with the recovery of SGCN.
- 3.5.3.16 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.

Beach nesting Birds

- 3.5.3.21 Develop management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.24 Based on research, modify management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.5.3.25 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to develop the necessary management strategies to reach or maintain viable population levels.

3.5.4 Fish and wildlife research, survey and management techniques

- 3.5.4.1 Develop studies to evaluate management strategies to improve the availability of prey/food resources for SGCN whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources. Monitor and investigate the management strategies over time to determine success and/or the need to revise methods.
- 3.5.4.10 Develop BMPs for lighting of/on tall structures that minimize harm to and/or disorientation of wildlife, in particular but not limited to migratory birds, bats and invertebrates.
- 3.5.4.13 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.
- 3.5.4.14 Develop and implement agreements, and update existing agreements, with government agencies regarding the protection of critical SGCN habitats (e.g., significant breeding populations of beach nesting birds, colonial waterbird nesting areas, bat colonies, etc.).
- 3.5.4.15 Investigate the success of management strategies used to protect and/or enhance SGCN populations and when appropriate, aid in identifying failures/resource problems and issues, and developing new strategies.
- 3.5.4.16 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels and develop the necessary management strategies.
- 3.5.4.17 Investigate new, non-invasive techniques for SGCN population evaluation through literature review, expert opinion, trial studies (if low risk), etc.
- 3.5.4.18 Investigate the effectiveness of survey techniques through selected “ground truthing” and literature and peer review in order to increase efficacy of survey, minimize surveyor bias and error, and increase accuracy of trend data.

4 Education

4.1 Educator/Instructor training

4.1.1 Aquatic resource education

- 4.1.1.1 Provide educational resources and training programs to teachers in aquatic resource education that includes information regarding climate change and sea-level rise for incorporation into the class curriculum and/or as the focus of school field trips.

Beach nesting Birds

- 4.1.1.2 Provide educational resources and training programs to teachers in aquatic resource education that includes information regarding how coastal stabilization negatively impacts wildlife by preventing natural processes for incorporation into the class curriculum and/or as the focus of school field trips.

5 Facilities and Areas

5.15 Wildlife Management Areas

5.15.6 Roads

- 5.15.6.1 Clearly post areas/roads where vehicle access is permitted.
- 5.15.6.2 Clearly post areas/trails where vehicle access is not permitted.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

- 6.0.0.1 Enhance and increase the effective size of critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates by securing adjacent habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.3 Secure and protect riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.5 Secure and protect critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

6.3 Conservation area designation

6.3.0 Conservation area designation strategies

- 6.3.0.1 Promote the protection of critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates and enhance these lands by increasing the effective size through conservation area designations of stopover habitats and adjacent private lands.
- 6.3.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN and/or connect conserved SGCN habitats through conservation area designations.
- 6.3.0.3 Increase the protection of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through conservation area designations.
- 6.3.0.5 Promote the protection of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through conservation area designations.

Beach nesting Birds

- 6.3.0.9 Promote the protection of critical marine habitats for SGCN through conservation area designations.

7 Law Enforcement

7.1 Law enforcement

7.1.2 National Level

- 7.1.2.1 Enforce regulations to protect nesting bird colonies from human disturbance.

7.1.3 Sub-national Level

- 7.1.3.2 Increase the number of law enforcement officers tending to wildlife issues to a reasonable number to sufficiently cover the State and marine waters.

7.1.4 Scale Unspecified

- 7.1.4.1 Improve enforcement of policies and/or regulations that promote the reduction of run-off and point and non-point source pollution into NJ's aquatic systems (streams, rivers, lakes/ponds, bays, ocean, wetlands, etc.).
- 7.1.4.2 Restrict human activity from staging areas for red knots and other migratory shorebirds through increasing law enforcement presence.
- 7.1.4.3 Increase law enforcement presence proximate to sensitive areas [e.g., avian nesting sites, in particular rookeries, and reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively)] to deter human activity and subsequent disturbance to SGCN.
- 7.1.4.4 Improve enforcement of policies/regulations aimed at protecting and preserving critical coastal and marsh habitats, and secure mitigation for losses that create an environmental benefit.
- 7.1.4.5 Enforce current policies and/or regulations to increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal SGCN, and implement and enforce amended policies/regulations.
- 7.1.4.6 Recruit law enforcement to assist in the protection and enhancement of SGCN populations, in particular endangered species, through improved awareness of species through trainings, partnerships, and other methods. Information should include but is not limited to: 1) Issues concerning illegal collection of reptiles, 2) Persecution of rare snakes, 3) Illegal recreational activities on public lands (e.g., off-road vehicles) and their impact on wildlife, 4) Identification of sensitive areas, critical sites and/or "hot-spots" for collection.
- 7.1.4.7 Increase law enforcement presence to enforce regulations governing recreational activities (e.g., the use of personal watercraft and off road vehicles, caving, rock climbing, etc.) on conserved lands and within other sensitive habitats, and discourage activities that cause harm or disturbance to vegetation, wetlands, fish and wildlife.
- 7.1.4.8 Implement policies that protect critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates.
- 7.1.4.9 Implement policies that improve and secure habitat connections between conserved SGCN habitats.
- 7.1.4.10 Implement policies that promotes expanding acreages and enhances the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.

Beach nesting Birds

- 7.1.4.11 Implement and enforce policies/regulations that will increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.
- 7.1.4.12 Implement policies and/or regulations that protect significant natural and/or unique communities in perpetuity.
- 7.1.4.16 Implement policies that protect and restore riparian areas.
- 7.1.4.17 Improve the enforcement of policies and/or regulations that protect wetlands, riparian and floodplain areas, and aquatic habitats (including open waters).
- 7.1.4.18 Increase law enforcement presence at important nesting areas on marsh islands to increase the likelihood of boat users acting in a manner that reduces disturbance to birds.
- 7.1.4.21 Implement regulations for lighting of/on tall structures that will minimize harm to and/or disorientation of wildlife, and enforce within state, county and local permitting processes.
- 7.1.4.22 Implement policies and/or regulations that prohibit the presence of managed cat colonies and trap, neuter and release programs in or near critical wildlife habitats.
- 7.1.4.25 Encourage the enforcement of municipal laws regulating domestic pets that may predate on wildlife.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.2 Develop a team of personnel from government entities, conservation organizations and other stakeholders engaged in oil/gas spill response for marine and freshwater habitats to develop a feasible plan for oil spill response and/or to amend NJ's current oil spill response plan that clearly outlines each organizations responsibilities and an assessment and location list of available equipment for boom deployment during oil spills.
- 8.1.0.3 Develop an outreach team of personnel from government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 8.1.0.4 Engage government agencies, conservation partners and other stakeholders in constructive dialogues encouraging them to influence policy change and the creation of incentives through a habitat bill and/or municipal ordinances for backyard habitat.
- 8.1.0.6 Engage government agencies, conservation partners and other stakeholders in discussions focused on sharing information regarding coastal and marine critical wildlife habitats, developing comprehensive mapping to assist in reducing impacts of energy production activities, and establishing a long-term monitoring program to update the data. Ensure this information is available to appropriate personnel for planning or response measures.
- 8.1.0.12 Engage government agencies, conservation partners and other stakeholders to collaboratively develop and implement an extensive educational/outreach program targeting sportsmen's organizations and fisheries, as well as public constituents, addressing the unintended effects fishing gear and tackle can have on wildlife.
- 8.1.0.16 Engage local governments in discussions regarding the importance of them adopting/passing ordinances which require assessing and addressing secondary impacts (i.e., ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Beach nesting Birds

- 8.1.0.19 Engage government agencies, conservation partners and other stakeholders to collaboratively develop a list of important projects, targeting SGCN and/or their habitat, as a guide for graduate student research. Distribute the list and contact information to all State colleges and universities.
- 8.1.0.20 Organize a small focal group of government and non-government agencies/organizations responsible for decisions regarding beach/dune management to share and coordinate their goals so that comprehensive planning can attempt to meet all needs.
- 8.1.0.21 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation human-subsidized and/or overabundant, native species cause to local nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.22 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation invasive species cause to native nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.24 Engage government agencies, conservation partners and other stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.25 Provide technical support to public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.30 Encourage government agencies and conservation partners to advise members of the relevant scientific community of the need for specific studies, reports or investigations targeting the data-deficiency regarding SGCN and/or their habitats.
- 8.1.0.33 Engage government agencies, conservation partners and other land managers, communities, landowners, and commercial and industrial stakeholders in discussions regarding the importance of protecting and methods to protect priority wetlands beyond the levels afforded through regulation by maintaining and/or restoring optimal biological buffers around wetlands.
- 8.1.0.34 Work with the NJ Education Association and Department of Education to design curriculum and outdoor experimental learning opportunities, and provide training to teachers on implementation of these activities.
- 8.1.0.37 Enlist landowners and NJ citizens in the protection of and survey efforts for SGCN, in particular rare species, by increasing enrollment in landowner incentives, forest stewardship, backyard habitat management and wildlife-related volunteer programs.
- 8.1.0.39 Deploy stewards at active nesting areas to work with and educate the public on how to reduce disturbance to birds.
- 8.1.0.40 Encourage researchers, land managers, naturalists and enthusiasts to follow proper procedures for the coordination and/or permitting of research/management activities involving wildlife and sensitive habitats, and discourage activities that alter vegetation or wetlands, or cause harm or disturbance to wildlife.
- 8.1.0.41 Engage beach-owning entities (e.g., government, non-government and non-profit organizations, and landowners) in a constructive dialogue to develop guidelines for management of beach/dune communities and to ensure that each group is educated and aware of the needs of the other groups.

Beach nesting Birds

- 8.1.0.42 Engage citizens, wildlife observers and photographers through discussions and distributable information regarding the importance of and encouraging implementing responsible and ethical behavior when observing wildlife by developing an alliance of wildlife photographers and widely circulating recommendations on how to reduce impact.
- 8.1.0.46 Form cooperative partnerships with dredging companies to facilitate habitat creation and enhancement within project areas, and to identify seasonal timing of activities that would minimize impacts to wildlife and their habitats.
- 8.1.0.47 Form cooperative partnerships with energy companies to facilitate habitat creation and enhancement away from and outside of project areas, the restoration of appropriate habitats within project areas (e.g., rights-of-way could benefit butterflies and some bird species), and to identify seasonal timing of activities that would minimize impacts to wildlife.
- 8.1.0.48 Form cooperative partnerships with transportation and shipment agencies and companies to facilitate habitat creation and enhancement away from and outside of project areas and to identify seasonal timing of activities that would minimize impacts to wildlife.

8.2 Recruitment and retention activities

8.2.3 For wildlife watching

- 8.2.3.1 Develop and implement nature-focused tourism opportunities including wildlife viewing sites, interpretive signage highlighting unique ecosystems/habitats, and wildlife-related recreational opportunities that do not negatively impact SGCN or their habitats.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.2 Utilize WSFR grant funds, in combination with alternate funding sources as needed, to implement an extensive educational/outreach program consisting of displays, fliers, list-serve mailings, Facebook posts and speaking engagements with sportsmen's organizations and fisheries, as well as public constituents, addressing the unintended effects fishing gear and tackle can have on non-target species.
- 8.3.0.4 Utilize WSFR grant funds, in combination with alternate funding sources as needed, to implement an extensive educational/outreach program consisting of displays, fliers, list-serve mailings, Facebook posts and speaking engagements with sportsmen's organizations and fisheries addressing the unintended effects abandoned fishing gear, tackle and crab pots can have on wildlife.
- 8.3.0.6 Develop and provide (or otherwise make publicly available) educational programs and/or materials to enlist landowners, land managers and local communities to discourage the presence of managed cat colonies and trap, neuter and release programs in wildlife habitats.
- 8.3.0.7 Develop and provide (or otherwise make publicly available) educational programs and/or materials that describe the negative impacts of off-road vehicles and watercraft use in and adjacent to critical SGCN habitats, and the importance of confining such activities to more appropriate locations and/or seasons.
- 8.3.0.8 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate recreationists and encourage landowners to eliminate garbage in the vicinity of suitable wildlife habitat, in particular SGCN habitat. Information should include the detrimental impacts garbage may have on various wildlife species.
- 8.3.0.9 Develop and provide (or otherwise make publicly available) educational programs and/or materials to enlist landowners and land managers to include only native plants in landscaping and restoration projects. Provide information to assist them in detecting problematic establishment of invasive, non-indigenous plants.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Beach nesting Birds

- 8.3.0.10 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate landowners and NJ citizens on threats to fish and wildlife (including marine animals).
- 8.3.0.12 Promote awareness of WSFR (Wildlife and Sportfish Restoration) Outreach/Awareness grants, an important funding source for conservation among hunters and anglers as well as the general public.
- 8.3.0.13 Conduct an educational campaign to encourage observer ethics and respect for wildlife and natural habitat.
- 8.3.0.14 Develop an educational outreach program using a variety of media to ensure maximizing the distribution of information, in particular targeting sportsmen's organizations and fisheries, regarding the unintended effects abandoned fishing gear, tackle and crab pots can have on wildlife, including non-target species.
- 8.3.0.15 Develop an educational outreach program for citizens regarding: 1) The impacts to wildlife as a result of plastic bags entering aquatic and marine systems, 2) The importance of decreasing the amount of plastic shopping bags in circulation, 3) The need for businesses to voluntarily charge for bags or reimburse people for using their own non-plastic bags, and 4) The need for their assistance through public pressure on legislators and government to pass legislation that limits the amount of plastic shopping bags in circulation.
- 8.3.0.19 Develop an educational outreach program for the public on the devastating effects predators can have on native nesting wildlife.
- 8.3.0.21 Develop an educational outreach program for the general public, in particular those within and adjacent to coastal and riparian areas on the realities of sea-level rise to help citizens living in these areas understand how this will affect them, how coastal stabilization negatively impacts wildlife by preventing natural processes, and how their decisions impact species.
- 8.3.0.22 Post signage in sensitive coastal habitats (e.g., bird and Diamondback Terrapin nesting areas) to educate the boating community on responsible use of these areas.
- 8.3.0.23 Develop an educational outreach program for coastal municipalities and residents to promote an understanding of the benefits of soft structures over hard structures for shoreline stabilization.
- 8.3.0.25 Develop educational outreach programs for landowners, nurseries and the general public regarding the negative impacts of invasive and non-native plants on our natural communities.
- 8.3.0.27 Develop educational outreach programs for public and private landowners and land managers regarding the importance of structural habitat diversity, methods to increase diversity, and/or incentive programs available to increase habitat diversity.
- 8.3.0.32 Develop an educational outreach program for landowners and citizens on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

- 9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and SGCN inhabiting them.
- 9.1.0.2 Develop town plans that avoid impacts to SGCN species and their habitats.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Beach nesting Birds

- 9.1.0.3 Develop a plan that directs the creation of impervious surfaces away from and to minimize impacts on aquatic systems and critical terrestrial habitats. The plan should also include strategies to increase the resiliency of aquatic and critical terrestrial habitats to threats and stressors that would impact the reproduction and survival of wildlife.
- 9.1.0.8 Develop a plan that focuses on strategies for oil pipelines to avoid sensitive habitats that would be highly impacted by oil spills.
- 9.1.0.19 Develop a plan to minimize the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 9.1.0.22 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 9.1.0.29 Provide GIS or related data, maps, resource inventories, as well as related training, pertaining to the SWAP and it's recommended conservation actions for use or consideration by State, County or municipal planning agencies.
- 9.1.0.30 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and other related threats associated with development.
- 9.1.0.31 Develop wetland restoration plans that consider the life history and needs of wildlife occupying targeted habitats.
- 9.1.0.33 Review the species, threats, action successes, and habitats, and work with partners to revise the 2017 State Wildlife Action Plan for the 2025 resubmittal.

9.2 Organizational strategic and CMS planning

9.2.1 Organizational strategic and operational planning

- 9.2.1.1 Identify and codify legal ORV access areas on state lands.

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.2 Develop a management plan to improve the availability of prey/food resources for SGCN whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources.
- 9.3.1.3 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.1.4 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.3.1.6 Amend NJ's current oil spill response plan to 1) expand the geographic area addressed, 2) expand the targeted species impacted and in need of recovery, and 3) revise current and integrate new actions into the plan as needed.
- 9.3.1.13 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
- 9.3.1.15 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.

9.3.2 Listed species recovery planning

Beach nesting Birds

- 9.3.2.1 Develop proactive species recovery plans for all endangered and threatened species including guidance and objectives pertaining to critical and supporting habitat to meet and maintain recovery goals.

9.3.3 Habitat management planning

- 9.3.3.1 Develop a management plan to improve the availability of prey/food resources for SGCN whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources.
- 9.3.3.2 Develop a management plan for using mined sand or dredged material to improve habitat for wildlife, particularly for spawning horseshoe crabs and migrating shorebirds.
- 9.3.3.3 Integrate best management practices (BMPs) regarding dune and beach management into beach nesting bird management agreements with government agencies (and private landowners where necessary).
- 9.3.3.10 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
- 9.3.3.11 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.3.3.12 Develop a management plan using engineering standards that embrace both shore protection/resiliency and habitat creation for shorebirds, horseshoe crabs and other coastal species along the Atlantic and Delaware Bay coasts.
- 9.3.3.13 Develop a management plan that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas and prevents or ameliorates near-term impacts of climate change throughout the State, but in particular within the coastal and Delaware Bay areas.
- 9.3.3.16 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.3.18 In cooperation with species and habitat experts, develop management plans for significant natural and/or unique communities, in particular those supporting SGCN, and provide the information to the landowners/managers (federal, state and local government agencies or non-government organization) for review and implementation.
- 9.3.3.19 Develop management plans for SGCN inhabiting permanently protected natural lands using available baseline and population trend data.
- 9.3.3.20 Develop an action plan for immediate implementation should habitat levels fall below the minimum necessary size and/or structure within the Cape May Peninsula to sustain the avian migration.
- 9.3.3.24 Develop a plan to improve the enforcement of policies and/or regulations that protect wetlands, riparian and floodplain areas, and aquatic habitats (including open waters).
- 9.3.3.25 Develop a habitat management plan focused on areas important to near-shore, coastal species (e.g., herring, sturgeon, terrapin, nesting birds) that prioritizes these areas to direct resources to minimize the impacts of sea-level rise, flooding and storms (including extreme rain events) such as increased erosion of beach, mudflat and marsh habitats, and the increased risk of saltwater intrusion into freshwater habitats. Gather "best information" for spatial modeling of anticipated habitat shifts from sea-level rise, flooding, etc.
- 9.3.3.28 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.

Beach nesting Birds

- 9.3.3.29 Develop habitat management plans aimed at reducing or eliminating negative impacts of ORVs.
- 9.3.3.35 Incorporate habitat connectivity, preservation of natural areas, and the implementation of BMPs into state and local land-use policy environmental review process and energy development plans to minimize habitat fragmentation and related threats associated with solar farms and altered habitats.
- 9.3.3.36 Integrate plans for properly located and timed habitat restoration and management along transportation, energy and service corridors to minimize risks to and benefit wildlife.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

- 11.1.1.1 Use Biotics database and Landscape Project Mapping in regulatory reviews to ensure protection by applicable laws and regulations.
- 11.1.1.2 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
- 11.1.1.3 Government organizations to thoroughly review wetland restoration plans, applying the most current science for wildlife, habitats and aquatic systems, to assess the impacts to resident and migratory wildlife occupying the targeted habitats.
- 11.1.1.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.
- 11.1.1.5 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 11.1.1.7 Review proposed construction or other work projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.8 Review proposed research projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.9 Review strategies for creating or enhancing connectivity (e.g., installing appropriately-sized wildlife passages) between wetlands to allow wildlife to disperse naturally and safely.
- 11.1.1.12 Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed solar farm projects to reduce habitat fragmentation and minimize impacts on wildlife.
- 11.1.1.13 Use the best available science (species data, habitat present, wind farm layout options, wind blade impacts on migratory species, location of migration routes, etc.) when conducting regulatory reviews of proposed wind farm projects to minimize impacts on migratory and resident wildlife and reduce habitat fragmentation.

11.1.2 Review of proposed policies and plans

- 11.1.2.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.

Beach nesting Birds

11.1.2.2 Government organizations to thoroughly review wetland restoration plans, applying the most current science for wildlife, habitats and aquatic systems, to assess the impacts to resident and migratory wildlife occupying the targeted habitats.

11.1.2.4 Review strategies for creating or enhancing connectivity (e.g., installing appropriately-sized wildlife passages) between wetlands to allow wildlife to disperse naturally and safely.

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

11.2.0.1 Provide technical support to private and public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.

11.2.0.2 Provide technical support to public and private landowners and land managers for controlling invasive, native and non-native plant species in order to increase structural habitat diversity.

11.2.0.3 Develop state, regional and local BMPs that focus on minimizing habitat fragmentation and human-wildlife conflicts associated with development. Make information available to land developers and private and public landowners for implementation.

11.2.0.6 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on habitat creation, enhancement and restoration within and adjacent to project areas, as well as away from and outside of project areas (depending on the target species), by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. Wind farms should address both terrestrial bound and low-flying species. Examples of habitat management include, but are not limited to, integrating short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.

11.2.0.8 Provide educational resources, training programs, and on-the-ground guidance to public and private landowners and land managers on habitat creation and enhancement strategies that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.

11.2.0.10 Provide technical support to private landowners, consultants, and land managers to create customized management plans based on location and SGCN.

11.2.0.26 Make educational resources available to the public that encourage researchers to seek out guidance prior to finalizing proposals and submitting State permit applications to reduce potential impacts on sensitive species.

11.2.0.27 Provide educational resources and presentations to coastal municipalities and residents to promote the understanding of the benefits of soft structures over hard structures for shoreline stabilization.

11.2.1 With individuals and groups involved in resource management decision making

11.2.1.1 Engage partners and stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.

11.2.1.2 Provide professional training and technical assistance tools (e.g., mapping, guidance documents, justification, etc.) to agencies/divisions/programs within and outside of the NJ DEP regarding the SWAP, and the conservation actions recommended therein to help facilitate SWAP implementation.

Beach nesting Birds

- 11.2.1.4 Provide educational resources, training programs, and on-the-ground guidance to dredging companies and resource managers on habitat creation and enhancement away from and outside of shipping lanes, and to identify seasonal timing of activities that would minimize impacts to wildlife and their habitats.
- 11.2.1.5 Provide educational resources, training programs, and on-the-ground guidance to municipalities, state and federal agency resource managers on tasks such as writing and integrating Beach Management Plans into other management documents.
- 11.2.1.6 Provide educational resources, training programs, and on-the-ground guidance to resource agencies prior to project initiation to ensure wildlife and their habitats are protected to the highest degree possible during construction, and provisions are in place for post-construction habitat use.

100 Law and Policy

100. Legislation

100.1.3 Sub-national Level

- 100.1.3.1 Develop laws and policies to increase protection and biological buffers of wetlands.
- 100.1.3.2 Develop policies for wetland restoration plans that consider life history requirements and needs of wildlife occupying targeted habitats.
- 100.1.3.3 Initiate legislative action to establish an annual budgetary line item designating funds to support programs focused on long-term research and monitoring of wildlife diseases.

100.1.4 County and Local

- 100.1.4.2 Secure and increase the effective size of SGCN habitats and connect conserved SGCN habitats through local ordinances.
- 100.1.4.13 Encourage municipal laws regulating domestic pets that may predate on wildlife.
- 100.1.4.15 Incorporate habitat connectivity and the preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.

100.1.5 Scale Unspecified

- 100.1.5.1 Develop laws and policies to increase protection and biological buffers of wetlands.
- 100.1.5.2 Develop policies for wetland restoration plans that consider life history requirements and needs of wildlife occupying targeted habitats.
- 100.1.5.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 100.1.5.5 Develop legislation to provide financial support for the New Jersey Invasive Species Strike Team.

100. State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.1 Develop (and/or improve) policies and/or regulations that will promote the reduction of run-off and point and non-point source pollution into NJ's aquatic systems (streams, rivers, lakes/ponds, bays, ocean, wetlands, etc.).
- 100.3.0.2 Improve policies/regulations aimed at protecting and preserving critical coastal and marsh habitats and securing mitigation for losses that create an environmental benefit.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Beach nesting Birds

- 100.3.0.3 Develop policies that will promote the long term protection of critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates.
- 100.3.0.4 Promote policies and regulations that support marine conservation zone designations in suitable areas identified through research and literature.
- 100.3.0.6 Develop policies that will promote expanding acreages and enhancing the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 100.3.0.7 Amend current policies and/or regulations to increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.
- 100.3.0.8 Develop policies and/or regulations with the objective of protecting significant natural and/or unique communities in perpetuity.
- 100.3.0.9 Secure mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.14 Develop policies and/or regulations that increase the protective buffers of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) to biologically appropriate distances to benefit SGCN that rely upon these habitats and improve the function of the [associated] aquatic systems.
- 100.3.0.16 Create regulations that restrict human activity from staging areas for red knots and other migratory shorebirds.
- 100.3.0.18 Develop policies for conserved lands that prohibit planting and supports the control of non-native vegetation and invasive, native vegetation.
- 100.3.0.19 Develop regulations for lighting of/on tall structures that will minimize harm to and/or disorientation of wildlife, in particular but not limited to migratory birds, bats and invertebrates. Implement BMPs into state, county and local permitting processes.
- 100.3.0.20 Develop policies and/or regulations that prohibit the presence of managed cat colonies and trap, neuter and release programs in or near critical wildlife habitats.
- 100.3.0.23 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.27 Amend harvest, license and/or permit requirements to incorporate guidance regarding the use of gear and/or tackle and current best practices to minimize bycatch or entanglement of non-target species.
- 100.3.0.36 Create legislation to limit the amount of plastic from shopping bags in circulation and re-instate incentives for citizens bringing their own shopping bag to grocery store.
- 100.3.0.41 Explore all State regulatory requirements for mitigation, restoration, habitat management, etc. to ensure they prohibit the use of specified invasive or other problematic plant species.
- 100.3.0.42 Fully adopt the former Storm water Management Rules' 300ft buffer requirements into the Flood Hazard Area Control Act Rules.
- 100.3.0.43 Identify and address (amend) regulatory impediments to beneficial habitat management.
- 100.3.0.44 Incorporate requirements for technical support and funding for mitigation or restoration efforts so as to be consistent with existing regulations.
- 100.3.0.46 Investigate and/or develop inter-agency Memorandum of Agreements to share common data stored or managed in program-specific databases.

Beach nesting Birds

- 100.3.0.47 Investigate regulatory options available to direct the location of aquaculture activities in Aquaculture Development Zone 4 (Delaware Bay area) in a manner which minimizes the loss of wildlife habitats and adverse impacts to the environment.
- 100.3.0.49 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address the issue of disturbance to habitat or species as a result of human activities (e.g., construction, bridge maintenance, road work, etc.).
- 100.3.0.50 Retain endangered, threatened and special concern wildlife and habitat protection measures in the Water Quality Management Program Rules.
- 100.3.0.52 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded energy sitings and facilities.
- 100.3.0.56 Develop regulations that when implemented will protect critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates.
- 100.3.0.57 Develop regulations that when implemented will improve and secure habitat connections between conserved SGCN habitats.
- 100.3.0.58 Develop regulations that when implemented will promote the expansion of acreages and enhancement of the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 100.3.0.59 Develop regulations that when implemented will increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.
- 100.3.0.60 Develop regulations that when implemented will protect significant natural and/or unique communities in perpetuity.
- 100.3.0.64 Develop regulations that when implemented will protect and restore riparian areas.
- 100.3.0.67 Develop regulations for lighting of/on tall structures that will minimize harm to and/or disorientation of wildlife, and enforce within state, county and local permitting processes.
- 100.3.0.68 Develop regulations that when implemented will prohibit the presence of managed cat colonies and trap, neuter and release programs in or near critical wildlife habitats.
- 100.3.0.69 Develop regulations that when implemented will minimize wildlife road mortality.
- 100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

100.3.2 State Land Acquisition Programs

- 100.3.2.1 Increase opportunities for habitat restoration by making any necessary policy changes to state, federal and local land acquisition programs (e.g., Green Acres, Blue Acres, etc.) to allow for acquisition within abandoned or failing bay shore communities, including mechanisms to relocate displaced people and infrastructure.

100. State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Beach nesting Birds

- 100.4.0.2 Create a policy that requires the NJ DEP to incorporate scientific information regarding climate change and sea level rise (e.g., predictions, habitat management/acquisition efforts to enhance resilience to inundation) on their websites and to work with other government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 100.4.0.16 Develop policies to implement habitat management strategies that will increase the structural diversity surrounding areas used for energy, mining, and transportation and service corridors which include but are not limited to the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-
- 100.4.0.17 Develop policies to implement habitat management strategies, including prescribed burns, that will increase the structural diversity on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies to control and reduce the impacts of invasive, non-native species in order to increase structural habitat diversity.
- 100.4.0.18 Develop policies to minimize the extent of infrastructure associated with energy and service corridors or areas (e.g., wind and solar farms, pipelines, utility lines) and that require the implementation of habitat management strategies that will increase the structural diversity in the area including (e.g., the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-asides).
- 100.4.0.20 Develop state regulations that require energy developers and utility service companies to implement habitat management strategies that will increase the structural diversity of the habitat, minimize habitat fragmentation and commercial infrastructure, and minimize the loss, alteration and/or degradation of the habitat and adjacent lands when working on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies.
- 100.4.0.24 Develop policies to provide financial support for the New Jersey Invasive Species Strike Team.
- 100.4.0.25 Develop policies that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

Forest Birds

Focal species that comprise this Conservation Target:

Cerulean Warbler	Kentucky Warbler	Prothonotary Warbler
Scarlet Tanager	Wood Thrush	

Threats and Action Drivers associated with this Conservation Target:

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale) (Avg. Score: 3.00)

NJ Specific Threats: 1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
1.1.1.2 Loss, alteration and/or degradation of habitat.
1.1.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.
1.1.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.1.2 Residential development using materials that cause collision hazards (Avg. Score: 2.00)

NJ Specific Threats: 1.1.2.1 Collision risk to volant species (birds, bats and invertebrates).

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale) (Avg. Score: 3.00)

NJ Specific Threats: 1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
1.2.1.2 Loss, alteration and/or degradation of habitat.
1.2.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.
1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.2.2 Commercial development using materials that cause collision hazards (Avg. Score: 2.00)

NJ Specific Threats: 1.2.2.1 Collision risk to volant species (birds, bats and invertebrates).

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale) (Avg. Score: 2.00)

NJ Specific Threats: 1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
1.3.1.2 Loss, alteration and/or degradation of habitat.
1.3.1.5 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

2 Agriculture and Aquaculture

2.1 Annual and Perennial Crops (non-timber)

2.1.2 Small-holder Farming (Avg. Score: 1.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Forest Birds

NJ Specific Threats: 2.1.2.2 Fragments terrestrial and aquatic habitats.

2.1.3 Agro-industry (Avg. Score: 2.00)

NJ Specific Threats: 2.1.3.2 Fragments terrestrial and aquatic habitats.

2.2 Wood and Pulp Plantations

2.2.1 Small Holder (Avg. Score: 1.00)

NJ Specific Threats: 2.2.1.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.

2.2.1.2 Tree harvesting can cause direct mortality to wildlife, especially if done during peak activity periods or vulnerable life stages (e.g., denning, nesting, gestation/birthing, basking, roosting, pre-volancy, etc.).

2.2.2 Agro-industry Plantations (Avg. Score: 2.00)

NJ Specific Threats: 2.2.2.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.

2.2.2.2 Tree harvesting can cause direct mortality to wildlife, especially if done during peak activity periods or vulnerable life stages (e.g., denning, nesting, gestation/birthing, basking, roosting, pre-volancy, etc.).

2.3 Livestock Farming and Ranching

2.3.2 Small-holder Grazing (Avg. Score: 1.00)

NJ Specific Threats: 2.3.2.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.

2.3.3 Agro-industry Grazing (Avg. Score: 2.00)

NJ Specific Threats: 2.3.3.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.

3 Energy Production and Mining

3.1 Oil and Gas Facilities and Pipelines

3.1.1 Distribution processes of petroleum and other liquid hydrocarbons (Avg. Score: 2.00)

NJ Specific Threats: 3.1.1.1 Fragments terrestrial and aquatic habitats.

