- 1.2.1.11** Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 1.2.1.12** Create incentives (non-monetary and/or monetary) for land developers to redevelop abandoned areas (e.g., shopping centers, office complexes) to minimize the loss of natural habitats and reduce the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 1.2.1.13** Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to land developers to minimize the impacts of new residential and commercial developments on SGCN and their habitats.

Leonard's Skipper

- 1.2.1.14 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of herbicides and pesticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.15 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of rodenticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.16 Create incentives (non-monetary and/or monetary) within State regulations (mitigations requirements or credit, BMP satisfaction, etc.) to promote the use of retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.17 Develop a public-relations oriented certification program for private retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.18 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and land managers to control and reduce the impacts of invasive, native and non-native species in order to increase structural habitat diversity.
- 1.2.1.19 Create incentives for federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to farmers, woodland landowners, and private landowners to adopt and/or endorse consistent BMPs concerning controlled burns to maintain and/or improve wildlife habitat.
- 1.2.1.20 Coordinate across government agencies and non-government organizations to create or expand upon tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMP's.
- 1.2.1.21 Create and/or support market-based programs that subsidize or create branding for products derived sustainably from managed wildlife habitats.
- 1.2.1.22 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to horse/livestock farm owners and managers to increase structural habitat diversity in and around the farms by managing vegetation for a variety of species, in particular, farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 1.2.1.23 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to provide cost shares and/or plan approvals for management based on management approaches and prescriptions.
- 1.2.1.24 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners, with habitat of suitable patch size to support breeding grassland-dependent species, to alter the timing of vegetation management to benefit grassland and pollinator species.
- 1.2.1.26 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing landowner incentive programs.
- 1.2.1.28 Create incentives to implement dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.

2 Direct Management of Natural Resources

2.3 Fire management

2.3.2 Fuel reduction

2.3.2.1 Prevent wildfires by reducing natural fuel (e.g., leaf litter).

2.3.3 Prescribed burning

2.3.3.1 Evaluate different management techniques of prescribed burns that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.

2.3.3.2 Conduct prescribed burning in Northern New Jersey forests to maintain and regenerate a mosaic of upland forest habitats.

2.3.3.3 Conduct prescribed burning to improve wildlife habitat.

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

2.8.0.1 Control invasive insect infestations by implementing BMP strategies through biological, chemical and/or mechanical means that will depress, or when appropriate, eradicate populations in a manner that avoids excessive harm to non-target species using BMPs to control infestations and limit their spread based on an inventory of invasive insect distribution and response to outbreaks.

2.8.0.2 Develop, implement, monitor and evaluate pest control/management strategies to reduce the impacts of over-abundant wildlife species (native and/or native, invasive species) on native vegetation and the degradation of habitats supporting SGCN. Over-abundant wildlife species include but are not limited to mute swans, Canada geese, beaver and white-tailed deer.

2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.

2.8.0.5 Implement biologically safe and appropriate control/management strategies, and where appropriate, eradication strategies to reduce the impacts and/or limit the distribution of invasive and/or non-native plant species within or near aquatic systems using methods that will provide the most protection to the aquatic and riparian ecological system, and minimize disturbance to the soil and wildlife. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.

2.8.0.6 Implement long-term management of invasive and/or non-native plants to help maintain functioning ecological systems and biological diversity, and to enhance travel corridors. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Leonard's Skipper

- 2.10.0.1 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 2.10.0.2 Improve the availability of prey/food resources through terrestrial and aquatic plantings and habitat restoration for SGCN populations, in particular for those populations thought to be limited due wholly or in part to a lack of (or contaminated) food resources, and for migratory species (birds, bats, invertebrates).
- 2.10.0.3 Restore and/or enhance habitats to benefit urban-associated SGCN.
- 2.10.0.4 Restore and/or enhance suitable travel corridors connecting conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats.
- 2.10.0.5 Implement habitat restoration and/or enhancement activities that include the creation of vegetative buffers between sensitive habitats (e.g., aquatic systems) and human-inhabited areas (e.g., residences, parks, etc.) and that is conducted during appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.10.0.6 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats.
- 2.10.0.7 Restore/reclaim and enhance degraded rare species habitats through strategic revegetation and management efforts for documented/target SGCN.
- 2.10.0.8 Protect significant natural and/or unique communities by implementing best management practices when conducting habitat restoration strategies.
- 2.10.0.9 Restore and/or enhance riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation, alteration and/or changes in hydrology and subsequent disturbances to and behavioral changes of wildlife (e.g., restoring biologically appropriate buffers, revegetation or restoration efforts, etc.).
- 2.10.0.10 Minimize the loss of important habitats (e.g., coastal scrub-shrub and grassy habitats, high and low marsh habitats, etc.) that provide nesting, migrating, and wintering areas for SGCN birds and other coastal and marsh-dependent species through habitat restoration efforts.
- 2.10.0.11 Restore and/or enhance critical migratory terrestrial and aquatic habitats (e.g., beach, grasslands, forest, scrub-shrub, etc.) for songbirds, raptors, shorebirds, waterfowl, bats and invertebrates through habitat restoration efforts and expand habitat restoration to adjacent private lands to increase the effective size of the habitat.
- 2.10.0.12 Create and/or maintain scrub-shrub habitats through revegetation efforts with little to no impact on forested, wetland and grassland habitats to maintain populations of shrub-dependent SGCN.
- 2.10.0.14 Implement best management practices (BMPs), protective strategies and guidelines for restoring and enhancing healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

Leonard's Skipper

- 2.10.0.15 Restore and/or enhance terrestrial and aquatic habitats proximate to but not adjacent to roads and other transportation corridors for terrestrial-bound SGCN species whose behavior (i.e., dispersal across roads) may be altered by doing so, and therefore decrease road mortality of such species (e.g., amphibians, snakes, turtles, small mammals).
- 2.10.0.21 Restore and/or enhance understory habitats that suppress invasive species and provide critical resources and enhance sheltering, foraging, and nesting cover for wildlife.
- 2.10.0.22 Restore and/or enhance terrestrial and aquatic habitats to promote the regeneration of native vegetation and enhance structural diversity to benefit SGCN (e.g., vegetative buffers of aquatic systems, allow coarse, woody debris to remain in terrestrial, aquatic and riparian habitats to provide shelter, riparian stabilization and necessary microclimates, plant native trees, shrubs and grasses, etc.).

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.
- 2.11.0.2 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas for target SGCN and/or species groups; management should complement rare species needs in a targeted area.
- 2.11.0.3 Create suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats through vegetation management.
- 2.11.0.4 Implement vegetation management strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife, particularly SGCN.
- 2.11.0.5 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats through vegetation management.
- 2.11.0.6 Reclaim degraded rare species habitats by conducting vegetation management needed to restore habitat value for the documented/target SGCN.
- 2.11.0.7 Protect significant natural and/or unique communities by implementing best management practices through vegetation management.
- 2.11.0.23 Implement appropriate habitat management actions in areas where natural disturbances, such as wildfire, have been precluded.
- 2.11.0.24 Conduct vegetation management adjacent to aquatic habitats following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.25 Conduct vegetation management along access roads following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.26 Conduct vegetation management along roadsides and medians, avoiding peak activity periods for wildlife, that enhances wildlife dispersal naturally and safely across roads and similar barriers to/between terrestrial and/or aquatic habitats.
- 2.11.0.27 Conduct vegetation management for target shrub- or young forest-dependent SGCN following BMPs to minimize the risk of the establishment of invasive and non-native plants.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Leonard's Skipper

- 2.11.0.28 Conduct vegetation management in agricultural areas following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.29 Conduct vegetation management on transportation and service corridors (i.e., rights-of-way) following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.30 Identify and prioritize areas where various management tools (such as increasing salinity through the management of water levels or chemical applications) may be effective in reducing phragmites within and restoring marsh habitat.
- 2.11.0.31 In areas where vegetative communities are shifting due to fire suppression and controlled burns are not feasible, manage vegetation to improve wildlife habitat.
- 2.11.0.32 Increase structural habitat diversity around and when feasible, within agricultural landscapes by managing vegetation for a variety of species, in particular, those farms that have removed scrub-shrub habitat and/or fragmented forests, and by implementing ecologically best practices (e.g., no-till farming, maintaining hedgerows, buffer set-asides, etc.).
- 2.11.0.33 Increase structural habitat diversity by implementing long-term vegetation management to minimize the potential for the establishment of invasive and/or non-native plants that may outcompete native vegetation.
- 2.11.0.34 Increase structural habitat diversity by managing residential, commercial and recreational areas' landscapes for a variety of species. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.36 Increase structural habitat diversity by managing vegetation for a variety of species and considering their life history requirements (e.g., travel corridors, shelter, resting and breeding areas) to minimize the risk of harm.
- 2.11.0.38 Increase structural habitat diversity in and around horse/livestock farms by managing vegetation for a variety of species, in particular, in and around farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 2.11.0.39 Increase structural habitat diversity in and around solar farms by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.40 Increase structural habitat diversity surrounding areas used for energy, mining, and transportation and service corridors by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides, and avoid managing habitat during the breeding seasons for ground-nesting birds, reptiles, amphibians and small mammals.
- 2.11.0.41 Increase structural habitat diversity through the implementation of a variety of vegetation management practices such as prescribed burns (either increasing or decreasing their frequency depending on the site and objective), plantings, etc. that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.

Leonard's Skipper

- 2.11.0.42 Increase structural habitat diversity within wind farms for terrestrial bound and low-flying species and around wind farms for other wildlife by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.43 Manage forests to increase variation in age structure and composition using BMPs that promote and maintain functioning ecological forest-based systems and biological diversity.
- 2.11.0.45 Regularly and/or rotationally create young forest habitat in targeted areas to maintain and regenerate a mosaic of upland forest habitats that will benefit shrub- and young forest-dependent species.

2.14 Wildlife disease management

2.14.0 Wildlife disease strategy development and investigation

- 2.14.0.1 Investigate diseases/pathogens impacting SGCN and/or their habitats.
- 2.14.0.2 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
- 2.14.0.3 Protect SGCN from exotic pathogen introduction or incident through implementation of a "rapid response plan"; DFW to give priority attention to these species in planning and/or implementing a response.
- 2.14.0.4 Conduct long-term monitoring of diseases in vulnerable wildlife to determine the magnitude of exposure within populations and around the State, the impacts to those species, in particular SGCN, and investigate the feasibility of mitigating for such impacts.
- 2.14.0.5 Assess the impacts of diseases on the life cycles of wildlife.

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

- 3.0.0.1 Conduct long-term monitoring of resident and migratory SGCN populations using standardized survey protocols to determine the variables that may impact their long-term persistence in the State (e.g., population viability, distribution, dispersal, home range and habitat use, travel corridors, food availability, vulnerability to pollutants and disease, etc.). Compile this information to determine the likely causes of population declines and to understand metapopulation dynamics. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.2 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) where data gaps exist regarding SGCN distribution, and their critical and supportive habitats. Conduct surveys using standardized survey protocols to acquire baseline data, and provide the data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
- 3.0.0.3 Gather baseline data on SGCN inhabiting permanently protected natural lands regarding their distribution and population (e.g., abundance, dispersal, demography including productivity and survival, etc.), and identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) critical and supporting habitats within those landscapes.
- 3.0.0.4 Conduct long-term studies on SGCN inhabiting permanently protected natural lands to develop population trend data and changes in demography, and to determine if critical and/or supporting habitats are limited or changing; i.e., diminishing in value, acreage or connectivity.

Leonard's Skipper

- 3.0.0.7 Collect baseline data to document species distributions, in particular SGCN, and current habitat for future analysis of possible distribution shifting as a result of habitat shifting or alteration associated with climate change impacts.
- 3.0.0.8 Conduct long-term studies and compare baseline metrics of documented species distributions and associated habitats to identify possible species and/or habitat shifting or alteration associated with climate change impacts.
- 3.0.0.13 Investigate the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats. Evaluate and modify management practices as appropriate.
- 3.0.0.14 Identify areas with invasive, aquatic plants and animals and collect a detailed baseline assessment of the species' status and distribution. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort. Researchers and contractors performing Forest Stewardship Inventories and/or Plans on state lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.0.0.15 Conduct long-term monitoring of areas identified as having invasive, aquatic plants and animals to track the species' status/progress over time with or without the implementation of management strategies. Areas without management strategies should be assessed and prioritized for management/control. Areas where management strategies are being implemented should include an assessment of the management effort and identify/recommend and implement necessary changes to improve its success. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort.
- 3.0.0.26 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species including objectives and guidance pertaining to and the condition/status of critical and supporting habitats.
- 3.0.0.27 Evaluate the effectiveness of strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals through research and monitoring. Develop and provide NJ DEP and other appropriate governing agencies/commissions a summary of findings and recommendations to improve such efforts.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.1 Division of Fish and Wildlife should maintain a robust, up-to-date database and mapping of species occurrences.
- 3.2.0.7 Track (via a database that includes a GIS component) and research problematic species and diseases to determine their distribution, impacts on SGCN wildlife/wildlife communities, and develop potential control measures.
- 3.2.0.8 Implement and conduct long-term monitoring of control measures aimed at minimizing the impacts of problematic species and/or diseases to evaluate the effectiveness of such efforts and to identify and incorporate additional strategies as appropriate.
- 3.2.0.18 Conduct baseline surveys/inventories to better understand the distribution of fish and invertebrate (including freshwater mussels) populations.

3.2.1 Abundance determination

Leonard's Skipper

- 3.2.1.1 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) population abundance and trends for SGCN using standardized survey protocols. Provide data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
 - 3.2.1.2 Conduct wildlife surveys on resident and migratory SGCN regarding their population abundance and trends.
 - 3.2.2 Age, size and sex structure
 - 3.2.2.1 Conduct wildlife surveys on resident and migratory SGCN regarding their survivorship.
 - 3.2.3 Baseline inventory
 - 3.2.3.9 Investigate hazardous environmental issues that may impact grassland invertebrates.
 - 3.2.7 Population assessment
 - 3.2.7.1 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
 - 3.2.7.2 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species to meet and maintain recovery goals.
- 3.3 Research, survey or monitoring - habitat
 - 3.3.1 Baseline inventory
 - 3.3.1.1 Conduct habitat assessments of significant natural and/or unique communities to identify threats to native terrestrial and aquatic habitats through systematic monitoring, review of available data, enlistment of habitat management and/or species experts, etc. Incorporate findings into a database that includes descriptions/qualifiers of the habitats, identifies and values/qualifies the threats, and includes a GIS component of the locations of the assessed areas. Share this information with landowners/managers (e.g., federal, state and local government agencies or non-government organization).
 - 3.3.1.2 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) resident and migratory SGCN habitats. Investigate their suitability for the various life history requirements of the species that dependent upon them to determine the ability for maintaining applicable SGCN populations in perpetuity.
 - 3.3.1.4 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and investigate the suitability of corridors that connect large, contiguous tracts of similar habitats to increase their effective size (i.e., forest with forest, grassland with grassland, wetlands with wetlands, etc.) for dependent SGCN.
 - 3.3.1.5 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) where habitat restoration and/or enhancement would benefit wildlife SGCN.
 - 3.3.1.6 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) that could, through revegetation and/or enhancement efforts, become suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN.
 - 3.3.1.7 Map and prioritize existing and potential areas for early succession forest management. Share the results with state, county and municipal planners.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Leonard's Skipper

- 3.3.1.8 Assess the availability and suitability of forest habitats for SGCN species (particularly reptiles and amphibians, birds, pollinators, and tiger beetles) in southern forests since Superstorm Sandy.
- 3.3.1.9 Inventory forests throughout northern New Jersey to develop a baseline characterization of the structure and composition of habitats and identify deficient forest habitat types.
- 3.3.1.10 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and document fish SGCN habitats by plotting their distributions in GIS and submitting the data to the State for integration into the DEP's Biotics database.
- 3.3.1.16 Gather "best information" for spatial modeling and update/create a current model/depiction of anticipated habitat shifts from sea-level rise, flooding, etc.
- 3.3.1.17 Identify and map undeveloped roads and trails in all conserved forests, and create a database of locations. Integrate information regarding potentially sensitive areas.
- 3.3.1.18 Conduct an assessment using available data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels.
- 3.3.1.19 Identify and codify legal ORV access areas on state (and if appropriate, other conserved) lands. Provide GIS mapping to the landowner for potential use in directing such recreational activities.
- 3.3.1.20 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) where invasive, non-indigenous plants and animals are either already established or are becoming established. Create a system for reporting and qualifying new locations of invasive species and for prioritizing areas for control measures according to the potential level of impact on the ecosystem and SGCN and the likelihood of success. Researchers and contractors encountering invasive plant species while performing plant and/or forest inventories on state or other conserved lands and/or private lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.3.1.24 Conduct regular investigations of SGCN habitat health and biodiversity on public and private lands to identify locations in need of revegetation, reduction of over-abundant, native wildlife and/or exotic species, conservation focal areas requiring limitations on human activity, etc.

3.3.2 Monitoring

- 3.3.2.2 Conduct long-term monitoring of resident and migratory SGCN habitats using standardized survey protocols to determine changes in habitat quality/suitability and threats (e.g., habitat loss and degradation, increased edge habitat, water quality) and other variables that may impact their long-term persistence in the State and to provide information needed for determining causes of population declines and understanding metapopulation dynamics.
- 3.3.2.3 Continue to update wildlife and habitat databases and revise models of critical SGCN habitats using the most current data available and where lacking, develop new SGCN and/or habitat models as data on species habitat requirements and applicable GIS data layers become available.
- 3.3.2.8 Evaluate the effectiveness of current prescribed burning practices on Pinelands dependent species.
- 3.3.2.10 Evaluate the efficacy and success of different management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.

Leonard's Skipper

- 3.3.2.11 Evaluate and compare the effectiveness of delayed mowing of warm season grass fields versus cool season hay fields to benefit grassland-dependent species.
- 3.3.2.12 Evaluate and compare the effectiveness of different management techniques (e.g., prescribed burning, mowing, brush-hogging, etc.) for maintaining suitable habitat for grassland-dependent species and species dependent upon early successional habitats.
- 3.3.2.13 Evaluate the effectiveness of management strategies (e.g., timing restrictions for mowing, cooperative agreements with utility companies for maintenance of rights-of-ways) that maintain and enhance large existing areas of grassland in perpetuity. Focus on habitat patches that can be managed to enhance the total size of suitable grassland habitat and create interspersed early-successional habitat.
- 3.3.2.15 Investigate the effectiveness of management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.3.2.16 Evaluate the effectiveness of best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 3.3.2.20 Once a system is developed for reporting and qualifying new locations of invasive species, develop, implement and monitor/evaluate invasive species removal strategies at identified locations. Priority should be given to those areas critical to SGCN and/or contain unique and/or rare plant communities supporting SGCN and/or other fish/wildlife species.
- 3.3.2.24 Conduct regular inventories of forests throughout northern New Jersey to characterize the changing structure and composition of habitats and monitor forest conditions.

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.1 Work with land management agencies to determine the appropriate actions needed to restore/reclaim degraded habitat for the documented/target SGCN.
- 3.5.3.3 Develop/improve management techniques that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.9 Develop strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 3.5.3.11 Develop strategies to protect native terrestrial and aquatic habitats and dependent SGCN species from the identified threats.
- 3.5.3.15 Modify management practices based on the effects of pesticides, herbicides and other biological controls on critical and supporting SGCN habitats.
- 3.5.3.16 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.

Leonard's Skipper

- 3.5.3.19 Work with foresters to develop prescribed burning practices for Pinelands dependent species that increase or maintain habitat quality for these species in the Pinelands.
 - 3.5.3.21 Develop management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
 - 3.5.3.22 Identify (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) and modify management strategies (e.g., timing restrictions for mowing, cooperative agreements with utility companies for maintenance of rights-of-ways), based on research, that maintain and enhance large existing areas of grassland in perpetuity.
 - 3.5.3.24 Based on research, modify management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
 - 3.5.3.25 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to develop the necessary management strategies to reach or maintain viable population levels.
 - 3.5.3.29 Explore the use of alternative vegetation (i.e., commodity crops) to address agriculture concerns.
- 3.5.4 Fish and wildlife research, survey and management techniques
 - 3.5.4.5 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
 - 3.5.4.6 Investigate the feasibility of mitigating for the impacts of contaminants to vulnerable wildlife, particularly SGCN. Maintain records on exposure of vulnerable wildlife to environmental toxins (such as flame retardants and endocrine disruptors), so that sources may be identified and controlled or eliminated.
 - 3.5.4.14 Develop and implement agreements, and update existing agreements, with government agencies regarding the protection of critical SGCN habitats (e.g., significant breeding populations of beach nesting birds, colonial waterbird nesting areas, bat colonies, etc.).
 - 3.5.4.15 Investigate the success of management strategies used to protect and/or enhance SGCN populations and when appropriate, aid in identifying failures/resource problems and issues, and developing new strategies.
 - 3.5.4.16 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels and develop the necessary management strategies.
 - 3.5.4.18 Investigate the effectiveness of survey techniques through selected “ground truthing” and literature and peer review in order to increase efficacy of survey, minimize surveyor bias and error, and increase accuracy of trend data.
 - 3.5.4.19 Develop reliable, standardized survey and monitoring protocols for SGCN species, for which none currently exist, and their habitats.
 - 3.5.4.21 Develop BMPs to address problematic species and diseases of unknown origin.

4 Education

4.1 Educator/Instructor training

4.1.0 Public education

- 4.1.0.1 Provide educational resources and training programs to private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.

5 Facilities and Areas

5.15 Wildlife Management Areas

5.15.6 Roads

- 5.15.6.1 Clearly post areas/roads where vehicle access is permitted.
 - 5.15.6.2 Clearly post areas/trails where vehicle access is not permitted.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

- 6.0.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
 - 6.0.0.7 Secure and protect critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.
 - 6.0.0.8 Secure and protect scrub-shrub habitats for SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

6.3 Conservation area designation

6.3.0 Conservation area designation strategies

- 6.3.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN and/or connect conserved SGCN habitats through conservation area designations.
 - 6.3.0.8 Promote the protection of scrub-shrub habitats for SGCN through conservation area designations.

6.4 Private lands agreements

6.4.0 Private land agreement strategies

- 6.4.0.1 Enter into private lands agreements to expand control burns on private lands, in particular those adjacent to conserved lands to improve SGCN habitats.

7 Law Enforcement

7.1 Law enforcement

7.1.3 Sub-national Level

- 7.1.3.2 Increase the number of law enforcement officers tending to wildlife issues to a reasonable number to sufficiently cover the State and marine waters.

7.1.4 Scale Unspecified

- 7.1.4.12 Implement policies and/or regulations that protect significant natural and/or unique communities in perpetuity.

- 7.1.4.26 Educate law enforcement personnel that there may be unauthorized research projects taking place and to encourage them to investigate any activities that appear to be harmful to wildlife.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.2 Develop a team of personnel from government entities, conservation organizations and other stakeholders engaged in oil/gas spill response for marine and freshwater habitats to develop a feasible plan for oil spill response and/or to amend NJ's current oil spill response plan that clearly outlines each organizations responsibilities and an assessment and location list of available equipment for boom deployment during oil spills.
- 8.1.0.3 Develop an outreach team of personnel from government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 8.1.0.4 Engage government agencies, conservation partners and other stakeholders in constructive dialogues encouraging them to influence policy change and the creation of incentives through a habitat bill and/or municipal ordinances for backyard habitat.
- 8.1.0.15 Engage government agencies, conservation partners and other stakeholders in discussions encouraging and supporting the creation of laws and policies requiring vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 8.1.0.16 Engage local governments in discussions regarding the importance of them adopting/passing ordinances which require assessing and addressing secondary impacts (i.e., ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 8.1.0.17 Engage municipalities in constructive dialogue to identify and minimize destruction of areas prioritized for early succession forest management.
- 8.1.0.18 Engage NJDOT, NJ Transit Authority and other road management entities, wildlife conservation organizations/agencies (e.g., Division of Fish and Wildlife, New Jersey Conservation Foundation, Conserve Wildlife Foundation of NJ), and communities and citizens in discussions regarding the importance of and methods to enhance habitat connectivity, and work together to develop feasible strategies for ensuring that wildlife can disperse naturally and safely across roads and similar barriers to terrestrial and/or aquatic habitats.
- 8.1.0.19 Engage government agencies, conservation partners and other stakeholders to collaboratively develop a list of important projects, targeting SGCN and/or their habitat, as a guide for graduate student research. Distribute the list and contact information to all State colleges and universities.
- 8.1.0.20 Organize a small focal group of government and non-government agencies/organizations responsible for decisions regarding beach/dune management to share and coordinate their goals so that comprehensive planning can attempt to meet all needs.
- 8.1.0.21 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation human-subsidized and/or overabundant, native species cause to local nesting species, and provide expert guidance on how residents can help alleviate this threat.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Leonard's Skipper

- 8.1.0.22 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation invasive species cause to native nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.24 Engage government agencies, conservation partners and other stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.25 Provide technical support to public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.26 Coordinate across federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to woodland landowners to adopt or endorse consistent best management practices concerning controlled burns to maintain and/or improve forested habitat for wildlife.
- 8.1.0.30 Encourage government agencies and conservation partners to advise members of the relevant scientific community of the need for specific studies, reports or investigations targeting the data-deficiency regarding SGCN and/or their habitats.
- 8.1.0.34 Work with the NJ Education Association and Department of Education to design curriculum and outdoor experimental learning opportunities, and provide training to teachers on implementation of these activities.
- 8.1.0.37 Enlist landowners and NJ citizens in the protection of and survey efforts for SGCN, in particular rare species, by increasing enrollment in landowner incentives, forest stewardship, backyard habitat management and wildlife-related volunteer programs.
- 8.1.0.38 Engage partners, stakeholders and land managers in constructive dialogue promoting forest stewardship for SGCN that use core forests and forested corridors.
- 8.1.0.40 Encourage researchers, land managers, naturalists and enthusiasts to follow proper procedures for the coordination and/or permitting of research/management activities involving wildlife and sensitive habitats, and discourage activities that alter vegetation or wetlands, or cause harm or disturbance to wildlife.
- 8.1.0.42 Engage citizens, wildlife observers and photographers through discussions and distributable information regarding the importance of and encouraging implementing responsible and ethical behavior when observing wildlife by developing an alliance of wildlife photographers and widely circulating recommendations on how to reduce impact.
- 8.1.0.44 Engage conservation partners, stakeholders, government agencies and other land stewards in constructive dialogues encouraging their inclusion of controlled burns in forest and other stewardship plans.
- 8.1.0.47 Form cooperative partnerships with energy companies to facilitate habitat creation and enhancement away from and outside of project areas, the restoration of appropriate habitats within project areas (e.g., rights-of-way could benefit butterflies and some bird species), and to identify seasonal timing of activities that would minimize impacts to wildlife.
- 8.1.0.48 Form cooperative partnerships with transportation and shipment agencies and companies to facilitate habitat creation and enhancement away from and outside of project areas and to identify seasonal timing of activities that would minimize impacts to wildlife.

8.2 Recruitment and retention activities

8.2.3 For wildlife watching

Leonard's Skipper

- 8.2.3.1 Develop and implement nature-focused tourism opportunities including wildlife viewing sites, interpretive signage highlighting unique ecosystems/habitats, and wildlife-related recreational opportunities that do not negatively impact SGCN or their habitats.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.7 Develop and provide (or otherwise make publicly available) educational programs and/or materials that describe the negative impacts of off-road vehicles and watercraft use in and adjacent to critical SGCN habitats, and the importance of confining such activities to more appropriate locations and/or seasons.
- 8.3.0.8 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate recreationists and encourage landowners to eliminate garbage in the vicinity of suitable wildlife habitat, in particular SGCN habitat. Information should include the detrimental impacts garbage may have on various wildlife species.
- 8.3.0.9 Develop and provide (or otherwise make publicly available) educational programs and/or materials to enlist landowners and land managers to include only native plants in landscaping and restoration projects. Provide information to assist them in detecting problematic establishment of invasive, non-indigenous plants.
- 8.3.0.10 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate landowners and NJ citizens on threats to fish and wildlife (including marine animals).
- 8.3.0.11 Develop and provide (or otherwise make publicly available) educational programs and/or materials to the public, wildlife-related professionals, foresters, etc., that describe the value of species that are often feared (e.g., snakes, bats, spiders, Allegheny woodrat) and/or deemed a "nuisance" (e.g., squirrel, deer, snapping turtle), and therefore, persecuted by people. Include information on tolerance, proper identification, eviction from human dwellings, how to minimize the animal's presence on the property, and/or how to live in harmony with the animal.
- 8.3.0.12 Promote awareness of WSFR (Wildlife and Sportfish Restoration) Outreach/Awareness grants, an important funding source for conservation among hunters and anglers as well as the general public.
- 8.3.0.13 Conduct an educational campaign to encourage observer ethics and respect for wildlife and natural habitat.
- 8.3.0.24 Develop educational outreach programs for local decision-makers, land developers, landowners and citizens about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
- 8.3.0.25 Develop educational outreach programs for landowners, nurseries and the general public regarding the negative impacts of invasive and non-native plants on our natural communities.
- 8.3.0.26 Develop educational outreach programs for private and public landowners and land managers regarding the importance of and how to manage core forests and forested corridors in a way that will be beneficial for SGCN, particularly endangered, threatened and special concern species.
- 8.3.0.27 Develop educational outreach programs for public and private landowners and land managers regarding the importance of structural habitat diversity, methods to increase diversity, and/or incentive programs available to increase habitat diversity.

Leonard's Skipper

- 8.3.0.28 Develop educational outreach programs for public and private landowners and land managers regarding the importance of managing grasslands for grassland-dependent species, methods of management, and/or incentive programs available.
- 8.3.0.30 Develop educational outreach programs for private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.
- 8.3.0.32 Develop an educational outreach program for landowners and citizens on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

- 9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and SGCN inhabiting them.
- 9.1.0.2 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.1.0.3 Develop a plan that directs the creation of impervious surfaces away from and to minimize impacts on aquatic systems and critical terrestrial habitats. The plan should also include strategies to increase the resiliency of aquatic and critical terrestrial habitats to threats and stressors that would impact the reproduction and survival of wildlife.
- 9.1.0.5 Develop a plan that directs the creation or expansion of energy or utility rights-of-way in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.6 Develop a plan that directs the creation or expansion of roads and railroads or the re-establishment of abandoned railroads within and adjacent to critical forested habitats in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.8 Develop a plan that focuses on strategies for oil pipelines to avoid sensitive habitats that would be highly impacted by oil spills.
- 9.1.0.9 Develop a plan that focuses on strategies to minimize the creation of renewable energy farms (e.g., solar, wind) and related infrastructures within and their impacts on forested habitats and the wildlife community.
- 9.1.0.10 Develop a plan that focuses on strategies to minimize the impacts of mining on critical forested habitats.
- 9.1.0.11 Develop a plan that focuses on strategies to minimize the impacts of power plants on critical forested habitats and the wildlife community.
- 9.1.0.13 Develop a plan to minimize agriculture that would result in groundwater withdrawal in critical forested areas.
- 9.1.0.15 Develop a plan to minimize fragmentation of terrestrial and aquatic habitats by roads.
- 9.1.0.16 Develop a plan to minimize new lawns and preserve natural vegetation within and adjacent to critical forest areas.
- 9.1.0.19 Develop a plan to minimize the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 9.1.0.21 Develop a plan to minimize the use of any-sized dam in critical forested areas.
- 9.1.0.22 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.

Leonard's Skipper

- 9.1.0.28 Develop and coordinate state, regional and local plans for suitable lot layout and landscaping to minimize human-wildlife conflicts that also incorporates habitat connectivity and preservation of natural areas.
- 9.1.0.29 Provide GIS or related data, maps, resource inventories, as well as related training, pertaining to the SWAP and it's recommended conservation actions for use or consideration by State, County or municipal planning agencies.
- 9.1.0.30 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and other related threats associated with development.
- 9.1.0.33 Review the species, threats, action successes, and habitats, and work with partners to revise the 2017 State Wildlife Action Plan for the 2025 resubmittal.

9.2 Organizational strategic and CMS planning

9.2.1 Organizational strategic and operational planning

- 9.2.1.1 Identify and codify legal ORV access areas on state lands.

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.3 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.1.4 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.3.1.5 Develop response plans to address disease outbreaks within wildlife populations, in particular SGCN.
- 9.3.1.7 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
- 9.3.1.9 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
- 9.3.1.10 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 9.3.1.13 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
- 9.3.1.15 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.
- 9.3.1.16 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.

9.3.3 Habitat management planning

- 9.3.3.5 Develop a management plan using forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Leonard's Skipper

- 9.3.3.7 Develop a management plan to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 9.3.3.8 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 9.3.3.10 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
- 9.3.3.11 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.3.3.13 Develop a management plan that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas and prevents or ameliorates near-term impacts of climate change throughout the State, but in particular within the coastal and Delaware Bay areas.
- 9.3.3.15 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
- 9.3.3.16 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.3.17 Develop a management plan for prescribed burning that will benefit Pinelands dependent species and increase or maintain habitat quality for these species in the Pinelands.
- 9.3.3.18 In cooperation with species and habitat experts, develop management plans for significant natural and/or unique communities, in particular those supporting SGCN, and provide the information to the landowners/managers (federal, state and local government agencies or non-government organization) for review and implementation.
- 9.3.3.19 Develop management plans for SGCN inhabiting permanently protected natural lands using available baseline and population trend data.
- 9.3.3.21 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
- 9.3.3.26 Develop a management plan for parcels of suitable size to be managed for native herbaceous plant species that support breeding grassland dependent species.
- 9.3.3.28 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.
- 9.3.3.29 Develop habitat management plans aimed at reducing or eliminating negative impacts of ORVs.
- 9.3.3.32 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.
- 9.3.3.34 Include controlled burn prescriptions in forest and stewardship plans to improve wildlife habitat.
- 9.3.3.35 Incorporate habitat connectivity, preservation of natural areas, and the implementation of BMPs into state and local land-use policy environmental review process and energy development plans to minimize habitat fragmentation and related threats associated with solar farms and altered habitats.
- 9.3.3.36 Integrate plans for properly located and timed habitat restoration and management along transportation, energy and service corridors to minimize risks to and benefit wildlife.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

- 11.1.1.1** Use Biotics database and Landscape Project Mapping in regulatory reviews to ensure protection by applicable laws and regulations.
- 11.1.1.2** Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
- 11.1.1.4** Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.
- 11.1.1.5** Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 11.1.1.7** Review proposed construction or other work projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.8** Review proposed research projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.12** Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed solar farm projects to reduce habitat fragmentation and minimize impacts on wildlife.

11.1.2 Review of proposed policies and plans

- 11.1.2.1** Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

- 11.2.0.1** Provide technical support to private and public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 11.2.0.2** Provide technical support to public and private landowners and land managers for controlling invasive, native and non-native plant species in order to increase structural habitat diversity.
- 11.2.0.3** Develop state, regional and local BMPs that focus on minimizing habitat fragmentation and human-wildlife conflicts associated with development. Make information available to land developers and private and public landowners for implementation.
- 11.2.0.5** Provide educational resources, training programs, and expert guidance to private and public landowners and land managers on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

- 11.2.0.6 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on habitat creation, enhancement and restoration within and adjacent to project areas, as well as away from and outside of project areas (depending on the target species), by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. Wind farms should address both terrestrial bound and low-flying species. Examples of habitat management include, but are not limited to, integrating short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 11.2.0.7 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on the importance of maintaining habitat connectivity, minimizing fragmentation, and the use of CHANJ products to help them target areas for such planning.
- 11.2.0.8 Provide educational resources, training programs, and on-the-ground guidance to public and private landowners and land managers on habitat creation and enhancement strategies that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 11.2.0.9 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and private landowners about the importance of leaving vegetation in place, especially along riparian areas and wildlife movement corridors.
- 11.2.0.10 Provide technical support to private landowners, consultants, and land managers to create customized management plans based on location and SGCN.
- 11.2.0.11 Provide educational resources, training programs, and on-the-ground guidance to private and public landowners and land managers on the benefits of and for creating young forest and early succession habitat for SGCN.
- 11.2.0.12 Provide educational resources and technical support to public landowners and land managers for managing grasslands for grassland-dependent species.
- 11.2.0.15 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and landowners about the importance of retaining and in an effort to protect, create, enhance and/or restore vegetation along aquatic habitats.
- 11.2.0.17 Provide educational resources and technical support to public and private landowners and land managers to promote the protection of vernal pools and the protection, enhancement and/or restoration of biologically appropriate buffers.
- 11.2.0.22 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
- 11.2.0.23 Provide educational resources and technical support to public and private landowners and land managers of lands adjacent to SGCN habitats to promote the protection and/or enhancement of those adjacent habitats to increase the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and that connect conserved SGCN habitats.

Leonard's Skipper

- 11.2.0.24 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers on how to manage vegetated roadside areas (e.g., mowing, brush-hogging, etc.) on a schedule that avoids peak activity periods for wildlife and therefore, minimizes harm.
- 11.2.0.25 Provide educational resources, training programs, and on-the-ground guidance to resource managers regarding the assessment of and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) related to residential and commercial development.
- 11.2.0.26 Make educational resources available to the public that encourage researchers to seek out guidance prior to finalizing proposals and submitting State permit applications to reduce potential impacts on sensitive species.

11.2.1 With individuals and groups involved in resource management decision making

- 11.2.1.1 Engage partners and stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 11.2.1.2 Provide professional training and technical assistance tools (e.g., mapping, guidance documents, justification, etc.) to agencies/divisions/programs within and outside of the NJ DEP regarding the SWAP, and the conservation actions recommended therein to help facilitate SWAP implementation.
- 11.2.1.3 Provide educational resources, training programs, and on-the-ground guidance to DOD to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop and implement forest management and other practices that minimize disturbances to SGCN (i.e., beyond their federal requirements).
- 11.2.1.5 Provide educational resources, training programs, and on-the-ground guidance to municipalities, state and federal agency resource managers on tasks such as writing and integrating Beach Management Plans into other management documents.
- 11.2.1.6 Provide educational resources, training programs, and on-the-ground guidance to resource agencies prior to project initiation to ensure wildlife and their habitats are protected to the highest degree possible during construction, and provisions are in place for post-construction habitat use.

11.2.2 With private landowners

- 11.2.2.1 Provide technical support to farming operations and woodland landowners on ways to decrease clean farming (edge-to-edge) practices and create ecotones to benefit bobwhite and other species dependent on early successional habitat.

100 Law and Policy

100. Legislation

100.1.2 National Level

- 100.1.2.1 Create legislation to establish markets for warm-season grasses to increase the permanency of this crop on the landscape.

100.1.3 Sub-national Level

- 100.1.3.3 Initiate legislative action to establish an annual budgetary line item designating funds to support programs focused on long-term research and monitoring of wildlife diseases.

100.1.4 County and Local

Leonard's Skipper

- 100.1.4.2 Secure and increase the effective size of SGCN habitats and connect conserved SGCN habitats through local ordinances.
- 100.1.4.3 Expand the acreages and enhance the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN through local ordinances.
- 100.1.4.14 Adopt/pass local ordinances which require assessing and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 100.1.4.15 Incorporate habitat connectivity and the preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.

100.1.5 Scale Unspecified

- 100.1.5.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 100.1.5.5 Develop legislation to provide financial support for the New Jersey Invasive Species Strike Team.

100. State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.5 Develop policies that will promote improved and secure habitat connections between conserved SGCN habitats.
- 100.3.0.6 Develop policies that will promote expanding acreages and enhancing the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 100.3.0.8 Develop policies and/or regulations with the objective of protecting significant natural and/or unique communities in perpetuity.
- 100.3.0.9 Secure mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.12 Develop policies that promote the preservation and protection of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.
- 100.3.0.18 Develop policies for conserved lands that prohibit planting and supports the control of non-native vegetation and invasive, native vegetation.
- 100.3.0.23 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.24 Create legislation to establish markets for warm-season grasses to increase the permanency of this crop on the landscape.
- 100.3.0.31 Create or expand tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMPs.
- 100.3.0.32 Coordinate regulations across agencies to maximize availability of and enrollment in existing Forestry Stewardship Programs (e.g., "Woodland Stewards", Farm Bill, partners, etc.) to maintain and/or improve forest habitat.

Leonard's Skipper

- 100.3.0.38 Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.
- 100.3.0.39 Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.3.0.40 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.3.0.41 Explore all State regulatory requirements for mitigation, restoration, habitat management, etc. to ensure they prohibit the use of specified invasive or other problematic plant species.
- 100.3.0.43 Identify and address (amend) regulatory impediments to beneficial habitat management.
- 100.3.0.44 Incorporate requirements for technical support and funding for mitigation or restoration efforts so as to be consistent with existing regulations.
- 100.3.0.45 Increase the controlled burn season to focus on restoring vegetative communities.
- 100.3.0.46 Investigate and/or develop inter-agency Memorandum of Agreements to share common data stored or managed in program-specific databases.
- 100.3.0.48 Propose new State law or regulation mandating that a State-level "development impact fee" be assessed on all new development approved by municipalities (via the Municipal Land Use Law processes), and dedicate such monies to the development and implementation of regional Habitat Conservation Plans (or existing plans/programs serving the same regional function).
- 100.3.0.50 Retain endangered, threatened and special concern wildlife and habitat protection measures in the Water Quality Management Program Rules.
- 100.3.0.52 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded energy sitings and facilities.
- 100.3.0.53 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded rights-of-way corridors associated with energy transport/transmission.
- 100.3.0.60 Develop regulations that when implemented will protect significant natural and/or unique communities in perpetuity.
- 100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.
- 100.3.0.73 Develop regulations that would exempt the conversion of lawns to native vegetation (beneficial to wildlife) from local lawn ordinances.

100.3.2 State Land Acquisition Programs

- 100.3.2.1 Increase opportunities for habitat restoration by making any necessary policy changes to state, federal and local land acquisition programs (e.g., Green Acres, Blue Acres, etc.) to allow for acquisition within abandoned or failing bay shore communities, including mechanisms to relocate displaced people and infrastructure.

100. State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.1** Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).
- 100.4.0.2** Create a policy that requires the NJ DEP to incorporate scientific information regarding climate change and sea level rise (e.g., predictions, habitat management/acquisition efforts to enhance resilience to inundation) on their websites and to work with other government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 100.4.0.3** Develop policies for mandatory buffer strips on preserved farmlands and state-owned agricultural lands.
- 100.4.0.8** Develop a white paper addressing the impacts that existing, new or expanded rights-of-way have upon wildlife, wildlife habitats and habitat connectivity.
- 100.4.0.10** Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.
- 100.4.0.11** Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.4.0.12** Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.4.0.13** Develop policies for different circumstances (e.g., roadsides and medians, riparian, aquatic and terrestrial habitats) that outline appropriate habitat/vegetation management strategies and schedules to minimize risks to and benefit wildlife.
- 100.4.0.14** Develop policies to facilitate agreements between eligible entities to manage appropriate conserved lands for grassland-dependent species, and to have access to/obtain restoration funds.
- 100.4.0.16** Develop policies to implement habitat management strategies that will increase the structural diversity surrounding areas used for energy, mining, and transportation and service corridors which include but are not limited to the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-
- 100.4.0.17** Develop policies to implement habitat management strategies, including prescribed burns, that will increase the structural diversity on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies to control and reduce the impacts of invasive, non-native species in order to increase structural habitat diversity.
- 100.4.0.18** Develop policies to minimize the extent of infrastructure associated with energy and service corridors or areas (e.g., wind and solar farms, pipelines, utility lines) and that require the implementation of habitat management strategies that will increase the structural diversity in the area including (e.g., the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-asides).

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Leonard's Skipper

- 100.4.0.19 Develop regulations that will minimize the creation of new barriers, remove or replace current barriers with appropriately-sized systems to accommodate wildlife dispersal, and to minimize road widening and traffic volume increases within critical wildlife habitat areas.
- 100.4.0.20 Develop state regulations that require energy developers and utility service companies to implement habitat management strategies that will increase the structural diversity of the habitat, minimize habitat fragmentation and commercial infrastructure, and minimize the loss, alteration and/or degradation of the habitat and adjacent lands when working on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies.
- 100.4.0.24 Develop policies to provide financial support for the New Jersey Invasive Species Strike Team.
- 100.4.0.25 Develop policies that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

Maritime Sunflower Borer Moth

Focal species that comprise this Conservation Target:

Maritime Sunflower Borer Moth

Threats and Action Drivers associated with this Conservation Target:

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale) (Avg. Score: 3.00)

NJ Specific Threats: 1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.1.1.2 Loss, alteration and/or degradation of habitat.

1.1.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale) (Avg. Score: 3.00)

NJ Specific Threats: 1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.2.1.2 Loss, alteration and/or degradation of habitat.

1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale) (Avg. Score: 3.00)

NJ Specific Threats: 1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.3.1.2 Loss, alteration and/or degradation of habitat.

1.3.1.5 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

2 Agriculture and Aquaculture

2.1 Annual and Perennial Crops (non-timber)

2.1.1 Shifting Agriculture (Avg. Score: 3.00)

NJ Specific Threats: 2.1.1.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.1.5 Lack of competitive market prices to maintain native grasslands causes conversion to other crops that have more monetary value but less value as wildlife habitat.

2.1.2 Small-holder Farming (Avg. Score: 1.00)

NJ Specific Threats: 2.1.2.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.2.2 Fragments terrestrial and aquatic habitats.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Maritime Sunflower Borer Moth

2.1.2.4 Agricultural practices (e.g., mechanized, row-crop agriculture) can cause direct mortality to wildlife when harvesting takes places.

2.1.2.5 Lack of competitive market prices to maintain native grasslands causes conversion to other crops that have more monetary value but less value as wildlife habitat.

2.1.3 Agro-industry (Avg. Score: 3.00)

NJ Specific Threats: 2.1.3.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.3.2 Fragments terrestrial and aquatic habitats.

2.1.3.5 Loss of ecotones by implementing clean farming (edge-to-edge) practices degrades habitat for early successional wildlife.

2.1.3.6 Lack of competitive market prices to maintain native grasslands causes conversion to other crops that have more monetary value but less value as wildlife habitat.

2.2 Wood and Pulp Plantations

2.2.1 Small Holder (Avg. Score: 1.00)

NJ Specific Threats: 2.2.1.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.

2.2.2 Agro-industry Plantations (Avg. Score: 1.00)

NJ Specific Threats: 2.2.2.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.

2.3 Livestock Farming and Ranching

2.3.2 Small-holder Grazing (Avg. Score: 1.00)

NJ Specific Threats: 2.3.2.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.

2.3.2.2 Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.

2.3.2.3 Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

2.3.2.4 Livestock allowed to wade into waterbodies trample and degrade aquatic habitats.

2.3.3 Agro-industry Grazing (Avg. Score: 3.00)

NJ Specific Threats: 2.3.3.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.

2.3.3.2 Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.

2.3.3.3 Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

2.3.3.4 Livestock allowed to wade into waterbodies trample and degrade aquatic habitats.

3 Energy Production and Mining

3.2 Mining and Quarrying

3.2.2 Surface Mining - Rock Quarry (and sand quarries) (Avg. Score: 1.00)

NJ Specific Threats: 3.2.2.1 Fragments terrestrial and aquatic habitats.

3.2.2.2 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

3.3 Renewable Energy

3.3.2 Solar Power (Avg. Score: 1.00)

NJ Specific Threats: 3.3.2.2 Loss, alteration and/or degradation of habitat.

4 **Transportation and Service Corridors**

4.1 Roads and Railroads

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale) (Avg. Score: 1.00)

NJ Specific Threats: 4.1.1.2 Loss, alteration and/or degradation of habitat associated with road and railroad construction and maintenance, and degradation of adjacent habitats.

4.2 Utility and Service Lines

4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads (Avg. Score: 1.00)

NJ Specific Threats: 4.2.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species, inhibiting dispersal of non-volant animals, reducing gene flow, and creating barriers to fish when service line-associated roads cross streams (e.g., bridges, culverts, fords, etc.).

4.2.1.2 Loss, alteration and/or degradation of habitat associated with rights-of-way construction and maintenance, and degradation of adjacent habitats.

4.2.2 Management of rights-of-way or communication tower facilities and/or their associated access roads (Avg. Score: 3.00)

NJ Specific Threats: 4.2.2.1 Improper or poorly scheduled vegetation management can cause direct mortality to and may reduce productivity of wildlife.

5 **Biological Resource Use**

5.1 Hunting and Collecting Terrestrial Animals

5.1.1 Intentional Use (Avg. Score: 1.00)

NJ Specific Threats: 5.1.1.1 Illegal collection of wildlife can have detrimental impacts on populations.

5.2 Gathering Terrestrial Plants

5.2.3 Control (Avg. Score: 2.00)

NJ Specific Threats: 5.2.3.1 Alteration or control of undesirable plants or plant communities can destroy important food and nectar plants for native insects and animals.

5.3 Logging and Wood Harvesting

5.3.1 Intentional Use (subsistence/small scale) (Avg. Score: 1.00)

NJ Specific Threats: 5.3.1.1 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may fragment their terrestrial habitats.

5.3.1.2 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may cause the loss, alteration and/or degradation of wildlife habitat.

5.3.1.3 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase soil erosion, impacting SGCN habitats.

5.3.1.4 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase the risk of invasive species establishment, impacting SGCN habitats.

5.3.1.5 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may decrease structural diversity and biomass leading to reduced biodiversity and ecological integrity.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Maritime Sunflower Borer Moth

- 5.3.1.6 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices in Atlantic White Cedar stands may destroy a unique wildlife wetland habitat that is difficult, and takes time, to restore.

5.3.2 Intentional Use (large scale) (Avg. Score: 1.00)

- NJ Specific Threats:** 5.3.2.1 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may fragment their terrestrial habitats.
- 5.3.2.2 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may cause the loss, alteration and/or degradation of wildlife habitat.
- 5.3.2.3 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase soil erosion, impacting SGCN habitats.
- 5.3.2.4 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase the risk of invasive species establishment, impacting SGCN habitats.
- 5.3.2.5 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may decrease structural diversity and biomass leading to reduced biodiversity and ecological integrity.
- 5.3.2.6 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices in Atlantic White Cedar stands may destroy a unique wildlife wetland habitat that is difficult, and takes time, to restore.

5.3.3 Unintentional effects (subsistence/small scale) (Avg. Score: 1.00)

- NJ Specific Threats:** 5.3.3.1 Direct mortality of wildlife, direct loss of suitable habitats (roost, foraging, shelter, etc.), and can disrupt sensitive species, decreasing the likelihood of success and/or reproduction.

5.3.4 Unintentional effects (large scale) (Avg. Score: 1.00)

- NJ Specific Threats:** 5.3.4.1 Direct mortality of wildlife, direct loss of suitable habitats (roost, foraging, shelter, etc.), and can disrupt sensitive species, decreasing the likelihood of success and/or reproduction.
- 5.3.4.5 Lack of appropriate, sustainable forest management can lead to a decrease in forest habitat diversity, degraded habitat for many forest species, the loss of habitat for early-successional species, and/or the loss of unique habitats for species that need canopy breaks and multi-aged tree composition to fulfill various life history requirements.

6 Human Intrusions and Disturbance

6.1 Recreational Activities

6.1.1 Off-road vehicles (motorized and non-motorized) (Avg. Score: 3.00)

- NJ Specific Threats:** 6.1.1.2 Inappropriate use of off-road vehicles can degrade terrestrial and aquatic habitat and reduce the suitability of adjacent habitats for wildlife.
- 6.1.1.3 Increased risk of harassment that results in a change in wildlife behavior and/or direct mortality from vehicle strikes.
- 6.1.1.6 Off-road vehicles can be a mechanism of transference of wildlife diseases and invasive plant species if gear and apparel are not properly sanitized between sites.

7 Natural Systems Modifications

7.1 Fire and Fire Suppression

7.1.1 Increase in Fire Frequency/Intensity (Avg. Score: 2.00)

- NJ Specific Threats:** 7.1.1.1 Increase in frequency and intensity of wild fires as a result of droughts and heat waves drying out vegetation and litter.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need
Maritime Sunflower Borer Moth

- 7.1.1.2 Increase in frequency of wild fires as a result of illegal activities.
- 7.1.1.3 Unnatural fire regimes occurring as a result of military exercises.
- 7.1.1.4 Lack of diversity in age structure and composition of vegetation due to expansive, frequent fires.

7.1.2 Suppression of Fire Frequency/Intensity (Avg. Score: 2.00)

- NJ Specific Threats:** 7.1.2.1 Shift in vegetative communities as a result of suppression of natural fires.
- 7.1.2.2 Lack of diversity in age structure and composition of vegetation due to the suppression of fire.

7.3 Other Ecosystem Modifications

7.3.2 Inappropriate timing of mowing (Avg. Score: 3.00)

- NJ Specific Threats:** 7.3.2.1 Increased risk of direct mortality and/or reduced productivity of wildlife, as well as reduced use by migrating species.