3.1.1.2 Loss, alteration and/or degradation of habitat.

3.1.1.3 Increased risk of oil spills.

3.1.1.4 Increased noise pollution.

3.1.1.5 Increased vehicular and ship traffic associated with construction and operations, and therefore an increased risk of wildlife mortality from strikes.

3.1.2 Natural gas distribution processes (Avg. Score: 2.00)

NJ Specific Threats: 3.1.2.1 Fragments terrestrial and aquatic habitats.

3.1.2.2 Loss, alteration and/or degradation of habitat.

3.1.2.3 Increased risk of gas leaks and explosions.

3.1.2.4 Increased noise pollution.

3.1.2.5 Increased vehicular and ship traffic associated with construction and operations, and therefore an increased risk of wildlife mortality from strikes.

3.2 Mining and Quarrying

3.2.2 Surface Mining - Rock Quarry (and sand quarries) (Avg. Score: 2.00)

NJ Specific Threats: 3.2.2.1 Fragments terrestrial and aquatic habitats.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Forest Birds

3.2.2.2 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

3.2.2.3 Increased risk of vehicle strikes/mortality to wildlife.

3.3 Renewable Energy

3.3.1 Wind Power (Avg. Score: 2.00)

NJ Specific Threats: 3.3.1.1 Turbines, blades, and structure foundations create a collision risk to volant species (birds, bats and invertebrates) and marine animals.

3.3.1.2 Fragments terrestrial habitats.

3.3.1.3 Loss, alteration and/or degradation of habitat.

3.3.2 Solar Power (Avg. Score: 2.00)

NJ Specific Threats: 3.3.2.1 Fragments terrestrial habitats.

3.3.2.2 Loss, alteration and/or degradation of habitat.

3.4 Conventional Power Plants

3.4.0 Conventional Power Plants (Avg. Score: 1.00)

NJ Specific Threats: 3.4.0.2 Loss, alteration and/or degradation of habitat due to new or the expansion of current facilities.

4 Transportation and Service Corridors

4.1 Roads and Railroads

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale) (Avg. Score: 2.00)

NJ Specific Threats: 4.1.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species and inhibiting dispersal of non-volant animals, reducing gene flow.

4.1.1.2 Loss, alteration and/or degradation of habitat associated with road and railroad construction and maintenance, and degradation of adjacent habitats.

4.1.1.4 Re-establishment of abandoned railroad lines may increase the risk of direct mortality on wildlife.

4.1.2 Movement of cars and other vehicles on roads and railroads (large and small scale) (Avg. Score: 2.00)

NJ Specific Threats: 4.1.2.1 Increased vehicle traffic increases the risk of wildlife mortality from strikes.

4.2 Utility and Service Lines

4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads (Avg. Score: 1.40)

NJ Specific Threats: 4.2.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species, inhibiting dispersal of non-volant animals, reducing gene flow, and creating barriers to fish when service line-associated roads cross streams (e.g., bridges, culverts, fords, etc.).

4.2.1.2 Loss, alteration and/or degradation of habitat associated with rights-of-way construction and maintenance, and degradation of adjacent habitats.

4.2.1.5 Tall radio and utility towers with guy lines pose a strike hazard for migrant bats and birds, especially in poor visibility conditions (e.g., fog, nighttime, poor weather conditions).

4.2.2 Management of rights-of-way or communication tower facilities and/or their associated access roads (Avg. Score: 1.00)

NJ Specific Threats: 4.2.2.1 Improper or poorly scheduled vegetation management can cause direct mortality to and may reduce productivity of wildlife.

4.4 Flight Paths

Forest Birds

4.4.1 Airplane flight paths (Avg. Score: 1.00)

NJ Specific Threats: 4.4.1.2 Increased risk of collision between airplanes and birds, bats and insects.

5 Biological Resource Use

5.1 Hunting and Collecting Terrestrial Animals

5.1.2 Unintentional effects (Avg. Score: 1.00)

NJ Specific Threats: 5.1.2.2 Disruption of normal wildlife behavior.

5.2 Gathering Terrestrial Plants

5.2.2 Unintentional effects (Avg. Score: 0.20)

NJ Specific Threats: 5.2.2.1 Stepping on nests or young/hatchling animals.

5.2.3 Control (Avg. Score: 0.60)

NJ Specific Threats: 5.2.3.2 Clearing of scrub-shrub vegetation [and snags] diminishes cover and nesting habitat.

5.3 Logging and Wood Harvesting

5.3.1 Intentional Use (subsistence/small scale) (Avg. Score: 1.00)

NJ Specific Threats: 5.3.1.1 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may fragment their terrestrial habitats.

5.3.1.2 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may cause the loss, alteration and/or degradation of wildlife habitat.

5.3.1.3 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase soil erosion, impacting SGCN habitats.

5.3.1.4 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase the risk of invasive species establishment, impacting SGCN habitats.

5.3.1.5 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may decrease structural diversity and biomass leading to reduced biodiversity and ecological integrity.

5.3.1.6 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices in Atlantic White Cedar stands may destroy a unique wildlife wetland habitat that is difficult, and takes time, to restore.

5.3.2 Intentional Use (large scale) (Avg. Score: 2.00)

NJ Specific Threats: 5.3.2.1 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may fragment their terrestrial habitats.

5.3.2.2 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may cause the loss, alteration and/or degradation of wildlife habitat.

5.3.2.3 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase soil erosion, impacting SGCN habitats.

5.3.2.4 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase the risk of invasive species establishment, impacting SGCN habitats.

5.3.2.5 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may decrease structural diversity and biomass leading to reduced biodiversity and ecological integrity.

Forest Birds

- 5.3.2.6 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices in Atlantic White Cedar stands may destroy a unique wildlife wetland habitat that is difficult, and takes time, to restore.

5.3.3 Unintentional effects (subsistence/small scale) (Avg. Score: 1.00)

- NJ Specific Threats:** 5.3.3.1 Direct mortality of wildlife, direct loss of suitable habitats (roost, foraging, shelter, etc.), and can disrupt sensitive species, decreasing the likelihood of success and/or reproduction.

5.3.4 Unintentional effects (large scale) (Avg. Score: 3.00)

- NJ Specific Threats:** 5.3.4.1 Direct mortality of wildlife, direct loss of suitable habitats (roost, foraging, shelter, etc.), and can disrupt sensitive species, decreasing the likelihood of success and/or reproduction.

- 5.3.4.2 Extensive infrastructure and larger equipment requirements present a potential risk of direct injury/mortality to wildlife.

- 5.3.4.4 Infrastructure and/or equipment use may result in subtle changes to drainage patterns, adversely affecting vernal pool and wetland hydrology.

- 5.3.4.5 Lack of appropriate, sustainable forest management can lead to a decrease in forest habitat diversity, degraded habitat for many forest species, the loss of habitat for early-successional species, and/or the loss of unique habitats for species that need canopy breaks and multi-aged tree composition to fulfill various life history requirements.

6 Human Intrusions and Disturbance

6.1 Recreational Activities

6.1.1 Off-road vehicles (motorized and non-motorized) (Avg. Score: 2.00)

- NJ Specific Threats:** 6.1.1.1 Inappropriate use of off-road vehicles creates new roads/trails which fragments habitat.

- 6.1.1.2 Inappropriate use of off-road vehicles can degrade terrestrial and aquatic habitat and reduce the suitability of adjacent habitats for wildlife.

- 6.1.1.3 Increased risk of harassment that results in a change in wildlife behavior and/or direct mortality from vehicle strikes.

- 6.1.1.4 Increased noise pollution.

- 6.1.1.6 Off-road vehicles can be a mechanism of transference of wildlife diseases and invasive plant species if gear and apparel are not properly sanitized between sites.

6.1.5 Wildlife observation and photography (Avg. Score: 1.00)

- NJ Specific Threats:** 6.1.5.1 Improperly conducted recreational activities may disrupt normal wildlife behaviors which can result in reduced reproductive success or survival, abandonment of critical sites, etc.

- 6.1.5.2 Participants may introduce wildlife diseases and invasive plant species when gear and apparel is not properly sanitized between sites.

6.1.7 Other (Avg. Score: 1.00)

- NJ Specific Threats:** 6.1.7.1 Use of recreational or commercial pyrotechnics may cause temporary disturbance to wildlife, in particular to nesting birds.

- 6.1.7.3 Drone use in areas with sensitive wildlife (e.g., nesting and foraging birds, migrating and foraging/feeding whales) can alter their behavior and can cause disturbance that impacts their reproductive and/or foraging success.

6.2 Military Exercises

6.2.1 Military exercises (Avg. Score: 1.00)

- NJ Specific Threats:** 6.2.1.1 Military testing and training exercises may inflict disturbance and potential physical harm to wildlife.

Forest Birds

- 6.2.1.3 Lack of opportunity for non-federal wildlife managers to influence activities on military bases may result in detrimental impacts to SGCN and/or missed opportunities to engage in projects that benefit SGCN.

6.3 Work and Other Activities

6.3.1 Unauthorized research projects at significant habitats (Avg. Score: 1.00)

NJ Specific Threats: 6.3.1.1 Participants may introduce wildlife diseases and invasive plant species when gear and apparel is not properly sanitized between sites.

6.3.1.2 Accidental trampling of nests, eggs/egg masses, and unseen individuals may impact reproductive success or cause direct mortality to SGCN.

6.3.1.3 Activities conducted without proper precautions may disturb and disrupt normal wildlife behaviors, which may impact reproductive success or survival, cause abandonment of critical sites, etc.

6.3.2 Authorized research projects at significant habitats (Avg. Score: 1.00)

NJ Specific Threats: 6.3.2.2 Participants may introduce wildlife diseases and invasive plant species when gear and apparel is not properly sanitized between sites.

6.3.2.3 Accidental trampling of nests, eggs/egg masses, and unseen individuals may impact reproductive success or cause direct mortality to SGCN.

6.3.2.4 Activities conducted without proper precautions may disturb and disrupt normal wildlife behaviors, which may impact reproductive success or survival, cause abandonment of critical sites, etc.

6.3.3 Other "work" unrelated to research (Avg. Score: 1.00)

NJ Specific Threats: 6.3.3.4 Workers may introduce wildlife diseases and invasive plant species when gear and apparel is not properly sanitized between sites.

7 Natural Systems Modifications

7.1 Fire and Fire Suppression

7.1.1 Increase in Fire Frequency/Intensity (Avg. Score: 1.00)

NJ Specific Threats: 7.1.1.1 Increase in frequency and intensity of wild fires as a result of droughts and heat waves drying out vegetation and litter.

7.1.1.2 Increase in frequency of wild fires as a result of illegal activities.

7.1.1.3 Unnatural fire regimes occurring as a result of military exercises.

7.1.2 Suppression of Fire Frequency/Intensity (Avg. Score: 3.00)

NJ Specific Threats: 7.1.2.1 Shift in vegetative communities as a result of suppression of natural fires.

7.1.2.2 Lack of diversity in age structure and composition of vegetation due to the suppression of fire.

7.2 Dams and Water Management/Use

7.2.1 Abstraction of Surface Water (domestic use) (Avg. Score: 1.00)

NJ Specific Threats: 7.2.1.5 Abstraction of surface water may deplete upland mesic habitats of water needed by plants and wildlife.

7.2.2 Abstraction of Surface Water (commercial use) (Avg. Score: 1.00)

NJ Specific Threats: 7.2.2.5 Abstraction of surface water may deplete upland mesic habitats of water needed by plants and wildlife.

7.2.3 Abstraction of Surface Water (agricultural use) (Avg. Score: 1.00)

NJ Specific Threats: 7.2.3.6 Abstraction of surface water may deplete upland mesic habitats of water needed by plants and wildlife.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Forest Birds

7.2.5 Abstraction of Ground Water (domestic use) (Avg. Score: 2.00)

NJ Specific Threats: 7.2.5.2 Abstraction of ground water may deplete upland mesic habitats of water needed by plants and wildlife.

7.2.6 Abstraction of Ground Water (commercial use) (Avg. Score: 2.00)

NJ Specific Threats: 7.2.6.2 Abstraction of ground water may deplete upland mesic habitats of water needed by plants and wildlife.

7.2.7 Abstraction of Ground Water (agricultural use) (Avg. Score: 1.00)

NJ Specific Threats: 7.2.7.2 Abstraction of ground water may deplete upland mesic habitats of water needed by plants and wildlife.

7.2.13 Stream Burial (Avg. Score: 2.00)

NJ Specific Threats: 7.2.13.1 Eliminates riparian habitats.

7.2.13.2 Eliminates in-stream habitat and water resources for wildlife.

7.3 Other Ecosystem Modifications

7.3.2 Inappropriate timing of mowing (Avg. Score: 0.40)

NJ Specific Threats: 7.3.2.1 Increased risk of direct mortality and/or reduced productivity of wildlife, as well as reduced use by migrating species.

7.3.3 Removal of coarse woody debris (streams, forests, scrub-shrub habitats) (Avg. Score: 1.80)

NJ Specific Threats: 7.3.3.3 Removal of dead trees (snags), large felled logs (i.e., those > 12" dbh), and other downed woody material diminishes nesting, roosting, and sheltering options for wildlife, and increases the ease at which deer can browse regenerating vegetation.

7.3.4 Lack of natural disturbance patterns or ecosystem functions due to species loss (Avg. Score: 2.00)

NJ Specific Threats: 7.3.4.1 The management and/or loss of beavers decreases natural disturbance patterns.

7.3.4.2 The loss of top-tier predators results in an overabundance of prey species which alter or degrade the natural function of the ecological system.

7.3.4.5 The lack of forest disturbance minimizes the diversity of herbaceous vegetation and other shrubs and trees that need a lot of sunlight to grow.

7.3.5 Poor habitat management (Avg. Score: 3.00)

NJ Specific Threats: 7.3.5.1 Improper or poorly scheduled maintenance of man-made corridors (e.g., roadsides and medians) can cause direct mortality to and may reduce productivity of wildlife.

7.3.5.5 Habitat management that alters or removes vegetation without implementing long-term management increases the risk of invasive and exotic plants establishing themselves, outcompeting native vegetation.

7.3.5.6 Habitat management, including that which occurs on public and private lands, that does not consider timing and species' behaviors can result in the direct mortality and/or alteration or loss of habitat.

7.3.5.10 Ditching, draining and filling of marshes and wetlands eliminates habitat and degrades the remaining surrounding areas for wildlife.

7.3.5.12 Lack of diversity in age structure and composition of vegetation due to lack of natural disturbances and/or vegetation management.

7.3.5.14 Intentional felling and removal of dead standing trees or snags eliminates resting, nesting or feeding habitat, and precludes the snags eventual contribution to coarse woody debris and forest floor structure and habitat.

Forest Birds

7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.

7.3.5.17 Decreased diversity in height and species of herbaceous vegetation resulting in reduced cover and food for nesting and foraging wildlife.

8 **Invasive and Other Problematic Species, Genes and Diseases**

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.1 Unspecified Species (Avg. Score: 2.00)

NJ Specific Threats: 8.1.1.1 Displace or outcompete native species for resources.

8.1.1.2 Alters, degrades and/or reduces the structural diversity of the natural composition of the landscape, including aquatic systems.

8.1.1.3 Invasive, non-native insects can damage native vegetation at a large scale, leading to die-offs, altering the ecological community.

8.1.1.4 Invasive, non-native animals increase the risk of predation on native animals and/or herbivory on native vegetation.

8.1.1.5 Invasive, non-native animals and plants increase the risk of introduction and transference of diseases

8.1.4 Invasive non-native terrestrial/wetland animals (Avg. Score: 1.60)

NJ Specific Threats: 8.1.4.1 Displace or out-compete native species for resources (food, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.1.4.2 Free-roaming and feral domestic animals such as cats and dogs causes direct mortality of wildlife and disturbance to wildlife breeding and resting areas.

8.1.5 Invasive non-native terrestrial/wetland plants (Avg. Score: 2.40)

NJ Specific Threats: 8.1.5.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.2 Problematic Native Species/Diseases

8.2.1 Unspecified Species (Avg. Score: 2.00)

NJ Specific Threats: 8.2.1.1 Overabundant native insects can damage native vegetation at a large scale, leading to die-offs, altering the ecological community.

8.2.1.2 Invasive pathogens and insects may increase in range and abundance as limiting factors (such as temperature) are altered as a result of climate change.

8.2.1.4 Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.

8.2.2 Named Species (Avg. Score: 2.00)

NJ Specific Threats: 8.2.2.2 Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.

8.5 Viral/Prion-induced Diseases

8.5.2 Named Species (Disease) (Avg. Score: 1.00)

NJ Specific Threats: 8.5.2.1 Diseases such as West Nile Virus, arenavirus, sudden oak death, Avian Influenza, and snake fungal disease cause morbidity or mortality to native populations.

8.6 Diseases of Unknown Cause

8.6.0 Unknown Diseases (Avg. Score: 1.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Forest Birds

NJ Specific Threats: 8.6.0.1 Diseases yet to be identified by pathologists and virologists cause decreased fitness or mortality to native populations.

9 Pollution

9.1 Domestic and Urban Waste Water

9.1.1 Sewage (Avg. Score: 1.00)

NJ Specific Threats: 9.1.1.3 Contaminants in sewage treatment effluents and Combined Sewer Overflows can cause developmental and behavioral abnormalities and reproductive failure in wildlife.

9.1.2 Run-off (Avg. Score: 1.00)

NJ Specific Threats: 9.1.2.3 Contaminants from road runoff (oil, sediment, salt, etc.) impact native vegetation and the species that rely upon them, degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.

9.2 Industrial and Military Effluents

9.2.1 Oil Spills (Avg. Score: 1.00)

NJ Specific Threats: 9.2.1.1 Oil spills render resting, breeding and foraging habitats temporarily unavailable to wildlife, altering normal wildlife behavior.

9.2.1.2 Oil spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.

9.2.3 Other (Avg. Score: 1.00)

NJ Specific Threats: 9.2.3.1 Point and nonpoint source pollution such as polychlorinated biphenyls (PCBs), pesticides, heavy metals, and endocrine disrupting compounds (EDC's) into freshwater and marine systems pose threats to wildlife through direct contact and/or ingestion, and to aquatic species and their predators through bioaccumulation, impacting the reproductive success and neurological function of many avian and fish species.

9.2.3.2 Chemical spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.

9.2.3.3 Chemical spills may render resting, breeding and foraging habitats temporarily unavailable to wildlife, altering normal wildlife behavior.

9.2.4 Other: Hydrofracturing (Avg. Score: 1.00)

NJ Specific Threats: 9.2.4.1 Contaminants from hydrofracturing degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.

9.2.4.2 Uncontrolled effluents escaping from hydrofracturing facilities can cause injury to wildlife and alter normal behaviors.

9.3 Agricultural and Forestry Effluents

9.3.3 Herbicides and Pesticides (Avg. Score: 1.00)

NJ Specific Threats: 9.3.3.3 Use of pesticides can directly harm non-target species through direct contact and/or by reducing and/or contaminating their food supply.

9.3.5 Control of insect pests and plants leading to mortality of non-target species not associated with agriculture (Avg. Score: 1.00)

NJ Specific Threats: 9.3.5.3 Use of pesticides and herbicides can minimize the abundance of invertebrates needed as a food source for many birds.

9.3.5.4 Improper use of current insecticides, such as those containing esfenvalerate, prallethrin, or piperonyl butoxide, or past use of pesticides containing chlordane still present in the soils, are toxic to various wildlife species, and can cause injury, mortality, or other effects that impair population viability.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Forest Birds

9.3.5.5 Use of pesticides and herbicides can minimize the abundance of food sources for native wildlife populations.

9.5 Air-Bourne Pollutants

9.5.1 Acid Rain (Avg. Score: 2.00)

NJ Specific Threats: 9.5.1.1 Causes acidification of water bodies, resulting in changes to aquatic and marine communities and reducing biodiversity, and creating conditions that are unsuitable for some aquatic (freshwater and marine) and semi-aquatic species that are sensitive to pH shifts.

9.5.1.2 Leaches calcium from the soils which in turn reduces the availability of prey, particularly calcium-rich prey such as snails.

9.5.2 Smog (Avg. Score: 1.00)

NJ Specific Threats: 9.5.2.1 Fine airborne particulate pollutants (such as smoke from controlled burns, soil particles from plowing arid soil, etc.) can adversely affect low mobility wildlife species, including avian species during nesting.

9.5.6 Herbicides and Pesticides (Avg. Score: 2.00)

NJ Specific Threats: 9.5.6.1 May result in injury or direct mortality of non-target species.

9.6 Excess Energy

9.6.1 Light Pollution (Avg. Score: 2.00)

NJ Specific Threats: 9.6.1.1 Artificial lighting can reduce suitability of adjacent habitat for species sensitive to artificial lights by disorienting wildlife, reducing foraging suitability or success, or increasing visibility to predators, resulting in reduced diversity and/or productivity of species in adjacent habitat.

9.6.3 Noise Pollution (Avg. Score: 1.00)

NJ Specific Threats: 9.6.3.1 Acute and chronic noise pollution in and adjacent to terrestrial and aquatic (marine and freshwater) environments could disrupt normal behaviors of wildlife such as migration, communication, feeding, eluding predators, resting and breeding, etc.

11 Climate Change and Severe Weather

11.1 Habitat Shifting or Alteration

11.1.0 Macro- and Micro-Climate Alterations (Avg. Score: 1.20)

NJ Specific Threats: 11.1.0.1 Alters native terrestrial and aquatic habitats at the macro- and micro-climate levels that can affect suitability for wildlife, in particular specialist species.

11.2 Droughts

11.2.1 Droughts (Avg. Score: 2.00)

NJ Specific Threats: 11.2.1.1 Contribute to hardened soils, decreasing water recharge during rains and increasing the likelihood of flash floods during storms.

11.2.1.2 Lead to lower groundwater levels and therefore, less available water for people and habitats.

11.2.1.3 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

11.3 Temperature Extremes

11.3.1 Temperature extremes (Avg. Score: 2.00)

NJ Specific Threats: 11.3.1.1 Increasing temperatures may cause habitat loss and degradation by desiccating and/or raising the temperatures of small wetlands and streams leading to the loss of freshwater mussels and other aquatic species and species reliant upon these habitats.

11.3.1.2 Increased temperatures can negatively impact wetland, riverine, lacustrine and vernal pool-associated or -dependent wildlife by reducing flows, increasing water temperatures, lowering water levels and causing premature drying of vernal habitats.

Forest Birds

11.4 Storms and Flooding

11.4.1 Storms and flooding (Avg. Score: 1.20)

NJ Specific Threats: 11.4.1.5 Storm damage can alter forest structure via blow-downs or micro-bursts, and can destroy bird nesting in the locales where the storms occur.

11.4.1.6 Increased storms and flooding reduce nesting success, especially for ground-nesting birds.

11.4.2 Increased rainfall (Avg. Score: 1.20)

NJ Specific Threats: 11.4.2.2 Extreme rain events can damage wildlife nesting and resting habitats, including impacts to avian eggs and chick and small mammal survivorship.

11.4.2.3 More frequent rain events can alter terrestrial and wetland vegetation communities as well as wetland hydrology, shifting wildlife community use.

11.6 Phenology Shifting or Alteration

11.6.2 Phenology shifts related to predator-prey ecology (Avg. Score: 2.00)

NJ Specific Threats: 11.6.2.1 Alters inter-specific relationships (e.g., competition, parasitism, predation) of wildlife, ultimately leads to detrimental impacts on the ecological system.

11.6.2.2 Shifts timing of species migration, breeding and hibernation, and available food resources, causes redistribution of species, or mortality for species that are unable to relocate due to their already isolated habitat or limited mobility.

11.6.3 Phenology shifts related to species redistribution (Avg. Score: 1.00)

NJ Specific Threats: 11.6.3.1 Shifts in timing of species migration, breeding and hibernation, and available food resources, as a result of wildlife range shifts driven by climate change.

11.6.3.2 Shifts in nesting times or egg incubation durations can limit nest success and longterm populations.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory (Avg. Score: 1.00)

NJ Specific Threats: 12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.1.6 Lack of information regarding migratory pathways and response of wildlife to lights and noise associated with offshore wind turbines.

12.1.2 Lack of up-to-date existing information (Avg. Score: 1.60)

NJ Specific Threats: 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

12.1.2.2 Lack of wildlife monitoring at sites with structures that pose high risk of mortality to SGCN wildlife.

12.1.3 Need to answer research question (Avg. Score: 1.20)

NJ Specific Threats: 12.1.3.1 There are significant knowledge gaps regarding distribution, dispersal, diseases, population trends, etc. of SGCN.

12.1.3.4 Lack of information regarding the potential short- and long-term impacts of wind turbines and other tall coastal structures on migratory populations.

12.1.4 Need to develop new technique (Avg. Score: 1.00)

NJ Specific Threats: 12.1.4.1 Improve and evaluate survey methods for SGCN and their habitats; alter as needed.

12.1.4.2 Improve and evaluate survey methods for species not easily detected through standard survey methods.

Forest Birds

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms

(Avg. Score: 2.00)

NJ Specific Threats: 12.3.0.1

Regulatory habitat protections within state land use regulations are spatially limited to specific geographic areas (e.g., Pinelands, Coastal Area) or geographic features (e.g., wetlands, streams) and so fail to protect critical habitats that exist outside of these regulated areas.

12.3.0.7

Activities that threaten SGCN, their food sources, and/or habitats are often regulated separately and without consideration for the cumulative and synergistic effects over time or over a larger spatial scale. Therefore, regulations can fail to protect SGCN populations over time.

12.3.0.9

Prescribed burns implemented by the NJ Forest Fire Service are constrained by State air quality regulations to a timeframe where seasonal weather conditions are less than ideal for effective burning. As a result, the Forest Fire Service is limited in the number of overall prescribed burns it can implement to restore habitat for wildlife.

12.3.0.10

Land use regulatory processes pertaining to habitat creation, enhancement or restoration projects can be costly and/or burdensome, precluding or discouraging the development or implementation of conservation projects.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform

(Avg. Score: 2.00)

NJ Specific Threats: 12.4.0.1

A species-by-species management focus as opposed to ecological systems and biodiversity generally has greater opportunity for unintended consequences for other species and may be less efficient in developing appropriate management actions.

12.4.0.2

Policies and procedures for lands management that lack consideration of the impacts of activity timing can result in unintended impacts to wildlife during vulnerable periods.

12.4.0.5

Bureau of Forest Fire Management policy has traditionally implemented prescribed burns on State lands for the sole purpose of public safety (i.e., addressing hazard fuel reduction), missing opportunities to burn in a manner that would additionally manage habitat for ecological diversity.

12.4.0.7

Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats

(Avg. Score: 2.00)

NJ Specific Threats: 14.1.1.1

Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.

14.1.1.2

Lack of general knowledge of SGCN life histories and vulnerabilities as they relate to land management practices.

14.1.1.3

Lack of understanding of the need to manage both natural and anthropogenic (e.g., yards, lawns, hayfields, etc.) habitats to minimize impacts or increase benefits to SGCN and their habitats.

14.2 Outreach needs

14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions

(Avg. Score: 2.60)

NJ Specific Threats: 14.2.1.1

Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various forest management practices.

14.2.1.5

Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various wetland management practices.

15 **Administrative Needs**

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning (Avg. Score: 2.00)

NJ Specific Threats: 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Actions to address the Threats and Action Drivers associated with this Conservation Target:

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.1 Enhance critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates through incentive programs with adjacent private landowners to increase the effective size of the habitat.
- 1.2.1.2 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to increase the effective size of SGCN habitats by protecting/restoring adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats.
- 1.2.1.3 Secure and promote the protection/restoration of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through incentive programs.
- 1.2.1.5 Secure and promote the protection/restoration of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through incentive programs.
- 1.2.1.6 Secure and promote the protection/restoration of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers through incentive programs.
- 1.2.1.8 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to municipalities, land developers, and other land managers to retain and/or enhance native vegetation adjacent to aquatic habitats, and along riparian areas and wildlife movement corridors.
- 1.2.1.9 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing Forestry Stewardship Programs.
- 1.2.1.10 Coordinate across government agencies and non-government organizations to maximize the availability of and enrollment in existing landowner incentive programs (e.g., "farm bill," partners, etc.) to maintain and/or improve habitat.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Forest Birds

- 1.2.1.11 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 1.2.1.12 Create incentives (non-monetary and/or monetary) for land developers to redevelop abandoned areas (e.g., shopping centers, office complexes) to minimize the loss of natural habitats and reduce the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 1.2.1.13 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to land developers to minimize the impacts of new residential and commercial developments on SGCN and their habitats.
- 1.2.1.14 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of herbicides and pesticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.16 Create incentives (non-monetary and/or monetary) within State regulations (mitigations requirements or credit, BMP satisfaction, etc.) to promote the use of retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.17 Develop a public-relations oriented certification program for private retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.18 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and land managers to control and reduce the impacts of invasive, native and non-native species in order to increase structural habitat diversity.
- 1.2.1.19 Create incentives for federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to farmers, woodland landowners, and private landowners to adopt and/or endorse consistent BMPs concerning controlled burns to maintain and/or improve wildlife habitat.
- 1.2.1.20 Coordinate across government agencies and non-government organizations to create or expand upon tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMP's.
- 1.2.1.21 Create and/or support market-based programs that subsidize or create branding for products derived sustainably from managed wildlife habitats.
- 1.2.1.22 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to horse/livestock farm owners and managers to increase structural habitat diversity in and around the farms by managing vegetation for a variety of species, in particular, farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).

Forest Birds

- 1.2.1.23 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to provide cost shares and/or plan approvals for management based on management approaches and prescriptions.
- 1.2.1.26 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing landowner incentive programs.
- 1.2.1.28 Create incentives to implement dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.

2 Direct Management of Natural Resources

2.3 Fire management

2.3.2 Fuel reduction

- 2.3.2.1 Prevent wildfires by reducing natural fuel (e.g., leaf litter).

2.3.3 Prescribed burning

- 2.3.3.1 Evaluate different management techniques of prescribed burns that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 2.3.3.2 Conduct prescribed burning in Northern New Jersey forests to maintain and regenerate a mosaic of upland forest habitats.
- 2.3.3.3 Conduct prescribed burning to improve wildlife habitat.

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

- 2.8.0.1 Control invasive insect infestations by implementing BMP strategies through biological, chemical and/or mechanical means that will depress, or when appropriate, eradicate populations in a manner that avoids excessive harm to non-target species using BMPs to control infestations and limit their spread based on an inventory of invasive insect distribution and response to outbreaks.
- 2.8.0.2 Develop, implement, monitor and evaluate pest control/management strategies to reduce the impacts of over-abundant wildlife species (native and/or native, invasive species) on native vegetation and the degradation of habitats supporting SGCN. Over-abundant wildlife species include but are not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.
- 2.8.0.6 Implement long-term management of invasive and/or non-native plants to help maintain functioning ecological systems and biological diversity, and to enhance travel corridors. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Forest Birds

- 2.10.0.1 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 2.10.0.5 Implement habitat restoration and/or enhancement activities that include the creation of vegetative buffers between sensitive habitats (e.g., aquatic systems) and human-inhabited areas (e.g., residences, parks, etc.) and that is conducted during appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.10.0.6 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats.
- 2.10.0.7 Restore/reclaim and enhance degraded rare species habitats through strategic revegetation and management efforts for documented/target SGCN.
- 2.10.0.8 Protect significant natural and/or unique communities by implementing best management practices when conducting habitat restoration strategies.
- 2.10.0.9 Restore and/or enhance riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation, alteration and/or changes in hydrology and subsequent disturbances to and behavioral changes of wildlife (e.g., restoring biologically appropriate buffers, revegetation or restoration efforts, etc.).
- 2.10.0.10 Minimize the loss of important habitats (e.g., coastal scrub-shrub and grassy habitats, high and low marsh habitats, etc.) that provide nesting, migrating, and wintering areas for SGCN birds and other coastal and marsh-dependent species through habitat restoration efforts.
- 2.10.0.11 Restore and/or enhance critical migratory terrestrial and aquatic habitats (e.g., beach, grasslands, forest, scrub-shrub, etc.) for songbirds, raptors, shorebirds, waterfowl, bats and invertebrates through habitat restoration efforts and expand habitat restoration to adjacent private lands to increase the effective size of the habitat.
- 2.10.0.12 Create and/or maintain scrub-shrub habitats through revegetation efforts with little to no impact on forested, wetland and grassland habitats to maintain populations of shrub-dependent SGCN.
- 2.10.0.14 Implement best management practices (BMPs), protective strategies and guidelines for restoring and enhancing healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.10.0.21 Restore and/or enhance understory habitats that suppress invasive species and provide critical resources and enhance sheltering, foraging, and nesting cover for wildlife.
- 2.10.0.22 Restore and/or enhance terrestrial and aquatic habitats to promote the regeneration of native vegetation and enhance structural diversity to benefit SGCN (e.g., vegetative buffers of aquatic systems, allow coarse, woody debris to remain in terrestrial, aquatic and riparian habitats to provide shelter, riparian stabilization and necessary microclimates, plant native trees, shrubs and grasses, etc.).
- 2.10.0.23 Restore and/or enhance roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.

Forest Birds

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.
- 2.11.0.2 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas for target SGCN and/or species groups; management should complement rare species needs in a targeted area.
- 2.11.0.3 Create suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats through vegetation management.
- 2.11.0.4 Implement vegetation management strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife, particularly SGCN.
- 2.11.0.5 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats through vegetation management.
- 2.11.0.6 Reclaim degraded rare species habitats by conducting vegetation management needed to restore habitat value for the documented/target SGCN.
- 2.11.0.7 Protect significant natural and/or unique communities by implementing best management practices through vegetation management.
- 2.11.0.8 Maintain, enhance and/or restore biologically appropriate buffers for SGCN-inhabited/used freshwater wetlands through vegetation management.
- 2.11.0.9 Minimize habitat loss of critical coastal habitats that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas through vegetation management.
- 2.11.0.12 Conduct vegetation management to create feeding and roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.
- 2.11.0.13 Implement best management practices (BMPs), protective strategies, and guidelines for vegetation management to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.11.0.16 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 2.11.0.19 Implement forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN.
- 2.11.0.20 Create and/or maintain scrub-shrub habitats through management efforts with little to no impact on forested, wetland and grassland habitats to maintain populations of shrub-dependent SGCN.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Forest Birds

- 2.11.0.21 Minimize the degradation, alteration and/or changes in hydrology of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) and subsequent disturbances to and behavioral changes of wildlife by maintaining or enhancing these areas and biologically appropriate buffers through habitat management and/or revegetation or restoration efforts.
- 2.11.0.23 Implement appropriate habitat management actions in areas where natural disturbances, such as wildfire, have been precluded.
- 2.11.0.25 Conduct vegetation management along access roads following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.27 Conduct vegetation management for target shrub- or young forest-dependent SGCN following BMPs to minimize the risk of the establishment of invasive and non-native plants.
- 2.11.0.28 Conduct vegetation management in agricultural areas following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.29 Conduct vegetation management on transportation and service corridors (i.e., rights-of-way) following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.31 In areas where vegetative communities are shifting due to fire suppression and controlled burns are not feasible, manage vegetation to improve wildlife habitat.
- 2.11.0.32 Increase structural habitat diversity around and when feasible, within agricultural landscapes by managing vegetation for a variety of species, in particular, those farms that have removed scrub-shrub habitat and/or fragmented forests, and by implementing ecologically best practices (e.g., no-till farming, maintaining hedgerows, buffer set-asides, etc.).
- 2.11.0.33 Increase structural habitat diversity by implementing long-term vegetation management to minimize the potential for the establishment of invasive and/or non-native plants that may outcompete native vegetation.
- 2.11.0.34 Increase structural habitat diversity by managing residential, commercial and recreational areas' landscapes for a variety of species. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.36 Increase structural habitat diversity by managing vegetation for a variety of species and considering their life history requirements (e.g., travel corridors, shelter, resting and breeding areas) to minimize the risk of harm.
- 2.11.0.37 Increase structural habitat diversity by minimizing the removal of coarse, woody debris in terrestrial, aquatic and riparian habitats which benefits wildlife.
- 2.11.0.38 Increase structural habitat diversity in and around horse/livestock farms by managing vegetation for a variety of species, in particular, in and around farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 2.11.0.39 Increase structural habitat diversity in and around solar farms by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.

Forest Birds

- 2.11.0.40 Increase structural habitat diversity surrounding areas used for energy, mining, and transportation and service corridors by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides, and avoid managing habitat during the breeding seasons for ground-nesting birds, reptiles, amphibians and small mammals.
- 2.11.0.41 Increase structural habitat diversity through the implementation of a variety of vegetation management practices such as prescribed burns (either increasing or decreasing their frequency depending on the site and objective), plantings, etc. that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.42 Increase structural habitat diversity within wind farms for terrestrial bound and low-flying species and around wind farms for other wildlife by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.43 Manage forests to increase variation in age structure and composition using BMPs that promote and maintain functioning ecological forest-based systems and biological diversity.
- 2.11.0.45 Regularly and/or rotationally create young forest habitat in targeted areas to maintain and regenerate a mosaic of upland forest habitats that will benefit shrub- and young forest-dependent species.

2.13 Wildlife damage management

2.13.0 Nuisance fish and wildlife damage

- 2.13.0.5 Investigate the impacts of human-subsidized and/or naturally occurring predator species on SGCN to assess the need for integrated wildlife damage management techniques (e.g., predator exclosures, fish blockages, electric fence, culls) and/or policy changes on state land management that minimize the impacts of human-subsidized predators.
- 2.13.0.7 Develop, implement, monitor and evaluate management strategies to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 2.13.0.8 Implement and assess management strategies to control and reduce the impacts of detrimental species and diseases that pose threats to native wildlife or communities.

2.14 Wildlife disease management

2.14.0 Wildlife disease strategy development and investigation

- 2.14.0.1 Investigate diseases/pathogens impacting SGCN and/or their habitats.
- 2.14.0.2 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

Forest Birds

- 3.0.0.1 Conduct long-term monitoring of resident and migratory SGCN populations using standardized survey protocols to determine the variables that may impact their long-term persistence in the State (e.g., population viability, distribution, dispersal, home range and habitat use, travel corridors, food availability, vulnerability to pollutants and disease, etc.). Compile this information to determine the likely causes of population declines and to understand metapopulation dynamics. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.2 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) where data gaps exist regarding SGCN distribution, and their critical and supportive habitats. Conduct surveys using standardized survey protocols to acquire baseline data, and provide the data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
- 3.0.0.3 Gather baseline data on SGCN inhabiting permanently protected natural lands regarding their distribution and population (e.g., abundance, dispersal, demography including productivity and survival, etc.), and identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) critical and supporting habitats within those landscapes.
- 3.0.0.4 Conduct long-term studies on SGCN inhabiting permanently protected natural lands to develop population trend data and changes in demography, and to determine if critical and/or supporting habitats are limited or changing; i.e., diminishing in value, acreage or connectivity.
- 3.0.0.5 Gather baseline data on resident and migratory SGCN (in particular migratory species for which New Jersey habitats are significant), terrestrial, freshwater and marine species, regarding the location and condition of their critical and supporting habitats (e.g., foraging, roosting, nesting/breeding, stopover, migration paths, etc.), and population demography (e.g., productivity, survival, dispersal). Compile this information into a database that includes descriptions of the conditions of the habitats and species, and a GIS component of the locations of these important habitats. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.6 Conduct long-term studies on resident and migratory SGCN to determine if there are changes to the populations' demography (productivity, survival, dispersal) and/or to their critical and/or supporting habitats (i.e., diminishing in value, acreage or connectivity, etc.), in particular changes that would not maintain SGCN at viable levels for species populations. Update data and GIS maps; provide updated information to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.7 Collect baseline data to document species distributions, in particular SGCN, and current habitat for future analysis of possible distribution shifting as a result of habitat shifting or alteration associated with climate change impacts.
- 3.0.0.8 Conduct long-term studies and compare baseline metrics of documented species distributions and associated habitats to identify possible species and/or habitat shifting or alteration associated with climate change impacts.
- 3.0.0.9 Identify SGCN (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources, and compile/collect and evaluate data/information regarding potential management strategies to improve the availability of such SGCN's food resources.

Forest Birds

- 3.0.0.10 Conduct long-term studies to evaluate the effectiveness of management strategies implemented to enhance food/prey availability for SGCN [whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources] through studies that investigate the populations and health of the food resources as well as the target SGCN. Revise management strategies as needed and continue to monitor the effectiveness of the efforts.
- 3.0.0.11 Develop, implement and evaluate the effectiveness of town plans that avoid impacts to SGCN species and their habitats.
- 3.0.0.13 Investigate the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats. Evaluate and modify management practices as appropriate.
- 3.0.0.25 Identify pathways of migratory SGCN in the Atlantic Coastal and Marine Regions (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and use the data to help evaluate the potential short- and long-term impacts of wind turbines, radio towers, utility guy lines, and other tall coastal structures on migratory populations.
- 3.0.0.26 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species including objectives and guidance pertaining to and the condition/status of critical and supporting habitats.
- 3.0.0.30 Conduct research to investigate the feasibility of managing and/or creating roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.
- 3.0.0.31 Conduct short- and long-term studies (e.g., wildlife surveys and habitat assessments) to evaluate the effectiveness of vegetation management efforts to maintain, enhance and/or create roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.1 Division of Fish and Wildlife should maintain a robust, up-to-date database and mapping of species occurrences.
- 3.2.0.2 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
- 3.2.0.5 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 3.2.0.10 Evaluate the effectiveness of sanitation/decontamination protocols in minimizing the transference of wildlife diseases and invasive plant species.
- 3.2.0.11 Investigate the impacts of ORV use as a mechanism to spread wildlife diseases and invasive plant species to native wildlife and habitats. Integrate this information when mapping undeveloped roads and trails to identify potentially sensitive areas in northern NJ forests.
- 3.2.0.17 Conduct monitoring at constructed wind farms (within or outside of NJ) to assess the impacts on migratory species (birds, bats, insects) and determine if NJ's land use planning efforts and/or smart-growth plans need to be revised.

Forest Birds

3.2.0.24 Develop, implement and evaluate the effectiveness of BMPs for lighting of/on tall structures that minimize harm to and/or disorient wildlife, in particular but not limited to migratory birds, bats and invertebrates. Implement BMPs into state, county and local permitting processes.

3.2.1 Abundance determination

3.2.1.1 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) population abundance and trends for SGCN using standardized survey protocols. Provide data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.

3.2.1.2 Conduct wildlife surveys on resident and migratory SGCN regarding their population abundance and trends.

3.2.2 Age, size and sex structure

3.2.2.1 Conduct wildlife surveys on resident and migratory SGCN regarding their survivorship.

3.2.7 Population assessment

3.2.7.1 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.

3.2.7.2 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species to meet and maintain recovery goals.

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

3.3.1.1 Conduct habitat assessments of significant natural and/or unique communities to identify threats to native terrestrial and aquatic habitats through systematic monitoring, review of available data, enlistment of habitat management and/or species experts, etc. Incorporate findings into a database that includes descriptions/qualifiers of the habitats, identifies and values/qualifies the threats, and includes a GIS component of the locations of the assessed areas. Share this information with landowners/managers (e.g., federal, state and local government agencies or non-government organization).

3.3.1.2 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) resident and migratory SGCN habitats. Investigate their suitability for the various life history requirements of the species that dependent upon them to determine the ability for maintaining applicable SGCN populations in perpetuity.

3.3.1.4 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and investigate the suitability of corridors that connect large, contiguous tracts of similar habitats to increase their effective size (i.e., forest with forest, grassland with grassland, wetlands with wetlands, etc.) for dependent SGCN.

3.3.1.5 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) where habitat restoration and/or enhancement would benefit wildlife SGCN.

3.3.1.7 Map and prioritize existing and potential areas for early succession forest management. Share the results with state, county and municipal planners.

3.3.1.8 Assess the availability and suitability of forest habitats for SGCN species (particularly reptiles and amphibians, birds, pollinators, and tiger beetles) in southern forests since Superstorm Sandy.

Forest Birds

- 3.3.1.9 Inventory forests throughout northern New Jersey to develop a baseline characterization of the structure and composition of habitats and identify deficient forest habitat types.
- 3.3.1.18 Conduct an assessment using available data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels.
- 3.3.1.20 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) where invasive, non-indigenous plants and animals are either already established or are becoming established. Create a system for reporting and qualifying new locations of invasive species and for prioritizing areas for control measures according to the potential level of impact on the ecosystem and SGCN and the likelihood of success. Researchers and contractors encountering invasive plant species while performing plant and/or forest inventories on state or other conserved lands and/or private lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.3.1.24 Conduct regular investigations of SGCN habitat health and biodiversity on public and private lands to identify locations in need of revegetation, reduction of over-abundant, native wildlife and/or exotic species, conservation focal areas requiring limitations on human activity, etc.

3.3.2 Monitoring

- 3.3.2.1 Evaluate the effectiveness of forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.
- 3.3.2.2 Conduct long-term monitoring of resident and migratory SGCN habitats using standardized survey protocols to determine changes in habitat quality/suitability and threats (e.g., habitat loss and degradation, increased edge habitat, water quality) and other variables that may impact their long-term persistence in the State and to provide information needed for determining causes of population declines and understanding metapopulation dynamics.
- 3.3.2.3 Continue to update wildlife and habitat databases and revise models of critical SGCN habitats using the most current data available and where lacking, develop new SGCN and/or habitat models as data on species habitat requirements and applicable GIS data layers become available.
- 3.3.2.8 Evaluate the effectiveness of current prescribed burning practices on Pinelands dependent species.
- 3.3.2.9 Investigate the effectiveness of various silviculture techniques for enhancing forests for forest-dependent SGCN.
- 3.3.2.10 Evaluate the efficacy and success of different management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.3.2.15 Investigate the effectiveness of management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.3.2.16 Evaluate the effectiveness of best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

Forest Birds

- 3.3.2.20 Once a system is developed for reporting and qualifying new locations of invasive species, develop, implement and monitor/evaluate invasive species removal strategies at identified locations. Priority should be given to those areas critical to SGCN and/or contain unique and/or rare plant communities supporting SGCN and/or other fish/wildlife species.
- 3.3.2.24 Conduct regular inventories of forests throughout northern New Jersey to characterize the changing structure and composition of habitats and monitor forest conditions.

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.1 Work with land management agencies to determine the appropriate actions needed to restore/reclaim degraded habitat for the documented/target SGCN.
- 3.5.3.3 Develop/improve management techniques that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.7 Develop/improve forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.
- 3.5.3.8 Develop best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 3.5.3.9 Develop strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 3.5.3.11 Develop strategies to protect native terrestrial and aquatic habitats and dependent SGCN species from the identified threats.
- 3.5.3.15 Modify management practices based on the effects of pesticides, herbicides and other biological controls on critical and supporting SGCN habitats.
- 3.5.3.19 Work with foresters to develop prescribed burning practices for Pinelands dependent species that increase or maintain habitat quality for these species in the Pinelands.
- 3.5.3.20 Develop guidance on various silviculture techniques for enhancing forests for forest-dependent SGCN.
- 3.5.3.21 Develop management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.24 Based on research, modify management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.5.3.25 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to develop the necessary management strategies to reach or maintain viable population levels.

3.5.4 Fish and wildlife research, survey and management techniques

- 3.5.4.2 Develop, implement, monitor and evaluate management strategies to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.

Forest Birds

- 3.5.4.10 Develop BMPs for lighting of/on tall structures that minimize harm to and/or disorientation of wildlife, in particular but not limited to migratory birds, bats and invertebrates.
- 3.5.4.14 Develop and implement agreements, and update existing agreements, with government agencies regarding the protection of critical SGCN habitats (e.g., significant breeding populations of beach nesting birds, colonial waterbird nesting areas, bat colonies, etc.).
- 3.5.4.15 Investigate the success of management strategies used to protect and/or enhance SGCN populations and when appropriate, aid in identifying failures/resource problems and issues, and developing new strategies.
- 3.5.4.16 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels and develop the necessary management strategies.
- 3.5.4.17 Investigate new, non-invasive techniques for SGCN population evaluation through literature review, expert opinion, trial studies (if low risk), etc.
- 3.5.4.18 Investigate the effectiveness of survey techniques through selected “ground truthing” and literature and peer review in order to increase efficacy of survey, minimize surveyor bias and error, and increase accuracy of trend data.
- 3.5.4.19 Develop reliable, standardized survey and monitoring protocols for SGCN species, for which none currently exist, and their habitats.

4 Education

4.1 Educator/Instructor training

4.1.0 Public education

- 4.1.0.1 Provide educational resources and training programs to private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.

5 Facilities and Areas

5.15 Wildlife Management Areas

5.15.6 Roads

- 5.15.6.1 Clearly post areas/roads where vehicle access is permitted.
- 5.15.6.2 Clearly post areas/trails where vehicle access is not permitted.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

- 6.0.0.1 Enhance and increase the effective size of critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates by securing adjacent habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.3 Secure and protect riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through an appropriate combination of fee title, non-fee title and landowner agreements.

Forest Birds

- 6.0.0.5 Secure and protect critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.7 Secure and protect critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.8 Secure and protect scrub-shrub habitats for SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

6.3 Conservation area designation

6.3.0 Conservation area designation strategies

- 6.3.0.1 Promote the protection of critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates and enhance these lands by increasing the effective size through conservation area designations of stopover habitats and adjacent private lands.
- 6.3.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN and/or connect conserved SGCN habitats through conservation area designations.
- 6.3.0.3 Increase the protection of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through conservation area designations.
- 6.3.0.5 Promote the protection of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through conservation area designations.
- 6.3.0.7 Promote the protection of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through conservation area designations.
- 6.3.0.8 Promote the protection of scrub-shrub habitats for SGCN through conservation area designations.

6.4 Private lands agreements

6.4.0 Private land agreement strategies

- 6.4.0.1 Enter into private lands agreements to expand control burns on private lands, in particular those adjacent to conserved lands to improve SGCN habitats.

7 Law Enforcement

7.1 Law enforcement

7.1.4 Scale Unspecified

- 7.1.4.1 Improve enforcement of policies and/or regulations that promote the reduction of run-off and point and non-point source pollution into NJ's aquatic systems (streams, rivers, lakes/ponds, bays, ocean, wetlands, etc.).
- 7.1.4.4 Improve enforcement of policies/regulations aimed at protecting and preserving critical coastal and marsh habitats, and secure mitigation for losses that create an environmental benefit.

Forest Birds

- 7.1.4.5 Enforce current policies and/or regulations to increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal SGCN, and implement and enforce amended policies/regulations.
- 7.1.4.7 Increase law enforcement presence to enforce regulations governing recreational activities (e.g., the use of personal watercraft and off road vehicles, caving, rock climbing, etc.) on conserved lands and within other sensitive habitats, and discourage activities that cause harm or disturbance to vegetation, wetlands, fish and wildlife.
- 7.1.4.8 Implement policies that protect critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates.
- 7.1.4.10 Implement policies that promotes expanding acreages and enhances the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 7.1.4.11 Implement and enforce policies/regulations that will increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.
- 7.1.4.12 Implement policies and/or regulations that protect significant natural and/or unique communities in perpetuity.
- 7.1.4.15 Implement policies that preserve and protect critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.
- 7.1.4.16 Implement policies that protect and restore riparian areas.
- 7.1.4.17 Improve the enforcement of policies and/or regulations that protect wetlands, riparian and floodplain areas, and aquatic habitats (including open waters).
- 7.1.4.19 Implement policies that protect and restore scrub-shrub habitats to benefit shrub-dependent SGCN.
- 7.1.4.21 Implement regulations for lighting of/on tall structures that will minimize harm to and/or disorientation of wildlife, and enforce within state, county and local permitting processes.
- 7.1.4.22 Implement policies and/or regulations that prohibit the presence of managed cat colonies and trap, neuter and release programs in or near critical wildlife habitats.
- 7.1.4.25 Encourage the enforcement of municipal laws regulating domestic pets that may predate on wildlife.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.4 Engage government agencies, conservation partners and other stakeholders in constructive dialogues encouraging them to influence policy change and the creation of incentives through a habitat bill and/or municipal ordinances for backyard habitat.
- 8.1.0.13 Engage DOD in a constructive dialogue regarding strategies to minimize disturbances to all SGCN (i.e., beyond their federal requirements) from forest management and other practices on their lands.
- 8.1.0.16 Engage local governments in discussions regarding the importance of them adopting/passing ordinances which require assessing and addressing secondary impacts (i.e., ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Forest Birds

- 8.1.0.17 Engage municipalities in constructive dialogue to identify and minimize destruction of areas prioritized for early succession forest management.
- 8.1.0.19 Engage government agencies, conservation partners and other stakeholders to collaboratively develop a list of important projects, targeting SGCN and/or their habitat, as a guide for graduate student research. Distribute the list and contact information to all State colleges and universities.
- 8.1.0.21 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation human-subsidized and/or overabundant, native species cause to local nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.22 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation invasive species cause to native nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.24 Engage government agencies, conservation partners and other stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.25 Provide technical support to public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.26 Coordinate across federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to woodland landowners to adopt or endorse consistent best management practices concerning controlled burns to maintain and/or improve forested habitat for wildlife.
- 8.1.0.30 Encourage government agencies and conservation partners to advise members of the relevant scientific community of the need for specific studies, reports or investigations targeting the data-deficiency regarding SGCN and/or their habitats.
- 8.1.0.33 Engage government agencies, conservation partners and other land managers, communities, landowners, and commercial and industrial stakeholders in discussions regarding the importance of protecting and methods to protect priority wetlands beyond the levels afforded through regulation by maintaining and/or restoring optimal biological buffers around wetlands.
- 8.1.0.37 Enlist landowners and NJ citizens in the protection of and survey efforts for SGCN, in particular rare species, by increasing enrollment in landowner incentives, forest stewardship, backyard habitat management and wildlife-related volunteer programs.
- 8.1.0.38 Engage partners, stakeholders and land managers in constructive dialogue promoting forest stewardship for SGCN that use core forests and forested corridors.
- 8.1.0.44 Engage conservation partners, stakeholders, government agencies and other land stewards in constructive dialogues encouraging their inclusion of controlled burns in forest and other stewardship plans.
- 8.1.0.47 Form cooperative partnerships with energy companies to facilitate habitat creation and enhancement away from and outside of project areas, the restoration of appropriate habitats within project areas (e.g., rights-of-way could benefit butterflies and some bird species), and to identify seasonal timing of activities that would minimize impacts to wildlife.
- 8.1.0.48 Form cooperative partnerships with transportation and shipment agencies and companies to facilitate habitat creation and enhancement away from and outside of project areas and to identify seasonal timing of activities that would minimize impacts to wildlife.

Forest Birds

8.2 Recruitment and retention activities

8.2.3 For wildlife watching

- 8.2.3.1** Develop and implement nature-focused tourism opportunities including wildlife viewing sites, interpretive signage highlighting unique ecosystems/habitats, and wildlife-related recreational opportunities that do not negatively impact SGCN or their habitats.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.5** Develop and provide (or otherwise make publicly available) educational programs and/or materials that provide homeowners information on how to design dwellings and other structures in a manner that is wildlife friendly (e.g., using bird-safe glass on windows).
- 8.3.0.6** Develop and provide (or otherwise make publicly available) educational programs and/or materials to enlist landowners, land managers and local communities to discourage the presence of managed cat colonies and trap, neuter and release programs in wildlife habitats.
- 8.3.0.9** Develop and provide (or otherwise make publicly available) educational programs and/or materials to enlist landowners and land managers to include only native plants in landscaping and restoration projects. Provide information to assist them in detecting problematic establishment of invasive, non-indigenous plants.
- 8.3.0.10** Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate landowners and NJ citizens on threats to fish and wildlife (including marine animals).
- 8.3.0.12** Promote awareness of WSFR (Wildlife and Sportfish Restoration) Outreach/Awareness grants, an important funding source for conservation among hunters and anglers as well as the general public.
- 8.3.0.13** Conduct an educational campaign to encourage observer ethics and respect for wildlife and natural habitat.
- 8.3.0.19** Develop an educational outreach program for the public on the devastating effects predators can have on native nesting wildlife.
- 8.3.0.25** Develop educational outreach programs for landowners, nurseries and the general public regarding the negative impacts of invasive and non-native plants on our natural communities.
- 8.3.0.26** Develop educational outreach programs for private and public landowners and land managers regarding the importance of and how to manage core forests and forested corridors in a way that will be beneficial for SGCN, particularly endangered, threatened and special concern species.
- 8.3.0.27** Develop educational outreach programs for public and private landowners and land managers regarding the importance of structural habitat diversity, methods to increase diversity, and/or incentive programs available to increase habitat diversity.
- 8.3.0.30** Develop educational outreach programs for private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.
- 8.3.0.32** Develop an educational outreach program for landowners and citizens on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Forest Birds

- 9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and SGCN inhabiting them.
- 9.1.0.2 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.1.0.3 Develop a plan that directs the creation of impervious surfaces away from and to minimize impacts on aquatic systems and critical terrestrial habitats. The plan should also include strategies to increase the resiliency of aquatic and critical terrestrial habitats to threats and stressors that would impact the reproduction and survival of wildlife.
- 9.1.0.5 Develop a plan that directs the creation or expansion of energy or utility rights-of-way in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.6 Develop a plan that directs the creation or expansion of roads and railroads or the re-establishment of abandoned railroads within and adjacent to critical forested habitats in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.7 Develop a plan that directs the maintenance of or new channelization of forested streams and rivers in a manner that minimizes impacts of the aquatic ecological system and adjacent forest
- 9.1.0.9 Develop a plan that focuses on strategies to minimize the creation of renewable energy farms (e.g., solar, wind) and related infrastructures within and their impacts on forested habitats and the wildlife community.
- 9.1.0.10 Develop a plan that focuses on strategies to minimize the impacts of mining on critical forested habitats.
- 9.1.0.11 Develop a plan that focuses on strategies to minimize the impacts of power plants on critical forested habitats and the wildlife community.
- 9.1.0.13 Develop a plan to minimize agriculture that would result in groundwater withdrawal in critical forested areas.
- 9.1.0.14 Develop a plan to minimize development that would result in groundwater withdrawal in critical forested areas.
- 9.1.0.15 Develop a plan to minimize fragmentation of terrestrial and aquatic habitats by roads.
- 9.1.0.16 Develop a plan to minimize new lawns and preserve natural vegetation within and adjacent to critical forest areas.
- 9.1.0.19 Develop a plan to minimize the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 9.1.0.20 Develop a plan to minimize the impacts of existing agricultural properties adjacent to and the conversion of forest habitats (terrestrial and aquatic, within or adjacent to critical forests) to agriculture, grazing areas/livestock farms, and plantations.
- 9.1.0.21 Develop a plan to minimize the use of any-sized dam in critical forested areas.
- 9.1.0.22 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 9.1.0.24 Develop a plan to prevent livestock from entering water bodies in critical forested habitats.
- 9.1.0.25 Develop a plan to prevent the conversion of forested stream buffers to pastures in critical forested habitats.
- 9.1.0.28 Develop and coordinate state, regional and local plans for suitable lot layout and landscaping to minimize human-wildlife conflicts that also incorporates habitat connectivity and preservation of natural areas.

Forest Birds

- 9.1.0.29 Provide GIS or related data, maps, resource inventories, as well as related training, pertaining to the SWAP and its recommended conservation actions for use or consideration by State, County or municipal planning agencies.
- 9.1.0.30 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and other related threats associated with development.
- 9.1.0.31 Develop wetland restoration plans that consider the life history and needs of wildlife occupying targeted habitats.
- 9.1.0.33 Review the species, threats, action successes, and habitats, and work with partners to revise the 2017 State Wildlife Action Plan for the 2025 resubmittal.

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.4 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.3.1.7 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
- 9.3.1.9 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
- 9.3.1.13 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
- 9.3.1.16 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.

9.3.2 Listed species recovery planning

- 9.3.2.1 Develop proactive species recovery plans for all endangered and threatened species including guidance and objectives pertaining to critical and supporting habitat to meet and maintain recovery goals.

9.3.3 Habitat management planning

- 9.3.3.5 Develop a management plan using forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.
- 9.3.3.6 Develop a management plan for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 9.3.3.7 Develop a management plan to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 9.3.3.8 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.

Forest Birds

- 9.3.3.9 Develop a response plan to outbreaks using BMPs to control infestations and limit their spread in a way that avoids excessive harm to non-target species.
- 9.3.3.10 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
- 9.3.3.11 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.3.3.13 Develop a management plan that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas and prevents or ameliorates near-term impacts of climate change throughout the State, but in particular within the coastal and Delaware Bay areas.
- 9.3.3.15 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
- 9.3.3.17 Develop a management plan for prescribed burning that will benefit Pinelands dependent species and increase or maintain habitat quality for these species in the Pinelands.
- 9.3.3.18 In cooperation with species and habitat experts, develop management plans for significant natural and/or unique communities, in particular those supporting SGCN, and provide the information to the landowners/managers (federal, state and local government agencies or non-government organization) for review and implementation.
- 9.3.3.19 Develop management plans for SGCN inhabiting permanently protected natural lands using available baseline and population trend data.
- 9.3.3.20 Develop an action plan for immediate implementation should habitat levels fall below the minimum necessary size and/or structure within the Cape May Peninsula to sustain the avian migration.
- 9.3.3.21 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
- 9.3.3.24 Develop a plan to improve the enforcement of policies and/or regulations that protect wetlands, riparian and floodplain areas, and aquatic habitats (including open waters).
- 9.3.3.29 Develop habitat management plans aimed at reducing or eliminating negative impacts of ORVs.
- 9.3.3.32 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.
- 9.3.3.34 Include controlled burn prescriptions in forest and stewardship plans to improve wildlife habitat.
- 9.3.3.35 Incorporate habitat connectivity, preservation of natural areas, and the implementation of BMPs into state and local land-use policy environmental review process and energy development plans to minimize habitat fragmentation and related threats associated with solar farms and altered habitats.
- 9.3.3.36 Integrate plans for properly located and timed habitat restoration and management along transportation, energy and service corridors to minimize risks to and benefit wildlife.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

Forest Birds

- 11.1.1.1 Use Biotics database and Landscape Project Mapping in regulatory reviews to ensure protection by applicable laws and regulations.
 - 11.1.1.2 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
 - 11.1.1.3 Government organizations to thoroughly review wetland restoration plans, applying the most current science for wildlife, habitats and aquatic systems, to assess the impacts to resident and migratory wildlife occupying the targeted habitats.
 - 11.1.1.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.
 - 11.1.1.5 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
 - 11.1.1.10 Use CHANJ mapping in reviews of proposed energy, mining, transportation and utility service companies/agencies' projects to attempt to maintain habitat connectivity and reduce fragmentation, and identify potential impacts of the projects.
 - 11.1.1.11 Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed offshore energy projects relating to drilling, extraction and distribution of petroleum and gas products to reduce habitat destruction and minimize impacts on wildlife.
 - 11.1.1.12 Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed solar farm projects to reduce habitat fragmentation and minimize impacts on wildlife.
 - 11.1.1.13 Use the best available science (species data, habitat present, wind farm layout options, wind blade impacts on migratory species, location of migration routes, etc.) when conducting regulatory reviews of proposed wind farm projects to minimize impacts on migratory and resident wildlife and reduce habitat fragmentation.
 - 11.1.2 Review of proposed policies and plans
 - 11.1.2.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
- 11.2 Technical assistance
 - 11.2.0 Assorted technical assistance strategies
 - 11.2.0.1 Provide technical support to private and public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
 - 11.2.0.2 Provide technical support to public and private landowners and land managers for controlling invasive, native and non-native plant species in order to increase structural habitat diversity.
 - 11.2.0.3 Develop state, regional and local BMPs that focus on minimizing habitat fragmentation and human-wildlife conflicts associated with development. Make information available to land developers and private and public landowners for implementation.
 - 11.2.0.5 Provide educational resources, training programs, and expert guidance to private and public landowners and land managers on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

Forest Birds

- 11.2.0.6 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on habitat creation, enhancement and restoration within and adjacent to project areas, as well as away from and outside of project areas (depending on the target species), by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. Wind farms should address both terrestrial bound and low-flying species. Examples of habitat management include, but are not limited to, integrating short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 11.2.0.7 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on the importance of maintaining habitat connectivity, minimizing fragmentation, and the use of CHANJ products to help them target areas for such planning.
- 11.2.0.8 Provide educational resources, training programs, and on-the-ground guidance to public and private landowners and land managers on habitat creation and enhancement strategies that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 11.2.0.9 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and private landowners about the importance of leaving vegetation in place, especially along riparian areas and wildlife movement corridors.
- 11.2.0.10 Provide technical support to private landowners, consultants, and land managers to create customized management plans based on location and SGCN.
- 11.2.0.11 Provide educational resources, training programs, and on-the-ground guidance to private and public landowners and land managers on the benefits of and for creating young forest and early succession habitat for SGCN.
- 11.2.0.14 Provide educational resources and technical support to public and private landowners and land managers to promote the protection of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters), and to enhance or restore biologically appropriate buffers.
- 11.2.0.16 Provide educational resources and technical support to public and private landowners and land managers to promote the protection of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.
- 11.2.0.19 Provide educational resources and technical support to public and private landowners and land managers to promote the protection and/or enhancement of scrub-shrub habitats for SGCN.
- 11.2.0.20 Provide educational resources and technical support to public and private landowners and land managers to promote the protection and/or enhancement of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN.
- 11.2.0.21 Provide educational resources and technical support to public and private landowners and land managers of lands adjacent to critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates to promote the protection and/or enhancement of those adjacent habitats to increase the effective size of the migratory habitat.