7.3.4 Lack of natural disturbance patterns or ecosystem functions due to species loss (Avg. Score: 3.00)

- NJ Specific Threats:** 7.3.4.5 The lack of forest disturbance minimizes the diversity of herbaceous vegetation and other shrubs and trees that need a lot of sunlight to grow.

7.3.5 Poor habitat management (Avg. Score: 3.00)

- NJ Specific Threats:** 7.3.5.1 Improper or poorly scheduled maintenance of man-made corridors (e.g., roadsides and medians) can cause direct mortality to and may reduce productivity of wildlife.
- 7.3.5.2 Shifting from natural vegetation to lawns can cause increased temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.
- 7.3.5.3 Vegetation clearing removes terrestrial and riparian corridors for animal movement, shelter, and resting areas.
- 7.3.5.4 Vegetation clearing or inappropriate alteration adjacent to aquatic habitats threatens aquatic species by degrading habitat and water quality (altering temperature and dissolved oxygen, increasing siltation and desiccation, etc.).
- 7.3.5.5 Habitat management that alters or removes vegetation without implementing long-term management increases the risk of invasive and exotic plants establishing themselves, outcompeting native vegetation.
- 7.3.5.6 Habitat management, including that which occurs on public and private lands, that does not consider timing and species' behaviors can result in the direct mortality and/or alteration or loss of habitat.
- 7.3.5.12 Lack of diversity in age structure and composition of vegetation due to lack of natural disturbances and/or vegetation management.
- 7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.
- 7.3.5.18 Lack of funding or competitive market prices to maintain native grasslands for grassland-dependent species causes conversion of fallow or hay fields to other crops or shrublands.

8 **Invasive and Other Problematic Species, Genes and Diseases**

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.1 Unspecified Species (Avg. Score: 1.00)

- NJ Specific Threats:** 8.1.1.1 Displace or outcompete native species for resources.
- 8.1.1.2 Alters, degrades and/or reduces the structural diversity of the natural composition of the landscape, including aquatic systems.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Maritime Sunflower Borer Moth

- 8.1.1.3 Invasive, non-native insects can damage native vegetation at a large scale, leading to die-offs, altering the ecological community.
- 8.1.1.4 Invasive, non-native animals increase the risk of predation on native animals and/or herbivory on native vegetation.
- 8.1.1.5 Invasive, non-native animals and plants increase the risk of introduction and transference of diseases
- 8.1.1.6 Invasive, non-native plants may create physical barriers for some species.

8.1.4 Invasive non-native terrestrial/wetland animals (Avg. Score: 2.00)

NJ Specific Threats: 8.1.4.1 Displace or out-compete native species for resources (food, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.1.6 Invasive non-native fungal/bacterial diseases (Avg. Score: 1.00)

NJ Specific Threats: 8.1.6.1 The introduction of non-native fungal and bacterial diseases threatens native populations and ecosystems.

8.2 Problematic Native Species/Diseases

8.2.2 Named Species (Avg. Score: 1.00)

NJ Specific Threats: 8.2.2.2 Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.

8.4 Problematic Species/Diseases of Unknown Origin

8.4.1 Unspecified Species (Avg. Score: 1.00)

NJ Specific Threats: 8.4.1.1 Non-native or poorly understood diseases and parasites could potentially impact native animals.

8.6 Diseases of Unknown Cause

8.6.0 Unknown Diseases (Avg. Score: 1.00)

NJ Specific Threats: 8.6.0.1 Diseases yet to be identified by pathologists and virologists cause decreased fitness or mortality to native populations.

9 Pollution

9.3 Agricultural and Forestry Effluents

9.3.3 Herbicides and Pesticides (Avg. Score: 3.00)

NJ Specific Threats: 9.3.3.1 Pesticides degrade terrestrial and aquatic habitats, especially streams, ponds and wetlands. Aquatic wildlife are particularly sensitive to these contaminants, which can cause developmental and behavioral abnormalities and reproductive failure. Some contaminants may bioaccumulate in predatory fish and birds and disrupt reproduction.

9.3.3.3 Use of pesticides can directly harm non-target species through direct contact and/or by reducing and/or contaminating their food supply.

9.3.3.4 Use of herbicides can destroy beneficial food and nectar plants for insects.

9.3.5 Control of insect pests and plants leading to mortality of non-target species not associated with agriculture (Avg. Score: 3.00)

NJ Specific Threats: 9.3.5.1 Use of pesticides, insecticides, and/or herbicides can directly harm non-target species, such as amphibians and beneficial invertebrates through direct contact and/or by reducing and/or contaminating their food supply.

9.3.5.2 Use of herbicides can destroy beneficial food and nectar plants for insects.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Maritime Sunflower Borer Moth

9.3.5.4 Improper use of current insecticides, such as those containing esfenvalerate, prallethrin, or piperonyl butoxide, or past use of pesticides containing chlordane still present in the soils, are toxic to various wildlife species, and can cause injury, mortality, or other effects that impair population viability.

9.3.5.5 Use of pesticides and herbicides can minimize the abundance of food sources for native wildlife populations.

9.5 Air-Bourne Pollutants

9.5.4 Other (Avg. Score: 1.00)

NJ Specific Threats: 9.5.4.1 Dust and/or airborne sedimentation from construction sites, agricultural operations or related earth disturbances can introduce mineral or organic sediments into adjacent wildlife habitats, degrading their quality and suitability for wildlife short-term and/or long-term.

9.5.6 Herbicides and Pesticides (Avg. Score: 3.00)

NJ Specific Threats: 9.5.6.1 May result in injury or direct mortality of non-target species.

11 Climate Change and Severe Weather

11.1 Habitat Shifting or Alteration

11.1.0 Macro- and Micro-Climate Alterations (Avg. Score: 3.00)

NJ Specific Threats: 11.1.0.1 Alters native terrestrial and aquatic habitats at the macro- and micro-climate levels that can affect suitability for wildlife, in particular specialist species.

11.6 Phenology Shifting or Alteration

11.6.1 Phenology shifts related to pollination ecology (Avg. Score: 1.00)

NJ Specific Threats: 11.6.1.1 Alters inter-specific relationships of wildlife and vegetation, ultimately leading to detrimental impacts on the ecological system.

11.6.3 Phenology shifts related to species redistribution (Avg. Score: 1.00)

NJ Specific Threats: 11.6.3.1 Shifts in timing of species migration, breeding and hibernation, and available food resources, as a result of wildlife range shifts driven by climate change.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory (Avg. Score: 3.00)

NJ Specific Threats: 12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.1.2 Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.

12.1.2 Lack of up-to-date existing information (Avg. Score: 3.00)

NJ Specific Threats: 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

12.1.3 Need to answer research question (Avg. Score: 3.00)

NJ Specific Threats: 12.1.3.1 There are significant knowledge gaps regarding distribution, dispersal, diseases, population trends, etc. of SGCN.

12.1.4 Need to develop new technique (Avg. Score: 3.00)

NJ Specific Threats: 12.1.4.1 Improve and evaluate survey methods for SGCN and their habitats; alter as needed.

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms (Avg. Score: 1.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Maritime Sunflower Borer Moth

- NJ Specific Threats:** 12.3.0.1 Regulatory habitat protections within state land use regulations are spatially limited to specific geographic areas (e.g., Pinelands, Coastal Area) or geographic features (e.g., wetlands, streams) and so fail to protect critical habitats that exist outside of these regulated areas.
- 12.3.0.7 Activities that threaten SGCN, their food sources, and/or habitats are often regulated separately and without consideration for the cumulative and synergistic effects over time or over a larger spatial scale. Therefore, regulations can fail to protect SGCN populations over time.
- 12.3.0.9 Prescribed burns implemented by the NJ Forest Fire Service are constrained by State air quality regulations to a timeframe where seasonal weather conditions are less than ideal for effective burning. As a result, the Forest Fire Service is limited in the number of overall prescribed burns it can implement to restore habitat for wildlife.
- 12.3.0.10 Land use regulatory processes pertaining to habitat creation, enhancement or restoration projects can be costly and/or burdensome, precluding or discouraging the development or implementation of conservation projects.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform (Avg. Score: 1.00)

- NJ Specific Threats:** 12.4.0.1 A species-by-species management focus as opposed to ecological systems and biodiversity generally has greater opportunity for unintended consequences for other species and may be less efficient in developing appropriate management actions.
- 12.4.0.2 Policies and procedures for lands management that lack consideration of the impacts of activity timing can result in unintended impacts to wildlife during vulnerable periods.
- 12.4.0.5 Bureau of Forest Fire Management policy has traditionally implemented prescribed burns on State lands for the sole purpose of public safety (i.e., addressing hazard fuel reduction), missing opportunities to burn in a manner that would additionally manage habitat for ecological diversity.
- 12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats (Avg. Score: 3.00)

- NJ Specific Threats:** 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.
- 14.1.1.2 Lack of general knowledge of SGCN life histories and vulnerabilities as they relate to land management practices.
- 14.1.1.3 Lack of understanding of the need to manage both natural and anthropogenic (e.g., yards, lawns, hayfields, etc.) habitats to minimize impacts or increase benefits to SGCN and their habitats.

14.2 Outreach needs

14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions (Avg. Score: 3.00)

- NJ Specific Threats:** 14.2.1.1 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various forest management practices.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning (Avg. Score: 1.00)

NJ Specific Threats: 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Actions to address the Threats and Action Drivers associated with this Conservation Target:

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.2 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to increase the effective size of SGCN habitats by protecting/restoring adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats.
- 1.2.1.5 Secure and promote the protection/restoration of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through incentive programs.
- 1.2.1.6 Secure and promote the protection/restoration of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers through incentive programs.
- 1.2.1.8 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to municipalities, land developers, and other land managers to retain and/or enhance native vegetation adjacent to aquatic habitats, and along riparian areas and wildlife movement corridors.
- 1.2.1.9 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing Forestry Stewardship Programs.
- 1.2.1.10 Coordinate across government agencies and non-government organizations to maximize the availability of and enrollment in existing landowner incentive programs (e.g., "farm bill," partners, etc.) to maintain and/or improve habitat.
- 1.2.1.11 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 1.2.1.12 Create incentives (non-monetary and/or monetary) for land developers to redevelop abandoned areas (e.g., shopping centers, office complexes) to minimize the loss of natural habitats and reduce the extent of impervious surfaces as part of new construction to increase water recharge in those areas.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Maritime Sunflower Borer Moth

- 1.2.1.13 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to land developers to minimize the impacts of new residential and commercial developments on SGCN and their habitats.
- 1.2.1.14 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of herbicides and pesticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.15 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of rodenticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.16 Create incentives (non-monetary and/or monetary) within State regulations (mitigations requirements or credit, BMP satisfaction, etc.) to promote the use of retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.17 Develop a public-relations oriented certification program for private retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.18 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and land managers to control and reduce the impacts of invasive, native and non-native species in order to increase structural habitat diversity.
- 1.2.1.19 Create incentives for federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to farmers, woodland landowners, and private landowners to adopt and/or endorse consistent BMPs concerning controlled burns to maintain and/or improve wildlife habitat.
- 1.2.1.20 Coordinate across government agencies and non-government organizations to create or expand upon tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMP's.
- 1.2.1.21 Create and/or support market-based programs that subsidize or create branding for products derived sustainably from managed wildlife habitats.
- 1.2.1.22 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to horse/livestock farm owners and managers to increase structural habitat diversity in and around the farms by managing vegetation for a variety of species, in particular, farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 1.2.1.23 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to provide cost shares and/or plan approvals for management based on management approaches and prescriptions.
- 1.2.1.24 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners, with habitat of suitable patch size to support breeding grassland-dependent species, to alter the timing of vegetation management to benefit grassland and pollinator species.
- 1.2.1.26 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing landowner incentive programs.

- 1.2.1.28 Create incentives to implement dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.

2 Direct Management of Natural Resources

2.3 Fire management

2.3.2 Fuel reduction

- 2.3.2.1 Prevent wildfires by reducing natural fuel (e.g., leaf litter).

2.3.3 Prescribed burning

- 2.3.3.1 Evaluate different management techniques of prescribed burns that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 2.3.3.2 Conduct prescribed burning in Northern New Jersey forests to maintain and regenerate a mosaic of upland forest habitats.
- 2.3.3.3 Conduct prescribed burning to improve wildlife habitat.

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

- 2.8.0.1 Control invasive insect infestations by implementing BMP strategies through biological, chemical and/or mechanical means that will depress, or when appropriate, eradicate populations in a manner that avoids excessive harm to non-target species using BMPs to control infestations and limit their spread based on an inventory of invasive insect distribution and response to outbreaks.
- 2.8.0.2 Develop, implement, monitor and evaluate pest control/management strategies to reduce the impacts of over-abundant wildlife species (native and/or native, invasive species) on native vegetation and the degradation of habitats supporting SGCN. Over-abundant wildlife species include but are not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.
- 2.8.0.5 Implement biologically safe and appropriate control/management strategies, and where appropriate, eradication strategies to reduce the impacts and/or limit the distribution of invasive and/or non-native plant species within or near aquatic systems using methods that will provide the most protection to the aquatic and riparian ecological system, and minimize disturbance to the soil and wildlife. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.
- 2.8.0.6 Implement long-term management of invasive and/or non-native plants to help maintain functioning ecological systems and biological diversity, and to enhance travel corridors. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

- 2.10.0.1** Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 2.10.0.2** Improve the availability of prey/food resources through terrestrial and aquatic plantings and habitat restoration for SGCN populations, in particular for those populations thought to be limited due wholly or in part to a lack of (or contaminated) food resources, and for migratory species (birds, bats, invertebrates).
- 2.10.0.3** Restore and/or enhance habitats to benefit urban-associated SGCN.
- 2.10.0.4** Restore and/or enhance suitable travel corridors connecting conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats.
- 2.10.0.5** Implement habitat restoration and/or enhancement activities that include the creation of vegetative buffers between sensitive habitats (e.g., aquatic systems) and human-inhabited areas (e.g., residences, parks, etc.) and that is conducted during appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity
- 2.10.0.6** Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats.
- 2.10.0.7** Restore/reclaim and enhance degraded rare species habitats through strategic revegetation and management efforts for documented/target SGCN.
- 2.10.0.8** Protect significant natural and/or unique communities by implementing best management practices when conducting habitat restoration strategies.
- 2.10.0.9** Restore and/or enhance riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation, alteration and/or changes in hydrology and subsequent disturbances to and behavioral changes of wildlife (e.g., restoring biologically appropriate buffers, revegetation or restoration efforts, etc.).
- 2.10.0.10** Minimize the loss of important habitats (e.g., coastal scrub-shrub and grassy habitats, high and low marsh habitats, etc.) that provide nesting, migrating, and wintering areas for SGCN birds and other coastal and marsh-dependent species through habitat restoration efforts.
- 2.10.0.11** Restore and/or enhance critical migratory terrestrial and aquatic habitats (e.g., beach, grasslands, forest, scrub-shrub, etc.) for songbirds, raptors, shorebirds, waterfowl, bats and invertebrates through habitat restoration efforts and expand habitat restoration to adjacent private lands to increase the effective size of the habitat.
- 2.10.0.12** Create and/or maintain scrub-shrub habitats through revegetation efforts with little to no impact on forested, wetland and grassland habitats to maintain populations of shrub-dependent SGCN.
- 2.10.0.14** Implement best management practices (BMPs), protective strategies and guidelines for restoring and enhancing healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

Maritime Sunflower Borer Moth

- 2.10.0.15 Restore and/or enhance terrestrial and aquatic habitats proximate to but not adjacent to roads and other transportation corridors for terrestrial-bound SGCN species whose behavior (i.e., dispersal across roads) may be altered by doing so, and therefore decrease road mortality of such species (e.g., amphibians, snakes, turtles, small mammals).
- 2.10.0.21 Restore and/or enhance understory habitats that suppress invasive species and provide critical resources and enhance sheltering, foraging, and nesting cover for wildlife.
- 2.10.0.22 Restore and/or enhance terrestrial and aquatic habitats to promote the regeneration of native vegetation and enhance structural diversity to benefit SGCN (e.g., vegetative buffers of aquatic systems, allow coarse, woody debris to remain in terrestrial, aquatic and riparian habitats to provide shelter, riparian stabilization and necessary microclimates, plant native trees, shrubs and grasses, etc.).

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.
- 2.11.0.2 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas for target SGCN and/or species groups; management should complement rare species needs in a targeted area.
- 2.11.0.3 Create suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats through vegetation management.
- 2.11.0.4 Implement vegetation management strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife, particularly SGCN.
- 2.11.0.5 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats through vegetation management.
- 2.11.0.6 Reclaim degraded rare species habitats by conducting vegetation management needed to restore habitat value for the documented/target SGCN.
- 2.11.0.7 Protect significant natural and/or unique communities by implementing best management practices through vegetation management.
- 2.11.0.23 Implement appropriate habitat management actions in areas where natural disturbances, such as wildfire, have been precluded.
- 2.11.0.24 Conduct vegetation management adjacent to aquatic habitats following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.25 Conduct vegetation management along access roads following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.26 Conduct vegetation management along roadsides and medians, avoiding peak activity periods for wildlife, that enhances wildlife dispersal naturally and safely across roads and similar barriers to/between terrestrial and/or aquatic habitats.
- 2.11.0.27 Conduct vegetation management for target shrub- or young forest-dependent SGCN following BMPs to minimize the risk of the establishment of invasive and non-native plants.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Maritime Sunflower Borer Moth

- 2.11.0.28 Conduct vegetation management in agricultural areas following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.29 Conduct vegetation management on transportation and service corridors (i.e., rights-of-way) following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.30 Identify and prioritize areas where various management tools (such as increasing salinity through the management of water levels or chemical applications) may be effective in reducing phragmites within and restoring marsh habitat.
- 2.11.0.31 In areas where vegetative communities are shifting due to fire suppression and controlled burns are not feasible, manage vegetation to improve wildlife habitat.
- 2.11.0.32 Increase structural habitat diversity around and when feasible, within agricultural landscapes by managing vegetation for a variety of species, in particular, those farms that have removed scrub-shrub habitat and/or fragmented forests, and by implementing ecologically best practices (e.g., no-till farming, maintaining hedgerows, buffer set-asides, etc.).
- 2.11.0.33 Increase structural habitat diversity by implementing long-term vegetation management to minimize the potential for the establishment of invasive and/or non-native plants that may outcompete native vegetation.
- 2.11.0.34 Increase structural habitat diversity by managing residential, commercial and recreational areas' landscapes for a variety of species. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.36 Increase structural habitat diversity by managing vegetation for a variety of species and considering their life history requirements (e.g., travel corridors, shelter, resting and breeding areas) to minimize the risk of harm.
- 2.11.0.38 Increase structural habitat diversity in and around horse/livestock farms by managing vegetation for a variety of species, in particular, in and around farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 2.11.0.39 Increase structural habitat diversity in and around solar farms by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.40 Increase structural habitat diversity surrounding areas used for energy, mining, and transportation and service corridors by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides, and avoid managing habitat during the breeding seasons for ground-nesting birds, reptiles, amphibians and small mammals.
- 2.11.0.41 Increase structural habitat diversity through the implementation of a variety of vegetation management practices such as prescribed burns (either increasing or decreasing their frequency depending on the site and objective), plantings, etc. that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.

- 2.11.0.42 Increase structural habitat diversity within wind farms for terrestrial bound and low-flying species and around wind farms for other wildlife by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.43 Manage forests to increase variation in age structure and composition using BMPs that promote and maintain functioning ecological forest-based systems and biological diversity.
- 2.11.0.45 Regularly and/or rotationally create young forest habitat in targeted areas to maintain and regenerate a mosaic of upland forest habitats that will benefit shrub- and young forest-dependent species.

2.14 Wildlife disease management

2.14.0 Wildlife disease strategy development and investigation

- 2.14.0.1 Investigate diseases/pathogens impacting SGCN and/or their habitats.
- 2.14.0.2 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
- 2.14.0.3 Protect SGCN from exotic pathogen introduction or incident through implementation of a "rapid response plan"; DFW to give priority attention to these species in planning and/or implementing a response.
- 2.14.0.4 Conduct long-term monitoring of diseases in vulnerable wildlife to determine the magnitude of exposure within populations and around the State, the impacts to those species, in particular SGCN, and investigate the feasibility of mitigating for such impacts.
- 2.14.0.5 Assess the impacts of diseases on the life cycles of wildlife.

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

- 3.0.0.1 Conduct long-term monitoring of resident and migratory SGCN populations using standardized survey protocols to determine the variables that may impact their long-term persistence in the State (e.g., population viability, distribution, dispersal, home range and habitat use, travel corridors, food availability, vulnerability to pollutants and disease, etc.). Compile this information to determine the likely causes of population declines and to understand metapopulation dynamics. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.2 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) where data gaps exist regarding SGCN distribution, and their critical and supportive habitats. Conduct surveys using standardized survey protocols to acquire baseline data, and provide the data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
- 3.0.0.3 Gather baseline data on SGCN inhabiting permanently protected natural lands regarding their distribution and population (e.g., abundance, dispersal, demography including productivity and survival, etc.), and identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) critical and supporting habitats within those landscapes.
- 3.0.0.4 Conduct long-term studies on SGCN inhabiting permanently protected natural lands to develop population trend data and changes in demography, and to determine if critical and/or supporting habitats are limited or changing; i.e., diminishing in value, acreage or connectivity.

Maritime Sunflower Borer Moth

- 3.0.0.7 Collect baseline data to document species distributions, in particular SGCN, and current habitat for future analysis of possible distribution shifting as a result of habitat shifting or alteration associated with climate change impacts.
- 3.0.0.8 Conduct long-term studies and compare baseline metrics of documented species distributions and associated habitats to identify possible species and/or habitat shifting or alteration associated with climate change impacts.
- 3.0.0.13 Investigate the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats. Evaluate and modify management practices as appropriate.
- 3.0.0.14 Identify areas with invasive, aquatic plants and animals and collect a detailed baseline assessment of the species' status and distribution. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort. Researchers and contractors performing Forest Stewardship Inventories and/or Plans on state lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.0.0.15 Conduct long-term monitoring of areas identified as having invasive, aquatic plants and animals to track the species' status/progress over time with or without the implementation of management strategies. Areas without management strategies should be assessed and prioritized for management/control. Areas where management strategies are being implemented should include an assessment of the management effort and identify/recommend and implement necessary changes to improve its success. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort.
- 3.0.0.26 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species including objectives and guidance pertaining to and the condition/status of critical and supporting habitats.
- 3.0.0.27 Evaluate the effectiveness of strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals through research and monitoring. Develop and provide NJ DEP and other appropriate governing agencies/commissions a summary of findings and recommendations to improve such efforts.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.1 Division of Fish and Wildlife should maintain a robust, up-to-date database and mapping of species occurrences.
- 3.2.0.7 Track (via a database that includes a GIS component) and research problematic species and diseases to determine their distribution, impacts on SGCN wildlife/wildlife communities, and develop potential control measures.
- 3.2.0.8 Implement and conduct long-term monitoring of control measures aimed at minimizing the impacts of problematic species and/or diseases to evaluate the effectiveness of such efforts and to identify and incorporate additional strategies as appropriate.
- 3.2.0.18 Conduct baseline surveys/inventories to better understand the distribution of fish and invertebrate (including freshwater mussels) populations.

3.2.1 Abundance determination

Maritime Sunflower Borer Moth

- 3.2.1.1 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) population abundance and trends for SGCN using standardized survey protocols. Provide data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
 - 3.2.1.2 Conduct wildlife surveys on resident and migratory SGCN regarding their population abundance and trends.
 - 3.2.2 Age, size and sex structure
 - 3.2.2.1 Conduct wildlife surveys on resident and migratory SGCN regarding their survivorship.
 - 3.2.3 Baseline inventory
 - 3.2.3.9 Investigate hazardous environmental issues that may impact grassland invertebrates.
 - 3.2.7 Population assessment
 - 3.2.7.1 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
 - 3.2.7.2 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species to meet and maintain recovery goals.
- 3.3 Research, survey or monitoring - habitat
 - 3.3.1 Baseline inventory
 - 3.3.1.1 Conduct habitat assessments of significant natural and/or unique communities to identify threats to native terrestrial and aquatic habitats through systematic monitoring, review of available data, enlistment of habitat management and/or species experts, etc. Incorporate findings into a database that includes descriptions/qualifiers of the habitats, identifies and values/qualifies the threats, and includes a GIS component of the locations of the assessed areas. Share this information with landowners/managers (e.g., federal, state and local government agencies or non-government organization).
 - 3.3.1.2 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) resident and migratory SGCN habitats. Investigate their suitability for the various life history requirements of the species that dependent upon them to determine the ability for maintaining applicable SGCN populations in perpetuity.
 - 3.3.1.4 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and investigate the suitability of corridors that connect large, contiguous tracts of similar habitats to increase their effective size (i.e., forest with forest, grassland with grassland, wetlands with wetlands, etc.) for dependent SGCN.
 - 3.3.1.5 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) where habitat restoration and/or enhancement would benefit wildlife SGCN.
 - 3.3.1.6 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) that could, through revegetation and/or enhancement efforts, become suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN.
 - 3.3.1.7 Map and prioritize existing and potential areas for early succession forest management. Share the results with state, county and municipal planners.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Maritime Sunflower Borer Moth

- 3.3.1.8 Assess the availability and suitability of forest habitats for SGCN species (particularly reptiles and amphibians, birds, pollinators, and tiger beetles) in southern forests since Superstorm Sandy.
- 3.3.1.10 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and document fish SGCN habitats by plotting their distributions in GIS and submitting the data to the State for integration into the DEP's Biotics database.
- 3.3.1.16 Gather "best information" for spatial modeling and update/create a current model/depiction of anticipated habitat shifts from sea-level rise, flooding, etc.
- 3.3.1.17 Identify and map undeveloped roads and trails in all conserved forests, and create a database of locations. Integrate information regarding potentially sensitive areas.
- 3.3.1.18 Conduct an assessment using available data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels.
- 3.3.1.19 Identify and codify legal ORV access areas on state (and if appropriate, other conserved) lands. Provide GIS mapping to the landowner for potential use in directing such recreational activities.
- 3.3.1.20 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) where invasive, non-indigenous plants and animals are either already established or are becoming established. Create a system for reporting and qualifying new locations of invasive species and for prioritizing areas for control measures according to the potential level of impact on the ecosystem and SGCN and the likelihood of success. Researchers and contractors encountering invasive plant species while performing plant and/or forest inventories on state or other conserved lands and/or private lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.3.1.24 Conduct regular investigations of SGCN habitat health and biodiversity on public and private lands to identify locations in need of revegetation, reduction of over-abundant, native wildlife and/or exotic species, conservation focal areas requiring limitations on human activity, etc.