Forest Birds

- 11.2.0.22 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
- 11.2.0.23 Provide educational resources and technical support to public and private landowners and land managers of lands adjacent to SGCN habitats to promote the protection and/or enhancement of those adjacent habitats to increase the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and that connect conserved SGCN habitats.
- 11.2.0.25 Provide educational resources, training programs, and on-the-ground guidance to resource managers regarding the assessment of and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) related to residential and commercial development.
- 11.2.1 With individuals and groups involved in resource management decision making
 - 11.2.1.1 Engage partners and stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
 - 11.2.1.2 Provide professional training and technical assistance tools (e.g., mapping, guidance documents, justification, etc.) to agencies/divisions/programs within and outside of the NJ DEP regarding the SWAP, and the conservation actions recommended therein to help facilitate SWAP implementation.
 - 11.2.1.3 Provide educational resources, training programs, and on-the-ground guidance to DOD to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop and implement forest management and other practices that minimize disturbances to SGCN (i.e., beyond their federal requirements).
 - 11.2.1.6 Provide educational resources, training programs, and on-the-ground guidance to resource agencies prior to project initiation to ensure wildlife and their habitats are protected to the highest degree possible during construction, and provisions are in place for post-construction habitat use.

100 Law and Policy

100. Legislation

100.1.3 Sub-national Level

- 100.1.3.1 Develop laws and policies to increase protection and biological buffers of wetlands.
- 100.1.3.3 Initiate legislative action to establish an annual budgetary line item designating funds to support programs focused on long-term research and monitoring of wildlife diseases.

100.1.4 County and Local

- 100.1.4.1 Enhance critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates through the local ordinances of adjacent private lands to increase the effective size of the habitat.
- 100.1.4.2 Secure and increase the effective size of SGCN habitats and connect conserved SGCN habitats through local ordinances.
- 100.1.4.3 Expand the acreages and enhance the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN through local ordinances.
- 100.1.4.4 Secure wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) and biologically appropriate buffers through local ordinances.

Forest Birds

- 100.1.4.5 Secure SGCN-inhabited/used freshwater wetlands and biologically appropriate buffers through local ordinances.
- 100.1.4.8 Secure critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through local ordinances.
- 100.1.4.10 Secure critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through local ordinances.
- 100.1.4.11 Secure riparian areas through local ordinances.
- 100.1.4.12 Secure scrub-shrub habitats for SGCN through local ordinances.
- 100.1.4.13 Encourage municipal laws regulating domestic pets that may predate on wildlife.
- 100.1.4.14 Adopt/pass local ordinances which require assessing and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 100.1.4.15 Incorporate habitat connectivity and the preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.

100.1.5 Scale Unspecified

- 100.1.5.1 Develop laws and policies to increase protection and biological buffers of wetlands.
- 100.1.5.2 Develop policies for wetland restoration plans that consider life history requirements and needs of wildlife occupying targeted habitats.
- 100.1.5.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 100.1.5.5 Develop legislation to provide financial support for the New Jersey Invasive Species Strike Team.

100. State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.3 Develop policies that will promote the long term protection of critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates.
- 100.3.0.5 Develop policies that will promote improved and secure habitat connections between conserved SGCN habitats.
- 100.3.0.6 Develop policies that will promote expanding acreages and enhancing the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 100.3.0.7 Amend current policies and/or regulations to increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.
- 100.3.0.8 Develop policies and/or regulations with the objective of protecting significant natural and/or unique communities in perpetuity.
- 100.3.0.9 Secure mitigation that creates an environmental benefit for losses of SGCN and their habitats.

Forest Birds

- 100.3.0.12 Develop policies that promote the preservation and protection of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.
- 100.3.0.14 Develop policies and/or regulations that increase the protective buffers of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) to biologically appropriate distances to benefit SGCN that rely upon these habitats and improve the function of the [associated] aquatic systems.
- 100.3.0.15 Develop policies that promote protecting and restoring scrub-shrub habitats to benefit shrub-dependent SGCN.
- 100.3.0.18 Develop policies for conserved lands that prohibit planting and supports the control of non-native vegetation and invasive, native vegetation.
- 100.3.0.19 Develop regulations for lighting of/on tall structures that will minimize harm to and/or disorientation of wildlife, in particular but not limited to migratory birds, bats and invertebrates. Implement BMPs into state, county and local permitting processes.
- 100.3.0.20 Develop policies and/or regulations that prohibit the presence of managed cat colonies and trap, neuter and release programs in or near critical wildlife habitats.
- 100.3.0.23 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.31 Create or expand tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMPs.
- 100.3.0.32 Coordinate regulations across agencies to maximize availability of and enrollment in existing Forestry Stewardship Programs (e.g., "Woodland Stewards", Farm Bill, partners, etc.) to maintain and/or improve forest habitat.
- 100.3.0.41 Explore all State regulatory requirements for mitigation, restoration, habitat management, etc. to ensure they prohibit the use of specified invasive or other problematic plant species.
- 100.3.0.42 Fully adopt the former Storm water Management Rules' 300ft buffer requirements into the Flood Hazard Area Control Act Rules.
- 100.3.0.43 Identify and address (amend) regulatory impediments to beneficial habitat management.
- 100.3.0.44 Incorporate requirements for technical support and funding for mitigation or restoration efforts so as to be consistent with existing regulations.
- 100.3.0.45 Increase the controlled burn season to focus on restoring vegetative communities.
- 100.3.0.46 Investigate and/or develop inter-agency Memorandum of Agreements to share common data stored or managed in program-specific databases.
- 100.3.0.48 Propose new State law or regulation mandating that a State-level "development impact fee" be assessed on all new development approved by municipalities (via the Municipal Land Use Law processes), and dedicate such monies to the development and implementation of regional Habitat Conservation Plans (or existing plans/programs serving the same regional function).
- 100.3.0.50 Retain endangered, threatened and special concern wildlife and habitat protection measures in the Water Quality Management Program Rules.
- 100.3.0.52 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded energy sitings and facilities.

Forest Birds

- 100.3.0.53 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded rights-of-way corridors associated with energy transport/transmission.
- 100.3.0.54 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded surface mining areas.
- 100.3.0.56 Develop regulations that when implemented will protect critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates.
- 100.3.0.57 Develop regulations that when implemented will improve and secure habitat connections between conserved SGCN habitats.
- 100.3.0.58 Develop regulations that when implemented will promote the expansion of acreages and enhancement of the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 100.3.0.59 Develop regulations that when implemented will increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.
- 100.3.0.60 Develop regulations that when implemented will protect significant natural and/or unique communities in perpetuity.
- 100.3.0.63 Develop regulations that when implemented will preserve and protect critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.
- 100.3.0.64 Develop regulations that when implemented will protect and restore riparian areas.
- 100.3.0.65 Develop regulations that when implemented will protect and restore scrub-shrub habitats to benefit shrub-dependent SGCN.
- 100.3.0.67 Develop regulations for lighting of/on tall structures that will minimize harm to and/or disorientation of wildlife, and enforce within state, county and local permitting processes.
- 100.3.0.68 Develop regulations that when implemented will prohibit the presence of managed cat colonies and trap, neuter and release programs in or near critical wildlife habitats.
- 100.3.0.70 Develop regulations that when implemented will facilitate the restoration of dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.
- 100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

100. State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).
- 100.4.0.4 Create a policy that requires the use of wildlife habitat and corridor mapping products for both regulatory use when conducting project reviews and planning/siting new or expanded rights-of-way projects.
- 100.4.0.8 Develop a white paper addressing the impacts that existing, new or expanded rights-of-way have upon wildlife, wildlife habitats and habitat connectivity.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Forest Birds

- 100.4.0.9 Develop and implement policies to minimize the removal of coarse, woody debris in terrestrial, aquatic and riparian habitats in order to benefit wildlife.
- 100.4.0.13 Develop policies for different circumstances (e.g., roadsides and medians, riparian, aquatic and terrestrial habitats) that outline appropriate habitat/vegetation management strategies and schedules to minimize risks to and benefit wildlife.
- 100.4.0.16 Develop policies to implement habitat management strategies that will increase the structural diversity surrounding areas used for energy, mining, and transportation and service corridors which include but are not limited to the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-
- 100.4.0.17 Develop policies to implement habitat management strategies, including prescribed burns, that will increase the structural diversity on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies to control and reduce the impacts of invasive, non-native species in order to increase structural habitat diversity.
- 100.4.0.18 Develop policies to minimize the extent of infrastructure associated with energy and service corridors or areas (e.g., wind and solar farms, pipelines, utility lines) and that require the implementation of habitat management strategies that will increase the structural diversity in the area including (e.g., the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-asides).
- 100.4.0.20 Develop state regulations that require energy developers and utility service companies to implement habitat management strategies that will increase the structural diversity of the habitat, minimize habitat fragmentation and commercial infrastructure, and minimize the loss, alteration and/or degradation of the habitat and adjacent lands when working on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies.
- 100.4.0.24 Develop policies to provide financial support for the New Jersey Invasive Species Strike Team.
- 100.4.0.25 Develop policies that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

Grassland Birds

Focal species that comprise this Conservation Target:

Bobolink Eastern Meadowlark Grasshopper Sparrow
Vesper Sparrow

Threats and Action Drivers associated with this Conservation Target:

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (Avg. Score: 2.00)
(large and small scale)

NJ Specific Threats: 1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
1.1.1.2 Loss, alteration and/or degradation of habitat.
1.1.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.
1.1.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.1.2 Residential development using materials that cause collision hazards (Avg. Score: 2.00)

NJ Specific Threats: 1.1.2.1 Collision risk to volant species (birds, bats and invertebrates).

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (Avg. Score: 3.00)
(large and small scale)

NJ Specific Threats: 1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
1.2.1.2 Loss, alteration and/or degradation of habitat.
1.2.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.
1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.2.2 Commercial development using materials that cause collision hazards (Avg. Score: 2.00)

NJ Specific Threats: 1.2.2.1 Collision risk to volant species (birds, bats and invertebrates).

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large (Avg. Score: 2.00)
and small scale)

NJ Specific Threats: 1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
1.3.1.2 Loss, alteration and/or degradation of habitat.
1.3.1.5 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

2 Agriculture and Aquaculture

2.1 Annual and Perennial Crops (non-timber)

2.1.1 Shifting Agriculture (Avg. Score: 3.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Grassland Birds

- NJ Specific Threats:** 2.1.1.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.
- 2.1.1.5 Lack of competitive market prices to maintain native grasslands causes conversion to other crops that have more monetary value but less value as wildlife habitat.

2.1.2 Small-holder Farming (Avg. Score: 2.00)

- NJ Specific Threats:** 2.1.2.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.
- 2.1.2.2 Fragments terrestrial and aquatic habitats.
- 2.1.2.3 Agricultural practices (e.g., mechanized, row-crop agriculture) can render lands unsuitable for most wildlife due to soil degradation and erosion.
- 2.1.2.4 Agricultural practices (e.g., mechanized, row-crop agriculture) can cause direct mortality to wildlife when harvesting takes places.
- 2.1.2.5 Lack of competitive market prices to maintain native grasslands causes conversion to other crops that have more monetary value but less value as wildlife habitat.

2.1.3 Agro-industry (Avg. Score: 3.00)

- NJ Specific Threats:** 2.1.3.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.
- 2.1.3.2 Fragments terrestrial and aquatic habitats.
- 2.1.3.3 Agricultural practices (e.g., mechanized, row-crop agriculture) can render lands unsuitable for most wildlife due to soil degradation and erosion.
- 2.1.3.4 Agricultural practices (e.g., mechanized, row-crop agriculture) can cause direct mortality to wildlife when harvesting takes places.
- 2.1.3.5 Loss of ecotones by implementing clean farming (edge-to-edge) practices degrades habitat for early successional wildlife.
- 2.1.3.6 Lack of competitive market prices to maintain native grasslands causes conversion to other crops that have more monetary value but less value as wildlife habitat.

2.3 Livestock Farming and Ranching

2.3.2 Small-holder Grazing (Avg. Score: 2.00)

- NJ Specific Threats:** 2.3.2.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.
- 2.3.2.2 Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.

2.3.3 Agro-industry Grazing (Avg. Score: 2.00)

- NJ Specific Threats:** 2.3.3.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.
- 2.3.3.2 Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.

3 Energy Production and Mining

3.1 Oil and Gas Facilities and Pipelines

3.1.1 Distribution processes of petroleum and other liquid hydrocarbons (Avg. Score: 1.00)

- NJ Specific Threats:** 3.1.1.1 Fragments terrestrial and aquatic habitats.
- 3.1.1.2 Loss, alteration and/or degradation of habitat.
- 3.1.1.3 Increased risk of oil spills.
- 3.1.1.4 Increased noise pollution.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Grassland Birds

- 3.1.1.5 Increased vehicular and ship traffic associated with construction and operations, and therefore an increased risk of wildlife mortality from strikes.

3.1.2 Natural gas distribution processes (Avg. Score: 1.00)

- NJ Specific Threats:** 3.1.2.1 Fragments terrestrial and aquatic habitats.
3.1.2.2 Loss, alteration and/or degradation of habitat.
3.1.2.3 Increased risk of gas leaks and explosions.
3.1.2.4 Increased noise pollution.
3.1.2.5 Increased vehicular and ship traffic associated with construction and operations, and therefore an increased risk of wildlife mortality from strikes.

3.2 Mining and Quarrying

3.2.2 Surface Mining - Rock Quarry (and sand quarries) (Avg. Score: 2.00)

- NJ Specific Threats:** 3.2.2.1 Fragments terrestrial and aquatic habitats.
3.2.2.2 Loss, alteration and/or degradation of terrestrial and aquatic habitats.
3.2.2.3 Increased risk of vehicle strikes/mortality to wildlife.

3.3 Renewable Energy

3.3.1 Wind Power (Avg. Score: 2.00)

- NJ Specific Threats:** 3.3.1.1 Turbines, blades, and structure foundations create a collision risk to volant species (birds, bats and invertebrates) and marine animals.
3.3.1.2 Fragments terrestrial habitats.
3.3.1.3 Loss, alteration and/or degradation of habitat.

3.3.2 Solar Power (Avg. Score: 2.00)

- NJ Specific Threats:** 3.3.2.1 Fragments terrestrial habitats.
3.3.2.2 Loss, alteration and/or degradation of habitat.

3.4 Conventional Power Plants

3.4.0 Conventional Power Plants (Avg. Score: 1.00)

- NJ Specific Threats:** 3.4.0.2 Loss, alteration and/or degradation of habitat due to new or the expansion of current facilities.

4 Transportation and Service Corridors

4.1 Roads and Railroads

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale) (Avg. Score: 1.00)

- NJ Specific Threats:** 4.1.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species and inhibiting dispersal of non-volant animals, reducing gene flow.
4.1.1.2 Loss, alteration and/or degradation of habitat associated with road and railroad construction and maintenance, and degradation of adjacent habitats.
4.1.1.4 Re-establishment of abandoned railroad lines may increase the risk of direct mortality on wildlife.

4.1.2 Movement of cars and other vehicles on roads and railroads (large and small scale) (Avg. Score: 2.00)

- NJ Specific Threats:** 4.1.2.1 Increased vehicle traffic increases the risk of wildlife mortality from strikes.

4.2 Utility and Service Lines

Grassland Birds

4.2.1 Land conversion from natural habitat to utility and other service lines (large (Avg. Score: 1.00)
and small scale) or communication towers and associated access roads

NJ Specific Threats: 4.2.1.2 Loss, alteration and/or degradation of habitat associated with rights-of-way construction and maintenance, and degradation of adjacent habitats.

4.2.1.5 Tall radio and utility towers with guy lines pose a strike hazard for migrant bats and birds, especially in poor visibility conditions (e.g., fog, nighttime, poor weather conditions).

4.2.2 Management of rights-of-way or communication tower facilities and/or (Avg. Score: 1.00)
their associated access roads

NJ Specific Threats: 4.2.2.1 Improper or poorly scheduled vegetation management can cause direct mortality to and may reduce productivity of wildlife.

4.4 Flight Paths

4.4.1 Airplane flight paths (Avg. Score: 2.00)

NJ Specific Threats: 4.4.1.1 Increased noise disturbance to wildlife, disrupting their normal behaviors.

4.4.1.2 Increased risk of collision between airplanes and birds, bats and insects.

5 **Biological Resource Use**

5.1 Hunting and Collecting Terrestrial Animals

5.1.2 Unintentional effects (Avg. Score: 1.00)

NJ Specific Threats: 5.1.2.2 Disruption of normal wildlife behavior.

5.2 Gathering Terrestrial Plants

5.2.2 Unintentional effects (Avg. Score: 1.00)

NJ Specific Threats: 5.2.2.1 Stepping on nests or young/hatchling animals.

5.2.3 Control (Avg. Score: 1.00)

NJ Specific Threats: 5.2.3.2 Clearing of scrub-shrub vegetation [and snags] diminishes cover and nesting habitat.

6 **Human Intrusions and Disturbance**

6.1 Recreational Activities

6.1.1 Off-road vehicles (motorized and non-motorized) (Avg. Score: 2.00)

NJ Specific Threats: 6.1.1.1 Inappropriate use of off-road vehicles creates new roads/trails which fragments habitat.

6.1.1.2 Inappropriate use of off-road vehicles can degrade terrestrial and aquatic habitat and reduce the suitability of adjacent habitats for wildlife.

6.1.1.3 Increased risk of harassment that results in a change in wildlife behavior and/or direct mortality from vehicle strikes.

6.1.1.4 Increased noise pollution.

6.1.1.6 Off-road vehicles can be a mechanism of transference of wildlife diseases and invasive plant species if gear and apparel are not properly sanitized between sites.

6.1.5 Wildlife observation and photography (Avg. Score: 1.00)

NJ Specific Threats: 6.1.5.1 Improperly conducted recreational activities may disrupt normal wildlife behaviors which can result in reduced reproductive success or survival, abandonment of critical sites, etc.

6.1.5.2 Participants may introduce wildlife diseases and invasive plant species when gear and apparel is not properly sanitized between sites.

6.1.7 Other (Avg. Score: 1.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Grassland Birds

NJ Specific Threats: 6.1.7.1 Use of recreational or commercial pyrotechnics may cause temporary disturbance to wildlife, in particular to nesting birds.

6.1.7.3 Drone use in areas with sensitive wildlife (e.g., nesting and foraging birds, migrating and foraging/feeding whales) can alter their behavior and can cause disturbance that impacts their reproductive and/or foraging success.

6.2 Military Exercises

6.2.1 Military exercises (Avg. Score: 1.00)

NJ Specific Threats: 6.2.1.1 Military testing and training exercises may inflict disturbance and potential physical harm to wildlife.

6.2.1.3 Lack of opportunity for non-federal wildlife managers to influence activities on military bases may result in detrimental impacts to SGCN and/or missed opportunities to engage in projects that benefit SGCN.

6.3 Work and Other Activities

6.3.1 Unauthorized research projects at significant habitats (Avg. Score: 1.00)

NJ Specific Threats: 6.3.1.1 Participants may introduce wildlife diseases and invasive plant species when gear and apparel is not properly sanitized between sites.

6.3.1.2 Accidental trampling of nests, eggs/egg masses, and unseen individuals may impact reproductive success or cause direct mortality to SGCN.

6.3.1.3 Activities conducted without proper precautions may disturb and disrupt normal wildlife behaviors, which may impact reproductive success or survival, cause abandonment of critical sites, etc.

6.3.2 Authorized research projects at significant habitats (Avg. Score: 1.00)

NJ Specific Threats: 6.3.2.2 Participants may introduce wildlife diseases and invasive plant species when gear and apparel is not properly sanitized between sites.

6.3.2.3 Accidental trampling of nests, eggs/egg masses, and unseen individuals may impact reproductive success or cause direct mortality to SGCN.

6.3.2.4 Activities conducted without proper precautions may disturb and disrupt normal wildlife behaviors, which may impact reproductive success or survival, cause abandonment of critical sites, etc.

6.3.3 Other "work" unrelated to research (Avg. Score: 1.00)

NJ Specific Threats: 6.3.3.4 Workers may introduce wildlife diseases and invasive plant species when gear and apparel is not properly sanitized between sites.

7 Natural Systems Modifications

7.1 Fire and Fire Suppression

7.1.1 Increase in Fire Frequency/Intensity (Avg. Score: 1.00)

NJ Specific Threats: 7.1.1.1 Increase in frequency and intensity of wild fires as a result of droughts and heat waves drying out vegetation and litter.

7.1.1.2 Increase in frequency of wild fires as a result of illegal activities.

7.1.1.3 Unnatural fire regimes occurring as a result of military exercises.

7.1.2 Suppression of Fire Frequency/Intensity (Avg. Score: 3.00)

NJ Specific Threats: 7.1.2.1 Shift in vegetative communities as a result of suppression of natural fires.

7.1.2.2 Lack of diversity in age structure and composition of vegetation due to the suppression of fire.

7.2 Dams and Water Management/Use

7.2.1 Abstraction of Surface Water (domestic use) (Avg. Score: 1.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Grassland Birds

- NJ Specific Threats:** 7.2.1.5 Abstraction of surface water may deplete upland mesic habitats of water needed by plants and wildlife.
- 7.2.2 Abstraction of Surface Water (commercial use) (Avg. Score: 1.00)
- NJ Specific Threats:** 7.2.2.5 Abstraction of surface water may deplete upland mesic habitats of water needed by plants and wildlife.
- 7.2.3 Abstraction of Surface Water (agricultural use) (Avg. Score: 1.00)
- NJ Specific Threats:** 7.2.3.6 Abstraction of surface water may deplete upland mesic habitats of water needed by plants and wildlife.
- 7.2.5 Abstraction of Ground Water (domestic use) (Avg. Score: 2.00)
- NJ Specific Threats:** 7.2.5.2 Abstraction of ground water may deplete upland mesic habitats of water needed by plants and wildlife.
- 7.2.6 Abstraction of Ground Water (commercial use) (Avg. Score: 2.00)
- NJ Specific Threats:** 7.2.6.2 Abstraction of ground water may deplete upland mesic habitats of water needed by plants and wildlife.
- 7.2.7 Abstraction of Ground Water (agricultural use) (Avg. Score: 2.00)
- NJ Specific Threats:** 7.2.7.2 Abstraction of ground water may deplete upland mesic habitats of water needed by plants and wildlife.
- 7.2.13 Stream Burial (Avg. Score: 2.00)
- NJ Specific Threats:** 7.2.13.1 Eliminates riparian habitats.
- 7.2.13.2 Eliminates in-stream habitat and water resources for wildlife.
- 7.3 Other Ecosystem Modifications**
- 7.3.2 Inappropriate timing of mowing (Avg. Score: 2.00)
- NJ Specific Threats:** 7.3.2.1 Increased risk of direct mortality and/or reduced productivity of wildlife, as well as reduced use by migrating species.
- 7.3.4 Lack of natural disturbance patterns or ecosystem functions due to species loss (Avg. Score: 1.00)
- NJ Specific Threats:** 7.3.4.1 The management and/or loss of beavers decreases natural disturbance patterns.
- 7.3.4.3 The extinction of prehistoric herd grazers and the more recent decline of the state's dairy industry has reduced the low-impact maintenance of early successional habitat relied upon by wildlife.
- 7.3.4.5 The lack of forest disturbance minimizes the diversity of herbaceous vegetation and other shrubs and trees that need a lot of sunlight to grow.
- 7.3.5 Poor habitat management (Avg. Score: 2.00)
- NJ Specific Threats:** 7.3.5.1 Improper or poorly scheduled maintenance of man-made corridors (e.g., roadsides and medians) can cause direct mortality to and may reduce productivity of wildlife.
- 7.3.5.5 Habitat management that alters or removes vegetation without implementing long-term management increases the risk of invasive and exotic plants establishing themselves, outcompeting native vegetation.
- 7.3.5.6 Habitat management, including that which occurs on public and private lands, that does not consider timing and species' behaviors can result in the direct mortality and/or alteration or loss of habitat.
- 7.3.5.10 Ditching, draining and filling of marshes and wetlands eliminates habitat and degrades the remaining surrounding areas for wildlife.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Grassland Birds

- 7.3.5.12 Lack of diversity in age structure and composition of vegetation due to lack of natural disturbances and/or vegetation management.
- 7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.
- 7.3.5.17 Decreased diversity in height and species of herbaceous vegetation resulting in reduced cover and food for nesting and foraging wildlife.
- 7.3.5.18 Lack of funding or competitive market prices to maintain native grasslands for grassland-dependent species causes conversion of fallow or hay fields to other crops or shrublands.

8 **Invasive and Other Problematic Species, Genes and Diseases**

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.1 Unspecified Species (Avg. Score: 2.00)

- NJ Specific Threats:**
- 8.1.1.1 Displace or outcompete native species for resources.
 - 8.1.1.2 Alters, degrades and/or reduces the structural diversity of the natural composition of the landscape, including aquatic systems.
 - 8.1.1.4 Invasive, non-native animals increase the risk of predation on native animals and/or herbivory on native vegetation.
 - 8.1.1.5 Invasive, non-native animals and plants increase the risk of introduction and transference of diseases

8.1.4 Invasive non-native terrestrial/wetland animals (Avg. Score: 2.00)

- NJ Specific Threats:**
- 8.1.4.1 Displace or out-compete native species for resources (food, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.
 - 8.1.4.2 Free-roaming and feral domestic animals such as cats and dogs causes direct mortality of wildlife and disturbance to wildlife breeding and resting areas.

8.1.5 Invasive non-native terrestrial/wetland plants (Avg. Score: 3.00)

- NJ Specific Threats:**
- 8.1.5.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.2 Problematic Native Species/Diseases

8.2.1 Unspecified Species (Avg. Score: 1.00)

- NJ Specific Threats:**
- 8.2.1.2 Invasive pathogens and insects may increase in range and abundance as limiting factors (such as temperature) are altered as a result of climate change.
 - 8.2.1.4 Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.

8.2.2 Named Species (Avg. Score: 1.00)

- NJ Specific Threats:**
- 8.2.2.2 Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.

8.5 Viral/Prion-induced Diseases

8.5.2 Named Species (Disease) (Avg. Score: 1.00)

- NJ Specific Threats:**
- 8.5.2.1 Diseases such as West Nile Virus, arenavirus, sudden oak death, Avian Influenza, and snake fungal disease cause morbidity or mortality to native populations.

8.6 Diseases of Unknown Cause

8.6.0 Unknown Diseases (Avg. Score: 1.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Grassland Birds

NJ Specific Threats: 8.6.0.1 Diseases yet to be identified by pathologists and virologists cause decreased fitness or mortality to native populations.

9 Pollution

9.1 Domestic and Urban Waste Water

9.1.1 Sewage (Avg. Score: 1.00)

NJ Specific Threats: 9.1.1.3 Contaminants in sewage treatment effluents and Combined Sewer Overflows can cause developmental and behavioral abnormalities and reproductive failure in wildlife.

9.1.2 Run-off (Avg. Score: 2.00)

NJ Specific Threats: 9.1.2.3 Contaminants from road runoff (oil, sediment, salt, etc.) impact native vegetation and the species that rely upon them, degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.

9.2 Industrial and Military Effluents

9.2.1 Oil Spills (Avg. Score: 1.00)

NJ Specific Threats: 9.2.1.1 Oil spills render resting, breeding and foraging habitats temporarily unavailable to wildlife, altering normal wildlife behavior.

9.2.1.2 Oil spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.

9.2.3 Other (Avg. Score: 1.00)

NJ Specific Threats: 9.2.3.1 Point and nonpoint source pollution such as polychlorinated biphenyls (PCBs), pesticides, heavy metals, and endocrine disrupting compounds (EDC's) into freshwater and marine systems pose threats to wildlife through direct contact and/or ingestion, and to aquatic species and their predators through bioaccumulation, impacting the reproductive success and neurological function of many avian and fish species.

9.2.3.2 Chemical spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.

9.2.3.3 Chemical spills may render resting, breeding and foraging habitats temporarily unavailable to wildlife, altering normal wildlife behavior.

9.2.4 Other: Hydrofracturing (Avg. Score: 1.00)

NJ Specific Threats: 9.2.4.1 Contaminants from hydrofracturing degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.

9.2.4.2 Uncontrolled effluents escaping from hydrofracturing facilities can cause injury to wildlife and alter normal behaviors.

9.3 Agricultural and Forestry Effluents

9.3.2 Soil Erosion and Sedimentation (Avg. Score: 1.00)

NJ Specific Threats: 9.3.2.2 Soil erosion and sedimentation limit the re-establishment of plants needed by terrestrial wildlife as cover and a food base.

9.3.3 Herbicides and Pesticides (Avg. Score: 2.00)

NJ Specific Threats: 9.3.3.1 Pesticides degrade terrestrial and aquatic habitats, especially streams, ponds and wetlands. Aquatic wildlife are particularly sensitive to these contaminants, which can cause developmental and behavioral abnormalities and reproductive failure. Some contaminants may bioaccumulate in predatory fish and birds and disrupt reproduction.

9.3.3.3 Use of pesticides can directly harm non-target species through direct contact and/or by reducing and/or contaminating their food supply.

Grassland Birds

9.3.5 Control of insect pests and plants leading to mortality of non-target species (Avg. Score: 1.00)
not associated with agriculture

- NJ Specific Threats:** 9.3.5.3 Use of pesticides and herbicides can minimize the abundance of invertebrates needed as a food source for many birds.
- 9.3.5.4 Improper use of current insecticides, such as those containing esfenvalerate, prallethrin, or piperonyl butoxide, or past use of pesticides containing chlordane still present in the soils, are toxic to various wildlife species, and can cause injury, mortality, or other effects that impair population viability.
- 9.3.5.5 Use of pesticides and herbicides can minimize the abundance of food sources for native wildlife populations.

9.5 Air-Bourne Pollutants

9.5.1 Acid Rain (Avg. Score: 2.00)

- NJ Specific Threats:** 9.5.1.1 Causes acidification of water bodies, resulting in changes to aquatic and marine communities and reducing biodiversity, and creating conditions that are unsuitable for some aquatic (freshwater and marine) and semi-aquatic species that are sensitive to pH shifts.
- 9.5.1.2 Leaches calcium from the soils which in turn reduces the availability of prey, particularly calcium-rich prey such as snails.

9.5.2 Smog (Avg. Score: 1.00)

- NJ Specific Threats:** 9.5.2.1 Fine airborne particulate pollutants (such as smoke from controlled burns, soil particles from plowing arid soil, etc.) can adversely affect low mobility wildlife species, including avian species during nesting.

9.5.4 Other (Avg. Score: 1.00)

- NJ Specific Threats:** 9.5.4.1 Dust and/or airborne sedimentation from construction sites, agricultural operations or related earth disturbances can introduce mineral or organic sediments into adjacent wildlife habitats, degrading their quality and suitability for wildlife short-term and/or long-term.

9.5.6 Herbicides and Pesticides (Avg. Score: 2.00)

- NJ Specific Threats:** 9.5.6.1 May result in injury or direct mortality of non-target species.

9.6 Excess Energy

9.6.1 Light Pollution (Avg. Score: 2.00)

- NJ Specific Threats:** 9.6.1.1 Artificial lighting can reduce suitability of adjacent habitat for species sensitive to artificial lights by disorienting wildlife, reducing foraging suitability or success, or increasing visibility to predators, resulting in reduced diversity and/or productivity of species in adjacent habitat.

9.6.3 Noise Pollution (Avg. Score: 1.00)

- NJ Specific Threats:** 9.6.3.1 Acute and chronic noise pollution in and adjacent to terrestrial and aquatic (marine and freshwater) environments could disrupt normal behaviors of wildlife such as migration, communication, feeding, eluding predators, resting and breeding, etc.

11 Climate Change and Severe Weather

11.1 Habitat Shifting or Alteration

11.1.0 Macro- and Micro-Climate Alterations (Avg. Score: 1.50)

- NJ Specific Threats:** 11.1.0.1 Alters native terrestrial and aquatic habitats at the macro- and micro-climate levels that can affect suitability for wildlife, in particular specialist species.

11.2 Droughts

11.2.1 Droughts (Avg. Score: 2.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Grassland Birds

- NJ Specific Threats:** 11.2.1.1 Contribute to hardened soils, decreasing water recharge during rains and increasing the likelihood of flash floods during storms.
- 11.2.1.2 Lead to lower groundwater levels and therefore, less available water for people and habitats.
- 11.2.1.3 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

11.3 Temperature Extremes

11.3.1 Temperature extremes (Avg. Score: 2.00)

- NJ Specific Threats:** 11.3.1.1 Increasing temperatures may cause habitat loss and degradation by desiccating and/or raising the temperatures of small wetlands and streams leading to the loss of freshwater mussels and other aquatic species and species reliant upon these habitats.
- 11.3.1.2 Increased temperatures can negatively impact wetland, riverine, lacustrine and vernal pool-associated or -dependent wildlife by reducing flows, increasing water temperatures, lowering water levels and causing premature drying of vernal habitats.

11.4 Storms and Flooding

11.4.1 Storms and flooding (Avg. Score: 2.00)

- NJ Specific Threats:** 11.4.1.6 Increased storms and flooding reduce nesting success, especially for ground-nesting birds.

11.4.2 Increased rainfall (Avg. Score: 2.00)

- NJ Specific Threats:** 11.4.2.2 Extreme rain events can damage wildlife nesting and resting habitats, including impacts to avian eggs and chick and small mammal survivorship.
- 11.4.2.3 More frequent rain events can alter terrestrial and wetland vegetation communities as well as wetland hydrology, shifting wildlife community use.

11.6 Phenology Shifting or Alteration

11.6.2 Phenology shifts related to predator-prey ecology (Avg. Score: 2.00)

- NJ Specific Threats:** 11.6.2.1 Alters inter-specific relationships (e.g., competition, parasitism, predation) of wildlife, ultimately leads to detrimental impacts on the ecological system.
- 11.6.2.2 Shifts timing of species migration, breeding and hibernation, and available food resources, causes redistribution of species, or mortality for species that are unable to relocate due to their already isolated habitat or limited mobility.

11.6.3 Phenology shifts related to species redistribution (Avg. Score: 1.00)

- NJ Specific Threats:** 11.6.3.1 Shifts in timing of species migration, breeding and hibernation, and available food resources, as a result of wildlife range shifts driven by climate change.
- 11.6.3.2 Shifts in nesting times or egg incubation durations can limit nest success and longterm populations.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory (Avg. Score: 1.00)

- NJ Specific Threats:** 12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.
- 12.1.1.6 Lack of information regarding migratory pathways and response of wildlife to lights and noise associated with offshore wind turbines.

12.1.2 Lack of up-to-date existing information (Avg. Score: 1.00)

- NJ Specific Threats:** 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.
- 12.1.2.2 Lack of wildlife monitoring at sites with structures that pose high risk of mortality to SGCN wildlife.

Grassland Birds

12.1.3 Need to answer research question (Avg. Score: 2.00)

- NJ Specific Threats:** 12.1.3.1 There are significant knowledge gaps regarding distribution, dispersal, diseases, population trends, etc. of SGCN.
- 12.1.3.4 Lack of information regarding the potential short- and long-term impacts of wind turbines and other tall coastal structures on migratory populations.

12.1.4 Need to develop new technique (Avg. Score: 1.00)

- NJ Specific Threats:** 12.1.4.1 Improve and evaluate survey methods for SGCN and their habitats; alter as needed.
- 12.1.4.2 Improve and evaluate survey methods for species not easily detected through standard survey methods.

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms (Avg. Score: 2.00)

- NJ Specific Threats:** 12.3.0.1 Regulatory habitat protections within state land use regulations are spatially limited to specific geographic areas (e.g., Pinelands, Coastal Area) or geographic features (e.g., wetlands, streams) and so fail to protect critical habitats that exist outside of these regulated areas.
- 12.3.0.7 Activities that threaten SGCN, their food sources, and/or habitats are often regulated separately and without consideration for the cumulative and synergistic effects over time or over a larger spatial scale. Therefore, regulations can fail to protect SGCN populations over time.
- 12.3.0.9 Prescribed burns implemented by the NJ Forest Fire Service are constrained by State air quality regulations to a timeframe where seasonal weather conditions are less than ideal for effective burning. As a result, the Forest Fire Service is limited in the number of overall prescribed burns it can implement to restore habitat for wildlife.
- 12.3.0.10 Land use regulatory processes pertaining to habitat creation, enhancement or restoration projects can be costly and/or burdensome, precluding or discouraging the development or implementation of conservation projects.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform (Avg. Score: 2.00)

- NJ Specific Threats:** 12.4.0.1 A species-by-species management focus as opposed to ecological systems and biodiversity generally has greater opportunity for unintended consequences for other species and may be less efficient in developing appropriate management actions.
- 12.4.0.2 Policies and procedures for lands management that lack consideration of the impacts of activity timing can result in unintended impacts to wildlife during vulnerable periods.
- 12.4.0.5 Bureau of Forest Fire Management policy has traditionally implemented prescribed burns on State lands for the sole purpose of public safety (i.e., addressing hazard fuel reduction), missing opportunities to burn in a manner that would additionally manage habitat for ecological diversity.
- 12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats (Avg. Score: 2.00)

- NJ Specific Threats:** 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.
- 14.1.1.2 Lack of general knowledge of SGCN life histories and vulnerabilities as they relate to land management practices.

Grassland Birds

- 14.1.1.3 Lack of understanding of the need to manage both natural and anthropogenic (e.g., yards, lawns, hayfields, etc.) habitats to minimize impacts or increase benefits to SGCN and their habitats.

15 Administrative Needs

15.2 Organizational/program planning needs

- 15.2.3 Need for multi-state, regional and landscape scale planning (Avg. Score: 2.00)

NJ Specific Threats: 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Actions to address the Threats and Action Drivers associated with this Conservation Target:

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.1 Enhance critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates through incentive programs with adjacent private landowners to increase the effective size of the habitat.
- 1.2.1.2 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to increase the effective size of SGCN habitats by protecting/restoring adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats.
- 1.2.1.3 Secure and promote the protection/restoration of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through incentive programs.
- 1.2.1.6 Secure and promote the protection/restoration of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers through incentive programs.
- 1.2.1.8 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to municipalities, land developers, and other land managers to retain and/or enhance native vegetation adjacent to aquatic habitats, and along riparian areas and wildlife movement corridors.
- 1.2.1.10 Coordinate across government agencies and non-government organizations to maximize the availability of and enrollment in existing landowner incentive programs (e.g., "farm bill," partners, etc.) to maintain and/or improve habitat.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Grassland Birds

- 1.2.1.11 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 1.2.1.12 Create incentives (non-monetary and/or monetary) for land developers to redevelop abandoned areas (e.g., shopping centers, office complexes) to minimize the loss of natural habitats and reduce the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 1.2.1.13 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to land developers to minimize the impacts of new residential and commercial developments on SGCN and their habitats.
- 1.2.1.14 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of herbicides and pesticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.16 Create incentives (non-monetary and/or monetary) within State regulations (mitigations requirements or credit, BMP satisfaction, etc.) to promote the use of retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.17 Develop a public-relations oriented certification program for private retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.18 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and land managers to control and reduce the impacts of invasive, native and non-native species in order to increase structural habitat diversity.
- 1.2.1.19 Create incentives for federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to farmers, woodland landowners, and private landowners to adopt and/or endorse consistent BMPs concerning controlled burns to maintain and/or improve wildlife habitat.
- 1.2.1.20 Coordinate across government agencies and non-government organizations to create or expand upon tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMP's.
- 1.2.1.21 Create and/or support market-based programs that subsidize or create branding for products derived sustainably from managed wildlife habitats.
- 1.2.1.22 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to horse/livestock farm owners and managers to increase structural habitat diversity in and around the farms by managing vegetation for a variety of species, in particular, farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).

Grassland Birds

- 1.2.1.23 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to provide cost shares and/or plan approvals for management based on management approaches and prescriptions.
- 1.2.1.24 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners, with habitat of suitable patch size to support breeding grassland-dependent species, to alter the timing of vegetation management to benefit grassland and pollinator species.
- 1.2.1.26 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing landowner incentive programs.
- 1.2.1.28 Create incentives to implement dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.

2 Direct Management of Natural Resources

2.3 Fire management

2.3.2 Fuel reduction

- 2.3.2.1 Prevent wildfires by reducing natural fuel (e.g., leaf litter).

2.3.3 Prescribed burning

- 2.3.3.1 Evaluate different management techniques of prescribed burns that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 2.3.3.3 Conduct prescribed burning to improve wildlife habitat.

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

- 2.8.0.1 Control invasive insect infestations by implementing BMP strategies through biological, chemical and/or mechanical means that will depress, or when appropriate, eradicate populations in a manner that avoids excessive harm to non-target species using BMPs to control infestations and limit their spread based on an inventory of invasive insect distribution and response to outbreaks.
- 2.8.0.2 Develop, implement, monitor and evaluate pest control/management strategies to reduce the impacts of over-abundant wildlife species (native and/or native, invasive species) on native vegetation and the degradation of habitats supporting SGCN. Over-abundant wildlife species include but are not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.
- 2.8.0.6 Implement long-term management of invasive and/or non-native plants to help maintain functioning ecological systems and biological diversity, and to enhance travel corridors. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.

2.10 Planting/seeding

Grassland Birds

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

- 2.10.0.1** Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 2.10.0.5** Implement habitat restoration and/or enhancement activities that include the creation of vegetative buffers between sensitive habitats (e.g., aquatic systems) and human-inhabited areas (e.g., residences, parks, etc.) and that is conducted during appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity
- 2.10.0.6** Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats.
- 2.10.0.7** Restore/reclaim and enhance degraded rare species habitats through strategic revegetation and management efforts for documented/target SGCN.
- 2.10.0.8** Protect significant natural and/or unique communities by implementing best management practices when conducting habitat restoration strategies.
- 2.10.0.9** Restore and/or enhance riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation, alteration and/or changes in hydrology and subsequent disturbances to and behavioral changes of wildlife (e.g., restoring biologically appropriate buffers, revegetation or restoration efforts, etc.).
- 2.10.0.10** Minimize the loss of important habitats (e.g., coastal scrub-shrub and grassy habitats, high and low marsh habitats, etc.) that provide nesting, migrating, and wintering areas for SGCN birds and other coastal and marsh-dependent species through habitat restoration efforts.
- 2.10.0.11** Restore and/or enhance critical migratory terrestrial and aquatic habitats (e.g., beach, grasslands, forest, scrub-shrub, etc.) for songbirds, raptors, shorebirds, waterfowl, bats and invertebrates through habitat restoration efforts and expand habitat restoration to adjacent private lands to increase the effective size of the habitat.
- 2.10.0.12** Create and/or maintain scrub-shrub habitats through revegetation efforts with little to no impact on forested, wetland and grassland habitats to maintain populations of shrub-dependent SGCN.
- 2.10.0.14** Implement best management practices (BMPs), protective strategies and guidelines for restoring and enhancing healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.10.0.21** Restore and/or enhance understory habitats that suppress invasive species and provide critical resources and enhance sheltering, foraging, and nesting cover for wildlife.
- 2.10.0.22** Restore and/or enhance terrestrial and aquatic habitats to promote the regeneration of native vegetation and enhance structural diversity to benefit SGCN (e.g., vegetative buffers of aquatic systems, allow coarse, woody debris to remain in terrestrial, aquatic and riparian habitats to provide shelter, riparian stabilization and necessary microclimates, plant native trees, shrubs and grasses, etc.).

Grassland Birds

- 2.10.0.23 Restore and/or enhance roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.
- 2.11.0.2 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas for target SGCN and/or species groups; management should complement rare species needs in a targeted area.
- 2.11.0.3 Create suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats through vegetation management.
- 2.11.0.4 Implement vegetation management strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife, particularly SGCN.
- 2.11.0.5 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats through vegetation management.
- 2.11.0.6 Reclaim degraded rare species habitats by conducting vegetation management needed to restore habitat value for the documented/target SGCN.
- 2.11.0.7 Protect significant natural and/or unique communities by implementing best management practices through vegetation management.
- 2.11.0.8 Maintain, enhance and/or restore biologically appropriate buffers for SGCN-inhabited/used freshwater wetlands through vegetation management.
- 2.11.0.9 Minimize habitat loss of critical coastal habitats that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas through vegetation management.
- 2.11.0.12 Conduct vegetation management to create feeding and roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.
- 2.11.0.13 Implement best management practices (BMPs), protective strategies, and guidelines for vegetation management to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.11.0.16 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 2.11.0.20 Create and/or maintain scrub-shrub habitats through management efforts with little to no impact on forested, wetland and grassland habitats to maintain populations of shrub-dependent SGCN.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Grassland Birds

- 2.11.0.21 Minimize the degradation, alteration and/or changes in hydrology of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) and subsequent disturbances to and behavioral changes of wildlife by maintaining or enhancing these areas and biologically appropriate buffers through habitat management and/or revegetation or restoration efforts.
- 2.11.0.23 Implement appropriate habitat management actions in areas where natural disturbances, such as wildfire, have been precluded.
- 2.11.0.25 Conduct vegetation management along access roads following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.28 Conduct vegetation management in agricultural areas following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.29 Conduct vegetation management on transportation and service corridors (i.e., rights-of-way) following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.31 In areas where vegetative communities are shifting due to fire suppression and controlled burns are not feasible, manage vegetation to improve wildlife habitat.
- 2.11.0.32 Increase structural habitat diversity around and when feasible, within agricultural landscapes by managing vegetation for a variety of species, in particular, those farms that have removed scrub-shrub habitat and/or fragmented forests, and by implementing ecologically best practices (e.g., no-till farming, maintaining hedgerows, buffer set-asides, etc.).
- 2.11.0.33 Increase structural habitat diversity by implementing long-term vegetation management to minimize the potential for the establishment of invasive and/or non-native plants that may outcompete native vegetation.
- 2.11.0.34 Increase structural habitat diversity by managing residential, commercial and recreational areas' landscapes for a variety of species. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.36 Increase structural habitat diversity by managing vegetation for a variety of species and considering their life history requirements (e.g., travel corridors, shelter, resting and breeding areas) to minimize the risk of harm.
- 2.11.0.37 Increase structural habitat diversity by minimizing the removal of coarse, woody debris in terrestrial, aquatic and riparian habitats which benefits wildlife.
- 2.11.0.38 Increase structural habitat diversity in and around horse/livestock farms by managing vegetation for a variety of species, in particular, in and around farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 2.11.0.39 Increase structural habitat diversity in and around solar farms by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.

Grassland Birds

- 2.11.0.40 Increase structural habitat diversity surrounding areas used for energy, mining, and transportation and service corridors by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides, and avoid managing habitat during the breeding seasons for ground-nesting birds, reptiles, amphibians and small mammals.
- 2.11.0.41 Increase structural habitat diversity through the implementation of a variety of vegetation management practices such as prescribed burns (either increasing or decreasing their frequency depending on the site and objective), plantings, etc. that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.42 Increase structural habitat diversity within wind farms for terrestrial bound and low-flying species and around wind farms for other wildlife by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.

2.13 Wildlife damage management

2.13.0 Nuisance fish and wildlife damage

- 2.13.0.5 Investigate the impacts of human-subsidized and/or naturally occurring predator species on SGCN to assess the need for integrated wildlife damage management techniques (e.g., predator exclosures, fish blockages, electric fence, culls) and/or policy changes on state land management that minimize the impacts of human-subsidized predators.
- 2.13.0.7 Develop, implement, monitor and evaluate management strategies to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 2.13.0.8 Implement and assess management strategies to control and reduce the impacts of detrimental species and diseases that pose threats to native wildlife or communities.

2.14 Wildlife disease management

2.14.0 Wildlife disease strategy development and investigation

- 2.14.0.1 Investigate diseases/pathogens impacting SGCN and/or their habitats.
- 2.14.0.2 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

- 3.0.0.1 Conduct long-term monitoring of resident and migratory SGCN populations using standardized survey protocols to determine the variables that may impact their long-term persistence in the State (e.g., population viability, distribution, dispersal, home range and habitat use, travel corridors, food availability, vulnerability to pollutants and disease, etc.). Compile this information to determine the likely causes of population declines and to understand metapopulation dynamics. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Grassland Birds

- 3.0.0.2 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) where data gaps exist regarding SGCN distribution, and their critical and supportive habitats. Conduct surveys using standardized survey protocols to acquire baseline data, and provide the data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
- 3.0.0.3 Gather baseline data on SGCN inhabiting permanently protected natural lands regarding their distribution and population (e.g., abundance, dispersal, demography including productivity and survival, etc.), and identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) critical and supporting habitats within those landscapes.
- 3.0.0.4 Conduct long-term studies on SGCN inhabiting permanently protected natural lands to develop population trend data and changes in demography, and to determine if critical and/or supporting habitats are limited or changing; i.e., diminishing in value, acreage or connectivity.
- 3.0.0.5 Gather baseline data on resident and migratory SGCN (in particular migratory species for which New Jersey habitats are significant), terrestrial, freshwater and marine species, regarding the location and condition of their critical and supporting habitats (e.g., foraging, roosting, nesting/breeding, stopover, migration paths, etc.), and population demography (e.g., productivity, survival, dispersal). Compile this information into a database that includes descriptions of the conditions of the habitats and species, and a GIS component of the locations of these important habitats. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.6 Conduct long-term studies on resident and migratory SGCN to determine if there are changes to the populations' demography (productivity, survival, dispersal) and/or to their critical and/or supporting habitats (i.e., diminishing in value, acreage or connectivity, etc.), in particular changes that would not maintain SGCN at viable levels for species populations. Update data and GIS maps; provide updated information to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.7 Collect baseline data to document species distributions, in particular SGCN, and current habitat for future analysis of possible distribution shifting as a result of habitat shifting or alteration associated with climate change impacts.
- 3.0.0.8 Conduct long-term studies and compare baseline metrics of documented species distributions and associated habitats to identify possible species and/or habitat shifting or alteration associated with climate change impacts.
- 3.0.0.9 Identify SGCN (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources, and compile/collect and evaluate data/information regarding potential management strategies to improve the availability of such SGCN's food resources.
- 3.0.0.10 Conduct long-term studies to evaluate the effectiveness of management strategies implemented to enhance food/prey availability for SGCN [whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources] through studies that investigate the populations and health of the food resources as well as the target SGCN. Revise management strategies as needed and continue to monitor the effectiveness of the efforts.
- 3.0.0.11 Develop, implement and evaluate the effectiveness of town plans that avoid impacts to SGCN species and their habitats.

Grassland Birds

- 3.0.0.13 Investigate the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats. Evaluate and modify management practices as appropriate.
- 3.0.0.25 Identify pathways of migratory SGCN in the Atlantic Coastal and Marine Regions (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and use the data to help evaluate the potential short- and long-term impacts of wind turbines, radio towers, utility guy lines, and other tall coastal structures on migratory populations.
- 3.0.0.26 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species including objectives and guidance pertaining to and the condition/status of critical and supporting habitats.
- 3.0.0.30 Conduct research to investigate the feasibility of managing and/or creating roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.
- 3.0.0.31 Conduct short- and long-term studies (e.g., wildlife surveys and habitat assessments) to evaluate the effectiveness of vegetation management efforts to maintain, enhance and/or create roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.1 Division of Fish and Wildlife should maintain a robust, up-to-date database and mapping of species occurrences.
- 3.2.0.2 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
- 3.2.0.5 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 3.2.0.10 Evaluate the effectiveness of sanitation/decontamination protocols in minimizing the transference of wildlife diseases and invasive plant species.
- 3.2.0.11 Investigate the impacts of ORV use as a mechanism to spread wildlife diseases and invasive plant species to native wildlife and habitats. Integrate this information when mapping undeveloped roads and trails to identify potentially sensitive areas in northern NJ forests.
- 3.2.0.17 Conduct monitoring at constructed wind farms (within or outside of NJ) to assess the impacts on migratory species (birds, bats, insects) and determine if NJ's land use planning efforts and/or smart-growth plans need to be revised.
- 3.2.0.24 Develop, implement and evaluate the effectiveness of BMPs for lighting of/on tall structures that minimize harm to and/or disorient wildlife, in particular but not limited to migratory birds, bats and invertebrates. Implement BMPs into state, county and local permitting processes.

3.2.1 Abundance determination

Grassland Birds

- 3.2.1.1 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) population abundance and trends for SGCN using standardized survey protocols. Provide data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
 - 3.2.1.2 Conduct wildlife surveys on resident and migratory SGCN regarding their population abundance and trends.
 - 3.2.3 Baseline inventory
 - 3.2.3.9 Investigate hazardous environmental issues that may impact grassland invertebrates.
 - 3.2.7 Population assessment
 - 3.2.7.1 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
 - 3.2.7.2 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species to meet and maintain recovery goals.
- 3.3 Research, survey or monitoring - habitat
 - 3.3.1 Baseline inventory
 - 3.3.1.1 Conduct habitat assessments of significant natural and/or unique communities to identify threats to native terrestrial and aquatic habitats through systematic monitoring, review of available data, enlistment of habitat management and/or species experts, etc. Incorporate findings into a database that includes descriptions/qualifiers of the habitats, identifies and values/qualifies the threats, and includes a GIS component of the locations of the assessed areas. Share this information with landowners/managers (e.g., federal, state and local government agencies or non-government organization).
 - 3.3.1.2 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) resident and migratory SGCN habitats. Investigate their suitability for the various life history requirements of the species that dependent upon them to determine the ability for maintaining applicable SGCN populations in perpetuity.
 - 3.3.1.4 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and investigate the suitability of corridors that connect large, contiguous tracts of similar habitats to increase their effective size (i.e., forest with forest, grassland with grassland, wetlands with wetlands, etc.) for dependent SGCN.
 - 3.3.1.5 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) where habitat restoration and/or enhancement would benefit wildlife SGCN.
 - 3.3.1.20 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) where invasive, non-indigenous plants and animals are either already established or are becoming established. Create a system for reporting and qualifying new locations of invasive species and for prioritizing areas for control measures according to the potential level of impact on the ecosystem and SGCN and the likelihood of success. Researchers and contractors encountering invasive plant species while performing plant and/or forest inventories on state or other conserved lands and/or private lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
 - 3.3.1.24 Conduct regular investigations of SGCN habitat health and biodiversity on public and private lands to identify locations in need of revegetation, reduction of over-abundant, native wildlife and/or exotic species, conservation focal areas requiring limitations on human activity, etc.

Grassland Birds

3.3.2 Monitoring

- 3.3.2.2** Conduct long-term monitoring of resident and migratory SGCN habitats using standardized survey protocols to determine changes in habitat quality/suitability and threats (e.g., habitat loss and degradation, increased edge habitat, water quality) and other variables that may impact their long-term persistence in the State and to provide information needed for determining causes of population declines and understanding metapopulation dynamics.
- 3.3.2.3** Continue to update wildlife and habitat databases and revise models of critical SGCN habitats using the most current data available and where lacking, develop new SGCN and/or habitat models as data on species habitat requirements and applicable GIS data layers become available.
- 3.3.2.10** Evaluate the efficacy and success of different management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.3.2.11** Evaluate and compare the effectiveness of delayed mowing of warm season grass fields versus cool season hay fields to benefit grassland-dependent species.
- 3.3.2.12** Evaluate and compare the effectiveness of different management techniques (e.g., prescribed burning, mowing, brush-hogging, etc.) for maintaining suitable habitat for grassland-dependent species and species dependent upon early successional habitats.
- 3.3.2.13** Evaluate the effectiveness of management strategies (e.g., timing restrictions for mowing, cooperative agreements with utility companies for maintenance of rights-of-ways) that maintain and enhance large existing areas of grassland in perpetuity. Focus on habitat patches that can be managed to enhance the total size of suitable grassland habitat and create interspersed early-successional habitat.
- 3.3.2.15** Investigate the effectiveness of management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.3.2.16** Evaluate the effectiveness of best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 3.3.2.20** Once a system is developed for reporting and qualifying new locations of invasive species, develop, implement and monitor/evaluate invasive species removal strategies at identified locations. Priority should be given to those areas critical to SGCN and/or contain unique and/or rare plant communities supporting SGCN and/or other fish/wildlife species.

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.1** Work with land management agencies to determine the appropriate actions needed to restore/reclaim degraded habitat for the documented/target SGCN.
- 3.5.3.3** Develop/improve management techniques that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.8** Develop best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Grassland Birds

- 3.5.3.9 Develop strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 3.5.3.11 Develop strategies to protect native terrestrial and aquatic habitats and dependent SGCN species from the identified threats.
- 3.5.3.15 Modify management practices based on the effects of pesticides, herbicides and other biological controls on critical and supporting SGCN habitats.
- 3.5.3.21 Develop management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.22 Identify (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) and modify management strategies (e.g., timing restrictions for mowing, cooperative agreements with utility companies for maintenance of rights-of-ways), based on research, that maintain and enhance large existing areas of grassland in perpetuity.
- 3.5.3.24 Based on research, modify management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.5.3.25 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to develop the necessary management strategies to reach or maintain viable population levels.
- 3.5.3.29 Explore the use of alternative vegetation (i.e., commodity crops) to address agriculture concerns.
- 3.5.4 Fish and wildlife research, survey and management techniques
 - 3.5.4.2 Develop, implement, monitor and evaluate management strategies to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.
 - 3.5.4.10 Develop BMPs for lighting of/on tall structures that minimize harm to and/or disorientation of wildlife, in particular but not limited to migratory birds, bats and invertebrates.
 - 3.5.4.14 Develop and implement agreements, and update existing agreements, with government agencies regarding the protection of critical SGCN habitats (e.g., significant breeding populations of beach nesting birds, colonial waterbird nesting areas, bat colonies, etc.).
 - 3.5.4.15 Investigate the success of management strategies used to protect and/or enhance SGCN populations and when appropriate, aid in identifying failures/resource problems and issues, and developing new strategies.
 - 3.5.4.16 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels and develop the necessary management strategies.
 - 3.5.4.17 Investigate new, non-invasive techniques for SGCN population evaluation through literature review, expert opinion, trial studies (if low risk), etc.
 - 3.5.4.18 Investigate the effectiveness of survey techniques through selected “ground truthing” and literature and peer review in order to increase efficacy of survey, minimize surveyor bias and error, and increase accuracy of trend data.
 - 3.5.4.19 Develop reliable, standardized survey and monitoring protocols for SGCN species, for which none currently exist, and their habitats.

4 Education

4.1 Educator/Instructor training

4.1.0 Public education

- 4.1.0.1** Provide educational resources and training programs to private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.

5 Facilities and Areas

5.15 Wildlife Management Areas

5.15.6 Roads

- 5.15.6.1** Clearly post areas/roads where vehicle access is permitted.
- 5.15.6.2** Clearly post areas/trails where vehicle access is not permitted.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

- 6.0.0.1** Enhance and increase the effective size of critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates by securing adjacent habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.2** Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.3** Secure and protect riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.5** Secure and protect critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

6.3 Conservation area designation

6.3.0 Conservation area designation strategies

- 6.3.0.1** Promote the protection of critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates and enhance these lands by increasing the effective size through conservation area designations of stopover habitats and adjacent private lands.
- 6.3.0.2** Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN and/or connect conserved SGCN habitats through conservation area designations.
- 6.3.0.3** Increase the protection of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through conservation area designations.

Grassland Birds

- 6.3.0.5 Promote the protection of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through conservation area designations.

6.4 Private lands agreements

6.4.0 Private land agreement strategies

- 6.4.0.1 Enter into private lands agreements to expand control burns on private lands, in particular those adjacent to conserved lands to improve SGCN habitats.

7 Law Enforcement

7.1 Law enforcement

7.1.4 Scale Unspecified

- 7.1.4.4 Improve enforcement of policies/regulations aimed at protecting and preserving critical coastal and marsh habitats, and secure mitigation for losses that create an environmental benefit.
 - 7.1.4.5 Enforce current policies and/or regulations to increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal SGCN, and implement and enforce amended policies/regulations.
 - 7.1.4.7 Increase law enforcement presence to enforce regulations governing recreational activities (e.g., the use of personal watercraft and off road vehicles, caving, rock climbing, etc.) on conserved lands and within other sensitive habitats, and discourage activities that cause harm or disturbance to vegetation, wetlands, fish and wildlife.
 - 7.1.4.8 Implement policies that protect critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates.
 - 7.1.4.10 Implement policies that promotes expanding acreages and enhances the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
 - 7.1.4.11 Implement and enforce policies/regulations that will increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.
 - 7.1.4.12 Implement policies and/or regulations that protect significant natural and/or unique communities in perpetuity.
 - 7.1.4.17 Improve the enforcement of policies and/or regulations that protect wetlands, riparian and floodplain areas, and aquatic habitats (including open waters).
 - 7.1.4.19 Implement policies that protect and restore scrub-shrub habitats to benefit shrub-dependent SGCN.
 - 7.1.4.21 Implement regulations for lighting of/on tall structures that will minimize harm to and/or disorientation of wildlife, and enforce within state, county and local permitting processes.
 - 7.1.4.22 Implement policies and/or regulations that prohibit the presence of managed cat colonies and trap, neuter and release programs in or near critical wildlife habitats.
 - 7.1.4.25 Encourage the enforcement of municipal laws regulating domestic pets that may predate on wildlife.

8 Outreach

8.1 Partner/stakeholder engagement

Grassland Birds

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.4** Engage government agencies, conservation partners and other stakeholders in constructive dialogues encouraging them to influence policy change and the creation of incentives through a habitat bill and/or municipal ordinances for backyard habitat.
- 8.1.0.13** Engage DOD in a constructive dialogue regarding strategies to minimize disturbances to all SGCN (i.e., beyond their federal requirements) from forest management and other practices on their lands.
- 8.1.0.15** Engage government agencies, conservation partners and other stakeholders in discussions encouraging and supporting the creation of laws and policies requiring vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 8.1.0.16** Engage local governments in discussions regarding the importance of them adopting/passing ordinances which require assessing and addressing secondary impacts (i.e., ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 8.1.0.19** Engage government agencies, conservation partners and other stakeholders to collaboratively develop a list of important projects, targeting SGCN and/or their habitat, as a guide for graduate student research. Distribute the list and contact information to all State colleges and universities.
- 8.1.0.21** Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation human-subsidized and/or overabundant, native species cause to local nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.22** Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation invasive species cause to native nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.24** Engage government agencies, conservation partners and other stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.25** Provide technical support to public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.30** Encourage government agencies and conservation partners to advise members of the relevant scientific community of the need for specific studies, reports or investigations targeting the data-deficiency regarding SGCN and/or their habitats.
- 8.1.0.33** Engage government agencies, conservation partners and other land managers, communities, landowners, and commercial and industrial stakeholders in discussions regarding the importance of protecting and methods to protect priority wetlands beyond the levels afforded through regulation by maintaining and/or restoring optimal biological buffers around wetlands.
- 8.1.0.37** Enlist landowners and NJ citizens in the protection of and survey efforts for SGCN, in particular rare species, by increasing enrollment in landowner incentives, forest stewardship, backyard habitat management and wildlife-related volunteer programs.
- 8.1.0.44** Engage conservation partners, stakeholders, government agencies and other land stewards in constructive dialogues encouraging their inclusion of controlled burns in forest and other stewardship plans.

Grassland Birds

- 8.1.0.47 Form cooperative partnerships with energy companies to facilitate habitat creation and enhancement away from and outside of project areas, the restoration of appropriate habitats within project areas (e.g., rights-of-way could benefit butterflies and some bird species), and to identify seasonal timing of activities that would minimize impacts to wildlife.
- 8.1.0.48 Form cooperative partnerships with transportation and shipment agencies and companies to facilitate habitat creation and enhancement away from and outside of project areas and to identify seasonal timing of activities that would minimize impacts to wildlife.