3.3.2 Monitoring

- 3.3.2.2 Conduct long-term monitoring of resident and migratory SGCN habitats using standardized survey protocols to determine changes in habitat quality/suitability and threats (e.g., habitat loss and degradation, increased edge habitat, water quality) and other variables that may impact their long-term persistence in the State and to provide information needed for determining causes of population declines and understanding metapopulation dynamics.
- 3.3.2.3 Continue to update wildlife and habitat databases and revise models of critical SGCN habitats using the most current data available and where lacking, develop new SGCN and/or habitat models as data on species habitat requirements and applicable GIS data layers become available.
- 3.3.2.8 Evaluate the effectiveness of current prescribed burning practices on Pinelands dependent species.
- 3.3.2.10 Evaluate the efficacy and success of different management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.3.2.11 Evaluate and compare the effectiveness of delayed mowing of warm season grass fields versus cool season hay fields to benefit grassland-dependent species.

- 3.3.2.12 Evaluate and compare the effectiveness of different management techniques (e.g., prescribed burning, mowing, brush-hogging, etc.) for maintaining suitable habitat for grassland-dependent species and species dependent upon early successional habitats.
- 3.3.2.13 Evaluate the effectiveness of management strategies (e.g., timing restrictions for mowing, cooperative agreements with utility companies for maintenance of rights-of-ways) that maintain and enhance large existing areas of grassland in perpetuity. Focus on habitat patches that can be managed to enhance the total size of suitable grassland habitat and create interspersed early-successional habitat.
- 3.3.2.15 Investigate the effectiveness of management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.3.2.16 Evaluate the effectiveness of best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 3.3.2.20 Once a system is developed for reporting and qualifying new locations of invasive species, develop, implement and monitor/evaluate invasive species removal strategies at identified locations. Priority should be given to those areas critical to SGCN and/or contain unique and/or rare plant communities supporting SGCN and/or other fish/wildlife species.

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.1 Work with land management agencies to determine the appropriate actions needed to restore/reclaim degraded habitat for the documented/target SGCN.
- 3.5.3.3 Develop/improve management techniques that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.9 Develop strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 3.5.3.11 Develop strategies to protect native terrestrial and aquatic habitats and dependent SGCN species from the identified threats.
- 3.5.3.15 Modify management practices based on the effects of pesticides, herbicides and other biological controls on critical and supporting SGCN habitats.
- 3.5.3.16 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.
- 3.5.3.19 Work with foresters to develop prescribed burning practices for Pinelands dependent species that increase or maintain habitat quality for these species in the Pinelands.
- 3.5.3.21 Develop management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.

- 3.5.3.22 Identify (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) and modify management strategies (e.g., timing restrictions for mowing, cooperative agreements with utility companies for maintenance of rights-of-ways), based on research, that maintain and enhance large existing areas of grassland in perpetuity.
- 3.5.3.24 Based on research, modify management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.5.3.25 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to develop the necessary management strategies to reach or maintain viable population levels.
- 3.5.3.29 Explore the use of alternative vegetation (i.e., commodity crops) to address agriculture concerns.

3.5.4 Fish and wildlife research, survey and management techniques

- 3.5.4.5 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
- 3.5.4.6 Investigate the feasibility of mitigating for the impacts of contaminants to vulnerable wildlife, particularly SGCN. Maintain records on exposure of vulnerable wildlife to environmental toxins (such as flame retardants and endocrine disruptors), so that sources may be identified and controlled or eliminated.
- 3.5.4.14 Develop and implement agreements, and update existing agreements, with government agencies regarding the protection of critical SGCN habitats (e.g., significant breeding populations of beach nesting birds, colonial waterbird nesting areas, bat colonies, etc.).
- 3.5.4.15 Investigate the success of management strategies used to protect and/or enhance SGCN populations and when appropriate, aid in identifying failures/resource problems and issues, and developing new strategies.
- 3.5.4.16 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels and develop the necessary management strategies.
- 3.5.4.18 Investigate the effectiveness of survey techniques through selected “ground truthing” and literature and peer review in order to increase efficacy of survey, minimize surveyor bias and error, and increase accuracy of trend data.
- 3.5.4.19 Develop reliable, standardized survey and monitoring protocols for SGCN species, for which none currently exist, and their habitats.
- 3.5.4.21 Develop BMPs to address problematic species and diseases of unknown origin.

4 Education

4.1 Educator/Instructor training

4.1.0 Public education

- 4.1.0.1 Provide educational resources and training programs to private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.

5 Facilities and Areas

5.15 Wildlife Management Areas

5.15.6 Roads

- 5.15.6.1 Clearly post areas/roads where vehicle access is permitted.
- 5.15.6.2 Clearly post areas/trails where vehicle access is not permitted.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

- 6.0.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.7 Secure and protect critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.8 Secure and protect scrub-shrub habitats for SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

6.3 Conservation area designation

6.3.0 Conservation area designation strategies

- 6.3.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN and/or connect conserved SGCN habitats through conservation area designations.
- 6.3.0.8 Promote the protection of scrub-shrub habitats for SGCN through conservation area designations.

6.4 Private lands agreements

6.4.0 Private land agreement strategies

- 6.4.0.1 Enter into private lands agreements to expand control burns on private lands, in particular those adjacent to conserved lands to improve SGCN habitats.

7 Law Enforcement

7.1 Law enforcement

7.1.3 Sub-national Level

- 7.1.3.2 Increase the number of law enforcement officers tending to wildlife issues to a reasonable number to sufficiently cover the State and marine waters.

7.1.4 Scale Unspecified

- 7.1.4.12 Implement policies and/or regulations that protect significant natural and/or unique communities in perpetuity.
- 7.1.4.19 Implement policies that protect and restore scrub-shrub habitats to benefit shrub-dependent SGCN.
- 7.1.4.26 Educate law enforcement personnel that there may be unauthorized research projects taking place and to encourage them to investigate any activities that appear to be harmful to wildlife.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.2** Develop a team of personnel from government entities, conservation organizations and other stakeholders engaged in oil/gas spill response for marine and freshwater habitats to develop a feasible plan for oil spill response and/or to amend NJ's current oil spill response plan that clearly outlines each organizations responsibilities and an assessment and location list of available equipment for boom deployment during oil spills.
- 8.1.0.3** Develop an outreach team of personnel from government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 8.1.0.4** Engage government agencies, conservation partners and other stakeholders in constructive dialogues encouraging them to influence policy change and the creation of incentives through a habitat bill and/or municipal ordinances for backyard habitat.
- 8.1.0.15** Engage government agencies, conservation partners and other stakeholders in discussions encouraging and supporting the creation of laws and policies requiring vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 8.1.0.16** Engage local governments in discussions regarding the importance of them adopting/passing ordinances which require assessing and addressing secondary impacts (i.e., ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 8.1.0.17** Engage municipalities in constructive dialogue to identify and minimize destruction of areas prioritized for early succession forest management.
- 8.1.0.18** Engage NJDOT, NJ Transit Authority and other road management entities, wildlife conservation organizations/agencies (e.g., Division of Fish and Wildlife, New Jersey Conservation Foundation, Conserve Wildlife Foundation of NJ), and communities and citizens in discussions regarding the importance of and methods to enhance habitat connectivity, and work together to develop feasible strategies for ensuring that wildlife can disperse naturally and safely across roads and similar barriers to terrestrial and/or aquatic habitats.
- 8.1.0.19** Engage government agencies, conservation partners and other stakeholders to collaboratively develop a list of important projects, targeting SGCN and/or their habitat, as a guide for graduate student research. Distribute the list and contact information to all State colleges and universities.
- 8.1.0.20** Organize a small focal group of government and non-government agencies/organizations responsible for decisions regarding beach/dune management to share and coordinate their goals so that comprehensive planning can attempt to meet all needs.
- 8.1.0.21** Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation human-subsidized and/or overabundant, native species cause to local nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.22** Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation invasive species cause to native nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.24** Engage government agencies, conservation partners and other stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Maritime Sunflower Borer Moth

- 8.1.0.25 Provide technical support to public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.26 Coordinate across federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to woodland landowners to adopt or endorse consistent best management practices concerning controlled burns to maintain and/or improve forested habitat for wildlife.
- 8.1.0.30 Encourage government agencies and conservation partners to advise members of the relevant scientific community of the need for specific studies, reports or investigations targeting the data-deficiency regarding SGCN and/or their habitats.
- 8.1.0.34 Work with the NJ Education Association and Department of Education to design curriculum and outdoor experimental learning opportunities, and provide training to teachers on implementation of these activities.
- 8.1.0.37 Enlist landowners and NJ citizens in the protection of and survey efforts for SGCN, in particular rare species, by increasing enrollment in landowner incentives, forest stewardship, backyard habitat management and wildlife-related volunteer programs.
- 8.1.0.38 Engage partners, stakeholders and land managers in constructive dialogue promoting forest stewardship for SGCN that use core forests and forested corridors.
- 8.1.0.40 Encourage researchers, land managers, naturalists and enthusiasts to follow proper procedures for the coordination and/or permitting of research/management activities involving wildlife and sensitive habitats, and discourage activities that alter vegetation or wetlands, or cause harm or disturbance to wildlife.
- 8.1.0.42 Engage citizens, wildlife observers and photographers through discussions and distributable information regarding the importance of and encouraging implementing responsible and ethical behavior when observing wildlife by developing an alliance of wildlife photographers and widely circulating recommendations on how to reduce impact.
- 8.1.0.44 Engage conservation partners, stakeholders, government agencies and other land stewards in constructive dialogues encouraging their inclusion of controlled burns in forest and other stewardship plans.
- 8.1.0.47 Form cooperative partnerships with energy companies to facilitate habitat creation and enhancement away from and outside of project areas, the restoration of appropriate habitats within project areas (e.g., rights-of-way could benefit butterflies and some bird species), and to identify seasonal timing of activities that would minimize impacts to wildlife.
- 8.1.0.48 Form cooperative partnerships with transportation and shipment agencies and companies to facilitate habitat creation and enhancement away from and outside of project areas and to identify seasonal timing of activities that would minimize impacts to wildlife.

8.2 Recruitment and retention activities

8.2.3 For wildlife watching

- 8.2.3.1 Develop and implement nature-focused tourism opportunities including wildlife viewing sites, interpretive signage highlighting unique ecosystems/habitats, and wildlife-related recreational opportunities that do not negatively impact SGCN or their habitats.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need
Maritime Sunflower Borer Moth

- 8.3.0.7 Develop and provide (or otherwise make publicly available) educational programs and/or materials that describe the negative impacts of off-road vehicles and watercraft use in and adjacent to critical SGCN habitats, and the importance of confining such activities to more appropriate locations and/or seasons.
- 8.3.0.8 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate recreationists and encourage landowners to eliminate garbage in the vicinity of suitable wildlife habitat, in particular SGCN habitat. Information should include the detrimental impacts garbage may have on various wildlife species.
- 8.3.0.9 Develop and provide (or otherwise make publicly available) educational programs and/or materials to enlist landowners and land managers to include only native plants in landscaping and restoration projects. Provide information to assist them in detecting problematic establishment of invasive, non-indigenous plants.
- 8.3.0.10 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate landowners and NJ citizens on threats to fish and wildlife (including marine animals).
- 8.3.0.11 Develop and provide (or otherwise make publicly available) educational programs and/or materials to the public, wildlife-related professionals, foresters, etc., that describe the value of species that are often feared (e.g., snakes, bats, spiders, Allegheny woodrat) and/or deemed a "nuisance" (e.g., squirrel, deer, snapping turtle), and therefore, persecuted by people. Include information on tolerance, proper identification, eviction from human dwellings, how to minimize the animal's presence on the property, and/or how to live in harmony with the animal.
- 8.3.0.12 Promote awareness of WSFR (Wildlife and Sportfish Restoration) Outreach/Awareness grants, an important funding source for conservation among hunters and anglers as well as the general public.
- 8.3.0.13 Conduct an educational campaign to encourage observer ethics and respect for wildlife and natural habitat.
- 8.3.0.24 Develop educational outreach programs for local decision-makers, land developers, landowners and citizens about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
- 8.3.0.25 Develop educational outreach programs for landowners, nurseries and the general public regarding the negative impacts of invasive and non-native plants on our natural communities.
- 8.3.0.26 Develop educational outreach programs for private and public landowners and land managers regarding the importance of and how to manage core forests and forested corridors in a way that will be beneficial for SGCN, particularly endangered, threatened and special concern species.
- 8.3.0.27 Develop educational outreach programs for public and private landowners and land managers regarding the importance of structural habitat diversity, methods to increase diversity, and/or incentive programs available to increase habitat diversity.
- 8.3.0.28 Develop educational outreach programs for public and private landowners and land managers regarding the importance of managing grasslands for grassland-dependent species, methods of management, and/or incentive programs available.
- 8.3.0.30 Develop educational outreach programs for private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.
- 8.3.0.32 Develop an educational outreach program for landowners and citizens on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

- 9.1.0.1** Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and SGCN inhabiting them.
- 9.1.0.2** Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.1.0.3** Develop a plan that directs the creation of impervious surfaces away from and to minimize impacts on aquatic systems and critical terrestrial habitats. The plan should also include strategies to increase the resiliency of aquatic and critical terrestrial habitats to threats and stressors that would impact the reproduction and survival of wildlife.
- 9.1.0.5** Develop a plan that directs the creation or expansion of energy or utility rights-of-way in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.6** Develop a plan that directs the creation or expansion of roads and railroads or the re-establishment of abandoned railroads within and adjacent to critical forested habitats in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.8** Develop a plan that focuses on strategies for oil pipelines to avoid sensitive habitats that would be highly impacted by oil spills.
- 9.1.0.9** Develop a plan that focuses on strategies to minimize the creation of renewable energy farms (e.g., solar, wind) and related infrastructures within and their impacts on forested habitats and the wildlife community.
- 9.1.0.10** Develop a plan that focuses on strategies to minimize the impacts of mining on critical forested habitats.
- 9.1.0.11** Develop a plan that focuses on strategies to minimize the impacts of power plants on critical forested habitats and the wildlife community.
- 9.1.0.13** Develop a plan to minimize agriculture that would result in groundwater withdrawal in critical forested areas.
- 9.1.0.15** Develop a plan to minimize fragmentation of terrestrial and aquatic habitats by roads.
- 9.1.0.16** Develop a plan to minimize new lawns and preserve natural vegetation within and adjacent to critical forest areas.
- 9.1.0.19** Develop a plan to minimize the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 9.1.0.21** Develop a plan to minimize the use of any-sized dam in critical forested areas.
- 9.1.0.22** Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 9.1.0.28** Develop and coordinate state, regional and local plans for suitable lot layout and landscaping to minimize human-wildlife conflicts that also incorporates habitat connectivity and preservation of natural areas.
- 9.1.0.29** Provide GIS or related data, maps, resource inventories, as well as related training, pertaining to the SWAP and its recommended conservation actions for use or consideration by State, County or municipal planning agencies.

Maritime Sunflower Borer Moth

- 9.1.0.30 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and other related threats associated with development.
 - 9.1.0.33 Review the species, threats, action successes, and habitats, and work with partners to revise the 2017 State Wildlife Action Plan for the 2025 resubmittal.
 - 9.2 Organizational strategic and CMS planning
 - 9.2.1 Organizational strategic and operational planning
 - 9.2.1.1 Identify and codify legal ORV access areas on state lands.
 - 9.3 Species and habitat management planning
 - 9.3.1 Species management planning
 - 9.3.1.3 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
 - 9.3.1.4 Develop town plans that avoid impacts to SGCN species and their habitats.
 - 9.3.1.5 Develop response plans to address disease outbreaks within wildlife populations, in particular SGCN.
 - 9.3.1.7 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
 - 9.3.1.9 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
 - 9.3.1.10 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
 - 9.3.1.13 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
 - 9.3.1.15 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.
 - 9.3.1.16 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.
 - 9.3.3 Habitat management planning
 - 9.3.3.5 Develop a management plan using forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.
 - 9.3.3.7 Develop a management plan to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.
 - 9.3.3.8 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
 - 9.3.3.10 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.

Maritime Sunflower Borer Moth

- 9.3.3.11 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.3.3.13 Develop a management plan that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas and prevents or ameliorates near-term impacts of climate change throughout the State, but in particular within the coastal and Delaware Bay areas.
- 9.3.3.15 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
- 9.3.3.16 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.3.17 Develop a management plan for prescribed burning that will benefit Pinelands dependent species and increase or maintain habitat quality for these species in the Pinelands.
- 9.3.3.18 In cooperation with species and habitat experts, develop management plans for significant natural and/or unique communities, in particular those supporting SGCN, and provide the information to the landowners/managers (federal, state and local government agencies or non-government organization) for review and implementation.
- 9.3.3.19 Develop management plans for SGCN inhabiting permanently protected natural lands using available baseline and population trend data.
- 9.3.3.21 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
- 9.3.3.26 Develop a management plan for parcels of suitable size to be managed for native herbaceous plant species that support breeding grassland dependent species.
- 9.3.3.28 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.
- 9.3.3.29 Develop habitat management plans aimed at reducing or eliminating negative impacts of ORVs.
- 9.3.3.32 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.
- 9.3.3.34 Include controlled burn prescriptions in forest and stewardship plans to improve wildlife habitat.
- 9.3.3.35 Incorporate habitat connectivity, preservation of natural areas, and the implementation of BMPs into state and local land-use policy environmental review process and energy development plans to minimize habitat fragmentation and related threats associated with solar farms and altered habitats.
- 9.3.3.36 Integrate plans for properly located and timed habitat restoration and management along transportation, energy and service corridors to minimize risks to and benefit wildlife.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

- 11.1.1.1 Use Biotics database and Landscape Project Mapping in regulatory reviews to ensure protection by applicable laws and regulations.

- 11.1.1.2 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
 - 11.1.1.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.
 - 11.1.1.5 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
 - 11.1.1.7 Review proposed construction or other work projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
 - 11.1.1.8 Review proposed research projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
 - 11.1.1.12 Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed solar farm projects to reduce habitat fragmentation and minimize impacts on wildlife.
 - 11.1.2 Review of proposed policies and plans
 - 11.1.2.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
- 11.2 Technical assistance
 - 11.2.0 Assorted technical assistance strategies
 - 11.2.0.1 Provide technical support to private and public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
 - 11.2.0.2 Provide technical support to public and private landowners and land managers for controlling invasive, native and non-native plant species in order to increase structural habitat diversity.
 - 11.2.0.3 Develop state, regional and local BMPs that focus on minimizing habitat fragmentation and human-wildlife conflicts associated with development. Make information available to land developers and private and public landowners for implementation.
 - 11.2.0.5 Provide educational resources, training programs, and expert guidance to private and public landowners and land managers on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.
 - 11.2.0.6 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on habitat creation, enhancement and restoration within and adjacent to project areas, as well as away from and outside of project areas (depending on the target species), by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. Wind farms should address both terrestrial bound and low-flying species. Examples of habitat management include, but are not limited to, integrating short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Maritime Sunflower Borer Moth

- 11.2.0.7 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on the importance of maintaining habitat connectivity, minimizing fragmentation, and the use of CHANJ products to help them target areas for such planning.
 - 11.2.0.8 Provide educational resources, training programs, and on-the-ground guidance to public and private landowners and land managers on habitat creation and enhancement strategies that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
 - 11.2.0.9 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and private landowners about the importance of leaving vegetation in place, especially along riparian areas and wildlife movement corridors.
 - 11.2.0.10 Provide technical support to private landowners, consultants, and land managers to create customized management plans based on location and SGCN.
 - 11.2.0.11 Provide educational resources, training programs, and on-the-ground guidance to private and public landowners and land managers on the benefits of and for creating young forest and early succession habitat for SGCN.
 - 11.2.0.12 Provide educational resources and technical support to public landowners and land managers for managing grasslands for grassland-dependent species.
 - 11.2.0.15 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and landowners about the importance of retaining and in an effort to protect, create, enhance and/or restore vegetation along aquatic habitats.
 - 11.2.0.17 Provide educational resources and technical support to public and private landowners and land managers to promote the protection of vernal pools and the protection, enhancement and/or restoration of biologically appropriate buffers.
 - 11.2.0.22 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
 - 11.2.0.23 Provide educational resources and technical support to public and private landowners and land managers of lands adjacent to SGCN habitats to promote the protection and/or enhancement of those adjacent habitats to increase the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and that connect conserved SGCN habitats.
 - 11.2.0.24 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers on how to manage vegetated roadside areas (e.g., mowing, brush-hogging, etc.) on a schedule that avoids peak activity periods for wildlife and therefore, minimizes harm.
 - 11.2.0.25 Provide educational resources, training programs, and on-the-ground guidance to resource managers regarding the assessment of and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) related to residential and commercial development.
 - 11.2.0.26 Make educational resources available to the public that encourage researchers to seek out guidance prior to finalizing proposals and submitting State permit applications to reduce potential impacts on sensitive species.
- 11.2.1 With individuals and groups involved in resource management decision making

Maritime Sunflower Borer Moth

- 11.2.1.1 Engage partners and stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
 - 11.2.1.2 Provide professional training and technical assistance tools (e.g., mapping, guidance documents, justification, etc.) to agencies/divisions/programs within and outside of the NJ DEP regarding the SWAP, and the conservation actions recommended therein to help facilitate SWAP implementation.
 - 11.2.1.3 Provide educational resources, training programs, and on-the-ground guidance to DOD to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop and implement forest management and other practices that minimize disturbances to SGCN (i.e., beyond their federal requirements).
 - 11.2.1.5 Provide educational resources, training programs, and on-the-ground guidance to municipalities, state and federal agency resource managers on tasks such as writing and integrating Beach Management Plans into other management documents.
 - 11.2.1.6 Provide educational resources, training programs, and on-the-ground guidance to resource agencies prior to project initiation to ensure wildlife and their habitats are protected to the highest degree possible during construction, and provisions are in place for post-construction habitat use.
- 11.2.2 With private landowners
 - 11.2.2.1 Provide technical support to farming operations and woodland landowners on ways to decrease clean farming (edge-to-edge) practices and create ecotones to benefit bobwhite and other species dependent on early successional habitat.

100 Law and Policy

100. Legislation

100.1.2 National Level

- 100.1.2.1 Create legislation to establish markets for warm-season grasses to increase the permanency of this crop on the landscape.

100.1.3 Sub-national Level

- 100.1.3.3 Initiate legislative action to establish an annual budgetary line item designating funds to support programs focused on long-term research and monitoring of wildlife diseases.

100.1.4 County and Local

- 100.1.4.2 Secure and increase the effective size of SGCN habitats and connect conserved SGCN habitats through local ordinances.
- 100.1.4.3 Expand the acreages and enhance the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN through local ordinances.
- 100.1.4.14 Adopt/pass local ordinances which require assessing and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 100.1.4.15 Incorporate habitat connectivity and the preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.

100.1.5 Scale Unspecified

- 100.1.5.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 100.1.5.5 Develop legislation to provide financial support for the New Jersey Invasive Species Strike Team.

100. State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.5 Develop policies that will promote improved and secure habitat connections between conserved SGCN habitats.
- 100.3.0.6 Develop policies that will promote expanding acreages and enhancing the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 100.3.0.8 Develop policies and/or regulations with the objective of protecting significant natural and/or unique communities in perpetuity.
- 100.3.0.9 Secure mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.12 Develop policies that promote the preservation and protection of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.
- 100.3.0.18 Develop policies for conserved lands that prohibit planting and supports the control of non-native vegetation and invasive, native vegetation.
- 100.3.0.23 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.31 Create or expand tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMPs.
- 100.3.0.32 Coordinate regulations across agencies to maximize availability of and enrollment in existing Forestry Stewardship Programs (e.g., "Woodland Stewards", Farm Bill, partners, etc.) to maintain and/or improve forest habitat.
- 100.3.0.38 Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.
- 100.3.0.39 Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.3.0.40 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.3.0.41 Explore all State regulatory requirements for mitigation, restoration, habitat management, etc. to ensure they prohibit the use of specified invasive or other problematic plant species.
- 100.3.0.43 Identify and address (amend) regulatory impediments to beneficial habitat management.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need
Maritime Sunflower Borer Moth

- 100.3.0.44 Incorporate requirements for technical support and funding for mitigation or restoration efforts so as to be consistent with existing regulations.
- 100.3.0.45 Increase the controlled burn season to focus on restoring vegetative communities.
- 100.3.0.46 Investigate and/or develop inter-agency Memorandum of Agreements to share common data stored or managed in program-specific databases.
- 100.3.0.48 Propose new State law or regulation mandating that a State-level "development impact fee" be assessed on all new development approved by municipalities (via the Municipal Land Use Law processes), and dedicate such monies to the development and implementation of regional Habitat Conservation Plans (or existing plans/programs serving the same regional function).
- 100.3.0.50 Retain endangered, threatened and special concern wildlife and habitat protection measures in the Water Quality Management Program Rules.
- 100.3.0.52 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded energy sitings and facilities.
- 100.3.0.53 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded rights-of-way corridors associated with energy transport/transmission.
- 100.3.0.60 Develop regulations that when implemented will protect significant natural and/or unique communities in perpetuity.
- 100.3.0.65 Develop regulations that when implemented will protect and restore scrub-shrub habitats to benefit shrub-dependent SGCN.
- 100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.
- 100.3.0.73 Develop regulations that would exempt the conversion of lawns to native vegetation (beneficial to wildlife) from local lawn ordinances.

100.3.2 State Land Acquisition Programs

- 100.3.2.1 Increase opportunities for habitat restoration by making any necessary policy changes to state, federal and local land acquisition programs (e.g., Green Acres, Blue Acres, etc.) to allow for acquisition within abandoned or failing bay shore communities, including mechanisms to relocate displaced people and infrastructure.