8.2 Recruitment and retention activities

8.2.3 For wildlife watching

- 8.2.3.1 Develop and implement nature-focused tourism opportunities including wildlife viewing sites, interpretive signage highlighting unique ecosystems/habitats, and wildlife-related recreational opportunities that do not negatively impact SGCN or their habitats.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.5 Develop and provide (or otherwise make publicly available) educational programs and/or materials that provide homeowners information on how to design dwellings and other structures in a manner that is wildlife friendly (e.g., using bird-safe glass on windows).
- 8.3.0.6 Develop and provide (or otherwise make publicly available) educational programs and/or materials to enlist landowners, land managers and local communities to discourage the presence of managed cat colonies and trap, neuter and release programs in wildlife habitats.
- 8.3.0.9 Develop and provide (or otherwise make publicly available) educational programs and/or materials to enlist landowners and land managers to include only native plants in landscaping and restoration projects. Provide information to assist them in detecting problematic establishment of invasive, non-indigenous plants.
- 8.3.0.10 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate landowners and NJ citizens on threats to fish and wildlife (including marine animals).
- 8.3.0.12 Promote awareness of WSFR (Wildlife and Sportfish Restoration) Outreach/Awareness grants, an important funding source for conservation among hunters and anglers as well as the general public.
- 8.3.0.13 Conduct an educational campaign to encourage observer ethics and respect for wildlife and natural habitat.
- 8.3.0.19 Develop an educational outreach program for the public on the devastating effects predators can have on native nesting wildlife.
- 8.3.0.25 Develop educational outreach programs for landowners, nurseries and the general public regarding the negative impacts of invasive and non-native plants on our natural communities.
- 8.3.0.27 Develop educational outreach programs for public and private landowners and land managers regarding the importance of structural habitat diversity, methods to increase diversity, and/or incentive programs available to increase habitat diversity.
- 8.3.0.28 Develop educational outreach programs for public and private landowners and land managers regarding the importance of managing grasslands for grassland-dependent species, methods of management, and/or incentive programs available.
- 8.3.0.30 Develop educational outreach programs for private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.

Grassland Birds

- 8.3.0.32 Develop an educational outreach program for landowners and citizens on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

- 9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and SGCN inhabiting them.
- 9.1.0.2 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.1.0.3 Develop a plan that directs the creation of impervious surfaces away from and to minimize impacts on aquatic systems and critical terrestrial habitats. The plan should also include strategies to increase the resiliency of aquatic and critical terrestrial habitats to threats and stressors that would impact the reproduction and survival of wildlife.
- 9.1.0.6 Develop a plan that directs the creation or expansion of roads and railroads or the re-establishment of abandoned railroads within and adjacent to critical forested habitats in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.15 Develop a plan to minimize fragmentation of terrestrial and aquatic habitats by roads.
- 9.1.0.19 Develop a plan to minimize the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 9.1.0.22 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 9.1.0.28 Develop and coordinate state, regional and local plans for suitable lot layout and landscaping to minimize human-wildlife conflicts that also incorporates habitat connectivity and preservation of natural areas.
- 9.1.0.29 Provide GIS or related data, maps, resource inventories, as well as related training, pertaining to the SWAP and it's recommended conservation actions for use or consideration by State, County or municipal planning agencies.
- 9.1.0.30 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and other related threats associated with development.
- 9.1.0.33 Review the species, threats, action successes, and habitats, and work with partners to revise the 2017 State Wildlife Action Plan for the 2025 resubmittal.

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.4 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.3.1.7 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
- 9.3.1.9 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
- 9.3.1.13 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.

Grassland Birds

- 9.3.1.16 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.
 - 9.3.2 Listed species recovery planning
 - 9.3.2.1 Develop proactive species recovery plans for all endangered and threatened species including guidance and objectives pertaining to critical and supporting habitat to meet and maintain recovery goals.
 - 9.3.3 Habitat management planning
 - 9.3.3.6 Develop a management plan for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
 - 9.3.3.7 Develop a management plan to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.
 - 9.3.3.8 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
 - 9.3.3.9 Develop a response plan to outbreaks using BMPs to control infestations and limit their spread in a way that avoids excessive harm to non-target species.
 - 9.3.3.10 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
 - 9.3.3.11 Develop town plans that avoid impacts to SGCN species and their habitats.
 - 9.3.3.13 Develop a management plan that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas and prevents or ameliorates near-term impacts of climate change throughout the State, but in particular within the coastal and Delaware Bay areas.
 - 9.3.3.15 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
 - 9.3.3.18 In cooperation with species and habitat experts, develop management plans for significant natural and/or unique communities, in particular those supporting SGCN, and provide the information to the landowners/managers (federal, state and local government agencies or non-government organization) for review and implementation.
 - 9.3.3.19 Develop management plans for SGCN inhabiting permanently protected natural lands using available baseline and population trend data.
 - 9.3.3.20 Develop an action plan for immediate implementation should habitat levels fall below the minimum necessary size and/or structure within the Cape May Peninsula to sustain the avian migration.
 - 9.3.3.21 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
 - 9.3.3.24 Develop a plan to improve the enforcement of policies and/or regulations that protect wetlands, riparian and floodplain areas, and aquatic habitats (including open waters).

Grassland Birds

- 9.3.3.26 Develop a management plan for parcels of suitable size to be managed for native herbaceous plant species that support breeding grassland dependent species.
- 9.3.3.29 Develop habitat management plans aimed at reducing or eliminating negative impacts of ORVs.
- 9.3.3.32 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.
- 9.3.3.34 Include controlled burn prescriptions in forest and stewardship plans to improve wildlife habitat.
- 9.3.3.35 Incorporate habitat connectivity, preservation of natural areas, and the implementation of BMPs into state and local land-use policy environmental review process and energy development plans to minimize habitat fragmentation and related threats associated with solar farms and altered habitats.
- 9.3.3.36 Integrate plans for properly located and timed habitat restoration and management along transportation, energy and service corridors to minimize risks to and benefit wildlife.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

- 11.1.1.1 Use Biotics database and Landscape Project Mapping in regulatory reviews to ensure protection by applicable laws and regulations.
- 11.1.1.2 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
- 11.1.1.3 Government organizations to thoroughly review wetland restoration plans, applying the most current science for wildlife, habitats and aquatic systems, to assess the impacts to resident and migratory wildlife occupying the targeted habitats.
- 11.1.1.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.
- 11.1.1.5 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 11.1.1.10 Use CHANJ mapping in reviews of proposed energy, mining, transportation and utility service companies/agencies' projects to attempt to maintain habitat connectivity and reduce fragmentation, and identify potential impacts of the projects.
- 11.1.1.11 Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed offshore energy projects relating to drilling, extraction and distribution of petroleum and gas products to reduce habitat destruction and minimize impacts on wildlife.
- 11.1.1.12 Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed solar farm projects to reduce habitat fragmentation and minimize impacts on wildlife.

Grassland Birds

- 11.1.1.13 Use the best available science (species data, habitat present, wind farm layout options, wind blade impacts on migratory species, location of migration routes, etc.) when conducting regulatory reviews of proposed wind farm projects to minimize impacts on migratory and resident wildlife and reduce habitat fragmentation.

11.1.2 Review of proposed policies and plans

- 11.1.2.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

- 11.2.0.1 Provide technical support to private and public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 11.2.0.2 Provide technical support to public and private landowners and land managers for controlling invasive, native and non-native plant species in order to increase structural habitat diversity.
- 11.2.0.3 Develop state, regional and local BMPs that focus on minimizing habitat fragmentation and human-wildlife conflicts associated with development. Make information available to land developers and private and public landowners for implementation.
- 11.2.0.5 Provide educational resources, training programs, and expert guidance to private and public landowners and land managers on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.
- 11.2.0.6 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on habitat creation, enhancement and restoration within and adjacent to project areas, as well as away from and outside of project areas (depending on the target species), by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. Wind farms should address both terrestrial bound and low-flying species. Examples of habitat management include, but are not limited to, integrating short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 11.2.0.7 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on the importance of maintaining habitat connectivity, minimizing fragmentation, and the use of CHANJ products to help them target areas for such planning.
- 11.2.0.8 Provide educational resources, training programs, and on-the-ground guidance to public and private landowners and land managers on habitat creation and enhancement strategies that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 11.2.0.9 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and private landowners about the importance of leaving vegetation in place, especially along riparian areas and wildlife movement corridors.
- 11.2.0.10 Provide technical support to private landowners, consultants, and land managers to create customized management plans based on location and SGCN.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Grassland Birds

- 11.2.0.11 Provide educational resources, training programs, and on-the-ground guidance to private and public landowners and land managers on the benefits of and for creating young forest and early succession habitat for SGCN.
 - 11.2.0.12 Provide educational resources and technical support to public landowners and land managers for managing grasslands for grassland-dependent species.
 - 11.2.0.14 Provide educational resources and technical support to public and private landowners and land managers to promote the protection of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters), and to enhance or restore biologically appropriate buffers.
 - 11.2.0.20 Provide educational resources and technical support to public and private landowners and land managers to promote the protection and/or enhancement of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN.
 - 11.2.0.21 Provide educational resources and technical support to public and private landowners and land managers of lands adjacent to critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates to promote the protection and/or enhancement of those adjacent habitats to increase the effective size of the migratory habitat.
 - 11.2.0.22 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
 - 11.2.0.23 Provide educational resources and technical support to public and private landowners and land managers of lands adjacent to SGCN habitats to promote the protection and/or enhancement of those adjacent habitats to increase the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and that connect conserved SGCN habitats.
 - 11.2.0.25 Provide educational resources, training programs, and on-the-ground guidance to resource managers regarding the assessment of and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) related to residential and commercial development.
- 11.2.1 With individuals and groups involved in resource management decision making
 - 11.2.1.1 Engage partners and stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
 - 11.2.1.2 Provide professional training and technical assistance tools (e.g., mapping, guidance documents, justification, etc.) to agencies/divisions/programs within and outside of the NJ DEP regarding the SWAP, and the conservation actions recommended therein to help facilitate SWAP implementation.
 - 11.2.1.3 Provide educational resources, training programs, and on-the-ground guidance to DOD to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop and implement forest management and other practices that minimize disturbances to SGCN (i.e., beyond their federal requirements).
 - 11.2.1.6 Provide educational resources, training programs, and on-the-ground guidance to resource agencies prior to project initiation to ensure wildlife and their habitats are protected to the highest degree possible during construction, and provisions are in place for post-construction habitat use.
- 11.2.2 With private landowners

Grassland Birds

- 11.2.2.1 Provide technical support to farming operations and woodland landowners on ways to decrease clean farming (edge-to-edge) practices and create ecotones to benefit bobwhite and other species dependent on early successional habitat.

100 Law and Policy

100. Legislation

100.1.2 National Level

- 100.1.2.1 Create legislation to establish markets for warm-season grasses to increase the permanency of this crop on the landscape.

100.1.3 Sub-national Level

- 100.1.3.1 Develop laws and policies to increase protection and biological buffers of wetlands.
- 100.1.3.3 Initiate legislative action to establish an annual budgetary line item designating funds to support programs focused on long-term research and monitoring of wildlife diseases.

100.1.4 County and Local

- 100.1.4.1 Enhance critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates through the local ordinances of adjacent private lands to increase the effective size of the habitat.
- 100.1.4.2 Secure and increase the effective size of SGCN habitats and connect conserved SGCN habitats through local ordinances.
- 100.1.4.3 Expand the acreages and enhance the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN through local ordinances.
- 100.1.4.4 Secure wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) and biologically appropriate buffers through local ordinances.
- 100.1.4.5 Secure SGCN-inhabited/used freshwater wetlands and biologically appropriate buffers through local ordinances.
- 100.1.4.8 Secure critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through local ordinances.
- 100.1.4.13 Encourage municipal laws regulating domestic pets that may predate on wildlife.
- 100.1.4.14 Adopt/pass local ordinances which require assessing and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 100.1.4.15 Incorporate habitat connectivity and the preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.

100.1.5 Scale Unspecified

- 100.1.5.1 Develop laws and policies to increase protection and biological buffers of wetlands.
- 100.1.5.2 Develop policies for wetland restoration plans that consider life history requirements and needs of wildlife occupying targeted habitats.
- 100.1.5.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.

Grassland Birds

- 100.1.5.5 Develop legislation to provide financial support for the New Jersey Invasive Species Strike Team.

100. State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.3 Develop policies that will promote the long term protection of critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates.
- 100.3.0.5 Develop policies that will promote improved and secure habitat connections between conserved SGCN habitats.
- 100.3.0.6 Develop policies that will promote expanding acreages and enhancing the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 100.3.0.7 Amend current policies and/or regulations to increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.
- 100.3.0.8 Develop policies and/or regulations with the objective of protecting significant natural and/or unique communities in perpetuity.
- 100.3.0.9 Secure mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.14 Develop policies and/or regulations that increase the protective buffers of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) to biologically appropriate distances to benefit SGCN that rely upon these habitats and improve the function of the [associated] aquatic systems.
- 100.3.0.18 Develop policies for conserved lands that prohibit planting and supports the control of non-native vegetation and invasive, native vegetation.
- 100.3.0.19 Develop regulations for lighting of/on tall structures that will minimize harm to and/or disorientation of wildlife, in particular but not limited to migratory birds, bats and invertebrates. Implement BMPs into state, county and local permitting processes.
- 100.3.0.20 Develop policies and/or regulations that prohibit the presence of managed cat colonies and trap, neuter and release programs in or near critical wildlife habitats.
- 100.3.0.23 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.24 Create legislation to establish markets for warm-season grasses to increase the permanency of this crop on the landscape.
- 100.3.0.31 Create or expand tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMPs.
- 100.3.0.40 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.3.0.41 Explore all State regulatory requirements for mitigation, restoration, habitat management, etc. to ensure they prohibit the use of specified invasive or other problematic plant species.
- 100.3.0.42 Fully adopt the former Storm water Management Rules' 300ft buffer requirements into the Flood Hazard Area Control Act Rules.

Grassland Birds

- 100.3.0.43 Identify and address (amend) regulatory impediments to beneficial habitat management.
- 100.3.0.44 Incorporate requirements for technical support and funding for mitigation or restoration efforts so as to be consistent with existing regulations.
- 100.3.0.45 Increase the controlled burn season to focus on restoring vegetative communities.
- 100.3.0.46 Investigate and/or develop inter-agency Memorandum of Agreements to share common data stored or managed in program-specific databases.
- 100.3.0.48 Propose new State law or regulation mandating that a State-level "development impact fee" be assessed on all new development approved by municipalities (via the Municipal Land Use Law processes), and dedicate such monies to the development and implementation of regional Habitat Conservation Plans (or existing plans/programs serving the same regional function).
- 100.3.0.50 Retain endangered, threatened and special concern wildlife and habitat protection measures in the Water Quality Management Program Rules.
- 100.3.0.52 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded energy sitings and facilities.
- 100.3.0.53 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded rights-of-way corridors associated with energy transport/transmission.
- 100.3.0.54 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded surface mining areas.
- 100.3.0.56 Develop regulations that when implemented will protect critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates.
- 100.3.0.57 Develop regulations that when implemented will improve and secure habitat connections between conserved SGCN habitats.
- 100.3.0.58 Develop regulations that when implemented will promote the expansion of acreages and enhancement of the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 100.3.0.59 Develop regulations that when implemented will increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.
- 100.3.0.60 Develop regulations that when implemented will protect significant natural and/or unique communities in perpetuity.
- 100.3.0.65 Develop regulations that when implemented will protect and restore scrub-shrub habitats to benefit shrub-dependent SGCN.
- 100.3.0.67 Develop regulations for lighting of/on tall structures that will minimize harm to and/or disorientation of wildlife, and enforce within state, county and local permitting processes.
- 100.3.0.68 Develop regulations that when implemented will prohibit the presence of managed cat colonies and trap, neuter and release programs in or near critical wildlife habitats.
- 100.3.0.70 Develop regulations that when implemented will facilitate the restoration of dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.
- 100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

- 100.3.0.73 Develop regulations that would exempt the conversion of lawns to native vegetation (beneficial to wildlife) from local lawn ordinances.

100. State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).
- 100.4.0.3 Develop policies for mandatory buffer strips on preserved farmlands and state-owned agricultural lands.
- 100.4.0.4 Create a policy that requires the use of wildlife habitat and corridor mapping products for both regulatory use when conducting project reviews and planning/siting new or expanded rights-of-way projects.
- 100.4.0.9 Develop and implement policies to minimize the removal of coarse, woody debris in terrestrial, aquatic and riparian habitats in order to benefit wildlife.
- 100.4.0.12 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.4.0.13 Develop policies for different circumstances (e.g., roadsides and medians, riparian, aquatic and terrestrial habitats) that outline appropriate habitat/vegetation management strategies and schedules to minimize risks to and benefit wildlife.
- 100.4.0.14 Develop policies to facilitate agreements between eligible entities to manage appropriate conserved lands for grassland-dependent species, and to have access to/obtain restoration funds.
- 100.4.0.16 Develop policies to implement habitat management strategies that will increase the structural diversity surrounding areas used for energy, mining, and transportation and service corridors which include but are not limited to the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-
- 100.4.0.17 Develop policies to implement habitat management strategies, including prescribed burns, that will increase the structural diversity on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies to control and reduce the impacts of invasive, non-native species in order to increase structural habitat diversity.
- 100.4.0.18 Develop policies to minimize the extent of infrastructure associated with energy and service corridors or areas (e.g., wind and solar farms, pipelines, utility lines) and that require the implementation of habitat management strategies that will increase the structural diversity in the area including (e.g., the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-asides).
- 100.4.0.20 Develop state regulations that require energy developers and utility service companies to implement habitat management strategies that will increase the structural diversity of the habitat, minimize habitat fragmentation and commercial infrastructure, and minimize the loss, alteration and/or degradation of the habitat and adjacent lands when working on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies.
- 100.4.0.24 Develop policies to provide financial support for the New Jersey Invasive Species Strike Team.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Grassland Birds

- 100.4.0.25 Develop policies that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

Marsh Birds

Focal species that comprise this Conservation Target:

Black Rail	Common Tern	Forster's Tern
Little Blue Heron	Snowy Egret	Tricolored Heron

Threats and Action Drivers associated with this Conservation Target:

1 Residential and Commercial Development

1.1 Housing and Urban Areas

- 1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale) (Avg. Score: 1.00)

NJ Specific Threats: 1.1.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

- 1.1.2 Residential development using materials that cause collision hazards (Avg. Score: 1.00)

NJ Specific Threats: 1.1.2.1 Collision risk to volant species (birds, bats and invertebrates).

1.2 Commercial and Industrial Areas

- 1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale) (Avg. Score: 1.00)

NJ Specific Threats: 1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

- 1.2.2 Commercial development using materials that cause collision hazards (Avg. Score: 2.00)

NJ Specific Threats: 1.2.2.1 Collision risk to volant species (birds, bats and invertebrates).

1.3 Tourism and Recreational Areas

- 1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale) (Avg. Score: 2.00)

NJ Specific Threats: 1.3.1.2 Loss, alteration and/or degradation of habitat.

1.3.1.5 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

2 Agriculture and Aquaculture

2.1 Annual and Perennial Crops (non-timber)

- 2.1.1 Shifting Agriculture (Avg. Score: 0.50)

NJ Specific Threats: 2.1.1.2 Conversion, and subsequent loss, of high salt marsh to low salt marsh threatens high-marsh dependent species and those dependent on the marsh-upland ecotone.

2.1.1.4 Salt hay farming on Delaware Bay marshes, and the subsequent conversion of those farms to fully tidal marshes, results in compressed sediments that are less resilient to coastal forces of erosion and sea level rise.

3 Energy Production and Mining

3.1 Oil and Gas Facilities and Pipelines

- 3.1.1 Distribution processes of petroleum and other liquid hydrocarbons (Avg. Score: 1.00)

NJ Specific Threats: 3.1.1.1 Fragments terrestrial and aquatic habitats.

3.1.1.2 Loss, alteration and/or degradation of habitat.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Marsh Birds

- 3.1.1.3 Increased risk of oil spills.
- 3.1.1.4 Increased noise pollution.
- 3.1.1.5 Increased vehicular and ship traffic associated with construction and operations, and therefore an increased risk of wildlife mortality from strikes.

3.1.2 Natural gas distribution processes (Avg. Score: 1.00)

- NJ Specific Threats:**
- 3.1.2.2 Loss, alteration and/or degradation of habitat.
 - 3.1.2.3 Increased risk of gas leaks and explosions.
 - 3.1.2.5 Increased vehicular and ship traffic associated with construction and operations, and therefore an increased risk of wildlife mortality from strikes.

3.2 Mining and Quarrying

3.2.4 Sand Dredging (outside shipping lanes) (Avg. Score: 0.83)

- NJ Specific Threats:**
- 3.2.4.1 Loss, alteration and/or degradation of benthic marine habitats.
 - 3.2.4.2 Increased noise pollution.
 - 3.2.4.3 Potential for direct mortality of benthic organisms.

3.3 Renewable Energy

3.3.1 Wind Power (Avg. Score: 1.33)

- NJ Specific Threats:**
- 3.3.1.1 Turbines, blades, and structure foundations create a collision risk to volant species (birds, bats and invertebrates) and marine animals.
 - 3.3.1.2 Fragments terrestrial habitats.
 - 3.3.1.3 Loss, alteration and/or degradation of habitat.
 - 3.3.1.4 Increased commercial infrastructure.

3.3.2 Solar Power (Avg. Score: 1.00)

- NJ Specific Threats:**
- 3.3.2.2 Loss, alteration and/or degradation of habitat.

4 Transportation and Service Corridors

4.1 Roads and Railroads

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale) (Avg. Score: 1.17)

- NJ Specific Threats:**
- 4.1.1.2 Loss, alteration and/or degradation of habitat associated with road and railroad construction and maintenance, and degradation of adjacent habitats.

4.1.2 Movement of cars and other vehicles on roads and railroads (large and small scale) (Avg. Score: 1.00)

- NJ Specific Threats:**
- 4.1.2.1 Increased vehicle traffic increases the risk of wildlife mortality from strikes.

4.2 Utility and Service Lines

4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads (Avg. Score: 1.00)

- NJ Specific Threats:**
- 4.2.1.2 Loss, alteration and/or degradation of habitat associated with rights-of-way construction and maintenance, and degradation of adjacent habitats.
 - 4.2.1.5 Tall radio and utility towers with guy lines pose a strike hazard for migrant bats and birds, especially in poor visibility conditions (e.g., fog, nighttime, poor weather conditions).

4.3 Shipping Lanes

Marsh Birds

4.3.1 Movement of large ships in shipping lanes (Avg. Score: 0.33)

NJ Specific Threats: 4.3.1.2 May disturb nesting and foraging of shoreline birds and aquatic animals, and/or alter migratory patterns of aquatic and marine wildlife.

4.3.2 Dredging impacts (Avg. Score: 1.50)

NJ Specific Threats: 4.3.2.2 Historic and current reuse of containment facilities over time may disrupt/displace nesting birds.

4.3.2.3 Transportation of materials to and from disposal facilities may pose temporary disturbance to wildlife impacting foraging and nesting success.

4.4 Flight Paths

4.4.1 Airplane flight paths (Avg. Score: 1.00)

NJ Specific Threats: 4.4.1.1 Increased noise disturbance to wildlife, disrupting their normal behaviors.

4.4.1.2 Increased risk of collision between airplanes and birds, bats and insects.

5 Biological Resource Use

5.4 Fishing and Harvesting of Aquatic Resources

5.4.2 Intentional Use (large scale) (Avg. Score: 0.83)

NJ Specific Threats: 5.4.2.1 Overharvesting of one species may lead to detrimental impacts on another; e.g., overharvest of menhaden affecting piscivorous birds.

5.4.3 Unintentional effects (subsistence/small scale) (Avg. Score: 1.00)

NJ Specific Threats: 5.4.3.1 Abandoned fishing tackle and gear, crab pots without excluders and ghost crab pots increase the risk of injury and death to marine mammals, sea turtles, sea birds, pinnipeds and fish species as well as terrestrial and semi-aquatic species as a result of consuming tackle or gear, entrapment and entanglement in gear.

5.4.3.2 Commercial/recreational shellfish dredging may impact marine ecosystems by uprooting submerged aquatic vegetation, disrupting substrates, increasing turbidity, and increasing predator species in localized areas.

5.4.3.3 Heavy fishing pressure in localized areas can prevent foraging birds from hunting prime areas decreasing their likelihood of success and reproduction.

5.4.3.6 Fishing gear used by commercial fisheries results in bycatch or entanglement of non-targeted wildlife leading to injury and/or mortality.

5.4.4 Unintentional effects (large scale) (Avg. Score: 1.00)

NJ Specific Threats: 5.4.4.1 Fish introduced for sport fishing can negatively impact native species by competing for resources and/or altering the habitat (e.g., disrupting benthic communities and/or severely impacting aquatic vegetation).

5.4.4.2 Commercial/recreational shellfish dredging may impact marine ecosystems by uprooting submerged aquatic vegetation, disrupting substrates, increasing turbidity, and increasing predator species in localized areas.

5.4.4.3 Heavy fishing pressure in localized areas can prevent foraging birds from hunting prime areas decreasing their likelihood of success and reproduction.

5.4.4.5 Fishing gear used by commercial fisheries results in bycatch or entanglement of non-targeted wildlife leading to injury and/or mortality.

5.4.4.6 Overexploitation of riparian, estuarine, and marine fisheries may deplete food resources required by marine mammals, sea turtles, marine fish and piscivorous birds, in turn resulting lower reproduction and survival.

6 Human Intrusions and Disturbance

Marsh Birds

6.1 Recreational Activities

6.1.1 Off-road vehicles (motorized and non-motorized) (Avg. Score: 0.33)

- NJ Specific Threats:** 6.1.1.1 Inappropriate use of off-road vehicles creates new roads/trails which fragments habitat.
- 6.1.1.2 Inappropriate use of off-road vehicles can degrade terrestrial and aquatic habitat and reduce the suitability of adjacent habitats for wildlife.
- 6.1.1.3 Increased risk of harassment that results in a change in wildlife behavior and/or direct mortality from vehicle strikes.
- 6.1.1.4 Increased noise pollution.
- 6.1.1.5 Vehicle use on beaches can cause disturbance, harms breeding and foraging habitats, and can cause direct mortality of beach-nesting birds.
- 6.1.1.6 Off-road vehicles can be a mechanism of transference of wildlife diseases and invasive plant species if gear and apparel are not properly sanitized between sites.

6.1.2 Boating (Avg. Score: 2.83)

- NJ Specific Threats:** 6.1.2.1 Alteration and/or degradation of aquatic habitat.
- 6.1.2.2 Increased disturbance to marine animals and ocean-, bay- and marsh-associated birds which can alter their behavior decreasing the likelihood of their success and/or reproduction.

6.1.3 Use of beaches (Avg. Score: 0.50)

- NJ Specific Threats:** 6.1.3.1 Increases disturbance to beach nesting birds that reduces nesting success, and reduces foraging and resting opportunities for a wide range of nesting and migrating shorebirds.

6.1.5 Wildlife observation and photography (Avg. Score: 1.83)

- NJ Specific Threats:** 6.1.5.1 Improperly conducted recreational activities may disrupt normal wildlife behaviors which can result in reduced reproductive success or survival, abandonment of critical sites, etc.

6.1.7 Other (Avg. Score: 1.00)

- NJ Specific Threats:** 6.1.7.1 Use of recreational or commercial pyrotechnics may cause temporary disturbance to wildlife, in particular to nesting birds.
- 6.1.7.3 Drone use in areas with sensitive wildlife (e.g., nesting and foraging birds, migrating and foraging/feeding whales) can alter their behavior and can cause disturbance that impacts their reproductive and/or foraging success.

6.2 Military Exercises

6.2.1 Military exercises (Avg. Score: 1.00)

- NJ Specific Threats:** 6.2.1.1 Military testing and training exercises may inflict disturbance and potential physical harm to wildlife.
- 6.2.1.3 Lack of opportunity for non-federal wildlife managers to influence activities on military bases may result in detrimental impacts to SGCN and/or missed opportunities to engage in projects that benefit SGCN.

6.3 Work and Other Activities

6.3.1 Unauthorized research projects at significant habitats (Avg. Score: 2.00)

- NJ Specific Threats:** 6.3.1.2 Accidental trampling of nests, eggs/egg masses, and unseen individuals may impact reproductive success or cause direct mortality to SGCN.
- 6.3.1.3 Activities conducted without proper precautions may disturb and disrupt normal wildlife behaviors, which may impact reproductive success or survival, cause abandonment of critical sites, etc.

6.3.2 Authorized research projects at significant habitats (Avg. Score: 1.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Marsh Birds

- NJ Specific Threats:** 6.3.2.3 Accidental trampling of nests, eggs/egg masses, and unseen individuals may impact reproductive success or cause direct mortality to SGCN.
- 6.3.2.4 Activities conducted without proper precautions may disturb and disrupt normal wildlife behaviors, which may impact reproductive success or survival, cause abandonment of critical sites, etc.
- 6.3.3 Other "work" unrelated to research (Avg. Score: 3.00)
- NJ Specific Threats:** 6.3.3.1 Construction projects may disrupt normal wildlife behavior which can result in reduced reproductive success or survival, abandonment of critical sites, etc. (e.g., bridge-nesting birds).
- 6.3.3.2 Intensive dune and beach management (including overuse of dune fencing, sand mining, mechanical beach raking, storm clean up), reduces foraging habitat for beach nesting and migratory shorebirds, and poses risks of injury and mortality to unfledged chicks.
- 6.3.3.3 Beach nourishment projects create suitable habitat for beach-nesting birds in areas of high human use, increasing the likelihood of disturbance to the birds, harm to the eggs, and injury and/or mortality to chicks.

7 Natural Systems Modifications

7.2 Dams and Water Management/Use

7.2.1 Abstraction of Surface Water (domestic use) (Avg. Score: 1.00)

- NJ Specific Threats:** 7.2.1.6 Impoundments may alter the water levels in high marshes and mudflats, impacting those foraging and nesting habitats.

7.2.2 Abstraction of Surface Water (commercial use) (Avg. Score: 1.00)

- NJ Specific Threats:** 7.2.2.6 Impoundments may alter the water levels in high marshes and mudflats, impacting those foraging and nesting habitats.

7.2.3 Abstraction of Surface Water (agricultural use) (Avg. Score: 1.00)

- NJ Specific Threats:** 7.2.3.7 Impoundments may alter the water levels in high marshes and mudflats, impacting those foraging and nesting habitats.

7.2.5 Abstraction of Ground Water (domestic use) (Avg. Score: 1.00)

- NJ Specific Threats:** 7.2.5.1 Heavy withdrawal of ground water for domestic use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.6 Abstraction of Ground Water (commercial use) (Avg. Score: 1.00)

- NJ Specific Threats:** 7.2.6.1 Heavy withdrawal of ground water for industrial and commercial use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.7 Abstraction of Ground Water (agricultural use) (Avg. Score: 1.00)

- NJ Specific Threats:** 7.2.7.1 Heavy withdrawal of ground water for agricultural use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.14 Tidal Water Management (Avg. Score: 1.17)

- NJ Specific Threats:** 7.2.14.1 Freshwater tidal management for flood control alters water levels and salinity in tidal wetlands.

7.2.14.2 Tidal water management for the purpose of managing for select species may alter existing hydrologic or vegetative conditions to the detriment of other species.

7.2.14.3 Open marsh water management (and other techniques) to control mosquito populations may alter existing hydrologic or vegetative conditions to the detriment of other species.

7.2.14.4 Manipulation of marsh water levels may disturb nesting areas and flood nests.

7.3 Other Ecosystem Modifications

Marsh Birds

7.3.1 Shoreline Stabilization (Avg. Score: 2.83)

NJ Specific Threats: 7.3.1.1 Efforts to stabilize barrier islands and shorelines, including jetties, groins, bulkheads, interfere with the natural geological processes needed to create and maintain high quality habitat for beach strand species.

7.3.4 Lack of natural disturbance patterns or ecosystem functions due to species loss (Avg. Score: 1.00)

NJ Specific Threats: 7.3.4.4 Human interference in natural processes such as clean up (e.g., beach-filling, shoreline hardening, tree/log removal from forests) after storms, in particular those causing post-hurricane washover and/or barrier island westward movement, and tree felling limits the disturbance needed to maintain appropriate habitats for wildlife.