100. State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).
- 100.4.0.2 Create a policy that requires the NJ DEP to incorporate scientific information regarding climate change and sea level rise (e.g., predictions, habitat management/acquisition efforts to enhance resilience to inundation) on their websites and to work with other government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 100.4.0.3 Develop policies for mandatory buffer strips on preserved farmlands and state-owned agricultural lands.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need
Maritime Sunflower Borer Moth

- 100.4.0.8 Develop a white paper addressing the impacts that existing, new or expanded rights-of-way have upon wildlife, wildlife habitats and habitat connectivity.
- 100.4.0.10 Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.
- 100.4.0.11 Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.4.0.12 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.4.0.13 Develop policies for different circumstances (e.g., roadsides and medians, riparian, aquatic and terrestrial habitats) that outline appropriate habitat/vegetation management strategies and schedules to minimize risks to and benefit wildlife.
- 100.4.0.14 Develop policies to facilitate agreements between eligible entities to manage appropriate conserved lands for grassland-dependent species, and to have access to/obtain restoration funds.
- 100.4.0.16 Develop policies to implement habitat management strategies that will increase the structural diversity surrounding areas used for energy, mining, and transportation and service corridors which include but are not limited to the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-
- 100.4.0.17 Develop policies to implement habitat management strategies, including prescribed burns, that will increase the structural diversity on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies to control and reduce the impacts of invasive, non-native species in order to increase structural habitat diversity.
- 100.4.0.18 Develop policies to minimize the extent of infrastructure associated with energy and service corridors or areas (e.g., wind and solar farms, pipelines, utility lines) and that require the implementation of habitat management strategies that will increase the structural diversity in the area including (e.g., the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-asides).
- 100.4.0.19 Develop regulations that will minimize the creation of new barriers, remove or replace current barriers with appropriately-sized systems to accommodate wildlife dispersal, and to minimize road widening and traffic volume increases within critical wildlife habitat areas.
- 100.4.0.20 Develop state regulations that require energy developers and utility service companies to implement habitat management strategies that will increase the structural diversity of the habitat, minimize habitat fragmentation and commercial infrastructure, and minimize the loss, alteration and/or degradation of the habitat and adjacent lands when working on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies.
- 100.4.0.24 Develop policies to provide financial support for the New Jersey Invasive Species Strike Team.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Maritime Sunflower Borer Moth

- 100.4.0.25 Develop policies that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

New Jersey Pine Barrens Tiger Beetle

Focal species that comprise this Conservation Target:

New Jersey Pine Barrens Tiger Beetle

Threats and Action Drivers associated with this Conservation Target:

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (Avg. Score: 3.00)
(large and small scale)

NJ Specific Threats: 1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.1.1.2 Loss, alteration and/or degradation of habitat.

1.1.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (Avg. Score: 3.00)
(large and small scale)

NJ Specific Threats: 1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.2.1.2 Loss, alteration and/or degradation of habitat.

1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large (Avg. Score: 2.00)
and small scale)

NJ Specific Threats: 1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.3.1.2 Loss, alteration and/or degradation of habitat.

1.3.1.5 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

2 Agriculture and Aquaculture

2.1 Annual and Perennial Crops (non-timber)

2.1.1 Shifting Agriculture (Avg. Score: 1.00)

NJ Specific Threats: 2.1.1.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.2 Wood and Pulp Plantations

2.2.1 Small Holder (Avg. Score: 1.00)

NJ Specific Threats: 2.2.1.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.

2.2.2 Agro-industry Plantations (Avg. Score: 1.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

New Jersey Pine Barrens Tiger Beetle

NJ Specific Threats: 2.2.2.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.

3 Energy Production and Mining

3.2 Mining and Quarrying

3.2.2 Surface Mining - Rock Quarry (and sand quarries) (Avg. Score: 1.00)

NJ Specific Threats: 3.2.2.1 Fragments terrestrial and aquatic habitats.

3.2.2.2 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

3.3 Renewable Energy

3.3.2 Solar Power (Avg. Score: 1.00)

NJ Specific Threats: 3.3.2.2 Loss, alteration and/or degradation of habitat.

4 Transportation and Service Corridors

4.1 Roads and Railroads

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale) (Avg. Score: 1.00)

NJ Specific Threats: 4.1.1.2 Loss, alteration and/or degradation of habitat associated with road and railroad construction and maintenance, and degradation of adjacent habitats.

4.2 Utility and Service Lines

4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads (Avg. Score: 1.00)

NJ Specific Threats: 4.2.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species, inhibiting dispersal of non-volant animals, reducing gene flow, and creating barriers to fish when service line-associated roads cross streams (e.g., bridges, culverts, fords, etc.).

4.2.1.2 Loss, alteration and/or degradation of habitat associated with rights-of-way construction and maintenance, and degradation of adjacent habitats.

4.2.2 Management of rights-of-way or communication tower facilities and/or their associated access roads (Avg. Score: 1.00)

NJ Specific Threats: 4.2.2.1 Improper or poorly scheduled vegetation management can cause direct mortality to and may reduce productivity of wildlife.

5 Biological Resource Use

5.1 Hunting and Collecting Terrestrial Animals

5.1.1 Intentional Use (Avg. Score: 1.00)

NJ Specific Threats: 5.1.1.1 Illegal collection of wildlife can have detrimental impacts on populations.

5.3 Logging and Wood Harvesting

5.3.1 Intentional Use (subsistence/small scale) (Avg. Score: 1.00)

NJ Specific Threats: 5.3.1.1 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may fragment their terrestrial habitats.

5.3.1.2 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may cause the loss, alteration and/or degradation of wildlife habitat.

5.3.1.3 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase soil erosion, impacting SGCN habitats.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

New Jersey Pine Barrens Tiger Beetle

5.3.1.4 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase the risk of invasive species establishment, impacting SGCN habitats.

5.3.1.5 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may decrease structural diversity and biomass leading to reduced biodiversity and ecological integrity.

5.3.1.6 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices in Atlantic White Cedar stands may destroy a unique wildlife wetland habitat that is difficult, and takes time, to restore.

5.3.2 Intentional Use (large scale) (Avg. Score: 1.00)

NJ Specific Threats: 5.3.2.1 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may fragment their terrestrial habitats.

5.3.2.2 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may cause the loss, alteration and/or degradation of wildlife habitat.

5.3.2.3 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase soil erosion, impacting SGCN habitats.

5.3.2.4 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase the risk of invasive species establishment, impacting SGCN habitats.

5.3.2.5 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may decrease structural diversity and biomass leading to reduced biodiversity and ecological integrity.

5.3.2.6 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices in Atlantic White Cedar stands may destroy a unique wildlife wetland habitat that is difficult, and takes time, to restore.

5.3.3 Unintentional effects (subsistence/small scale) (Avg. Score: 1.00)

NJ Specific Threats: 5.3.3.1 Direct mortality of wildlife, direct loss of suitable habitats (roost, foraging, shelter, etc.), and can disrupt sensitive species, decreasing the likelihood of success and/or reproduction.

5.3.4 Unintentional effects (large scale) (Avg. Score: 1.00)

NJ Specific Threats: 5.3.4.1 Direct mortality of wildlife, direct loss of suitable habitats (roost, foraging, shelter, etc.), and can disrupt sensitive species, decreasing the likelihood of success and/or reproduction.

5.3.4.5 Lack of appropriate, sustainable forest management can lead to a decrease in forest habitat diversity, degraded habitat for many forest species, the loss of habitat for early-successional species, and/or the loss of unique habitats for species that need canopy breaks and multi-aged tree composition to fulfill various life history requirements.

6 Human Intrusions and Disturbance

6.1 Recreational Activities

6.1.1 Off-road vehicles (motorized and non-motorized) (Avg. Score: 3.00)

NJ Specific Threats: 6.1.1.2 Inappropriate use of off-road vehicles can degrade terrestrial and aquatic habitat and reduce the suitability of adjacent habitats for wildlife.

6.1.1.3 Increased risk of harassment that results in a change in wildlife behavior and/or direct mortality from vehicle strikes.

6.1.1.6 Off-road vehicles can be a mechanism of transference of wildlife diseases and invasive plant species if gear and apparel are not properly sanitized between sites.

7 **Natural Systems Modifications**

7.1 Fire and Fire Suppression

7.1.1 Increase in Fire Frequency/Intensity (Avg. Score: 3.00)

NJ Specific Threats: 7.1.1.1 Increase in frequency and intensity of wild fires as a result of droughts and heat waves drying out vegetation and litter.

7.1.1.2 Increase in frequency of wild fires as a result of illegal activities.

7.1.1.3 Unnatural fire regimes occurring as a result of military exercises.

7.1.1.4 Lack of diversity in age structure and composition of vegetation due to expansive, frequent fires.

7.1.2 Suppression of Fire Frequency/Intensity (Avg. Score: 3.00)

NJ Specific Threats: 7.1.2.1 Shift in vegetative communities as a result of suppression of natural fires.

7.1.2.2 Lack of diversity in age structure and composition of vegetation due to the suppression of fire.

7.3 Other Ecosystem Modifications

7.3.2 Inappropriate timing of mowing (Avg. Score: 1.00)

NJ Specific Threats: 7.3.2.1 Increased risk of direct mortality and/or reduced productivity of wildlife, as well as reduced use by migrating species.

7.3.5 Poor habitat management (Avg. Score: 3.00)

NJ Specific Threats: 7.3.5.1 Improper or poorly scheduled maintenance of man-made corridors (e.g., roadsides and medians) can cause direct mortality to and may reduce productivity of wildlife.

7.3.5.2 Shifting from natural vegetation to lawns can cause increased temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

7.3.5.3 Vegetation clearing removes terrestrial and riparian corridors for animal movement, shelter, and resting areas.

7.3.5.4 Vegetation clearing or inappropriate alteration adjacent to aquatic habitats threatens aquatic species by degrading habitat and water quality (altering temperature and dissolved oxygen, increasing siltation and desiccation, etc.).

7.3.5.5 Habitat management that alters or removes vegetation without implementing long-term management increases the risk of invasive and exotic plants establishing themselves, outcompeting native vegetation.

7.3.5.6 Habitat management, including that which occurs on public and private lands, that does not consider timing and species' behaviors can result in the direct mortality and/or alteration or loss of habitat.

7.3.5.12 Lack of diversity in age structure and composition of vegetation due to lack of natural disturbances and/or vegetation management.

7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.

8 **Invasive and Other Problematic Species, Genes and Diseases**

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.1 Unspecified Species (Avg. Score: 1.00)

NJ Specific Threats: 8.1.1.1 Displace or outcompete native species for resources.

8.1.1.2 Alters, degrades and/or reduces the structural diversity of the natural composition of the landscape, including aquatic systems.

8.1.1.3 Invasive, non-native insects can damage native vegetation at a large scale, leading to die-offs, altering the ecological community.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

New Jersey Pine Barrens Tiger Beetle

- 8.1.1.4 Invasive, non-native animals increase the risk of predation on native animals and/or herbivory on native vegetation.
- 8.1.1.5 Invasive, non-native animals and plants increase the risk of introduction and transference of diseases
- 8.1.1.6 Invasive, non-native plants may create physical barriers for some species.

8.1.4 Invasive non-native terrestrial/wetland animals (Avg. Score: 1.00)

NJ Specific Threats: 8.1.4.1 Displace or out-compete native species for resources (food, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.6 Diseases of Unknown Cause

8.6.0 Unknown Diseases (Avg. Score: 1.00)

NJ Specific Threats: 8.6.0.1 Diseases yet to be identified by pathologists and virologists cause decreased fitness or mortality to native populations.

9 Pollution

9.3 Agricultural and Forestry Effluents

9.3.3 Herbicides and Pesticides (Avg. Score: 2.00)

NJ Specific Threats: 9.3.3.1 Pesticides degrade terrestrial and aquatic habitats, especially streams, ponds and wetlands. Aquatic wildlife are particularly sensitive to these contaminants, which can cause developmental and behavioral abnormalities and reproductive failure. Some contaminants may bioaccumulate in predatory fish and birds and disrupt reproduction.

9.3.3.3 Use of pesticides can directly harm non-target species through direct contact and/or by reducing and/or contaminating their food supply.

**9.3.5 Control of insect pests and plants leading to mortality of non-target species (Avg. Score: 2.00)
not associated with agriculture**

NJ Specific Threats: 9.3.5.1 Use of pesticides, insecticides, and/or herbicides can directly harm non-target species, such as amphibians and beneficial invertebrates through direct contact and/or by reducing and/or contaminating their food supply.

9.3.5.4 Improper use of current insecticides, such as those containing esfenvalerate, prallethrin, or piperonyl butoxide, or past use of pesticides containing chlordane still present in the soils, are toxic to various wildlife species, and can cause injury, mortality, or other effects that impair population viability.

9.3.5.5 Use of pesticides and herbicides can minimize the abundance of food sources for native wildlife populations.

9.5 Air-Bourne Pollutants

9.5.6 Herbicides and Pesticides (Avg. Score: 2.00)

NJ Specific Threats: 9.5.6.1 May result in injury or direct mortality of non-target species.

11 Climate Change and Severe Weather

11.1 Habitat Shifting or Alteration

11.1.0 Macro- and Micro-Climate Alterations (Avg. Score: 2.00)

NJ Specific Threats: 11.1.0.1 Alters native terrestrial and aquatic habitats at the macro- and micro-climate levels that can affect suitability for wildlife, in particular specialist species.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory (Avg. Score: 3.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

New Jersey Pine Barrens Tiger Beetle

NJ Specific Threats: 12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.1.2 Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.

12.1.2 Lack of up-to-date existing information (Avg. Score: 3.00)

NJ Specific Threats: 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

12.1.3 Need to answer research question (Avg. Score: 3.00)

NJ Specific Threats: 12.1.3.1 There are significant knowledge gaps regarding distribution, dispersal, diseases, population trends, etc. of SGCN.

12.1.4 Need to develop new technique (Avg. Score: 3.00)

NJ Specific Threats: 12.1.4.1 Improve and evaluate survey methods for SGCN and their habitats; alter as needed.

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms (Avg. Score: 1.00)

NJ Specific Threats: 12.3.0.1 Regulatory habitat protections within state land use regulations are spatially limited to specific geographic areas (e.g., Pinelands, Coastal Area) or geographic features (e.g., wetlands, streams) and so fail to protect critical habitats that exist outside of these regulated areas.

12.3.0.7 Activities that threaten SGCN, their food sources, and/or habitats are often regulated separately and without consideration for the cumulative and synergistic effects over time or over a larger spatial scale. Therefore, regulations can fail to protect SGCN populations over time.

12.3.0.9 Prescribed burns implemented by the NJ Forest Fire Service are constrained by State air quality regulations to a timeframe where seasonal weather conditions are less than ideal for effective burning. As a result, the Forest Fire Service is limited in the number of overall prescribed burns it can implement to restore habitat for wildlife.

12.3.0.10 Land use regulatory processes pertaining to habitat creation, enhancement or restoration projects can be costly and/or burdensome, precluding or discouraging the development or implementation of conservation projects.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform (Avg. Score: 1.00)

NJ Specific Threats: 12.4.0.1 A species-by-species management focus as opposed to ecological systems and biodiversity generally has greater opportunity for unintended consequences for other species and may be less efficient in developing appropriate management actions.

12.4.0.2 Policies and procedures for lands management that lack consideration of the impacts of activity timing can result in unintended impacts to wildlife during vulnerable periods.

12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats (Avg. Score: 3.00)

NJ Specific Threats: 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.

14.1.1.2 Lack of general knowledge of SGCN life histories and vulnerabilities as they relate to land management practices.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

New Jersey Pine Barrens Tiger Beetle

- 14.1.1.3 Lack of understanding of the need to manage both natural and anthropogenic (e.g., yards, lawns, hayfields, etc.) habitats to minimize impacts or increase benefits to SGCN and their habitats.

14.2 Outreach needs

- 14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions (Avg. Score: 3.00)

NJ Specific Threats: 14.2.1.1 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various forest management practices.

15 Administrative Needs

15.2 Organizational/program planning needs

- 15.2.3 Need for multi-state, regional and landscape scale planning (Avg. Score: 1.00)

NJ Specific Threats: 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Actions to address the Threats and Action Drivers associated with this Conservation Target:

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.2 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to increase the effective size of SGCN habitats by protecting/restoring adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats.
- 1.2.1.5 Secure and promote the protection/restoration of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through incentive programs.
- 1.2.1.6 Secure and promote the protection/restoration of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers through incentive programs.
- 1.2.1.8 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to municipalities, land developers, and other land managers to retain and/or enhance native vegetation adjacent to aquatic habitats, and along riparian areas and wildlife movement corridors.
- 1.2.1.9 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing Forestry Stewardship Programs.
- 1.2.1.10 Coordinate across government agencies and non-government organizations to maximize the availability of and enrollment in existing landowner incentive programs (e.g., "farm bill," partners, etc.) to maintain and/or improve habitat.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

New Jersey Pine Barrens Tiger Beetle

- 1.2.1.11 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 1.2.1.12 Create incentives (non-monetary and/or monetary) for land developers to redevelop abandoned areas (e.g., shopping centers, office complexes) to minimize the loss of natural habitats and reduce the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 1.2.1.13 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to land developers to minimize the impacts of new residential and commercial developments on SGCN and their habitats.
- 1.2.1.14 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of herbicides and pesticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.15 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of rodenticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.16 Create incentives (non-monetary and/or monetary) within State regulations (mitigations requirements or credit, BMP satisfaction, etc.) to promote the use of retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.17 Develop a public-relations oriented certification program for private retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.18 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and land managers to control and reduce the impacts of invasive, native and non-native species in order to increase structural habitat diversity.
- 1.2.1.19 Create incentives for federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to farmers, woodland landowners, and private landowners to adopt and/or endorse consistent BMPs concerning controlled burns to maintain and/or improve wildlife habitat.
- 1.2.1.20 Coordinate across government agencies and non-government organizations to create or expand upon tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMP's.
- 1.2.1.21 Create and/or support market-based programs that subsidize or create branding for products derived sustainably from managed wildlife habitats.

New Jersey Pine Barrens Tiger Beetle

- 1.2.1.22 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to horse/livestock farm owners and managers to increase structural habitat diversity in and around the farms by managing vegetation for a variety of species, in particular, farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 1.2.1.23 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to provide cost shares and/or plan approvals for management based on management approaches and prescriptions.
- 1.2.1.24 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners, with habitat of suitable patch size to support breeding grassland-dependent species, to alter the timing of vegetation management to benefit grassland and pollinator species.
- 1.2.1.26 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing landowner incentive programs.
- 1.2.1.28 Create incentives to implement dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.

2 Direct Management of Natural Resources

2.3 Fire management

2.3.2 Fuel reduction

- 2.3.2.1 Prevent wildfires by reducing natural fuel (e.g., leaf litter).

2.3.3 Prescribed burning

- 2.3.3.1 Evaluate different management techniques of prescribed burns that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 2.3.3.2 Conduct prescribed burning in Northern New Jersey forests to maintain and regenerate a mosaic of upland forest habitats.
- 2.3.3.3 Conduct prescribed burning to improve wildlife habitat.

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

- 2.8.0.1 Control invasive insect infestations by implementing BMP strategies through biological, chemical and/or mechanical means that will depress, or when appropriate, eradicate populations in a manner that avoids excessive harm to non-target species using BMPs to control infestations and limit their spread based on an inventory of invasive insect distribution and response to outbreaks.
- 2.8.0.2 Develop, implement, monitor and evaluate pest control/management strategies to reduce the impacts of over-abundant wildlife species (native and/or native, invasive species) on native vegetation and the degradation of habitats supporting SGCN. Over-abundant wildlife species include but are not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.

New Jersey Pine Barrens Tiger Beetle

- 2.8.0.5 Implement biologically safe and appropriate control/management strategies, and where appropriate, eradication strategies to reduce the impacts and/or limit the distribution of invasive and/or non-native plant species within or near aquatic systems using methods that will provide the most protection to the aquatic and riparian ecological system, and minimize disturbance to the soil and wildlife. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.
- 2.8.0.6 Implement long-term management of invasive and/or non-native plants to help maintain functioning ecological systems and biological diversity, and to enhance travel corridors. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

- 2.10.0.1 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 2.10.0.2 Improve the availability of prey/food resources through terrestrial and aquatic plantings and habitat restoration for SGCN populations, in particular for those populations thought to be limited due wholly or in part to a lack of (or contaminated) food resources, and for migratory species (birds, bats, invertebrates).
- 2.10.0.3 Restore and/or enhance habitats to benefit urban-associated SGCN.
- 2.10.0.4 Restore and/or enhance suitable travel corridors connecting conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats.
- 2.10.0.5 Implement habitat restoration and/or enhancement activities that include the creation of vegetative buffers between sensitive habitats (e.g., aquatic systems) and human-inhabited areas (e.g., residences, parks, etc.) and that is conducted during appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.10.0.6 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats.
- 2.10.0.7 Restore/reclaim and enhance degraded rare species habitats through strategic revegetation and management efforts for documented/target SGCN.
- 2.10.0.8 Protect significant natural and/or unique communities by implementing best management practices when conducting habitat restoration strategies.
- 2.10.0.9 Restore and/or enhance riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation, alteration and/or changes in hydrology and subsequent disturbances to and behavioral changes of wildlife (e.g., restoring biologically appropriate buffers, revegetation or restoration efforts, etc.).

New Jersey Pine Barrens Tiger Beetle

- 2.10.0.10 Minimize the loss of important habitats (e.g., coastal scrub-shrub and grassy habitats, high and low marsh habitats, etc.) that provide nesting, migrating, and wintering areas for SGCN birds and other coastal and marsh-dependent species through habitat restoration efforts.
- 2.10.0.11 Restore and/or enhance critical migratory terrestrial and aquatic habitats (e.g., beach, grasslands, forest, scrub-shrub, etc.) for songbirds, raptors, shorebirds, waterfowl, bats and invertebrates through habitat restoration efforts and expand habitat restoration to adjacent private lands to increase the effective size of the habitat.
- 2.10.0.12 Create and/or maintain scrub-shrub habitats through revegetation efforts with little to no impact on forested, wetland and grassland habitats to maintain populations of shrub-dependent SGCN.
- 2.10.0.14 Implement best management practices (BMPs), protective strategies and guidelines for restoring and enhancing healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.10.0.15 Restore and/or enhance terrestrial and aquatic habitats proximate to but not adjacent to roads and other transportation corridors for terrestrial-bound SGCN species whose behavior (i.e., dispersal across roads) may be altered by doing so, and therefore decrease road mortality of such species (e.g., amphibians, snakes, turtles, small mammals).
- 2.10.0.21 Restore and/or enhance understory habitats that suppress invasive species and provide critical resources and enhance sheltering, foraging, and nesting cover for wildlife.
- 2.10.0.22 Restore and/or enhance terrestrial and aquatic habitats to promote the regeneration of native vegetation and enhance structural diversity to benefit SGCN (e.g., vegetative buffers of aquatic systems, allow coarse, woody debris to remain in terrestrial, aquatic and riparian habitats to provide shelter, riparian stabilization and necessary microclimates, plant native trees, shrubs and grasses, etc.).

2.11 Vegetation management

- 2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration
 - 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.
 - 2.11.0.2 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas for target SGCN and/or species groups; management should complement rare species needs in a targeted area.
 - 2.11.0.3 Create suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats through vegetation management.
 - 2.11.0.4 Implement vegetation management strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife, particularly SGCN.
 - 2.11.0.5 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats through vegetation management.
 - 2.11.0.6 Reclaim degraded rare species habitats by conducting vegetation management needed to restore habitat value for the documented/target SGCN.
 - 2.11.0.7 Protect significant natural and/or unique communities by implementing best management practices through vegetation management.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

New Jersey Pine Barrens Tiger Beetle

- 2.11.0.23 Implement appropriate habitat management actions in areas where natural disturbances, such as wildfire, have been precluded.
- 2.11.0.24 Conduct vegetation management adjacent to aquatic habitats following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.25 Conduct vegetation management along access roads following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.26 Conduct vegetation management along roadsides and medians, avoiding peak activity periods for wildlife, that enhances wildlife dispersal naturally and safely across roads and similar barriers to/between terrestrial and/or aquatic habitats.
- 2.11.0.27 Conduct vegetation management for target shrub- or young forest-dependent SGCN following BMPs to minimize the risk of the establishment of invasive and non-native plants.
- 2.11.0.28 Conduct vegetation management in agricultural areas following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.29 Conduct vegetation management on transportation and service corridors (i.e., rights-of-way) following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.30 Identify and prioritize areas where various management tools (such as increasing salinity through the management of water levels or chemical applications) may be effective in reducing phragmites within and restoring marsh habitat.
- 2.11.0.31 In areas where vegetative communities are shifting due to fire suppression and controlled burns are not feasible, manage vegetation to improve wildlife habitat.
- 2.11.0.32 Increase structural habitat diversity around and when feasible, within agricultural landscapes by managing vegetation for a variety of species, in particular, those farms that have removed scrub-shrub habitat and/or fragmented forests, and by implementing ecologically best practices (e.g., no-till farming, maintaining hedgerows, buffer set-asides, etc.).
- 2.11.0.33 Increase structural habitat diversity by implementing long-term vegetation management to minimize the potential for the establishment of invasive and/or non-native plants that may outcompete native vegetation.
- 2.11.0.34 Increase structural habitat diversity by managing residential, commercial and recreational areas' landscapes for a variety of species. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.36 Increase structural habitat diversity by managing vegetation for a variety of species and considering their life history requirements (e.g., travel corridors, shelter, resting and breeding areas) to minimize the risk of harm.
- 2.11.0.38 Increase structural habitat diversity in and around horse/livestock farms by managing vegetation for a variety of species, in particular, in and around farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).

New Jersey Pine Barrens Tiger Beetle

- 2.11.0.39 Increase structural habitat diversity in and around solar farms by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.40 Increase structural habitat diversity surrounding areas used for energy, mining, and transportation and service corridors by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides, and avoid managing habitat during the breeding seasons for ground-nesting birds, reptiles, amphibians and small mammals.
- 2.11.0.41 Increase structural habitat diversity through the implementation of a variety of vegetation management practices such as prescribed burns (either increasing or decreasing their frequency depending on the site and objective), plantings, etc. that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.42 Increase structural habitat diversity within wind farms for terrestrial bound and low-flying species and around wind farms for other wildlife by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.43 Manage forests to increase variation in age structure and composition using BMPs that promote and maintain functioning ecological forest-based systems and biological diversity.
- 2.11.0.45 Regularly and/or rotationally create young forest habitat in targeted areas to maintain and regenerate a mosaic of upland forest habitats that will benefit shrub- and young forest-dependent species.

2.14 Wildlife disease management

2.14.0 Wildlife disease strategy development and investigation

- 2.14.0.1 Investigate diseases/pathogens impacting SGCN and/or their habitats.
- 2.14.0.2 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
- 2.14.0.3 Protect SGCN from exotic pathogen introduction or incident through implementation of a "rapid response plan"; DFW to give priority attention to these species in planning and/or implementing a response.
- 2.14.0.4 Conduct long-term monitoring of diseases in vulnerable wildlife to determine the magnitude of exposure within populations and around the State, the impacts to those species, in particular SGCN, and investigate the feasibility of mitigating for such impacts.
- 2.14.0.5 Assess the impacts of diseases on the life cycles of wildlife.

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

New Jersey Pine Barrens Tiger Beetle

- 3.0.0.1 Conduct long-term monitoring of resident and migratory SGCN populations using standardized survey protocols to determine the variables that may impact their long-term persistence in the State (e.g., population viability, distribution, dispersal, home range and habitat use, travel corridors, food availability, vulnerability to pollutants and disease, etc.). Compile this information to determine the likely causes of population declines and to understand metapopulation dynamics. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.2 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) where data gaps exist regarding SGCN distribution, and their critical and supportive habitats. Conduct surveys using standardized survey protocols to acquire baseline data, and provide the data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
- 3.0.0.3 Gather baseline data on SGCN inhabiting permanently protected natural lands regarding their distribution and population (e.g., abundance, dispersal, demography including productivity and survival, etc.), and identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) critical and supporting habitats within those landscapes.
- 3.0.0.4 Conduct long-term studies on SGCN inhabiting permanently protected natural lands to develop population trend data and changes in demography, and to determine if critical and/or supporting habitats are limited or changing; i.e., diminishing in value, acreage or connectivity.
- 3.0.0.7 Collect baseline data to document species distributions, in particular SGCN, and current habitat for future analysis of possible distribution shifting as a result of habitat shifting or alteration associated with climate change impacts.
- 3.0.0.8 Conduct long-term studies and compare baseline metrics of documented species distributions and associated habitats to identify possible species and/or habitat shifting or alteration associated with climate change impacts.
- 3.0.0.13 Investigate the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats. Evaluate and modify management practices as appropriate.
- 3.0.0.14 Identify areas with invasive, aquatic plants and animals and collect a detailed baseline assessment of the species' status and distribution. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort. Researchers and contractors performing Forest Stewardship Inventories and/or Plans on state lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.0.0.15 Conduct long-term monitoring of areas identified as having invasive, aquatic plants and animals to track the species' status/progress over time with or without the implementation of management strategies. Areas without management strategies should be assessed and prioritized for management/control. Areas where management strategies are being implemented should include an assessment of the management effort and identify/recommend and implement necessary changes to improve its success. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort.
- 3.0.0.26 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species including objectives and guidance pertaining to and the condition/status of critical and supporting habitats.

New Jersey Pine Barrens Tiger Beetle

- 3.0.0.27 Evaluate the effectiveness of strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals through research and monitoring. Develop and provide NJ DEP and other appropriate governing agencies/commissions a summary of findings and recommendations to improve such efforts.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.1 Division of Fish and Wildlife should maintain a robust, up-to-date database and mapping of species occurrences.
- 3.2.0.7 Track (via a database that includes a GIS component) and research problematic species and diseases to determine their distribution, impacts on SGCN wildlife/wildlife communities, and develop potential control measures.
- 3.2.0.8 Implement and conduct long-term monitoring of control measures aimed at minimizing the impacts of problematic species and/or diseases to evaluate the effectiveness of such efforts and to identify and incorporate additional strategies as appropriate.
- 3.2.0.18 Conduct baseline surveys/inventories to better understand the distribution of fish and invertebrate (including freshwater mussels) populations.

3.2.1 Abundance determination

- 3.2.1.1 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) population abundance and trends for SGCN using standardized survey protocols. Provide data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
- 3.2.1.2 Conduct wildlife surveys on resident and migratory SGCN regarding their population abundance and trends.

3.2.2 Age, size and sex structure

- 3.2.2.1 Conduct wildlife surveys on resident and migratory SGCN regarding their survivorship.

3.2.3 Baseline inventory

- 3.2.3.9 Investigate hazardous environmental issues that may impact grassland invertebrates.

3.2.7 Population assessment

- 3.2.7.1 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
- 3.2.7.2 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species to meet and maintain recovery goals.

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

- 3.3.1.1 Conduct habitat assessments of significant natural and/or unique communities to identify threats to native terrestrial and aquatic habitats through systematic monitoring, review of available data, enlistment of habitat management and/or species experts, etc. Incorporate findings into a database that includes descriptions/qualifiers of the habitats, identifies and values/qualifies the threats, and includes a GIS component of the locations of the assessed areas. Share this information with landowners/managers (e.g., federal, state and local government agencies or non-government organization).

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

New Jersey Pine Barrens Tiger Beetle

- 3.3.1.2 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) resident and migratory SGCN habitats. Investigate their suitability for the various life history requirements of the species that dependent upon them to determine the ability for maintaining applicable SGCN populations in perpetuity.
- 3.3.1.4 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and investigate the suitability of corridors that connect large, contiguous tracts of similar habitats to increase their effective size (i.e., forest with forest, grassland with grassland, wetlands with wetlands, etc.) for dependent SGCN.
- 3.3.1.5 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) where habitat restoration and/or enhancement would benefit wildlife SGCN.
- 3.3.1.6 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) that could, through revegetation and/or enhancement efforts, become suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN.
- 3.3.1.7 Map and prioritize existing and potential areas for early succession forest management. Share the results with state, county and municipal planners.
- 3.3.1.8 Assess the availability and suitability of forest habitats for SGCN species (particularly reptiles and amphibians, birds, pollinators, and tiger beetles) in southern forests since Superstorm Sandy.
- 3.3.1.10 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and document fish SGCN habitats by plotting their distributions in GIS and submitting the data to the State for integration into the DEP's Biotics database.
- 3.3.1.16 Gather "best information" for spatial modeling and update/create a current model/depiction of anticipated habitat shifts from sea-level rise, flooding, etc.
- 3.3.1.17 Identify and map undeveloped roads and trails in all conserved forests, and create a database of locations. Integrate information regarding potentially sensitive areas.
- 3.3.1.18 Conduct an assessment using available data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels.
- 3.3.1.19 Identify and codify legal ORV access areas on state (and if appropriate, other conserved) lands. Provide GIS mapping to the landowner for potential use in directing such recreational activities.
- 3.3.1.20 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) where invasive, non-indigenous plants and animals are either already established or are becoming established. Create a system for reporting and qualifying new locations of invasive species and for prioritizing areas for control measures according to the potential level of impact on the ecosystem and SGCN and the likelihood of success. Researchers and contractors encountering invasive plant species while performing plant and/or forest inventories on state or other conserved lands and/or private lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.3.1.24 Conduct regular investigations of SGCN habitat health and biodiversity on public and private lands to identify locations in need of revegetation, reduction of over-abundant, native wildlife and/or exotic species, conservation focal areas requiring limitations on human activity, etc.

3.3.2 Monitoring

New Jersey Pine Barrens Tiger Beetle

- 3.3.2.2 Conduct long-term monitoring of resident and migratory SGCN habitats using standardized survey protocols to determine changes in habitat quality/suitability and threats (e.g., habitat loss and degradation, increased edge habitat, water quality) and other variables that may impact their long-term persistence in the State and to provide information needed for determining causes of population declines and understanding metapopulation dynamics.
- 3.3.2.3 Continue to update wildlife and habitat databases and revise models of critical SGCN habitats using the most current data available and where lacking, develop new SGCN and/or habitat models as data on species habitat requirements and applicable GIS data layers become available.
- 3.3.2.8 Evaluate the effectiveness of current prescribed burning practices on Pinelands dependent species.
- 3.3.2.9 Investigate the effectiveness of various silviculture techniques for enhancing forests for forest-dependent SGCN.
- 3.3.2.10 Evaluate the efficacy and success of different management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.3.2.15 Investigate the effectiveness of management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.3.2.16 Evaluate the effectiveness of best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 3.3.2.20 Once a system is developed for reporting and qualifying new locations of invasive species, develop, implement and monitor/evaluate invasive species removal strategies at identified locations. Priority should be given to those areas critical to SGCN and/or contain unique and/or rare plant communities supporting SGCN and/or other fish/wildlife species.

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.1 Work with land management agencies to determine the appropriate actions needed to restore/reclaim degraded habitat for the documented/target SGCN.
- 3.5.3.3 Develop/improve management techniques that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.9 Develop strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 3.5.3.11 Develop strategies to protect native terrestrial and aquatic habitats and dependent SGCN species from the identified threats.
- 3.5.3.15 Modify management practices based on the effects of pesticides, herbicides and other biological controls on critical and supporting SGCN habitats.

New Jersey Pine Barrens Tiger Beetle

- 3.5.3.16 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.
 - 3.5.3.19 Work with foresters to develop prescribed burning practices for Pinelands dependent species that increase or maintain habitat quality for these species in the Pinelands.
 - 3.5.3.21 Develop management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
 - 3.5.3.24 Based on research, modify management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
 - 3.5.3.25 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to develop the necessary management strategies to reach or maintain viable population levels.
- 3.5.4 Fish and wildlife research, survey and management techniques
 - 3.5.4.5 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
 - 3.5.4.6 Investigate the feasibility of mitigating for the impacts of contaminants to vulnerable wildlife, particularly SGCN. Maintain records on exposure of vulnerable wildlife to environmental toxins (such as flame retardants and endocrine disruptors), so that sources may be identified and controlled or eliminated.
 - 3.5.4.14 Develop and implement agreements, and update existing agreements, with government agencies regarding the protection of critical SGCN habitats (e.g., significant breeding populations of beach nesting birds, colonial waterbird nesting areas, bat colonies, etc.).
 - 3.5.4.15 Investigate the success of management strategies used to protect and/or enhance SGCN populations and when appropriate, aid in identifying failures/resource problems and issues, and developing new strategies.
 - 3.5.4.16 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels and develop the necessary management strategies.
 - 3.5.4.18 Investigate the effectiveness of survey techniques through selected “ground truthing” and literature and peer review in order to increase efficacy of survey, minimize surveyor bias and error, and increase accuracy of trend data.
 - 3.5.4.19 Develop reliable, standardized survey and monitoring protocols for SGCN species, for which none currently exist, and their habitats.
 - 3.5.4.21 Develop BMPs to address problematic species and diseases of unknown origin.

4 Education

4.1 Educator/Instructor training

4.1.0 Public education

- 4.1.0.1** Provide educational resources and training programs to private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.

5 Facilities and Areas

5.15 Wildlife Management Areas

5.15.6 Roads

- 5.15.6.1** Clearly post areas/roads where vehicle access is permitted.
- 5.15.6.2** Clearly post areas/trails where vehicle access is not permitted.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

- 6.0.0.2** Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.7** Secure and protect critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.8** Secure and protect scrub-shrub habitats for SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

6.3 Conservation area designation

6.3.0 Conservation area designation strategies

- 6.3.0.2** Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN and/or connect conserved SGCN habitats through conservation area designations.
- 6.3.0.8** Promote the protection of scrub-shrub habitats for SGCN through conservation area designations.

6.4 Private lands agreements

6.4.0 Private land agreement strategies

- 6.4.0.1** Enter into private lands agreements to expand control burns on private lands, in particular those adjacent to conserved lands to improve SGCN habitats.

7 Law Enforcement

7.1 Law enforcement

7.1.3 Sub-national Level

- 7.1.3.2** Increase the number of law enforcement officers tending to wildlife issues to a reasonable number to sufficiently cover the State and marine waters.

7.1.4 Scale Unspecified

- 7.1.4.12** Implement policies and/or regulations that protect significant natural and/or unique communities in perpetuity.

New Jersey Pine Barrens Tiger Beetle

- 7.1.4.19 Implement policies that protect and restore scrub-shrub habitats to benefit shrub-dependent SGCN.
- 7.1.4.26 Educate law enforcement personnel that there may be unauthorized research projects taking place and to encourage them to investigate any activities that appear to be harmful to wildlife.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.2 Develop a team of personnel from government entities, conservation organizations and other stakeholders engaged in oil/gas spill response for marine and freshwater habitats to develop a feasible plan for oil spill response and/or to amend NJ's current oil spill response plan that clearly outlines each organizations responsibilities and an assessment and location list of available equipment for boom deployment during oil spills.
- 8.1.0.3 Develop an outreach team of personnel from government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 8.1.0.4 Engage government agencies, conservation partners and other stakeholders in constructive dialogues encouraging them to influence policy change and the creation of incentives through a habitat bill and/or municipal ordinances for backyard habitat.
- 8.1.0.15 Engage government agencies, conservation partners and other stakeholders in discussions encouraging and supporting the creation of laws and policies requiring vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 8.1.0.16 Engage local governments in discussions regarding the importance of them adopting/passing ordinances which require assessing and addressing secondary impacts (i.e., ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 8.1.0.17 Engage municipalities in constructive dialogue to identify and minimize destruction of areas prioritized for early succession forest management.
- 8.1.0.18 Engage NJDOT, NJ Transit Authority and other road management entities, wildlife conservation organizations/agencies (e.g., Division of Fish and Wildlife, New Jersey Conservation Foundation, Conserve Wildlife Foundation of NJ), and communities and citizens in discussions regarding the importance of and methods to enhance habitat connectivity, and work together to develop feasible strategies for ensuring that wildlife can disperse naturally and safely across roads and similar barriers to terrestrial and/or aquatic habitats.
- 8.1.0.19 Engage government agencies, conservation partners and other stakeholders to collaboratively develop a list of important projects, targeting SGCN and/or their habitat, as a guide for graduate student research. Distribute the list and contact information to all State colleges and universities.
- 8.1.0.20 Organize a small focal group of government and non-government agencies/organizations responsible for decisions regarding beach/dune management to share and coordinate their goals so that comprehensive planning can attempt to meet all needs.
- 8.1.0.21 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation human-subsidized and/or overabundant, native species cause to local nesting species, and provide expert guidance on how residents can help alleviate this threat.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

New Jersey Pine Barrens Tiger Beetle

- 8.1.0.22 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation invasive species cause to native nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.24 Engage government agencies, conservation partners and other stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.25 Provide technical support to public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.26 Coordinate across federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to woodland landowners to adopt or endorse consistent best management practices concerning controlled burns to maintain and/or improve forested habitat for wildlife.
- 8.1.0.30 Encourage government agencies and conservation partners to advise members of the relevant scientific community of the need for specific studies, reports or investigations targeting the data-deficiency regarding SGCN and/or their habitats.
- 8.1.0.34 Work with the NJ Education Association and Department of Education to design curriculum and outdoor experimental learning opportunities, and provide training to teachers on implementation of these activities.
- 8.1.0.37 Enlist landowners and NJ citizens in the protection of and survey efforts for SGCN, in particular rare species, by increasing enrollment in landowner incentives, forest stewardship, backyard habitat management and wildlife-related volunteer programs.
- 8.1.0.38 Engage partners, stakeholders and land managers in constructive dialogue promoting forest stewardship for SGCN that use core forests and forested corridors.
- 8.1.0.40 Encourage researchers, land managers, naturalists and enthusiasts to follow proper procedures for the coordination and/or permitting of research/management activities involving wildlife and sensitive habitats, and discourage activities that alter vegetation or wetlands, or cause harm or disturbance to wildlife.
- 8.1.0.42 Engage citizens, wildlife observers and photographers through discussions and distributable information regarding the importance of and encouraging implementing responsible and ethical behavior when observing wildlife by developing an alliance of wildlife photographers and widely circulating recommendations on how to reduce impact.
- 8.1.0.44 Engage conservation partners, stakeholders, government agencies and other land stewards in constructive dialogues encouraging their inclusion of controlled burns in forest and other stewardship plans.
- 8.1.0.47 Form cooperative partnerships with energy companies to facilitate habitat creation and enhancement away from and outside of project areas, the restoration of appropriate habitats within project areas (e.g., rights-of-way could benefit butterflies and some bird species), and to identify seasonal timing of activities that would minimize impacts to wildlife.
- 8.1.0.48 Form cooperative partnerships with transportation and shipment agencies and companies to facilitate habitat creation and enhancement away from and outside of project areas and to identify seasonal timing of activities that would minimize impacts to wildlife.

8.2 Recruitment and retention activities

8.2.3 For wildlife watching

New Jersey Pine Barrens Tiger Beetle

- 8.2.3.1 Develop and implement nature-focused tourism opportunities including wildlife viewing sites, interpretive signage highlighting unique ecosystems/habitats, and wildlife-related recreational opportunities that do not negatively impact SGCN or their habitats.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.7 Develop and provide (or otherwise make publicly available) educational programs and/or materials that describe the negative impacts of off-road vehicles and watercraft use in and adjacent to critical SGCN habitats, and the importance of confining such activities to more appropriate locations and/or seasons.
- 8.3.0.8 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate recreationists and encourage landowners to eliminate garbage in the vicinity of suitable wildlife habitat, in particular SGCN habitat. Information should include the detrimental impacts garbage may have on various wildlife species.
- 8.3.0.9 Develop and provide (or otherwise make publicly available) educational programs and/or materials to enlist landowners and land managers to include only native plants in landscaping and restoration projects. Provide information to assist them in detecting problematic establishment of invasive, non-indigenous plants.
- 8.3.0.10 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate landowners and NJ citizens on threats to fish and wildlife (including marine animals).
- 8.3.0.11 Develop and provide (or otherwise make publicly available) educational programs and/or materials to the public, wildlife-related professionals, foresters, etc., that describe the value of species that are often feared (e.g., snakes, bats, spiders, Allegheny woodrat) and/or deemed a "nuisance" (e.g., squirrel, deer, snapping turtle), and therefore, persecuted by people. Include information on tolerance, proper identification, eviction from human dwellings, how to minimize the animal's presence on the property, and/or how to live in harmony with the animal.
- 8.3.0.12 Promote awareness of WSFR (Wildlife and Sportfish Restoration) Outreach/Awareness grants, an important funding source for conservation among hunters and anglers as well as the general public.
- 8.3.0.13 Conduct an educational campaign to encourage observer ethics and respect for wildlife and natural habitat.
- 8.3.0.24 Develop educational outreach programs for local decision-makers, land developers, landowners and citizens about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
- 8.3.0.25 Develop educational outreach programs for landowners, nurseries and the general public regarding the negative impacts of invasive and non-native plants on our natural communities.
- 8.3.0.26 Develop educational outreach programs for private and public landowners and land managers regarding the importance of and how to manage core forests and forested corridors in a way that will be beneficial for SGCN, particularly endangered, threatened and special concern species.
- 8.3.0.27 Develop educational outreach programs for public and private landowners and land managers regarding the importance of structural habitat diversity, methods to increase diversity, and/or incentive programs available to increase habitat diversity.
- 8.3.0.30 Develop educational outreach programs for private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.

New Jersey Pine Barrens Tiger Beetle

- 8.3.0.32 Develop an educational outreach program for landowners and citizens on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

- 9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and SGCN inhabiting them.
- 9.1.0.2 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.1.0.3 Develop a plan that directs the creation of impervious surfaces away from and to minimize impacts on aquatic systems and critical terrestrial habitats. The plan should also include strategies to increase the resiliency of aquatic and critical terrestrial habitats to threats and stressors that would impact the reproduction and survival of wildlife.
- 9.1.0.5 Develop a plan that directs the creation or expansion of energy or utility rights-of-way in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.6 Develop a plan that directs the creation or expansion of roads and railroads or the re-establishment of abandoned railroads within and adjacent to critical forested habitats in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.8 Develop a plan that focuses on strategies for oil pipelines to avoid sensitive habitats that would be highly impacted by oil spills.
- 9.1.0.9 Develop a plan that focuses on strategies to minimize the creation of renewable energy farms (e.g., solar, wind) and related infrastructures within and their impacts on forested habitats and the wildlife community.
- 9.1.0.10 Develop a plan that focuses on strategies to minimize the impacts of mining on critical forested habitats.
- 9.1.0.11 Develop a plan that focuses on strategies to minimize the impacts of power plants on critical forested habitats and the wildlife community.
- 9.1.0.13 Develop a plan to minimize agriculture that would result in groundwater withdrawal in critical forested areas.
- 9.1.0.15 Develop a plan to minimize fragmentation of terrestrial and aquatic habitats by roads.
- 9.1.0.16 Develop a plan to minimize new lawns and preserve natural vegetation within and adjacent to critical forest areas.
- 9.1.0.19 Develop a plan to minimize the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 9.1.0.21 Develop a plan to minimize the use of any-sized dam in critical forested areas.
- 9.1.0.22 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 9.1.0.28 Develop and coordinate state, regional and local plans for suitable lot layout and landscaping to minimize human-wildlife conflicts that also incorporates habitat connectivity and preservation of natural areas.

New Jersey Pine Barrens Tiger Beetle

- 9.1.0.29 Provide GIS or related data, maps, resource inventories, as well as related training, pertaining to the SWAP and it's recommended conservation actions for use or consideration by State, County or municipal planning agencies.
 - 9.1.0.30 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and other related threats associated with development.
 - 9.1.0.33 Review the species, threats, action successes, and habitats, and work with partners to revise the 2017 State Wildlife Action Plan for the 2025 resubmittal.
- 9.2 Organizational strategic and CMS planning
 - 9.2.1 Organizational strategic and operational planning
 - 9.2.1.1 Identify and codify legal ORV access areas on state lands.
- 9.3 Species and habitat management planning
 - 9.3.1 Species management planning
 - 9.3.1.3 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
 - 9.3.1.4 Develop town plans that avoid impacts to SGCN species and their habitats.
 - 9.3.1.5 Develop response plans to address disease outbreaks within wildlife populations, in particular SGCN.
 - 9.3.1.7 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
 - 9.3.1.9 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
 - 9.3.1.10 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
 - 9.3.1.13 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
 - 9.3.1.15 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.
 - 9.3.1.16 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.
 - 9.3.3 Habitat management planning
 - 9.3.3.5 Develop a management plan using forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.
 - 9.3.3.7 Develop a management plan to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.

New Jersey Pine Barrens Tiger Beetle

- 9.3.3.8 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 9.3.3.10 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
- 9.3.3.11 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.3.3.13 Develop a management plan that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas and prevents or ameliorates near-term impacts of climate change throughout the State, but in particular within the coastal and Delaware Bay areas.
- 9.3.3.15 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
- 9.3.3.16 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.3.17 Develop a management plan for prescribed burning that will benefit Pinelands dependent species and increase or maintain habitat quality for these species in the Pinelands.
- 9.3.3.18 In cooperation with species and habitat experts, develop management plans for significant natural and/or unique communities, in particular those supporting SGCN, and provide the information to the landowners/managers (federal, state and local government agencies or non-government organization) for review and implementation.
- 9.3.3.19 Develop management plans for SGCN inhabiting permanently protected natural lands using available baseline and population trend data.
- 9.3.3.21 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
- 9.3.3.26 Develop a management plan for parcels of suitable size to be managed for native herbaceous plant species that support breeding grassland dependent species.
- 9.3.3.28 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.
- 9.3.3.29 Develop habitat management plans aimed at reducing or eliminating negative impacts of ORVs.
- 9.3.3.32 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.
- 9.3.3.34 Include controlled burn prescriptions in forest and stewardship plans to improve wildlife habitat.
- 9.3.3.35 Incorporate habitat connectivity, preservation of natural areas, and the implementation of BMPs into state and local land-use policy environmental review process and energy development plans to minimize habitat fragmentation and related threats associated with solar farms and altered habitats.
- 9.3.3.36 Integrate plans for properly located and timed habitat restoration and management along transportation, energy and service corridors to minimize risks to and benefit wildlife.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

- 11.1.1.1** Use Biotics database and Landscape Project Mapping in regulatory reviews to ensure protection by applicable laws and regulations.
- 11.1.1.2** Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
- 11.1.1.4** Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.
- 11.1.1.5** Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 11.1.1.7** Review proposed construction or other work projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.8** Review proposed research projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.12** Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed solar farm projects to reduce habitat fragmentation and minimize impacts on wildlife.

11.1.2 Review of proposed policies and plans

- 11.1.2.1** Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

- 11.2.0.1** Provide technical support to private and public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 11.2.0.2** Provide technical support to public and private landowners and land managers for controlling invasive, native and non-native plant species in order to increase structural habitat diversity.
- 11.2.0.3** Develop state, regional and local BMPs that focus on minimizing habitat fragmentation and human-wildlife conflicts associated with development. Make information available to land developers and private and public landowners for implementation.
- 11.2.0.5** Provide educational resources, training programs, and expert guidance to private and public landowners and land managers on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

New Jersey Pine Barrens Tiger Beetle

- 11.2.0.6 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on habitat creation, enhancement and restoration within and adjacent to project areas, as well as away from and outside of project areas (depending on the target species), by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. Wind farms should address both terrestrial bound and low-flying species. Examples of habitat management include, but are not limited to, integrating short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 11.2.0.7 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on the importance of maintaining habitat connectivity, minimizing fragmentation, and the use of CHANJ products to help them target areas for such planning.
- 11.2.0.8 Provide educational resources, training programs, and on-the-ground guidance to public and private landowners and land managers on habitat creation and enhancement strategies that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 11.2.0.9 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and private landowners about the importance of leaving vegetation in place, especially along riparian areas and wildlife movement corridors.
- 11.2.0.10 Provide technical support to private landowners, consultants, and land managers to create customized management plans based on location and SGCN.
- 11.2.0.11 Provide educational resources, training programs, and on-the-ground guidance to private and public landowners and land managers on the benefits of and for creating young forest and early succession habitat for SGCN.
- 11.2.0.15 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and landowners about the importance of retaining and in an effort to protect, create, enhance and/or restore vegetation along aquatic habitats.
- 11.2.0.17 Provide educational resources and technical support to public and private landowners and land managers to promote the protection of vernal pools and the protection, enhancement and/or restoration of biologically appropriate buffers.
- 11.2.0.19 Provide educational resources and technical support to public and private landowners and land managers to promote the protection and/or enhancement of scrub-shrub habitats for SGCN.
- 11.2.0.22 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
- 11.2.0.23 Provide educational resources and technical support to public and private landowners and land managers of lands adjacent to SGCN habitats to promote the protection and/or enhancement of those adjacent habitats to increase the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and that connect conserved SGCN habitats.

New Jersey Pine Barrens Tiger Beetle

- 11.2.0.24 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers on how to manage vegetated roadside areas (e.g., mowing, brush-hogging, etc.) on a schedule that avoids peak activity periods for wildlife and therefore, minimizes harm.
- 11.2.0.25 Provide educational resources, training programs, and on-the-ground guidance to resource managers regarding the assessment of and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) related to residential and commercial development.
- 11.2.0.26 Make educational resources available to the public that encourage researchers to seek out guidance prior to finalizing proposals and submitting State permit applications to reduce potential impacts on sensitive species.