7.3.5 Poor habitat management (Avg. Score: 3.00)

NJ Specific Threats: 7.3.5.5 Habitat management that alters or removes vegetation without implementing long-term management increases the risk of invasive and exotic plants establishing themselves, outcompeting native vegetation.

7.3.5.6 Habitat management, including that which occurs on public and private lands, that does not consider timing and species' behaviors can result in the direct mortality and/or alteration or loss of habitat.

7.3.5.10 Ditching, draining and filling of marshes and wetlands eliminates habitat and degrades the remaining surrounding areas for wildlife.

7.3.5.11 Salt marsh water management to control mosquitoes may result in negative effects on other species (e.g., changing hydrology of low and high marsh).

7.3.5.13 Private landowners with rare species on their properties are not always cooperative in the protection and management of the species' habitats. Landowners may be held accountable for their actions when they cause harm to the species or destroy the habitat, but it is often too late for the species' population.

7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.

7.3.5.16 Lack of proactive management to preserve or maintain viable and functioning marshes for SGCN wildlife.

8 Invasive and Other Problematic Species, Genes and Diseases

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.1 Unspecified Species (Avg. Score: 3.00)

NJ Specific Threats: 8.1.1.2 Alters, degrades and/or reduces the structural diversity of the natural composition of the landscape, including aquatic systems.

8.1.1.4 Invasive, non-native animals increase the risk of predation on native animals and/or herbivory on native vegetation.

8.1.1.6 Invasive, non-native plants may create physical barriers for some species.

8.1.4 Invasive non-native terrestrial/wetland animals (Avg. Score: 2.00)

NJ Specific Threats: 8.1.4.2 Free-roaming and feral domestic animals such as cats and dogs causes direct mortality of wildlife and disturbance to wildlife breeding and resting areas.

8.1.5 Invasive non-native terrestrial/wetland plants (Avg. Score: 2.00)

NJ Specific Threats: 8.1.5.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.2 Problematic Native Species/Diseases

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Marsh Birds

8.2.1 Unspecified Species (Avg. Score: 3.00)

NJ Specific Threats: 8.2.1.4 Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.

8.2.2 Named Species (Avg. Score: 3.00)

NJ Specific Threats: 8.2.2.2 Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.

8.5 Viral/Prion-induced Diseases

8.5.2 Named Species (Disease) (Avg. Score: 1.00)

NJ Specific Threats: 8.5.2.1 Diseases such as West Nile Virus, arenavirus, sudden oak death, Avian Influenza, and snake fungal disease cause morbidity or mortality to native populations.

8.6 Diseases of Unknown Cause

8.6.0 Unknown Diseases (Avg. Score: 1.00)

NJ Specific Threats: 8.6.0.1 Diseases yet to be identified by pathologists and virologists cause decreased fitness or mortality to native populations.

9 Pollution

9.1 Domestic and Urban Waste Water

9.1.1 Sewage (Avg. Score: 1.00)

NJ Specific Threats: 9.1.1.1 Degradation of aquatic and marine water quality and habitats by changing turbidity, flow and water chemistry.

9.1.1.2 Leads to increased eutrophication and algae blooms that result in oxygen depletion.

9.1.2 Run-off (Avg. Score: 1.00)

NJ Specific Threats: 9.1.2.2 Contaminants degrade aquatic and marine water quality and can bioaccumulate in benthic organisms, threatening wildlife by causing developmental and behavioral abnormalities and reproductive failure.

9.1.2.3 Contaminants from road runoff (oil, sediment, salt, etc.) impact native vegetation and the species that rely upon them, degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.

9.2 Industrial and Military Effluents

9.2.1 Oil Spills (Avg. Score: 1.00)

NJ Specific Threats: 9.2.1.1 Oil spills render resting, breeding and foraging habitats temporarily unavailable to wildlife, altering normal wildlife behavior.

9.2.1.2 Oil spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.

9.2.1.3 Oil spills cause external oiling of wildlife and ingestion of oil, both of which can injure or kill wildlife.

9.2.3 Other (Avg. Score: 1.00)

NJ Specific Threats: 9.2.3.1 Point and nonpoint source pollution such as polychlorinated biphenyls (PCBs), pesticides, heavy metals, and endocrine disrupting compounds (EDC's) into freshwater and marine systems pose threats to wildlife through direct contact and/or ingestion, and to aquatic species and their predators through bioaccumulation, impacting the reproductive success and neurological function of many avian and fish species.

9.2.3.2 Chemical spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Marsh Birds

- 9.2.3.3 Chemical spills may render resting, breeding and foraging habitats temporarily unavailable to wildlife, altering normal wildlife behavior.

9.3 Agricultural and Forestry Effluents

- 9.3.1 Nutrient Loads (Avg. Score: 1.00)

NJ Specific Threats: 9.3.1.2 Animal waste degrades terrestrial and aquatic habitats, especially streams, ponds and wetlands, resulting in eutrophication, which disrupts oxygen and nutrient balances, and causes injury and mortality to aquatic organisms.

- 9.3.3 Herbicides and Pesticides (Avg. Score: 1.00)

NJ Specific Threats: 9.3.3.1 Pesticides degrade terrestrial and aquatic habitats, especially streams, ponds and wetlands. Aquatic wildlife are particularly sensitive to these contaminants, which can cause developmental and behavioral abnormalities and reproductive failure. Some contaminants may bioaccumulate in predatory fish and birds and disrupt reproduction.

- 9.3.3.3 Use of pesticides can directly harm non-target species through direct contact and/or by reducing and/or contaminating their food supply.

- 9.3.5 Control of insect pests and plants leading to mortality of non-target species not associated with agriculture (Avg. Score: 1.00)

NJ Specific Threats: 9.3.5.5 Use of pesticides and herbicides can minimize the abundance of food sources for native wildlife populations.

9.4 Garbage and Solid Waste

- 9.4.1 Direct hazards to wildlife (Avg. Score: 2.00)

NJ Specific Threats: 9.4.1.1 Wildlife may ingest garbage causing choking or impingement in the digestive system, or they may become physically entangled in it (e.g., plastic or abandoned fish nets); conditions that make them unable to feed or drink, cause them to suffocate or drown, or otherwise restrict the animal's movement making them more susceptible to predators, starvation or injury.

9.5 Air-Bourne Pollutants

- 9.5.1 Acid Rain (Avg. Score: 1.00)

NJ Specific Threats: 9.5.1.1 Causes acidification of water bodies, resulting in changes to aquatic and marine communities and reducing biodiversity, and creating conditions that are unsuitable for some aquatic (freshwater and marine) and semi-aquatic species that are sensitive to pH shifts.

- 9.5.6 Herbicides and Pesticides (Avg. Score: 1.00)

NJ Specific Threats: 9.5.6.1 May result in injury or direct mortality of non-target species.

9.6 Excess Energy

- 9.6.1 Light Pollution (Avg. Score: 1.83)

NJ Specific Threats: 9.6.1.1 Artificial lighting can reduce suitability of adjacent habitat for species sensitive to artificial lights by disorienting wildlife, reducing foraging suitability or success, or increasing visibility to predators, resulting in reduced diversity and/or productivity of species in adjacent habitat.

- 9.6.3 Noise Pollution (Avg. Score: 2.00)

NJ Specific Threats: 9.6.3.1 Acute and chronic noise pollution in and adjacent to terrestrial and aquatic (marine and freshwater) environments could disrupt normal behaviors of wildlife such as migration, communication, feeding, eluding predators, resting and breeding, etc.

11 Climate Change and Severe Weather

11.1 Habitat Shifting or Alteration

- 11.1.0 Macro- and Micro-Climate Alterations (Avg. Score: 1.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Marsh Birds

NJ Specific Threats: 11.1.0.1 Alters native terrestrial and aquatic habitats at the macro- and micro-climate levels that can affect suitability for wildlife, in particular specialist species.

11.2 Droughts

11.2.1 Droughts (Avg. Score: 1.00)

NJ Specific Threats: 11.2.1.3 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

11.3 Temperature Extremes

11.3.1 Temperature extremes (Avg. Score: 2.00)

NJ Specific Threats: 11.3.1.1 Increasing temperatures may cause habitat loss and degradation by desiccating and/or raising the temperatures of small wetlands and streams leading to the loss of freshwater mussels and other aquatic species and species reliant upon these habitats.

11.3.1.2 Increased temperatures can negatively impact wetland, riverine, lacustrine and vernal pool-associated or -dependent wildlife by reducing flows, increasing water temperatures, lowering water levels and causing premature drying of vernal habitats.

11.3.1.3 Temperature extremes of surface water and air degrades marine habitats and ecosystems, threatening marine wildlife. Such extremes also disrupt offshore currents and migratory patterns, species' ranges, and/or impact communities/food chains, all of which further impact the ecosystem.

11.3.1.4 Extremely low temperatures and/or extensive periods of unseasonably low temperatures during critical life history stages (e.g., hibernation, gestation/nesting) can alter animals' behaviors and decrease survivorship.

11.4 Storms and Flooding

11.4.1 Storms and flooding (Avg. Score: 3.00)

NJ Specific Threats: 11.4.1.1 Extreme storms and flooding events threaten aquatic and marine wildlife through habitat degradation and alteration, including alterations to off-shore or back-bay benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic and marine wildlife.

11.4.1.2 Potentially damage coastal habitats, including beach- and marsh-nesting bird habitats and interdunal wetlands, and can increase marsh erosion.

11.4.1.6 Increased storms and flooding reduce nesting success, especially for ground-nesting birds.

11.4.1.7 Potentially damage coastal habitats, including beach and marsh habitats used by spawning horseshoe crabs, nesting diamondback terrapins, and resting and foraging birds.

11.4.2 Increased rainfall (Avg. Score: 2.00)

NJ Specific Threats: 11.4.2.1 Extreme rain events threaten aquatic wildlife through habitat degradation and alteration, including alterations to benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic wildlife.

11.4.2.2 Extreme rain events can damage wildlife nesting and resting habitats, including impacts to avian eggs and chick and small mammal survivorship.

11.4.2.3 More frequent rain events can alter terrestrial and wetland vegetation communities as well as wetland hydrology, shifting wildlife community use.

11.6 Phenology Shifting or Alteration

11.6.2 Phenology shifts related to predator-prey ecology (Avg. Score: 2.00)

NJ Specific Threats: 11.6.2.1 Alters inter-specific relationships (e.g., competition, parasitism, predation) of wildlife, ultimately leads to detrimental impacts on the ecological system.

Marsh Birds

11.6.2.2 Shifts timing of species migration, breeding and hibernation, and available food resources, causes redistribution of species, or mortality for species that are unable to relocate due to their already isolated habitat or limited mobility.

11.6.3 Phenology shifts related to species redistribution (Avg. Score: 1.00)

NJ Specific Threats: 11.6.3.1 Shifts in timing of species migration, breeding and hibernation, and available food resources, as a result of wildlife range shifts driven by climate change.

11.6.3.2 Shifts in nesting times or egg incubation durations can limit nest success and longterm populations.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory (Avg. Score: 2.17)

NJ Specific Threats: 12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.1.4 Lack of information on the morphometrics and trends of coastal salt marshes and salt marsh islands.

12.1.1.5 Lack of information regarding the SGCN populations that use managed salt marshes and the best techniques for making improvements for marsh-dependent SGCN wildlife.

12.1.1.6 Lack of information regarding migratory pathways and response of wildlife to lights and noise associated with offshore wind turbines.

12.1.2 Lack of up-to-date existing information (Avg. Score: 1.33)

NJ Specific Threats: 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

12.1.2.2 Lack of wildlife monitoring at sites with structures that pose high risk of mortality to SGCN wildlife.

12.1.3 Need to answer research question (Avg. Score: 3.00)

NJ Specific Threats: 12.1.3.1 There are significant knowledge gaps regarding distribution, dispersal, diseases, population trends, etc. of SGCN.

12.1.3.4 Lack of information regarding the potential short- and long-term impacts of wind turbines and other tall coastal structures on migratory populations.

12.1.4 Need to develop new technique (Avg. Score: 2.17)

NJ Specific Threats: 12.1.4.1 Improve and evaluate survey methods for SGCN and their habitats; alter as needed.

12.1.4.3 Lack of techniques for high marsh preservation that includes impoundments and elevated islands.

12.1.4.4 Lack of consideration of habitat management opportunities in the course of salt marsh management for mosquito control.

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms (Avg. Score: 2.00)

NJ Specific Threats: 12.3.0.6 Certain geographic or habitat features, such as vernal pools and headwater wetlands or streams, may be too small, mischaracterized, or misidentified to benefit from regulatory protection.

12.3.0.7 Activities that threaten SGCN, their food sources, and/or habitats are often regulated separately and without consideration for the cumulative and synergistic effects over time or over a larger spatial scale. Therefore, regulations can fail to protect SGCN populations over time.

12.3.0.10 Land use regulatory processes pertaining to habitat creation, enhancement or restoration projects can be costly and/or burdensome, precluding or discouraging the development or implementation of conservation projects.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform

(Avg. Score: 1.00)

- NJ Specific Threats:** 12.4.0.1 A species-by-species management focus as opposed to ecological systems and biodiversity generally has greater opportunity for unintended consequences for other species and may be less efficient in developing appropriate management actions.
- 12.4.0.2 Policies and procedures for lands management that lack consideration of the impacts of activity timing can result in unintended impacts to wildlife during vulnerable periods.
- 12.4.0.6 Techniques for ecological management or restoration of shorelines are not fully developed or evaluated for effectiveness for target and non-target SGCN in coastal areas.
- 12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats

(Avg. Score: 3.00)

- NJ Specific Threats:** 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.
- 14.1.1.2 Lack of general knowledge of SGCN life histories and vulnerabilities as they relate to land management practices.
- 14.1.1.3 Lack of understanding of the need to manage both natural and anthropogenic (e.g., yards, lawns, hayfields, etc.) habitats to minimize impacts or increase benefits to SGCN and their habitats.

14.2 Outreach needs

14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions

(Avg. Score: 3.00)

- NJ Specific Threats:** 14.2.1.2 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various aquatic and riparian management practices.
- 14.2.1.3 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various coastal management practices.
- 14.2.1.4 Need to develop greater understanding of and support for efforts implemented to maintain disturbance-free habitats that allow coastal wildlife populations to thrive alongside human residential and recreational uses.
- 14.2.1.5 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various wetland management practices.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

(Avg. Score: 2.00)

- NJ Specific Threats:** 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Actions to address the Threats and Action Drivers associated with this Conservation Target:

Marsh Birds

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.1** Enhance critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates through incentive programs with adjacent private landowners to increase the effective size of the habitat.
- 1.2.1.2** Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to increase the effective size of SGCN habitats by protecting/restoring adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats.
- 1.2.1.3** Secure and promote the protection/restoration of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through incentive programs.
- 1.2.1.6** Secure and promote the protection/restoration of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers through incentive programs.
- 1.2.1.10** Coordinate across government agencies and non-government organizations to maximize the availability of and enrollment in existing landowner incentive programs (e.g., "farm bill," partners, etc.) to maintain and/or improve habitat.
- 1.2.1.11** Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 1.2.1.12** Create incentives (non-monetary and/or monetary) for land developers to redevelop abandoned areas (e.g., shopping centers, office complexes) to minimize the loss of natural habitats and reduce the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 1.2.1.13** Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to land developers to minimize the impacts of new residential and commercial developments on SGCN and their habitats.
- 1.2.1.14** Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of herbicides and pesticides, and implementing more ecologically safe strategies when using such products.

Marsh Birds

- 1.2.1.16 Create incentives (non-monetary and/or monetary) within State regulations (mitigations requirements or credit, BMP satisfaction, etc.) to promote the use of retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.17 Develop a public-relations oriented certification program for private retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.18 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and land managers to control and reduce the impacts of invasive, native and non-native species in order to increase structural habitat diversity.
- 1.2.1.20 Coordinate across government agencies and non-government organizations to create or expand upon tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMP's.
- 1.2.1.21 Create and/or support market-based programs that subsidize or create branding for products derived sustainably from managed wildlife habitats.
- 1.2.1.23 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to provide cost shares and/or plan approvals for management based on management approaches and prescriptions.
- 1.2.1.25 Create incentives (non-monetary and/or monetary) within State regulations to assist and programs to deliver those incentives to aquaculture growers to relocate, for example, from intertidal to subtidal lease areas through buyouts of leases or microloans, and/or promoting on-lease conservation measures used by aquaculture growers (such as the implementation of conservation easements, use of living shorelines, incorporation of BMPs for habitat protection, etc.) for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity
- 1.2.1.26 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing landowner incentive programs.
- 1.2.1.27 Create legislation to re-instate incentives for citizens bringing their own shopping bag(s) to grocery stores in an effort to decrease the amount of plastic shopping bags in circulation.

2 Direct Management of Natural Resources

2.1 Create new habitat or natural processes

2.1.1 Habitat conversion

- 2.1.1.1 Create high marsh habitat through impoundments and diking of low marsh areas that are less susceptible to breaching by storms and sea-level rise.
- 2.1.1.2 Utilize dredged materials to create marsh islands to provide nesting habitat for birds and marine turtles.

2.6 Hazard or infrastructure removal

2.6.6 Shoreline armoring removal

- 2.6.6.1 Remove shoreline armoring to reduce its impacts on aquatic habitats.

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

Marsh Birds

- 2.8.0.2 Develop, implement, monitor and evaluate pest control/management strategies to reduce the impacts of over-abundant wildlife species (native and/or native, invasive species) on native vegetation and the degradation of habitats supporting SGCN. Over-abundant wildlife species include but are not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.
- 2.8.0.5 Implement biologically safe and appropriate control/management strategies, and where appropriate, eradication strategies to reduce the impacts and/or limit the distribution of invasive and/or non-native plant species within or near aquatic systems using methods that will provide the most protection to the aquatic and riparian ecological system, and minimize disturbance to the soil and wildlife. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.
- 2.8.0.6 Implement long-term management of invasive and/or non-native plants to help maintain functioning ecological systems and biological diversity, and to enhance travel corridors. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.

2.9 Living shorelines

2.9.1 Beach renourishment

- 2.9.1.1 Implement best management practices for using mined sand or dredged material to improve habitat for wildlife, particularly for spawning horseshoe crabs and migrating shorebirds.
- 2.9.1.2 Coordinate the beneficial placement of dredge materials to create, enhance, and/or maintain colonial waterbird nesting, in particular along the Intra-Coastal Waterway.

2.9.2 Erosion control structures

- 2.9.2.1 Install breakwaters in the form of living shorelines to reduce the impact of wave erosion while preserving the natural character of the site.

2.9.3 Sand dune restoration

- 2.9.3.2 Implement sand dune restoration strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimizes harm to wildlife, particularly SGCN.

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

- 2.10.0.1 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.

Marsh Birds

- 2.10.0.5 Implement habitat restoration and/or enhancement activities that include the creation of vegetative buffers between sensitive habitats (e.g., aquatic systems) and human-inhabited areas (e.g., residences, parks, etc.) and that is conducted during appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity
- 2.10.0.6 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats.
- 2.10.0.7 Restore/reclaim and enhance degraded rare species habitats through strategic revegetation and management efforts for documented/target SGCN.
- 2.10.0.9 Restore and/or enhance riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation, alteration and/or changes in hydrology and subsequent disturbances to and behavioral changes of wildlife (e.g., restoring biologically appropriate buffers, revegetation or restoration efforts, etc.).
- 2.10.0.10 Minimize the loss of important habitats (e.g., coastal scrub-shrub and grassy habitats, high and low marsh habitats, etc.) that provide nesting, migrating, and wintering areas for SGCN birds and other coastal and marsh-dependent species through habitat restoration efforts.
- 2.10.0.11 Restore and/or enhance critical migratory terrestrial and aquatic habitats (e.g., beach, grasslands, forest, scrub-shrub, etc.) for songbirds, raptors, shorebirds, waterfowl, bats and invertebrates through habitat restoration efforts and expand habitat restoration to adjacent private lands to increase the effective size of the habitat.
- 2.10.0.12 Create and/or maintain scrub-shrub habitats through revegetation efforts with little to no impact on forested, wetland and grassland habitats to maintain populations of shrub-dependent SGCN.
- 2.10.0.13 Restore and/or enhance impoundments to provide suitable foraging and nesting habitat for SGCN species inhabiting them (e.g., bitterns, rails, ducks, turtles and some invertebrates).
- 2.10.0.14 Implement best management practices (BMPs), protective strategies and guidelines for restoring and enhancing healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.10.0.17 Maintain, enhance and/or restore SGCN-inhabited/used freshwater wetlands through restoring submerged aquatic vegetation.
- 2.10.0.23 Restore and/or enhance roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.
- 2.10.0.26 Reestablish/restore historically important submerged aquatic vegetation beds in Delaware Bay tributaries to benefit SGCN waterfowl, waterbirds, terrapins, sea turtles and finfish.

2.11 Vegetation management

- 2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration
 - 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.
 - 2.11.0.2 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas for target SGCN and/or species groups; management should complement rare species needs in a targeted area.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Marsh Birds

- 2.11.0.4 Implement vegetation management strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife, particularly SGCN.
- 2.11.0.5 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats through vegetation management.
- 2.11.0.6 Reclaim degraded rare species habitats by conducting vegetation management needed to restore habitat value for the documented/target SGCN.
- 2.11.0.7 Protect significant natural and/or unique communities by implementing best management practices through vegetation management.
- 2.11.0.8 Maintain, enhance and/or restore biologically appropriate buffers for SGCN-inhabited/used freshwater wetlands through vegetation management.
- 2.11.0.9 Minimize habitat loss of critical coastal habitats that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas through vegetation management.
- 2.11.0.13 Implement best management practices (BMPs), protective strategies, and guidelines for vegetation management to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.11.0.16 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 2.11.0.20 Create and/or maintain scrub-shrub habitats through management efforts with little to no impact on forested, wetland and grassland habitats to maintain populations of shrub-dependent SGCN.
- 2.11.0.22 Minimize habitat loss of high and low marsh habitats that provide nesting, migrating and wintering areas for SGCN birds and other marsh-dependent SGCN by maintaining or enhancing these areas through habitat management and/or revegetation or restoration efforts.
- 2.11.0.23 Implement appropriate habitat management actions in areas where natural disturbances, such as wildfire, have been precluded.
- 2.11.0.30 Identify and prioritize areas where various management tools (such as increasing salinity through the management of water levels or chemical applications) may be effective in reducing phragmites within and restoring marsh habitat.
- 2.11.0.33 Increase structural habitat diversity by implementing long-term vegetation management to minimize the potential for the establishment of invasive and/or non-native plants that may outcompete native vegetation.
- 2.11.0.35 Increase structural habitat diversity by managing vegetation adjacent to aquatic habitats in a manner that provides a buffer from runoff and erosion and a microclimate to stabilize seasonal temperatures to benefit a variety of aquatic and semi-aquatic species.
- 2.11.0.36 Increase structural habitat diversity by managing vegetation for a variety of species and considering their life history requirements (e.g., travel corridors, shelter, resting and breeding areas) to minimize the risk of harm.

Marsh Birds

- 2.11.0.41 Increase structural habitat diversity through the implementation of a variety of vegetation management practices such as prescribed burns (either increasing or decreasing their frequency depending on the site and objective), plantings, etc. that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.44 Manage phragmites adjacent to coastal marshes of interest, in particular those that are within underdeveloped areas and are unprotected, through herbicide application and water management to improve resiliency of the marshes to sea level rise.

2.12 Water management

2.12.1 Ditch plugs

- 2.12.1.1 Implement best management practices (BMPs), protective strategies, and guidelines for ditch plugging to maintain and enhance healthy, resident and migratory SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

2.12.2 Diversion/headgate

- 2.12.2.1 Prevent or ameliorate near-term impacts of climate change throughout the State but in particular within the coastal and Delaware Bay areas by implementing habitat management strategies that will establish/improve habitat resilience, such as using diversions, that benefits wildlife inhabiting these areas.

2.12.3 Drainage

- 2.12.3.3 Remove tile drains and drainage ditches to improve wetland hydrology and restore natural stream flows during appropriate times to avoid sensitive periods (e.g., nesting, denning, roosting) and minimizes harm to wildlife, particularly SGCN.
- 2.12.3.4 Expand the acreages and enhance the effective size of SGCN habitats by reclaiming/restoring adjacent, degraded habitats by removing tile drains and drainage ditches.
- 2.12.3.6 Protect significant natural and/or unique communities by and when removing tile drains and drainage ditches.
- 2.12.3.7 Minimize habitat loss of critical coastal habitats that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas by removing drainage ditches.
- 2.12.3.9 Implement drain removal on state and other conservation lands to enhance food availability for migratory species (birds, bats, invertebrates).
- 2.12.3.11 Implement best management practices (BMPs), protective strategies, and guidelines when removing tile drains and drainage ditches to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

2.12.6 Tide gate

- 2.12.6.1 Prevent or ameliorate near-term impacts of climate change throughout the State but in particular within the coastal and Delaware Bay areas by implementing habitat management strategies that will establish/improve habitat resilience, such as tide gates, that benefits wildlife inhabiting these areas.

2.12.7 Waterfowl impoundment maintenance

Marsh Birds

- 2.12.7.1 Manage impoundments to benefit SGCN species inhabiting them (e.g., bitterns, rails, ducks, turtles and some invertebrates).
- 2.12.7.2 Use impoundment management to create feeding and roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.
- 2.12.7.3 Implement best management practices (BMPs), protective strategies, and guidelines for impoundment management to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.12.7.4 Implement impoundment management strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimizes harm to wildlife, particularly SGCN.
- 2.12.7.5 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats through impoundment management.
- 2.12.7.6 Reclaim degraded rare species habitats through impoundment management needed to restore habitat value for the documented/target SGCN.
- 2.12.7.7 Protect significant natural and/or unique communities by implementing best management practices for impoundment management.
- 2.12.7.8 Repair impoundments damaged by salt hay farm/dike abandonment and conduct restoration of degraded sites for targeted SGCN species and their habitats.
- 2.12.7.9 Minimize habitat loss of critical coastal habitats in Delaware Bay that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas through impoundment management.
- 2.12.7.11 Restore existing salt hay farm areas by repairing breaches in impoundments to create habitat for high marsh nesting species and waterfowl.
- 2.12.7.14 Prevent or ameliorate near-term impacts of climate change throughout the State but in particular within the coastal and Delaware Bay areas by implementing habitat management strategies that will establish/improve habitat resilience, such as impoundment management, that benefits wildlife inhabiting these areas.
- 2.12.7.15 Implement impoundment management on state and other conservation lands to enhance food availability for migratory species (birds, bats, invertebrates).

2.12.8 Watering facilities

- 2.12.8.1 Install water control structures to reduce the impact of excessive salt water flooding to particularly vulnerable high marsh habitats.
- 2.12.8.2 Manage water levels in impoundments to improve coastal marsh habitat availability to wildlife and improve resiliency of the marshes to sea level rise.

2.13 Wildlife damage management

2.13.0 Nuisance fish and wildlife damage

- 2.13.0.3 Investigate alternative saltmarsh mosquito control methods that may produce benefits for coastal marsh dependent SGCN wildlife, including but not limited to high-marsh nesting birds and migrating shorebirds and landbirds.

Marsh Birds

- 2.13.0.5 Investigate the impacts of human-subsidized and/or naturally occurring predator species on SGCN to assess the need for integrated wildlife damage management techniques (e.g., predator exclosures, fish blockages, electric fence, culls) and/or policy changes on state land management that minimize the impacts of human-subsidized predators.
- 2.13.0.8 Implement and assess management strategies to control and reduce the impacts of detrimental species and diseases that pose threats to native wildlife or communities.

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

- 3.0.0.1 Conduct long-term monitoring of resident and migratory SGCN populations using standardized survey protocols to determine the variables that may impact their long-term persistence in the State (e.g., population viability, distribution, dispersal, home range and habitat use, travel corridors, food availability, vulnerability to pollutants and disease, etc.). Compile this information to determine the likely causes of population declines and to understand metapopulation dynamics. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.2 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) where data gaps exist regarding SGCN distribution, and their critical and supportive habitats. Conduct surveys using standardized survey protocols to acquire baseline data, and provide the data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
- 3.0.0.3 Gather baseline data on SGCN inhabiting permanently protected natural lands regarding their distribution and population (e.g., abundance, dispersal, demography including productivity and survival, etc.), and identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) critical and supporting habitats within those landscapes.
- 3.0.0.4 Conduct long-term studies on SGCN inhabiting permanently protected natural lands to develop population trend data and changes in demography, and to determine if critical and/or supporting habitats are limited or changing; i.e., diminishing in value, acreage or connectivity.
- 3.0.0.5 Gather baseline data on resident and migratory SGCN (in particular migratory species for which New Jersey habitats are significant), terrestrial, freshwater and marine species, regarding the location and condition of their critical and supporting habitats (e.g., foraging, roosting, nesting/breeding, stopover, migration paths, etc.), and population demography (e.g., productivity, survival, dispersal). Compile this information into a database that includes descriptions of the conditions of the habitats and species, and a GIS component of the locations of these important habitats. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.6 Conduct long-term studies on resident and migratory SGCN to determine if there are changes to the populations' demography (productivity, survival, dispersal) and/or to their critical and/or supporting habitats (i.e., diminishing in value, acreage or connectivity, etc.), in particular changes that would not maintain SGCN at viable levels for species populations. Update data and GIS maps; provide updated information to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.7 Collect baseline data to document species distributions, in particular SGCN, and current habitat for future analysis of possible distribution shifting as a result of habitat shifting or alteration associated with climate change impacts.

Marsh Birds

- 3.0.0.8 Conduct long-term studies and compare baseline metrics of documented species distributions and associated habitats to identify possible species and/or habitat shifting or alteration associated with climate change impacts.
- 3.0.0.9 Identify SGCN (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources, and compile/collect and evaluate data/information regarding potential management strategies to improve the availability of such SGCN's food resources.
- 3.0.0.10 Conduct long-term studies to evaluate the effectiveness of management strategies implemented to enhance food/prey availability for SGCN [whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources] through studies that investigate the populations and health of the food resources as well as the target SGCN. Revise management strategies as needed and continue to monitor the effectiveness of the efforts.
- 3.0.0.11 Develop, implement and evaluate the effectiveness of town plans that avoid impacts to SGCN species and their habitats.
- 3.0.0.14 Identify areas with invasive, aquatic plants and animals and collect a detailed baseline assessment of the species' status and distribution. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort. Researchers and contractors performing Forest Stewardship Inventories and/or Plans on state lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.0.0.15 Conduct long-term monitoring of areas identified as having invasive, aquatic plants and animals to track the species' status/progress over time with or without the implementation of management strategies. Areas without management strategies should be assessed and prioritized for management/control. Areas where management strategies are being implemented should include an assessment of the management effort and identify/recommend and implement necessary changes to improve its success. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort.
- 3.0.0.16 Develop a baseline status (through studies and assessments, review of available data, enlistment of species experts, etc.) of marsh- and beach-dependent SGCN (and their habitats) whose populations may be impaired due to habitat degradation as a result of salt hay farm/dike abandonment.
- 3.0.0.17 Conduct long-term monitoring of marsh- and beach-dependent SGCN (and their habitats) to evaluate the effectiveness of the management strategies implemented to repair degraded marshes and beaches damaged by salt hay farm/dike abandonment within all bay shore areas.
- 3.0.0.21 Conduct long-term monitoring to determine the impacts of the fish and shellfish aquaculture industries on focal and non-focal SGCN and their habitats (i.e., NJ bays, estuaries, ocean areas). Assess the success of management actions implemented to minimize these impacts and make specific recommendations to the NJ DEP regarding how such management efforts may be improved to minimize harm to wildlife and their habitats.
- 3.0.0.25 Identify pathways of migratory SGCN in the Atlantic Coastal and Marine Regions (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and use the data to help evaluate the potential short- and long-term impacts of wind turbines, radio towers, utility guy lines, and other tall coastal structures on migratory populations.