11.2.1 With individuals and groups involved in resource management decision making

- 11.2.1.1 Engage partners and stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 11.2.1.2 Provide professional training and technical assistance tools (e.g., mapping, guidance documents, justification, etc.) to agencies/divisions/programs within and outside of the NJ DEP regarding the SWAP, and the conservation actions recommended therein to help facilitate SWAP implementation.
- 11.2.1.3 Provide educational resources, training programs, and on-the-ground guidance to DOD to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop and implement forest management and other practices that minimize disturbances to SGCN (i.e., beyond their federal requirements).
- 11.2.1.5 Provide educational resources, training programs, and on-the-ground guidance to municipalities, state and federal agency resource managers on tasks such as writing and integrating Beach Management Plans into other management documents.
- 11.2.1.6 Provide educational resources, training programs, and on-the-ground guidance to resource agencies prior to project initiation to ensure wildlife and their habitats are protected to the highest degree possible during construction, and provisions are in place for post-construction habitat use.

11.2.2 With private landowners

- 11.2.2.1 Provide technical support to farming operations and woodland landowners on ways to decrease clean farming (edge-to-edge) practices and create ecotones to benefit bobwhite and other species dependent on early successional habitat.

100 Law and Policy

100. Legislation

100.1.3 Sub-national Level

- 100.1.3.3 Initiate legislative action to establish an annual budgetary line item designating funds to support programs focused on long-term research and monitoring of wildlife diseases.

100.1.4 County and Local

- 100.1.4.2 Secure and increase the effective size of SGCN habitats and connect conserved SGCN habitats through local ordinances.
- 100.1.4.3 Expand the acreages and enhance the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN through local ordinances.

New Jersey Pine Barrens Tiger Beetle

100.1.4.12 Secure scrub-shrub habitats for SGCN through local ordinances.

100.1.4.14 Adopt/pass local ordinances which require assessing and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.

100.1.4.15 Incorporate habitat connectivity and the preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.

100.1.5 Scale Unspecified

100.1.5.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.

100.1.5.5 Develop legislation to provide financial support for the New Jersey Invasive Species Strike Team.

100. State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

100.3.0.5 Develop policies that will promote improved and secure habitat connections between conserved SGCN habitats.

100.3.0.6 Develop policies that will promote expanding acreages and enhancing the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.

100.3.0.8 Develop policies and/or regulations with the objective of protecting significant natural and/or unique communities in perpetuity.

100.3.0.9 Secure mitigation that creates an environmental benefit for losses of SGCN and their habitats.

100.3.0.12 Develop policies that promote the preservation and protection of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.

100.3.0.15 Develop policies that promote protecting and restoring scrub-shrub habitats to benefit shrub-dependent SGCN.

100.3.0.18 Develop policies for conserved lands that prohibit planting and supports the control of non-native vegetation and invasive, native vegetation.

100.3.0.23 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address mitigation that creates an environmental benefit for losses of SGCN and their habitats.

100.3.0.31 Create or expand tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMPs.

100.3.0.32 Coordinate regulations across agencies to maximize availability of and enrollment in existing Forestry Stewardship Programs (e.g., "Woodland Stewards", Farm Bill, partners, etc.) to maintain and/or improve forest habitat.

100.3.0.38 Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.

New Jersey Pine Barrens Tiger Beetle

- 100.3.0.39 Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.3.0.40 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.3.0.41 Explore all State regulatory requirements for mitigation, restoration, habitat management, etc. to ensure they prohibit the use of specified invasive or other problematic plant species.
- 100.3.0.43 Identify and address (amend) regulatory impediments to beneficial habitat management.
- 100.3.0.44 Incorporate requirements for technical support and funding for mitigation or restoration efforts so as to be consistent with existing regulations.
- 100.3.0.45 Increase the controlled burn season to focus on restoring vegetative communities.
- 100.3.0.46 Investigate and/or develop inter-agency Memorandum of Agreements to share common data stored or managed in program-specific databases.
- 100.3.0.48 Propose new State law or regulation mandating that a State-level "development impact fee" be assessed on all new development approved by municipalities (via the Municipal Land Use Law processes), and dedicate such monies to the development and implementation of regional Habitat Conservation Plans (or existing plans/programs serving the same regional function).
- 100.3.0.50 Retain endangered, threatened and special concern wildlife and habitat protection measures in the Water Quality Management Program Rules.
- 100.3.0.52 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded energy sitings and facilities.
- 100.3.0.53 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded rights-of-way corridors associated with energy transport/transmission.
- 100.3.0.60 Develop regulations that when implemented will protect significant natural and/or unique communities in perpetuity.
- 100.3.0.65 Develop regulations that when implemented will protect and restore scrub-shrub habitats to benefit shrub-dependent SGCN.
- 100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

100.3.2 State Land Acquisition Programs

- 100.3.2.1 Increase opportunities for habitat restoration by making any necessary policy changes to state, federal and local land acquisition programs (e.g., Green Acres, Blue Acres, etc.) to allow for acquisition within abandoned or failing bay shore communities, including mechanisms to relocate displaced people and infrastructure.

100. State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

New Jersey Pine Barrens Tiger Beetle

- 100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).
- 100.4.0.2 Create a policy that requires the NJ DEP to incorporate scientific information regarding climate change and sea level rise (e.g., predictions, habitat management/acquisition efforts to enhance resilience to inundation) on their websites and to work with other government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 100.4.0.3 Develop policies for mandatory buffer strips on preserved farmlands and state-owned agricultural lands.
- 100.4.0.8 Develop a white paper addressing the impacts that existing, new or expanded rights-of-way have upon wildlife, wildlife habitats and habitat connectivity.
- 100.4.0.10 Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.
- 100.4.0.11 Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.4.0.12 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.4.0.13 Develop policies for different circumstances (e.g., roadsides and medians, riparian, aquatic and terrestrial habitats) that outline appropriate habitat/vegetation management strategies and schedules to minimize risks to and benefit wildlife.
- 100.4.0.16 Develop policies to implement habitat management strategies that will increase the structural diversity surrounding areas used for energy, mining, and transportation and service corridors which include but are not limited to the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-
- 100.4.0.17 Develop policies to implement habitat management strategies, including prescribed burns, that will increase the structural diversity on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies to control and reduce the impacts of invasive, non-native species in order to increase structural habitat diversity.
- 100.4.0.18 Develop policies to minimize the extent of infrastructure associated with energy and service corridors or areas (e.g., wind and solar farms, pipelines, utility lines) and that require the implementation of habitat management strategies that will increase the structural diversity in the area including (e.g., the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-asides).
- 100.4.0.19 Develop regulations that will minimize the creation of new barriers, remove or replace current barriers with appropriately-sized systems to accommodate wildlife dispersal, and to minimize road widening and traffic volume increases within critical wildlife habitat areas.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

New Jersey Pine Barrens Tiger Beetle

- 100.4.0.20 Develop state regulations that require energy developers and utility service companies to implement habitat management strategies that will increase the structural diversity of the habitat, minimize habitat fragmentation and commercial infrastructure, and minimize the loss, alteration and/or degradation of the habitat and adjacent lands when working on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies.
- 100.4.0.24 Develop policies to provide financial support for the New Jersey Invasive Species Strike Team.
- 100.4.0.25 Develop policies that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

Northern Metalmark

Focal species that comprise this Conservation Target:

Northern Metalmark

Threats and Action Drivers associated with this Conservation Target:

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale) (Avg. Score: 3.00)

NJ Specific Threats: 1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.1.1.2 Loss, alteration and/or degradation of habitat.

1.1.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale) (Avg. Score: 3.00)

NJ Specific Threats: 1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.2.1.2 Loss, alteration and/or degradation of habitat.

1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale) (Avg. Score: 2.00)

NJ Specific Threats: 1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.3.1.2 Loss, alteration and/or degradation of habitat.

1.3.1.5 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

2 Agriculture and Aquaculture

2.1 Annual and Perennial Crops (non-timber)

2.1.1 Shifting Agriculture (Avg. Score: 1.00)

NJ Specific Threats: 2.1.1.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.1.2 Conversion, and subsequent loss, of high salt marsh to low salt marsh threatens high-marsh dependent species and those dependent on the marsh-upland ecotone.

2.1.1.3 Conversion of agricultural landscape that results in increased erosion, runoff, and chemical and thermal pollution decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

2.1.2 Small-holder Farming (Avg. Score: 1.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Northern Metalmark

NJ Specific Threats: 2.1.2.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.2.2 Fragments terrestrial and aquatic habitats.

2.1.3 Agro-industry (Avg. Score: 1.00)

NJ Specific Threats: 2.1.3.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.3.2 Fragments terrestrial and aquatic habitats.

2.1.3.5 Loss of ecotones by implementing clean farming (edge-to-edge) practices degrades habitat for early successional wildlife.

2.2 Wood and Pulp Plantations

2.2.1 Small Holder (Avg. Score: 1.00)

NJ Specific Threats: 2.2.1.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.

2.2.2 Agro-industry Plantations (Avg. Score: 1.00)

NJ Specific Threats: 2.2.2.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.

2.3 Livestock Farming and Ranching

2.3.2 Small-holder Grazing (Avg. Score: 1.00)

NJ Specific Threats: 2.3.2.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.

2.3.2.2 Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.

2.3.2.3 Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

2.3.2.4 Livestock allowed to wade into waterbodies trample and degrade aquatic habitats.

2.3.3 Agro-industry Grazing (Avg. Score: 1.00)

NJ Specific Threats: 2.3.3.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.

2.3.3.2 Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.

2.3.3.3 Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

2.3.3.4 Livestock allowed to wade into waterbodies trample and degrade aquatic habitats.

3 Energy Production and Mining

3.2 Mining and Quarrying

3.2.2 Surface Mining - Rock Quarry (and sand quarries) (Avg. Score: 1.00)

NJ Specific Threats: 3.2.2.1 Fragments terrestrial and aquatic habitats.

3.2.2.2 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

3.3 Renewable Energy

3.3.2 Solar Power (Avg. Score: 1.00)

NJ Specific Threats: 3.3.2.2 Loss, alteration and/or degradation of habitat.

4 Transportation and Service Corridors

4.1 Roads and Railroads

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Northern Metalmark

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale) (Avg. Score: 1.00)

NJ Specific Threats: 4.1.1.2 Loss, alteration and/or degradation of habitat associated with road and railroad construction and maintenance, and degradation of adjacent habitats.

4.1.2 Movement of cars and other vehicles on roads and railroads (large and small scale) (Avg. Score: 1.00)

NJ Specific Threats: 4.1.2.1 Increased vehicle traffic increases the risk of wildlife mortality from strikes.

4.2 Utility and Service Lines

4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads (Avg. Score: 1.00)

NJ Specific Threats: 4.2.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species, inhibiting dispersal of non-volant animals, reducing gene flow, and creating barriers to fish when service line-associated roads cross streams (e.g., bridges, culverts, fords, etc.).

4.2.1.2 Loss, alteration and/or degradation of habitat associated with rights-of-way construction and maintenance, and degradation of adjacent habitats.

4.2.2 Management of rights-of-way or communication tower facilities and/or their associated access roads (Avg. Score: 2.00)

NJ Specific Threats: 4.2.2.1 Improper or poorly scheduled vegetation management can cause direct mortality to and may reduce productivity of wildlife.

5 Biological Resource Use

5.1 Hunting and Collecting Terrestrial Animals

5.1.1 Intentional Use (Avg. Score: 1.00)

NJ Specific Threats: 5.1.1.1 Illegal collection of wildlife can have detrimental impacts on populations.

5.2 Gathering Terrestrial Plants

5.2.3 Control (Avg. Score: 1.00)

NJ Specific Threats: 5.2.3.1 Alteration or control of undesirable plants or plant communities can destroy important food and nectar plants for native insects and animals.

5.3 Logging and Wood Harvesting

5.3.1 Intentional Use (subsistence/small scale) (Avg. Score: 1.00)

NJ Specific Threats: 5.3.1.1 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may fragment their terrestrial habitats.

5.3.1.2 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may cause the loss, alteration and/or degradation of wildlife habitat.

5.3.1.3 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase soil erosion, impacting SGCN habitats.

5.3.1.4 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase the risk of invasive species establishment, impacting SGCN habitats.

5.3.1.5 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may decrease structural diversity and biomass leading to reduced biodiversity and ecological integrity.

Northern Metalmark

- 5.3.1.6 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices in Atlantic White Cedar stands may destroy a unique wildlife wetland habitat that is difficult, and takes time, to restore.

5.3.2 Intentional Use (large scale) (Avg. Score: 1.00)

- NJ Specific Threats:** 5.3.2.1 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may fragment their terrestrial habitats.
- 5.3.2.2 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may cause the loss, alteration and/or degradation of wildlife habitat.
- 5.3.2.3 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase soil erosion, impacting SGCN habitats.
- 5.3.2.4 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase the risk of invasive species establishment, impacting SGCN habitats.
- 5.3.2.5 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may decrease structural diversity and biomass leading to reduced biodiversity and ecological integrity.
- 5.3.2.6 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices in Atlantic White Cedar stands may destroy a unique wildlife wetland habitat that is difficult, and takes time, to restore.

5.3.3 Unintentional effects (subsistence/small scale) (Avg. Score: 1.00)

- NJ Specific Threats:** 5.3.3.1 Direct mortality of wildlife, direct loss of suitable habitats (roost, foraging, shelter, etc.), and can disrupt sensitive species, decreasing the likelihood of success and/or reproduction.

5.3.4 Unintentional effects (large scale) (Avg. Score: 1.00)

- NJ Specific Threats:** 5.3.4.1 Direct mortality of wildlife, direct loss of suitable habitats (roost, foraging, shelter, etc.), and can disrupt sensitive species, decreasing the likelihood of success and/or reproduction.
- 5.3.4.5 Lack of appropriate, sustainable forest management can lead to a decrease in forest habitat diversity, degraded habitat for many forest species, the loss of habitat for early-successional species, and/or the loss of unique habitats for species that need canopy breaks and multi-aged tree composition to fulfill various life history requirements.

6 Human Intrusions and Disturbance

6.1 Recreational Activities

6.1.1 Off-road vehicles (motorized and non-motorized) (Avg. Score: 3.00)

- NJ Specific Threats:** 6.1.1.2 Inappropriate use of off-road vehicles can degrade terrestrial and aquatic habitat and reduce the suitability of adjacent habitats for wildlife.
- 6.1.1.3 Increased risk of harassment that results in a change in wildlife behavior and/or direct mortality from vehicle strikes.
- 6.1.1.6 Off-road vehicles can be a mechanism of transference of wildlife diseases and invasive plant species if gear and apparel are not properly sanitized between sites.

7 Natural Systems Modifications

7.1 Fire and Fire Suppression

7.1.1 Increase in Fire Frequency/Intensity (Avg. Score: 1.00)

- NJ Specific Threats:** 7.1.1.1 Increase in frequency and intensity of wild fires as a result of droughts and heat waves drying out vegetation and litter.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need
Northern Metalmark

- 7.1.1.2 Increase in frequency of wild fires as a result of illegal activities.
- 7.1.1.3 Unnatural fire regimes occurring as a result of military exercises.
- 7.1.1.4 Lack of diversity in age structure and composition of vegetation due to expansive, frequent fires.

7.1.2 Suppression of Fire Frequency/Intensity (Avg. Score: 1.00)

- NJ Specific Threats:** 7.1.2.1 Shift in vegetative communities as a result of suppression of natural fires.
- 7.1.2.2 Lack of diversity in age structure and composition of vegetation due to the suppression of fire.

7.3 Other Ecosystem Modifications

7.3.2 Inappropriate timing of mowing (Avg. Score: 3.00)

- NJ Specific Threats:** 7.3.2.1 Increased risk of direct mortality and/or reduced productivity of wildlife, as well as reduced use by migrating species.

7.3.4 Lack of natural disturbance patterns or ecosystem functions due to species loss (Avg. Score: 3.00)

- NJ Specific Threats:** 7.3.4.5 The lack of forest disturbance minimizes the diversity of herbaceous vegetation and other shrubs and trees that need a lot of sunlight to grow.

7.3.5 Poor habitat management (Avg. Score: 3.00)

- NJ Specific Threats:** 7.3.5.1 Improper or poorly scheduled maintenance of man-made corridors (e.g., roadsides and medians) can cause direct mortality to and may reduce productivity of wildlife.
- 7.3.5.2 Shifting from natural vegetation to lawns can cause increased temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.
- 7.3.5.3 Vegetation clearing removes terrestrial and riparian corridors for animal movement, shelter, and resting areas.
- 7.3.5.4 Vegetation clearing or inappropriate alteration adjacent to aquatic habitats threatens aquatic species by degrading habitat and water quality (altering temperature and dissolved oxygen, increasing siltation and desiccation, etc.).
- 7.3.5.5 Habitat management that alters or removes vegetation without implementing long-term management increases the risk of invasive and exotic plants establishing themselves, outcompeting native vegetation.
- 7.3.5.6 Habitat management, including that which occurs on public and private lands, that does not consider timing and species' behaviors can result in the direct mortality and/or alteration or loss of habitat.
- 7.3.5.12 Lack of diversity in age structure and composition of vegetation due to lack of natural disturbances and/or vegetation management.
- 7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.

8 Invasive and Other Problematic Species, Genes and Diseases

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.1 Unspecified Species (Avg. Score: 1.00)

- NJ Specific Threats:** 8.1.1.1 Displace or outcompete native species for resources.
- 8.1.1.2 Alters, degrades and/or reduces the structural diversity of the natural composition of the landscape, including aquatic systems.
- 8.1.1.3 Invasive, non-native insects can damage native vegetation at a large scale, leading to die-offs, altering the ecological community.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Northern Metalmark

8.1.1.4 Invasive, non-native animals increase the risk of predation on native animals and/or herbivory on native vegetation.

8.1.1.5 Invasive, non-native animals and plants increase the risk of introduction and transference of diseases

8.1.1.6 Invasive, non-native plants may create physical barriers for some species.

8.1.4 Invasive non-native terrestrial/wetland animals (Avg. Score: 2.00)

NJ Specific Threats: 8.1.4.1 Displace or out-compete native species for resources (food, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.1.6 Invasive non-native fungal/bacterial diseases (Avg. Score: 1.00)

NJ Specific Threats: 8.1.6.1 The introduction of non-native fungal and bacterial diseases threatens native populations and ecosystems.

8.2 Problematic Native Species/Diseases

8.2.2 Named Species (Avg. Score: 2.00)

NJ Specific Threats: 8.2.2.2 Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.

8.4 Problematic Species/Diseases of Unknown Origin

8.4.1 Unspecified Species (Avg. Score: 1.00)

NJ Specific Threats: 8.4.1.1 Non-native or poorly understood diseases and parasites could potentially impact native animals.

8.6 Diseases of Unknown Cause

8.6.0 Unknown Diseases (Avg. Score: 1.00)

NJ Specific Threats: 8.6.0.1 Diseases yet to be identified by pathologists and virologists cause decreased fitness or mortality to native populations.

9 Pollution

9.3 Agricultural and Forestry Effluents

9.3.2 Soil Erosion and Sedimentation (Avg. Score: 1.00)

NJ Specific Threats: 9.3.2.2 Soil erosion and sedimentation limit the re-establishment of plants needed by terrestrial wildlife as cover and a food base.

9.3.3 Herbicides and Pesticides (Avg. Score: 3.00)

NJ Specific Threats: 9.3.3.1 Pesticides degrade terrestrial and aquatic habitats, especially streams, ponds and wetlands. Aquatic wildlife are particularly sensitive to these contaminants, which can cause developmental and behavioral abnormalities and reproductive failure. Some contaminants may bioaccumulate in predatory fish and birds and disrupt reproduction.

9.3.3.3 Use of pesticides can directly harm non-target species through direct contact and/or by reducing and/or contaminating their food supply.

9.3.3.4 Use of herbicides can destroy beneficial food and nectar plants for insects.

9.3.5 Control of insect pests and plants leading to mortality of non-target species (Avg. Score: 3.00)
not associated with agriculture

NJ Specific Threats: 9.3.5.1 Use of pesticides, insecticides, and/or herbicides can directly harm non-target species, such as amphibians and beneficial invertebrates through direct contact and/or by reducing and/or contaminating their food supply.

9.3.5.2 Use of herbicides can destroy beneficial food and nectar plants for insects.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Northern Metalmark

9.3.5.4 Improper use of current insecticides, such as those containing esfenvalerate, prallethrin, or piperonyl butoxide, or past use of pesticides containing chlordane still present in the soils, are toxic to various wildlife species, and can cause injury, mortality, or other effects that impair population viability.

9.3.5.5 Use of pesticides and herbicides can minimize the abundance of food sources for native wildlife populations.

9.5 Air-Bourne Pollutants

9.5.1 Acid Rain (Avg. Score: 1.00)

NJ Specific Threats: 9.5.1.1 Causes acidification of water bodies, resulting in changes to aquatic and marine communities and reducing biodiversity, and creating conditions that are unsuitable for some aquatic (freshwater and marine) and semi-aquatic species that are sensitive to pH shifts.

9.5.4 Other (Avg. Score: 1.00)

NJ Specific Threats: 9.5.4.1 Dust and/or airborne sedimentation from construction sites, agricultural operations or related earth disturbances can introduce mineral or organic sediments into adjacent wildlife habitats, degrading their quality and suitability for wildlife short-term and/or long-term.

9.5.6 Herbicides and Pesticides (Avg. Score: 3.00)

NJ Specific Threats: 9.5.6.1 May result in injury or direct mortality of non-target species.

11 Climate Change and Severe Weather

11.1 Habitat Shifting or Alteration

11.1.0 Macro- and Micro-Climate Alterations (Avg. Score: 3.00)

NJ Specific Threats: 11.1.0.1 Alters native terrestrial and aquatic habitats at the macro- and micro-climate levels that can affect suitability for wildlife, in particular specialist species.

11.6 Phenology Shifting or Alteration

11.6.1 Phenology shifts related to pollination ecology (Avg. Score: 1.00)

NJ Specific Threats: 11.6.1.1 Alters inter-specific relationships of wildlife and vegetation, ultimately leading to detrimental impacts on the ecological system.

11.6.3 Phenology shifts related to species redistribution (Avg. Score: 1.00)

NJ Specific Threats: 11.6.3.1 Shifts in timing of species migration, breeding and hibernation, and available food resources, as a result of wildlife range shifts driven by climate change.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory (Avg. Score: 3.00)

NJ Specific Threats: 12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.1.2 Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.

12.1.2 Lack of up-to-date existing information (Avg. Score: 3.00)

NJ Specific Threats: 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

12.1.3 Need to answer research question (Avg. Score: 3.00)

NJ Specific Threats: 12.1.3.1 There are significant knowledge gaps regarding distribution, dispersal, diseases, population trends, etc. of SGCN.

12.1.4 Need to develop new technique (Avg. Score: 3.00)

NJ Specific Threats: 12.1.4.1 Improve and evaluate survey methods for SGCN and their habitats; alter as needed.

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms (Avg. Score: 1.00)

NJ Specific Threats: 12.3.0.1 Regulatory habitat protections within state land use regulations are spatially limited to specific geographic areas (e.g., Pinelands, Coastal Area) or geographic features (e.g., wetlands, streams) and so fail to protect critical habitats that exist outside of these regulated areas.

12.3.0.7 Activities that threaten SGCN, their food sources, and/or habitats are often regulated separately and without consideration for the cumulative and synergistic effects over time or over a larger spatial scale. Therefore, regulations can fail to protect SGCN populations over time.

12.3.0.10 Land use regulatory processes pertaining to habitat creation, enhancement or restoration projects can be costly and/or burdensome, precluding or discouraging the development or implementation of conservation projects.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform (Avg. Score: 1.00)

NJ Specific Threats: 12.4.0.1 A species-by-species management focus as opposed to ecological systems and biodiversity generally has greater opportunity for unintended consequences for other species and may be less efficient in developing appropriate management actions.

12.4.0.2 Policies and procedures for lands management that lack consideration of the impacts of activity timing can result in unintended impacts to wildlife during vulnerable periods.

12.4.0.5 Bureau of Forest Fire Management policy has traditionally implemented prescribed burns on State lands for the sole purpose of public safety (i.e., addressing hazard fuel reduction), missing opportunities to burn in a manner that would additionally manage habitat for ecological diversity.

12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats (Avg. Score: 3.00)

NJ Specific Threats: 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.

14.1.1.2 Lack of general knowledge of SGCN life histories and vulnerabilities as they relate to land management practices.

14.1.1.3 Lack of understanding of the need to manage both natural and anthropogenic (e.g., yards, lawns, hayfields, etc.) habitats to minimize impacts or increase benefits to SGCN and their habitats.

14.2 Outreach needs

14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions (Avg. Score: 3.00)

NJ Specific Threats: 14.2.1.1 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various forest management practices.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning (Avg. Score: 1.00)

NJ Specific Threats: 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Actions to address the Threats and Action Drivers associated with this Conservation Target:

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.2 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to increase the effective size of SGCN habitats by protecting/restoring adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats.
- 1.2.1.5 Secure and promote the protection/restoration of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through incentive programs.
- 1.2.1.6 Secure and promote the protection/restoration of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers through incentive programs.
- 1.2.1.8 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to municipalities, land developers, and other land managers to retain and/or enhance native vegetation adjacent to aquatic habitats, and along riparian areas and wildlife movement corridors.
- 1.2.1.9 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing Forestry Stewardship Programs.
- 1.2.1.10 Coordinate across government agencies and non-government organizations to maximize the availability of and enrollment in existing landowner incentive programs (e.g., "farm bill," partners, etc.) to maintain and/or improve habitat.
- 1.2.1.11 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 1.2.1.12 Create incentives (non-monetary and/or monetary) for land developers to redevelop abandoned areas (e.g., shopping centers, office complexes) to minimize the loss of natural habitats and reduce the extent of impervious surfaces as part of new construction to increase water recharge in those areas.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Northern Metalmark

- 1.2.1.13 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to land developers to minimize the impacts of new residential and commercial developments on SGCN and their habitats.
- 1.2.1.14 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of herbicides and pesticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.15 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of rodenticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.16 Create incentives (non-monetary and/or monetary) within State regulations (mitigations requirements or credit, BMP satisfaction, etc.) to promote the use of retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.17 Develop a public-relations oriented certification program for private retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.18 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and land managers to control and reduce the impacts of invasive, native and non-native species in order to increase structural habitat diversity.
- 1.2.1.19 Create incentives for federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to farmers, woodland landowners, and private landowners to adopt and/or endorse consistent BMPs concerning controlled burns to maintain and/or improve wildlife habitat.
- 1.2.1.20 Coordinate across government agencies and non-government organizations to create or expand upon tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMP's.
- 1.2.1.21 Create and/or support market-based programs that subsidize or create branding for products derived sustainably from managed wildlife habitats.
- 1.2.1.22 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to horse/livestock farm owners and managers to increase structural habitat diversity in and around the farms by managing vegetation for a variety of species, in particular, farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 1.2.1.23 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to provide cost shares and/or plan approvals for management based on management approaches and prescriptions.
- 1.2.1.24 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners, with habitat of suitable patch size to support breeding grassland-dependent species, to alter the timing of vegetation management to benefit grassland and pollinator species.
- 1.2.1.26 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing landowner incentive programs.