Marsh Birds

- 3.0.0.28 Evaluate best management practices for using mined sand or dredged material to improve habitat for wildlife, particularly for spawning horseshoe crabs and migrating shorebirds.
- 3.0.0.30 Conduct research to investigate the feasibility of managing and/or creating roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.
- 3.0.0.31 Conduct short- and long-term studies (e.g., wildlife surveys and habitat assessments) to evaluate the effectiveness of vegetation management efforts to maintain, enhance and/or create roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.1 Division of Fish and Wildlife should maintain a robust, up-to-date database and mapping of species occurrences.
- 3.2.0.2 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
- 3.2.0.5 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 3.2.0.8 Implement and conduct long-term monitoring of control measures aimed at minimizing the impacts of problematic species and/or diseases to evaluate the effectiveness of such efforts and to identify and incorporate additional strategies as appropriate.
- 3.2.0.17 Conduct monitoring at constructed wind farms (within or outside of NJ) to assess the impacts on migratory species (birds, bats, insects) and determine if NJ's land use planning efforts and/or smart-growth plans need to be revised.
- 3.2.0.19 Develop, implement and evaluate aquaculture practices in coastal areas that are compatible with the recovery of SGCNs and industry needs.
- 3.2.0.20 Evaluate the effectiveness of BMPs for mosquito control methods that may produce benefits for coastal marsh dependent SGCN wildlife, including but not limited to high-marsh nesting birds and migrating shorebirds and landbirds.
- 3.2.0.24 Develop, implement and evaluate the effectiveness of BMPs for lighting of/on tall structures that minimize harm to and/or disorient wildlife, in particular but not limited to migratory birds, bats and invertebrates. Implement BMPs into state, county and local permitting processes.

3.2.1 Abundance determination

- 3.2.1.1 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) population abundance and trends for SGCN using standardized survey protocols. Provide data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
- 3.2.1.2 Conduct wildlife surveys on resident and migratory SGCN regarding their population abundance and trends.

3.2.2 Age, size and sex structure

- 3.2.2.1 Conduct wildlife surveys on resident and migratory SGCN regarding their survivorship.

Marsh Birds

3.2.3 Baseline inventory

- 3.2.3.2** Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) suitable areas for marine conservation zone designation and promote policies and regulations that support the designation of such areas.

3.2.7 Population assessment

- 3.2.7.1** Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
- 3.2.7.2** Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species to meet and maintain recovery goals.

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

- 3.3.1.1** Conduct habitat assessments of significant natural and/or unique communities to identify threats to native terrestrial and aquatic habitats through systematic monitoring, review of available data, enlistment of habitat management and/or species experts, etc. Incorporate findings into a database that includes descriptions/qualifiers of the habitats, identifies and values/qualifies the threats, and includes a GIS component of the locations of the assessed areas. Share this information with landowners/managers (e.g., federal, state and local government agencies or non-government organization).
- 3.3.1.2** Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) resident and migratory SGCN habitats. Investigate their suitability for the various life history requirements of the species that dependent upon them to determine the ability for maintaining applicable SGCN populations in perpetuity.
- 3.3.1.3** Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) remaining high and low marsh habitats with natural buffers and stable water levels that provide suitable habitat for SGCN and marsh habitats that would benefit from restoration. Conduct research to assess their condition for nesting, migrating and wintering birds.
- 3.3.1.5** Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) where habitat restoration and/or enhancement would benefit wildlife SGCN.
- 3.3.1.11** Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and investigate the quality and importance of areas with submerged aquatic vegetation to benefit waterfowl, finfish, and shellfish species.
- 3.3.1.14** Compile information (obtained through literature reviews, communication with other States along the Atlantic coast, academia, etc.) regarding the impacts of above water operation of wind turbines on migratory marine birds and bats. Provide data to appropriate governing agencies and/or State commissions for integration into permitting review processes.
- 3.3.1.16** Gather "best information" for spatial modeling and update/create a current model/depiction of anticipated habitat shifts from sea-level rise, flooding, etc.
- 3.3.1.18** Conduct an assessment using available data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels.
- 3.3.1.19** Identify and codify legal ORV access areas on state (and if appropriate, other conserved) lands. Provide GIS mapping to the landowner for potential use in directing such recreational activities.

Marsh Birds

- 3.3.1.20 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) where invasive, non-indigenous plants and animals are either already established or are becoming established. Create a system for reporting and qualifying new locations of invasive species and for prioritizing areas for control measures according to the potential level of impact on the ecosystem and SGCN and the likelihood of success. Researchers and contractors encountering invasive plant species while performing plant and/or forest inventories on state or other conserved lands and/or private lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.3.1.21 Conduct comprehensive baseline surveys of all marsh islands; surveys to include, but are not limited to, documented elevations, and assessments of the habitat's current condition and vulnerability of dependent SGCN species in relation to the increased inundation rate.
- 3.3.1.22 Identify, assess and prioritize marsh habitats for restoration where various management tools (such as increasing salinity through the management of water levels or chemical applications) may be effective in reducing the presence of phragmites.
- 3.3.1.23 Identify areas (through surveys/studies, predictive modeling, review of available data, enlistment of habitat management and/or species experts, etc.) where the State can allow coastal marsh migration due to sea level rise, and target these areas for land acquisition and/or land management to accommodate this transition. Targeted areas should include underdeveloped areas adjacent to unprotected coastal marshes.
- 3.3.1.24 Conduct regular investigations of SGCN habitat health and biodiversity on public and private lands to identify locations in need of revegetation, reduction of over-abundant, native wildlife and/or exotic species, conservation focal areas requiring limitations on human activity, etc.
- 3.3.1.28 Identify key habitats for the potential allowance of natural coastal processes without interfering through shoreline stabilization, etc. and evaluate the risks and benefits if coastal migration was permitted to occur naturally. Create a GIS map of the identified areas; provide the assessment and mapping to local towns and other appropriate governing agencies.
- 3.3.1.29 Identify coastal wildlife habitats unimpacted by development and/or at greatest risk of habitat loss to help guide enlightened coastal stabilization efforts (i.e., use of soft stabilization) to reduce the impacts on wildlife and their habitats.

3.3.2 Monitoring

- 3.3.2.2 Conduct long-term monitoring of resident and migratory SGCN habitats using standardized survey protocols to determine changes in habitat quality/suitability and threats (e.g., habitat loss and degradation, increased edge habitat, water quality) and other variables that may impact their long-term persistence in the State and to provide information needed for determining causes of population declines and understanding metapopulation dynamics.
- 3.3.2.3 Continue to update wildlife and habitat databases and revise models of critical SGCN habitats using the most current data available and where lacking, develop new SGCN and/or habitat models as data on species habitat requirements and applicable GIS data layers become available.
- 3.3.2.6 Investigate the effectiveness and potential impacts of marsh management techniques by studying the effects of Open Marsh Water Management on wildlife species, in particular high marsh nesting birds and waterfowl. Evaluate best management practices as appropriate.
- 3.3.2.7 Conduct studies on land use practices such as ditching, impounding, dredging, open marsh water management, burning, and marsh restoration to evaluate the effectiveness and potential impacts on marsh-dependent SGCN.

Marsh Birds

- 3.3.2.10 Evaluate the efficacy and success of different management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.3.2.15 Investigate the effectiveness of management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.3.2.16 Evaluate the effectiveness of best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 3.3.2.19 Once baseline data on the marsh islands' and associated SGCN species' vulnerability to inundation is completed, continue to conduct long-term monitoring the islands to determine sustainability for wildlife dependent on these areas.
- 3.3.2.20 Once a system is developed for reporting and qualifying new locations of invasive species, develop, implement and monitor/evaluate invasive species removal strategies at identified locations. Priority should be given to those areas critical to SGCN and/or contain unique and/or rare plant communities supporting SGCN and/or other fish/wildlife species.
- 3.3.2.21 Develop, implement and evaluate the effectiveness of management strategies use to restore marsh habitat (e.g., phragmites reduction).

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.1 Work with land management agencies to determine the appropriate actions needed to restore/reclaim degraded habitat for the documented/target SGCN.
- 3.5.3.2 Develop management strategies to improve the availability of prey/food resources for SGCN whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources. Monitor and investigate the management strategies over time to determine success and/or the need to revise methods.
- 3.5.3.4 Modify best management practices of Open Marsh Water Management based on evaluation of the effectiveness and potential impacts of marsh management techniques on wildlife species, in particular high marsh nesting birds and waterfowl.
- 3.5.3.5 Develop best management practices for using mined sand or dredged material to improve habitat for wildlife, particularly for spawning horseshoe crabs and migrating shorebirds.
- 3.5.3.6 Develop/improve management strategies to repair marshes and associated beaches damaged by salt hay farm/dike abandonment for all bay shore areas currently degraded.
- 3.5.3.8 Develop best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 3.5.3.11 Develop strategies to protect native terrestrial and aquatic habitats and dependent SGCN species from the identified threats.
- 3.5.3.13 Developing engineering standards that embrace both shore protection/resiliency and habitat creation for shorebirds, horseshoe crabs and other coastal species along the Atlantic and Delaware Bay coasts.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Marsh Birds

- 3.5.3.14 Develop aquaculture practices in the coastal areas that are compatible with the recovery of SGCN.
- 3.5.3.16 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.
- 3.5.3.17 Investigate and improve marsh management techniques to benefit critical wildlife species, in particular high marsh nesting birds and waterfowl.
- 3.5.3.18 Develop recommendations to improve methods on land use practices such as ditching, impounding, dredging, open marsh water management, burning, and marsh restoration based on potential impacts on marsh-dependent SGCN.
- 3.5.3.21 Develop management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.24 Based on research, modify management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.5.3.25 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to develop the necessary management strategies to reach or maintain viable population levels.
- 3.5.4 Fish and wildlife research, survey and management techniques
 - 3.5.4.1 Develop studies to evaluate management strategies to improve the availability of prey/food resources for SGCN whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources. Monitor and investigate the management strategies over time to determine success and/or the need to revise methods.
 - 3.5.4.3 Investigate alternative saltmarsh mosquito control methods that may produce benefits for coastal marsh dependent SGCN wildlife, including but not limited to high-marsh nesting birds and migrating shorebirds and landbirds.
 - 3.5.4.10 Develop BMPs for lighting of/on tall structures that minimize harm to and/or disorientation of wildlife, in particular but not limited to migratory birds, bats and invertebrates.
 - 3.5.4.13 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.
 - 3.5.4.14 Develop and implement agreements, and update existing agreements, with government agencies regarding the protection of critical SGCN habitats (e.g., significant breeding populations of beach nesting birds, colonial waterbird nesting areas, bat colonies, etc.).

Marsh Birds

- 3.5.4.15 Investigate the success of management strategies used to protect and/or enhance SGCN populations and when appropriate, aid in identifying failures/resource problems and issues, and developing new strategies.
- 3.5.4.16 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels and develop the necessary management strategies.
- 3.5.4.17 Investigate new, non-invasive techniques for SGCN population evaluation through literature review, expert opinion, trial studies (if low risk), etc.
- 3.5.4.18 Investigate the effectiveness of survey techniques through selected “ground truthing” and literature and peer review in order to increase efficacy of survey, minimize surveyor bias and error, and increase accuracy of trend data.

4 Education

4.1 Educator/Instructor training

4.1.1 Aquatic resource education

- 4.1.1.1 Provide educational resources and training programs to teachers in aquatic resource education that includes information regarding climate change and sea-level rise for incorporation into the class curriculum and/or as the focus of school field trips.
- 4.1.1.2 Provide educational resources and training programs to teachers in aquatic resource education that includes information regarding how coastal stabilization negatively impacts wildlife by preventing natural processes for incorporation into the class curriculum and/or as the focus of school field trips.

5 Facilities and Areas

5.15 Wildlife Management Areas

5.15.6 Roads

- 5.15.6.1 Clearly post areas/roads where vehicle access is permitted.
- 5.15.6.2 Clearly post areas/trails where vehicle access is not permitted.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

- 6.0.0.1 Enhance and increase the effective size of critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates by securing adjacent habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.3 Secure and protect riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through an appropriate combination of fee title, non-fee title and landowner agreements.

Marsh Birds

6.0.0.5 Secure and protect critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

6.0.0.8 Secure and protect scrub-shrub habitats for SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

6.1 Land acquisition

6.1.1 Fee title

6.1.1.1 Use state, federal, and local land acquisition programs (e.g., Green Acres, Blue Acres, etc.) to acquire abandoned or failing bay shore communities and to relocate displaced people and infrastructure.

6.3 Conservation area designation

6.3.0 Conservation area designation strategies

6.3.0.1 Promote the protection of critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates and enhance these lands by increasing the effective size through conservation area designations of stopover habitats and adjacent private lands.

6.3.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN and/or connect conserved SGCN habitats through conservation area designations.

6.3.0.3 Increase the protection of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through conservation area designations.

6.3.0.5 Promote the protection of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through conservation area designations.

6.3.0.8 Promote the protection of scrub-shrub habitats for SGCN through conservation area designations.

6.3.0.9 Promote the protection of critical marine habitats for SGCN through conservation area designations.

7 Law Enforcement

7.1 Law enforcement

7.1.2 National Level

7.1.2.1 Enforce regulations to protect nesting bird colonies from human disturbance.

7.1.3 Sub-national Level

7.1.3.1 Enforce slow wake zones and marine conservation area regulations to protect aquatic vegetation.

7.1.3.2 Increase the number of law enforcement officers tending to wildlife issues to a reasonable number to sufficiently cover the State and marine waters.

7.1.4 Scale Unspecified

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Marsh Birds

- 7.1.4.1 Improve enforcement of policies and/or regulations that promote the reduction of run-off and point and non-point source pollution into NJ's aquatic systems (streams, rivers, lakes/ponds, bays, ocean, wetlands, etc.).
- 7.1.4.2 Restrict human activity from staging areas for red knots and other migratory shorebirds through increasing law enforcement presence.
- 7.1.4.3 Increase law enforcement presence proximate to sensitive areas [e.g., avian nesting sites, in particular rookeries, and reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively)] to deter human activity and subsequent disturbance to SGCN.
- 7.1.4.4 Improve enforcement of policies/regulations aimed at protecting and preserving critical coastal and marsh habitats, and secure mitigation for losses that create an environmental benefit.
- 7.1.4.5 Enforce current policies and/or regulations to increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal SGCN, and implement and enforce amended policies/regulations.
- 7.1.4.6 Recruit law enforcement to assist in the protection and enhancement of SGCN populations, in particular endangered species, through improved awareness of species through trainings, partnerships, and other methods. Information should include but is not limited to: 1) Issues concerning illegal collection of reptiles, 2) Persecution of rare snakes, 3) Illegal recreational activities on public lands (e.g., off-road vehicles) and their impact on wildlife, 4) Identification of sensitive areas, critical sites and/or "hot-spots" for collection.
- 7.1.4.7 Increase law enforcement presence to enforce regulations governing recreational activities (e.g., the use of personal watercraft and off road vehicles, caving, rock climbing, etc.) on conserved lands and within other sensitive habitats, and discourage activities that cause harm or disturbance to vegetation, wetlands, fish and wildlife.
- 7.1.4.8 Implement policies that protect critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates.
- 7.1.4.9 Implement policies that improve and secure habitat connections between conserved SGCN habitats.
- 7.1.4.10 Implement policies that promotes expanding acreages and enhances the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 7.1.4.11 Implement and enforce policies/regulations that will increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.
- 7.1.4.12 Implement policies and/or regulations that protect significant natural and/or unique communities in perpetuity.
- 7.1.4.16 Implement policies that protect and restore riparian areas.
- 7.1.4.17 Improve the enforcement of policies and/or regulations that protect wetlands, riparian and floodplain areas, and aquatic habitats (including open waters).
- 7.1.4.18 Increase law enforcement presence at important nesting areas on marsh islands to increase the likelihood of boat users acting in a manner that reduces disturbance to birds.
- 7.1.4.19 Implement policies that protect and restore scrub-shrub habitats to benefit shrub-dependent SGCN.

Marsh Birds

- 7.1.4.21 Implement regulations for lighting of/on tall structures that will minimize harm to and/or disorientation of wildlife, and enforce within state, county and local permitting processes.
- 7.1.4.22 Implement policies and/or regulations that prohibit the presence of managed cat colonies and trap, neuter and release programs in or near critical wildlife habitats.
- 7.1.4.25 Encourage the enforcement of municipal laws regulating domestic pets that may predate on wildlife.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.2 Develop a team of personnel from government entities, conservation organizations and other stakeholders engaged in oil/gas spill response for marine and freshwater habitats to develop a feasible plan for oil spill response and/or to amend NJ's current oil spill response plan that clearly outlines each organizations responsibilities and an assessment and location list of available equipment for boom deployment during oil spills.
- 8.1.0.3 Develop an outreach team of personnel from government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 8.1.0.4 Engage government agencies, conservation partners and other stakeholders in constructive dialogues encouraging them to influence policy change and the creation of incentives through a habitat bill and/or municipal ordinances for backyard habitat.
- 8.1.0.6 Engage government agencies, conservation partners and other stakeholders in discussions focused on sharing information regarding coastal and marine critical wildlife habitats, developing comprehensive mapping to assist in reducing impacts of energy production activities, and establishing a long-term monitoring program to update the data. Ensure this information is available to appropriate personnel for planning or response measures.
- 8.1.0.7 Engage government agencies, conservation partners and other stakeholders to collaboratively develop and implement an extensive educational/outreach program targeting coastal boating and recreation communities about eelgrass/widgeongrass, their impacts on marine environments, and the value, fragility and location of submerged aquatic vegetation beds and habitats.
- 8.1.0.16 Engage local governments in discussions regarding the importance of them adopting/passing ordinances which require assessing and addressing secondary impacts (i.e., ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 8.1.0.19 Engage government agencies, conservation partners and other stakeholders to collaboratively develop a list of important projects, targeting SGCN and/or their habitat, as a guide for graduate student research. Distribute the list and contact information to all State colleges and universities.
- 8.1.0.21 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation human-subsidized and/or overabundant, native species cause to local nesting species, and provide expert guidance on how residents can help alleviate this threat.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Marsh Birds

- 8.1.0.22 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation invasive species cause to native nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.24 Engage government agencies, conservation partners and other stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.25 Provide technical support to public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.30 Encourage government agencies and conservation partners to advise members of the relevant scientific community of the need for specific studies, reports or investigations targeting the data-deficiency regarding SGCN and/or their habitats.
- 8.1.0.33 Engage government agencies, conservation partners and other land managers, communities, landowners, and commercial and industrial stakeholders in discussions regarding the importance of protecting and methods to protect priority wetlands beyond the levels afforded through regulation by maintaining and/or restoring optimal biological buffers around wetlands.
- 8.1.0.34 Work with the NJ Education Association and Department of Education to design curriculum and outdoor experimental learning opportunities, and provide training to teachers on implementation of these activities.
- 8.1.0.37 Enlist landowners and NJ citizens in the protection of and survey efforts for SGCN, in particular rare species, by increasing enrollment in landowner incentives, forest stewardship, backyard habitat management and wildlife-related volunteer programs.
- 8.1.0.39 Deploy stewards at active nesting areas to work with and educate the public on how to reduce disturbance to birds.
- 8.1.0.40 Encourage researchers, land managers, naturalists and enthusiasts to follow proper procedures for the coordination and/or permitting of research/management activities involving wildlife and sensitive habitats, and discourage activities that alter vegetation or wetlands, or cause harm or disturbance to wildlife.
- 8.1.0.42 Engage citizens, wildlife observers and photographers through discussions and distributable information regarding the importance of and encouraging implementing responsible and ethical behavior when observing wildlife by developing an alliance of wildlife photographers and widely circulating recommendations on how to reduce impact.
- 8.1.0.46 Form cooperative partnerships with dredging companies to facilitate habitat creation and enhancement within project areas, and to identify seasonal timing of activities that would minimize impacts to wildlife and their habitats.
- 8.1.0.47 Form cooperative partnerships with energy companies to facilitate habitat creation and enhancement away from and outside of project areas, the restoration of appropriate habitats within project areas (e.g., rights-of-way could benefit butterflies and some bird species), and to identify seasonal timing of activities that would minimize impacts to wildlife.
- 8.1.0.48 Form cooperative partnerships with transportation and shipment agencies and companies to facilitate habitat creation and enhancement away from and outside of project areas and to identify seasonal timing of activities that would minimize impacts to wildlife.

8.2 Recruitment and retention activities

8.2.3 For wildlife watching

Marsh Birds

- 8.2.3.1 Develop and implement nature-focused tourism opportunities including wildlife viewing sites, interpretive signage highlighting unique ecosystems/habitats, and wildlife-related recreational opportunities that do not negatively impact SGCN or their habitats.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.6 Develop and provide (or otherwise make publicly available) educational programs and/or materials to enlist landowners, land managers and local communities to discourage the presence of managed cat colonies and trap, neuter and release programs in wildlife habitats.
- 8.3.0.7 Develop and provide (or otherwise make publicly available) educational programs and/or materials that describe the negative impacts of off-road vehicles and watercraft use in and adjacent to critical SGCN habitats, and the importance of confining such activities to more appropriate locations and/or seasons.
- 8.3.0.8 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate recreationists and encourage landowners to eliminate garbage in the vicinity of suitable wildlife habitat, in particular SGCN habitat. Information should include the detrimental impacts garbage may have on various wildlife species.
- 8.3.0.9 Develop and provide (or otherwise make publicly available) educational programs and/or materials to enlist landowners and land managers to include only native plants in landscaping and restoration projects. Provide information to assist them in detecting problematic establishment of invasive, non-indigenous plants.
- 8.3.0.10 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate landowners and NJ citizens on threats to fish and wildlife (including marine animals).
- 8.3.0.12 Promote awareness of WSFR (Wildlife and Sportfish Restoration) Outreach/Awareness grants, an important funding source for conservation among hunters and anglers as well as the general public.
- 8.3.0.13 Conduct an educational campaign to encourage observer ethics and respect for wildlife and natural habitat.
- 8.3.0.15 Develop an educational outreach program for citizens regarding: 1) The impacts to wildlife as a result of plastic bags entering aquatic and marine systems, 2) The importance of decreasing the amount of plastic shopping bags in circulation, 3) The need for businesses to voluntarily charge for bags or reimburse people for using their own non-plastic bags, and 4) The need for their assistance through public pressure on legislators and government to pass legislation that limits the amount of plastic shopping bags in circulation.
- 8.3.0.19 Develop an educational outreach program for the public on the devastating effects predators can have on native nesting wildlife.
- 8.3.0.21 Develop an educational outreach program for the general public, in particular those within and adjacent to coastal and riparian areas on the realities of sea-level rise to help citizens living in these areas understand how this will affect them, how coastal stabilization negatively impacts wildlife by preventing natural processes, and how their decisions impact species.
- 8.3.0.22 Post signage in sensitive coastal habitats (e.g., bird and Diamondback Terrapin nesting areas) to educate the boating community on responsible use of these areas.
- 8.3.0.23 Develop an educational outreach program for coastal municipalities and residents to promote an understanding of the benefits of soft structures over hard structures for shoreline stabilization.

Marsh Birds

- 8.3.0.25 Develop educational outreach programs for landowners, nurseries and the general public regarding the negative impacts of invasive and non-native plants on our natural communities.
- 8.3.0.27 Develop educational outreach programs for public and private landowners and land managers regarding the importance of structural habitat diversity, methods to increase diversity, and/or incentive programs available to increase habitat diversity.
- 8.3.0.32 Develop an educational outreach program for landowners and citizens on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

- 9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and SGCN inhabiting them.
- 9.1.0.2 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.1.0.3 Develop a plan that directs the creation of impervious surfaces away from and to minimize impacts on aquatic systems and critical terrestrial habitats. The plan should also include strategies to increase the resiliency of aquatic and critical terrestrial habitats to threats and stressors that would impact the reproduction and survival of wildlife.
- 9.1.0.8 Develop a plan that focuses on strategies for oil pipelines to avoid sensitive habitats that would be highly impacted by oil spills.
- 9.1.0.12 Develop a plan to avoid freshwater tidal management.
- 9.1.0.15 Develop a plan to minimize fragmentation of terrestrial and aquatic habitats by roads.
- 9.1.0.18 Develop a plan to minimize the effects of road widening and traffic volume increases within critical wildlife habitat areas using CHANJ products.
- 9.1.0.19 Develop a plan to minimize the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 9.1.0.22 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 9.1.0.26 Develop a plan to minimize any adverse impacts of aquaculture farming techniques and structures on freshwater and intertidal habitats.
- 9.1.0.29 Provide GIS or related data, maps, resource inventories, as well as related training, pertaining to the SWAP and it's recommended conservation actions for use or consideration by State, County or municipal planning agencies.
- 9.1.0.30 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and other related threats associated with development.
- 9.1.0.31 Develop wetland restoration plans that consider the life history and needs of wildlife occupying targeted habitats.
- 9.1.0.33 Review the species, threats, action successes, and habitats, and work with partners to revise the 2017 State Wildlife Action Plan for the 2025 resubmittal.

9.2 Organizational strategic and CMS planning

Marsh Birds

9.2.1 Organizational strategic and operational planning

9.2.1.1 Identify and codify legal ORV access areas on state lands.

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.2 Develop a management plan to improve the availability of prey/food resources for SGCN whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources.

9.3.1.3 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.

9.3.1.4 Develop town plans that avoid impacts to SGCN species and their habitats.

9.3.1.6 Amend NJ's current oil spill response plan to 1) expand the geographic area addressed, 2) expand the targeted species impacted and in need of recovery, and 3) revise current and integrate new actions into the plan as needed.

9.3.1.13 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.

9.3.1.15 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.

9.3.1.17 Evaluate the potential benefits to high marsh species (such as Black Rail and Northern Harrier) by restoring salt hay farms along Delaware Bay.

9.3.2 Listed species recovery planning

9.3.2.1 Develop proactive species recovery plans for all endangered and threatened species including guidance and objectives pertaining to critical and supporting habitat to meet and maintain recovery goals.

9.3.3 Habitat management planning

9.3.3.1 Develop a management plan to improve the availability of prey/food resources for SGCN whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources.

9.3.3.2 Develop a management plan for using mined sand or dredged material to improve habitat for wildlife, particularly for spawning horseshoe crabs and migrating shorebirds.

9.3.3.4 Create habitat restoration plans to repair marshes and associated beaches damaged by salt hay farm/dike abandonment for all bay shore areas currently degraded.

9.3.3.10 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.

9.3.3.11 Develop town plans that avoid impacts to SGCN species and their habitats.

9.3.3.12 Develop a management plan using engineering standards that embrace both shore protection/resiliency and habitat creation for shorebirds, horseshoe crabs and other coastal species along the Atlantic and Delaware Bay coasts.

9.3.3.13 Develop a management plan that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas and prevents or ameliorates near-term impacts of climate change throughout the State, but in particular within the coastal and Delaware Bay areas.

Marsh Birds

- 9.3.3.16 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.3.18 In cooperation with species and habitat experts, develop management plans for significant natural and/or unique communities, in particular those supporting SGCN, and provide the information to the landowners/managers (federal, state and local government agencies or non-government organization) for review and implementation.
- 9.3.3.19 Develop management plans for SGCN inhabiting permanently protected natural lands using available baseline and population trend data.
- 9.3.3.20 Develop an action plan for immediate implementation should habitat levels fall below the minimum necessary size and/or structure within the Cape May Peninsula to sustain the avian migration.
- 9.3.3.24 Develop a plan to improve the enforcement of policies and/or regulations that protect wetlands, riparian and floodplain areas, and aquatic habitats (including open waters).
- 9.3.3.25 Develop a habitat management plan focused on areas important to near-shore, coastal species (e.g., herring, sturgeon, terrapin, nesting birds) that prioritizes these areas to direct resources to minimize the impacts of sea-level rise, flooding and storms (including extreme rain events) such as increased erosion of beach, mudflat and marsh habitats, and the increased risk of saltwater intrusion into freshwater habitats. Gather "best information" for spatial modeling of anticipated habitat shifts from sea-level rise, flooding, etc.
- 9.3.3.28 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.
- 9.3.3.29 Develop habitat management plans aimed at reducing or eliminating negative impacts of ORVs.
- 9.3.3.31 Using data from baseline inventory and monitoring of all current marsh islands and their vulnerability to inundation as a result of sea level rise, create a plan to delineate each island's ideal fit for habitat management (e.g., restoration, hasting, dredging). Planning will factor in criteria to designate which islands should be maintained or restored, and which will be passively allowed to submerge.
- 9.3.3.33 Evaluate the potential benefits to increasing high marsh habitat by restoring salt hay farms along Delaware Bay.
- 9.3.3.35 Incorporate habitat connectivity, preservation of natural areas, and the implementation of BMPs into state and local land-use policy environmental review process and energy development plans to minimize habitat fragmentation and related threats associated with solar farms and altered habitats.
- 9.3.3.36 Integrate plans for properly located and timed habitat restoration and management along transportation, energy and service corridors to minimize risks to and benefit wildlife.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

- 11.1.1.1 Use Biotics database and Landscape Project Mapping in regulatory reviews to ensure protection by applicable laws and regulations.

Marsh Birds

- 11.1.1.2 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
- 11.1.1.3 Government organizations to thoroughly review wetland restoration plans, applying the most current science for wildlife, habitats and aquatic systems, to assess the impacts to resident and migratory wildlife occupying the targeted habitats.
- 11.1.1.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.
- 11.1.1.5 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 11.1.1.6 Review all projects to be conducted in or adjacent to coastal wetlands and marshes, and provide recommendations on how to best avoid or reduce human disturbance at nesting areas (for example, timing restrictions) and actions not permitted.
- 11.1.1.7 Review proposed construction or other work projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.8 Review proposed research projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.9 Review strategies for creating or enhancing connectivity (e.g., installing appropriately-sized wildlife passages) between wetlands to allow wildlife to disperse naturally and safely.
- 11.1.1.12 Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed solar farm projects to reduce habitat fragmentation and minimize impacts on wildlife.
- 11.1.1.13 Use the best available science (species data, habitat present, wind farm layout options, wind blade impacts on migratory species, location of migration routes, etc.) when conducting regulatory reviews of proposed wind farm projects to minimize impacts on migratory and resident wildlife and reduce habitat fragmentation.

11.1.2 Review of proposed policies and plans

- 11.1.2.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
- 11.1.2.2 Government organizations to thoroughly review wetland restoration plans, applying the most current science for wildlife, habitats and aquatic systems, to assess the impacts to resident and migratory wildlife occupying the targeted habitats.
- 11.1.2.4 Review strategies for creating or enhancing connectivity (e.g., installing appropriately-sized wildlife passages) between wetlands to allow wildlife to disperse naturally and safely.

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

- 11.2.0.1 Provide technical support to private and public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 11.2.0.2 Provide technical support to public and private landowners and land managers for controlling invasive, native and non-native plant species in order to increase structural habitat diversity.

Marsh Birds

- 11.2.0.3 Develop state, regional and local BMPs that focus on minimizing habitat fragmentation and human-wildlife conflicts associated with development. Make information available to land developers and private and public landowners for implementation.
- 11.2.0.6 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on habitat creation, enhancement and restoration within and adjacent to project areas, as well as away from and outside of project areas (depending on the target species), by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. Wind farms should address both terrestrial bound and low-flying species. Examples of habitat management include, but are not limited to, integrating short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 11.2.0.8 Provide educational resources, training programs, and on-the-ground guidance to public and private landowners and land managers on habitat creation and enhancement strategies that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 11.2.0.9 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and private landowners about the importance of leaving vegetation in place, especially along riparian areas and wildlife movement corridors.
- 11.2.0.10 Provide technical support to private landowners, consultants, and land managers to create customized management plans based on location and SGCN.
- 11.2.0.15 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and landowners about the importance of retaining and in an effort to protect, create, enhance and/or restore vegetation along aquatic habitats.
- 11.2.0.26 Make educational resources available to the public that encourage researchers to seek out guidance prior to finalizing proposals and submitting State permit applications to reduce potential impacts on sensitive species.
- 11.2.0.27 Provide educational resources and presentations to coastal municipalities and residents to promote the understanding of the benefits of soft structures over hard structures for shoreline stabilization.
- 11.2.1 With individuals and groups involved in resource management decision making
 - 11.2.1.1 Engage partners and stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
 - 11.2.1.2 Provide professional training and technical assistance tools (e.g., mapping, guidance documents, justification, etc.) to agencies/divisions/programs within and outside of the NJ DEP regarding the SWAP, and the conservation actions recommended therein to help facilitate SWAP implementation.
 - 11.2.1.4 Provide educational resources, training programs, and on-the-ground guidance to dredging companies and resource managers on habitat creation and enhancement away from and outside of shipping lanes, and to identify seasonal timing of activities that would minimize impacts to wildlife and their habitats.

Marsh Birds