Northern Metalmark

- 1.2.1.28 Create incentives to implement dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.

2 Direct Management of Natural Resources

2.3 Fire management

2.3.2 Fuel reduction

- 2.3.2.1 Prevent wildfires by reducing natural fuel (e.g., leaf litter).

2.3.3 Prescribed burning

- 2.3.3.1 Evaluate different management techniques of prescribed burns that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 2.3.3.2 Conduct prescribed burning in Northern New Jersey forests to maintain and regenerate a mosaic of upland forest habitats.
- 2.3.3.3 Conduct prescribed burning to improve wildlife habitat.

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

- 2.8.0.1 Control invasive insect infestations by implementing BMP strategies through biological, chemical and/or mechanical means that will depress, or when appropriate, eradicate populations in a manner that avoids excessive harm to non-target species using BMPs to control infestations and limit their spread based on an inventory of invasive insect distribution and response to outbreaks.
- 2.8.0.2 Develop, implement, monitor and evaluate pest control/management strategies to reduce the impacts of over-abundant wildlife species (native and/or native, invasive species) on native vegetation and the degradation of habitats supporting SGCN. Over-abundant wildlife species include but are not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.
- 2.8.0.5 Implement biologically safe and appropriate control/management strategies, and where appropriate, eradication strategies to reduce the impacts and/or limit the distribution of invasive and/or non-native plant species within or near aquatic systems using methods that will provide the most protection to the aquatic and riparian ecological system, and minimize disturbance to the soil and wildlife. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.
- 2.8.0.6 Implement long-term management of invasive and/or non-native plants to help maintain functioning ecological systems and biological diversity, and to enhance travel corridors. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.

2.10 Planting/seeding

Northern Metalmark

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

- 2.10.0.1** Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 2.10.0.2** Improve the availability of prey/food resources through terrestrial and aquatic plantings and habitat restoration for SGCN populations, in particular for those populations thought to be limited due wholly or in part to a lack of (or contaminated) food resources, and for migratory species (birds, bats, invertebrates).
- 2.10.0.3** Restore and/or enhance habitats to benefit urban-associated SGCN.
- 2.10.0.4** Restore and/or enhance suitable travel corridors connecting conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats.
- 2.10.0.5** Implement habitat restoration and/or enhancement activities that include the creation of vegetative buffers between sensitive habitats (e.g., aquatic systems) and human-inhabited areas (e.g., residences, parks, etc.) and that is conducted during appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity
- 2.10.0.6** Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats.
- 2.10.0.7** Restore/reclaim and enhance degraded rare species habitats through strategic revegetation and management efforts for documented/target SGCN.
- 2.10.0.8** Protect significant natural and/or unique communities by implementing best management practices when conducting habitat restoration strategies.
- 2.10.0.9** Restore and/or enhance riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation, alteration and/or changes in hydrology and subsequent disturbances to and behavioral changes of wildlife (e.g., restoring biologically appropriate buffers, revegetation or restoration efforts, etc.).
- 2.10.0.10** Minimize the loss of important habitats (e.g., coastal scrub-shrub and grassy habitats, high and low marsh habitats, etc.) that provide nesting, migrating, and wintering areas for SGCN birds and other coastal and marsh-dependent species through habitat restoration efforts.
- 2.10.0.11** Restore and/or enhance critical migratory terrestrial and aquatic habitats (e.g., beach, grasslands, forest, scrub-shrub, etc.) for songbirds, raptors, shorebirds, waterfowl, bats and invertebrates through habitat restoration efforts and expand habitat restoration to adjacent private lands to increase the effective size of the habitat.
- 2.10.0.12** Create and/or maintain scrub-shrub habitats through revegetation efforts with little to no impact on forested, wetland and grassland habitats to maintain populations of shrub-dependent SGCN.
- 2.10.0.14** Implement best management practices (BMPs), protective strategies and guidelines for restoring and enhancing healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

Northern Metalmark

- 2.10.0.15 Restore and/or enhance terrestrial and aquatic habitats proximate to but not adjacent to roads and other transportation corridors for terrestrial-bound SGCN species whose behavior (i.e., dispersal across roads) may be altered by doing so, and therefore decrease road mortality of such species (e.g., amphibians, snakes, turtles, small mammals).
- 2.10.0.21 Restore and/or enhance understory habitats that suppress invasive species and provide critical resources and enhance sheltering, foraging, and nesting cover for wildlife.
- 2.10.0.22 Restore and/or enhance terrestrial and aquatic habitats to promote the regeneration of native vegetation and enhance structural diversity to benefit SGCN (e.g., vegetative buffers of aquatic systems, allow coarse, woody debris to remain in terrestrial, aquatic and riparian habitats to provide shelter, riparian stabilization and necessary microclimates, plant native trees, shrubs and grasses, etc.).

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.
- 2.11.0.2 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas for target SGCN and/or species groups; management should complement rare species needs in a targeted area.
- 2.11.0.3 Create suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats through vegetation management.
- 2.11.0.4 Implement vegetation management strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife, particularly SGCN.
- 2.11.0.5 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats through vegetation management.
- 2.11.0.6 Reclaim degraded rare species habitats by conducting vegetation management needed to restore habitat value for the documented/target SGCN.
- 2.11.0.7 Protect significant natural and/or unique communities by implementing best management practices through vegetation management.
- 2.11.0.23 Implement appropriate habitat management actions in areas where natural disturbances, such as wildfire, have been precluded.
- 2.11.0.24 Conduct vegetation management adjacent to aquatic habitats following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.25 Conduct vegetation management along access roads following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.26 Conduct vegetation management along roadsides and medians, avoiding peak activity periods for wildlife, that enhances wildlife dispersal naturally and safely across roads and similar barriers to/between terrestrial and/or aquatic habitats.
- 2.11.0.27 Conduct vegetation management for target shrub- or young forest-dependent SGCN following BMPs to minimize the risk of the establishment of invasive and non-native plants.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Northern Metalmark

- 2.11.0.28 Conduct vegetation management in agricultural areas following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.29 Conduct vegetation management on transportation and service corridors (i.e., rights-of-way) following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.30 Identify and prioritize areas where various management tools (such as increasing salinity through the management of water levels or chemical applications) may be effective in reducing phragmites within and restoring marsh habitat.
- 2.11.0.31 In areas where vegetative communities are shifting due to fire suppression and controlled burns are not feasible, manage vegetation to improve wildlife habitat.
- 2.11.0.32 Increase structural habitat diversity around and when feasible, within agricultural landscapes by managing vegetation for a variety of species, in particular, those farms that have removed scrub-shrub habitat and/or fragmented forests, and by implementing ecologically best practices (e.g., no-till farming, maintaining hedgerows, buffer set-asides, etc.).
- 2.11.0.33 Increase structural habitat diversity by implementing long-term vegetation management to minimize the potential for the establishment of invasive and/or non-native plants that may outcompete native vegetation.
- 2.11.0.34 Increase structural habitat diversity by managing residential, commercial and recreational areas' landscapes for a variety of species. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.36 Increase structural habitat diversity by managing vegetation for a variety of species and considering their life history requirements (e.g., travel corridors, shelter, resting and breeding areas) to minimize the risk of harm.
- 2.11.0.38 Increase structural habitat diversity in and around horse/livestock farms by managing vegetation for a variety of species, in particular, in and around farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 2.11.0.39 Increase structural habitat diversity in and around solar farms by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.40 Increase structural habitat diversity surrounding areas used for energy, mining, and transportation and service corridors by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides, and avoid managing habitat during the breeding seasons for ground-nesting birds, reptiles, amphibians and small mammals.
- 2.11.0.41 Increase structural habitat diversity through the implementation of a variety of vegetation management practices such as prescribed burns (either increasing or decreasing their frequency depending on the site and objective), plantings, etc. that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.

Northern Metalmark

- 2.11.0.42 Increase structural habitat diversity within wind farms for terrestrial bound and low-flying species and around wind farms for other wildlife by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.43 Manage forests to increase variation in age structure and composition using BMPs that promote and maintain functioning ecological forest-based systems and biological diversity.
- 2.11.0.45 Regularly and/or rotationally create young forest habitat in targeted areas to maintain and regenerate a mosaic of upland forest habitats that will benefit shrub- and young forest-dependent species.

2.14 Wildlife disease management

2.14.0 Wildlife disease strategy development and investigation

- 2.14.0.1 Investigate diseases/pathogens impacting SGCN and/or their habitats.
- 2.14.0.2 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
- 2.14.0.3 Protect SGCN from exotic pathogen introduction or incident through implementation of a "rapid response plan"; DFW to give priority attention to these species in planning and/or implementing a response.
- 2.14.0.4 Conduct long-term monitoring of diseases in vulnerable wildlife to determine the magnitude of exposure within populations and around the State, the impacts to those species, in particular SGCN, and investigate the feasibility of mitigating for such impacts.
- 2.14.0.5 Assess the impacts of diseases on the life cycles of wildlife.

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

- 3.0.0.1 Conduct long-term monitoring of resident and migratory SGCN populations using standardized survey protocols to determine the variables that may impact their long-term persistence in the State (e.g., population viability, distribution, dispersal, home range and habitat use, travel corridors, food availability, vulnerability to pollutants and disease, etc.). Compile this information to determine the likely causes of population declines and to understand metapopulation dynamics. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.2 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) where data gaps exist regarding SGCN distribution, and their critical and supportive habitats. Conduct surveys using standardized survey protocols to acquire baseline data, and provide the data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
- 3.0.0.3 Gather baseline data on SGCN inhabiting permanently protected natural lands regarding their distribution and population (e.g., abundance, dispersal, demography including productivity and survival, etc.), and identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) critical and supporting habitats within those landscapes.
- 3.0.0.4 Conduct long-term studies on SGCN inhabiting permanently protected natural lands to develop population trend data and changes in demography, and to determine if critical and/or supporting habitats are limited or changing; i.e., diminishing in value, acreage or connectivity.

Northern Metalmark

- 3.0.0.7 Collect baseline data to document species distributions, in particular SGCN, and current habitat for future analysis of possible distribution shifting as a result of habitat shifting or alteration associated with climate change impacts.
- 3.0.0.8 Conduct long-term studies and compare baseline metrics of documented species distributions and associated habitats to identify possible species and/or habitat shifting or alteration associated with climate change impacts.
- 3.0.0.13 Investigate the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats. Evaluate and modify management practices as appropriate.
- 3.0.0.14 Identify areas with invasive, aquatic plants and animals and collect a detailed baseline assessment of the species' status and distribution. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort. Researchers and contractors performing Forest Stewardship Inventories and/or Plans on state lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.0.0.15 Conduct long-term monitoring of areas identified as having invasive, aquatic plants and animals to track the species' status/progress over time with or without the implementation of management strategies. Areas without management strategies should be assessed and prioritized for management/control. Areas where management strategies are being implemented should include an assessment of the management effort and identify/recommend and implement necessary changes to improve its success. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort.
- 3.0.0.26 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species including objectives and guidance pertaining to and the condition/status of critical and supporting habitats.
- 3.0.0.27 Evaluate the effectiveness of strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals through research and monitoring. Develop and provide NJ DEP and other appropriate governing agencies/commissions a summary of findings and recommendations to improve such efforts.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.1 Division of Fish and Wildlife should maintain a robust, up-to-date database and mapping of species occurrences.
- 3.2.0.7 Track (via a database that includes a GIS component) and research problematic species and diseases to determine their distribution, impacts on SGCN wildlife/wildlife communities, and develop potential control measures.
- 3.2.0.8 Implement and conduct long-term monitoring of control measures aimed at minimizing the impacts of problematic species and/or diseases to evaluate the effectiveness of such efforts and to identify and incorporate additional strategies as appropriate.
- 3.2.0.18 Conduct baseline surveys/inventories to better understand the distribution of fish and invertebrate (including freshwater mussels) populations.

3.2.1 Abundance determination

Northern Metalmark

- 3.2.1.1 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) population abundance and trends for SGCN using standardized survey protocols. Provide data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
 - 3.2.1.2 Conduct wildlife surveys on resident and migratory SGCN regarding their population abundance and trends.
 - 3.2.2 Age, size and sex structure
 - 3.2.2.1 Conduct wildlife surveys on resident and migratory SGCN regarding their survivorship.
 - 3.2.3 Baseline inventory
 - 3.2.3.9 Investigate hazardous environmental issues that may impact grassland invertebrates.
 - 3.2.7 Population assessment
 - 3.2.7.1 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
 - 3.2.7.2 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species to meet and maintain recovery goals.
- 3.3 Research, survey or monitoring - habitat
 - 3.3.1 Baseline inventory
 - 3.3.1.1 Conduct habitat assessments of significant natural and/or unique communities to identify threats to native terrestrial and aquatic habitats through systematic monitoring, review of available data, enlistment of habitat management and/or species experts, etc. Incorporate findings into a database that includes descriptions/qualifiers of the habitats, identifies and values/qualifies the threats, and includes a GIS component of the locations of the assessed areas. Share this information with landowners/managers (e.g., federal, state and local government agencies or non-government organization).
 - 3.3.1.2 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) resident and migratory SGCN habitats. Investigate their suitability for the various life history requirements of the species that dependent upon them to determine the ability for maintaining applicable SGCN populations in perpetuity.
 - 3.3.1.4 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and investigate the suitability of corridors that connect large, contiguous tracts of similar habitats to increase their effective size (i.e., forest with forest, grassland with grassland, wetlands with wetlands, etc.) for dependent SGCN.
 - 3.3.1.5 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) where habitat restoration and/or enhancement would benefit wildlife SGCN.
 - 3.3.1.6 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) that could, through revegetation and/or enhancement efforts, become suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN.
 - 3.3.1.7 Map and prioritize existing and potential areas for early succession forest management. Share the results with state, county and municipal planners.
 - 3.3.1.9 Inventory forests throughout northern New Jersey to develop a baseline characterization of the structure and composition of habitats and identify deficient forest habitat types.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Northern Metalmark

- 3.3.1.10 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and document fish SGCN habitats by plotting their distributions in GIS and submitting the data to the State for integration into the DEP's Biotics database.
- 3.3.1.16 Gather "best information" for spatial modeling and update/create a current model/depiction of anticipated habitat shifts from sea-level rise, flooding, etc.
- 3.3.1.17 Identify and map undeveloped roads and trails in all conserved forests, and create a database of locations. Integrate information regarding potentially sensitive areas.
- 3.3.1.18 Conduct an assessment using available data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels.
- 3.3.1.19 Identify and codify legal ORV access areas on state (and if appropriate, other conserved) lands. Provide GIS mapping to the landowner for potential use in directing such recreational activities.
- 3.3.1.20 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) where invasive, non-indigenous plants and animals are either already established or are becoming established. Create a system for reporting and qualifying new locations of invasive species and for prioritizing areas for control measures according to the potential level of impact on the ecosystem and SGCN and the likelihood of success. Researchers and contractors encountering invasive plant species while performing plant and/or forest inventories on state or other conserved lands and/or private lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.3.1.24 Conduct regular investigations of SGCN habitat health and biodiversity on public and private lands to identify locations in need of revegetation, reduction of over-abundant, native wildlife and/or exotic species, conservation focal areas requiring limitations on human activity, etc.

3.3.2 Monitoring

- 3.3.2.2 Conduct long-term monitoring of resident and migratory SGCN habitats using standardized survey protocols to determine changes in habitat quality/suitability and threats (e.g., habitat loss and degradation, increased edge habitat, water quality) and other variables that may impact their long-term persistence in the State and to provide information needed for determining causes of population declines and understanding metapopulation dynamics.
- 3.3.2.3 Continue to update wildlife and habitat databases and revise models of critical SGCN habitats using the most current data available and where lacking, develop new SGCN and/or habitat models as data on species habitat requirements and applicable GIS data layers become available.
- 3.3.2.9 Investigate the effectiveness of various silviculture techniques for enhancing forests for forest-dependent SGCN.
- 3.3.2.10 Evaluate the efficacy and success of different management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.3.2.15 Investigate the effectiveness of management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.

Northern Metalmark

- 3.3.2.16 Evaluate the effectiveness of best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 3.3.2.20 Once a system is developed for reporting and qualifying new locations of invasive species, develop, implement and monitor/evaluate invasive species removal strategies at identified locations. Priority should be given to those areas critical to SGCN and/or contain unique and/or rare plant communities supporting SGCN and/or other fish/wildlife species.
- 3.3.2.24 Conduct regular inventories of forests throughout northern New Jersey to characterize the changing structure and composition of habitats and monitor forest conditions.

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.1 Work with land management agencies to determine the appropriate actions needed to restore/reclaim degraded habitat for the documented/target SGCN.
- 3.5.3.3 Develop/improve management techniques that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.9 Develop strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 3.5.3.11 Develop strategies to protect native terrestrial and aquatic habitats and dependent SGCN species from the identified threats.
- 3.5.3.15 Modify management practices based on the effects of pesticides, herbicides and other biological controls on critical and supporting SGCN habitats.
- 3.5.3.16 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.
- 3.5.3.21 Develop management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.24 Based on research, modify management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.5.3.25 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to develop the necessary management strategies to reach or maintain viable population levels.

3.5.4 Fish and wildlife research, survey and management techniques

- 3.5.4.5 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.

Northern Metalmark

- 3.5.4.6 Investigate the feasibility of mitigating for the impacts of contaminants to vulnerable wildlife, particularly SGCN. Maintain records on exposure of vulnerable wildlife to environmental toxins (such as flame retardants and endocrine disruptors), so that sources may be identified and controlled or eliminated.
- 3.5.4.14 Develop and implement agreements, and update existing agreements, with government agencies regarding the protection of critical SGCN habitats (e.g., significant breeding populations of beach nesting birds, colonial waterbird nesting areas, bat colonies, etc.).
- 3.5.4.15 Investigate the success of management strategies used to protect and/or enhance SGCN populations and when appropriate, aid in identifying failures/resource problems and issues, and developing new strategies.
- 3.5.4.16 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels and develop the necessary management strategies.
- 3.5.4.18 Investigate the effectiveness of survey techniques through selected “ground truthing” and literature and peer review in order to increase efficacy of survey, minimize surveyor bias and error, and increase accuracy of trend data.
- 3.5.4.19 Develop reliable, standardized survey and monitoring protocols for SGCN species, for which none currently exist, and their habitats.
- 3.5.4.21 Develop BMPs to address problematic species and diseases of unknown origin.

4 Education

4.1 Educator/Instructor training

4.1.0 Public education

- 4.1.0.1 Provide educational resources and training programs to private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.

5 Facilities and Areas

5.15 Wildlife Management Areas

5.15.6 Roads

- 5.15.6.1 Clearly post areas/roads where vehicle access is permitted.
- 5.15.6.2 Clearly post areas/trails where vehicle access is not permitted.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

- 6.0.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.7 Secure and protect critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.8 Secure and protect scrub-shrub habitats for SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

6.3 Conservation area designation

Northern Metalmark

6.3.0 Conservation area designation strategies

- 6.3.0.2** Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN and/or connect conserved SGCN habitats through conservation area designations.
- 6.3.0.8** Promote the protection of scrub-shrub habitats for SGCN through conservation area designations.

7 Law Enforcement

7.1 Law enforcement

7.1.3 Sub-national Level

- 7.1.3.2** Increase the number of law enforcement officers tending to wildlife issues to a reasonable number to sufficiently cover the State and marine waters.

7.1.4 Scale Unspecified

- 7.1.4.12** Implement policies and/or regulations that protect significant natural and/or unique communities in perpetuity.
- 7.1.4.19** Implement policies that protect and restore scrub-shrub habitats to benefit shrub-dependent SGCN.
- 7.1.4.26** Educate law enforcement personnel that there may be unauthorized research projects taking place and to encourage them to investigate any activities that appear to be harmful to wildlife.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.2** Develop a team of personnel from government entities, conservation organizations and other stakeholders engaged in oil/gas spill response for marine and freshwater habitats to develop a feasible plan for oil spill response and/or to amend NJ's current oil spill response plan that clearly outlines each organizations responsibilities and an assessment and location list of available equipment for boom deployment during oil spills.
- 8.1.0.3** Develop an outreach team of personnel from government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 8.1.0.4** Engage government agencies, conservation partners and other stakeholders in constructive dialogues encouraging them to influence policy change and the creation of incentives through a habitat bill and/or municipal ordinances for backyard habitat.
- 8.1.0.15** Engage government agencies, conservation partners and other stakeholders in discussions encouraging and supporting the creation of laws and policies requiring vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 8.1.0.16** Engage local governments in discussions regarding the importance of them adopting/passing ordinances which require assessing and addressing secondary impacts (i.e., ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 8.1.0.17** Engage municipalities in constructive dialogue to identify and minimize destruction of areas prioritized for early succession forest management.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Northern Metalmark

- 8.1.0.18 Engage NJDOT, NJ Transit Authority and other road management entities, wildlife conservation organizations/agencies (e.g., Division of Fish and Wildlife, New Jersey Conservation Foundation, Conserve Wildlife Foundation of NJ), and communities and citizens in discussions regarding the importance of and methods to enhance habitat connectivity, and work together to develop feasible strategies for ensuring that wildlife can disperse naturally and safely across roads and similar barriers to terrestrial and/or aquatic habitats.
- 8.1.0.19 Engage government agencies, conservation partners and other stakeholders to collaboratively develop a list of important projects, targeting SGCN and/or their habitat, as a guide for graduate student research. Distribute the list and contact information to all State colleges and universities.
- 8.1.0.20 Organize a small focal group of government and non-government agencies/organizations responsible for decisions regarding beach/dune management to share and coordinate their goals so that comprehensive planning can attempt to meet all needs.
- 8.1.0.21 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation human-subsidized and/or overabundant, native species cause to local nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.22 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation invasive species cause to native nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.24 Engage government agencies, conservation partners and other stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.25 Provide technical support to public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.26 Coordinate across federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to woodland landowners to adopt or endorse consistent best management practices concerning controlled burns to maintain and/or improve forested habitat for wildlife.
- 8.1.0.30 Encourage government agencies and conservation partners to advise members of the relevant scientific community of the need for specific studies, reports or investigations targeting the data-deficiency regarding SGCN and/or their habitats.
- 8.1.0.34 Work with the NJ Education Association and Department of Education to design curriculum and outdoor experimental learning opportunities, and provide training to teachers on implementation of these activities.
- 8.1.0.37 Enlist landowners and NJ citizens in the protection of and survey efforts for SGCN, in particular rare species, by increasing enrollment in landowner incentives, forest stewardship, backyard habitat management and wildlife-related volunteer programs.
- 8.1.0.38 Engage partners, stakeholders and land managers in constructive dialogue promoting forest stewardship for SGCN that use core forests and forested corridors.
- 8.1.0.40 Encourage researchers, land managers, naturalists and enthusiasts to follow proper procedures for the coordination and/or permitting of research/management activities involving wildlife and sensitive habitats, and discourage activities that alter vegetation or wetlands, or cause harm or disturbance to wildlife.

Northern Metalmark

- 8.1.0.42 Engage citizens, wildlife observers and photographers through discussions and distributable information regarding the importance of and encouraging implementing responsible and ethical behavior when observing wildlife by developing an alliance of wildlife photographers and widely circulating recommendations on how to reduce impact.
- 8.1.0.44 Engage conservation partners, stakeholders, government agencies and other land stewards in constructive dialogues encouraging their inclusion of controlled burns in forest and other stewardship plans.
- 8.1.0.47 Form cooperative partnerships with energy companies to facilitate habitat creation and enhancement away from and outside of project areas, the restoration of appropriate habitats within project areas (e.g., rights-of-way could benefit butterflies and some bird species), and to identify seasonal timing of activities that would minimize impacts to wildlife.
- 8.1.0.48 Form cooperative partnerships with transportation and shipment agencies and companies to facilitate habitat creation and enhancement away from and outside of project areas and to identify seasonal timing of activities that would minimize impacts to wildlife.

8.2 Recruitment and retention activities

8.2.3 For wildlife watching

- 8.2.3.1 Develop and implement nature-focused tourism opportunities including wildlife viewing sites, interpretive signage highlighting unique ecosystems/habitats, and wildlife-related recreational opportunities that do not negatively impact SGCN or their habitats.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.7 Develop and provide (or otherwise make publicly available) educational programs and/or materials that describe the negative impacts of off-road vehicles and watercraft use in and adjacent to critical SGCN habitats, and the importance of confining such activities to more appropriate locations and/or seasons.
- 8.3.0.8 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate recreationists and encourage landowners to eliminate garbage in the vicinity of suitable wildlife habitat, in particular SGCN habitat. Information should include the detrimental impacts garbage may have on various wildlife species.
- 8.3.0.9 Develop and provide (or otherwise make publicly available) educational programs and/or materials to enlist landowners and land managers to include only native plants in landscaping and restoration projects. Provide information to assist them in detecting problematic establishment of invasive, non-indigenous plants.
- 8.3.0.10 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate landowners and NJ citizens on threats to fish and wildlife (including marine animals).
- 8.3.0.11 Develop and provide (or otherwise make publicly available) educational programs and/or materials to the public, wildlife-related professionals, foresters, etc., that describe the value of species that are often feared (e.g., snakes, bats, spiders, Allegheny woodrat) and/or deemed a "nuisance" (e.g., squirrel, deer, snapping turtle), and therefore, persecuted by people. Include information on tolerance, proper identification, eviction from human dwellings, how to minimize the animal's presence on the property, and/or how to live in harmony with the animal.
- 8.3.0.12 Promote awareness of WSFR (Wildlife and Sportfish Restoration) Outreach/Awareness grants, an important funding source for conservation among hunters and anglers as well as the general public.

Northern Metalmark

- 8.3.0.13 Conduct an educational campaign to encourage observer ethics and respect for wildlife and natural habitat.
- 8.3.0.24 Develop educational outreach programs for local decision-makers, land developers, landowners and citizens about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
- 8.3.0.25 Develop educational outreach programs for landowners, nurseries and the general public regarding the negative impacts of invasive and non-native plants on our natural communities.
- 8.3.0.26 Develop educational outreach programs for private and public landowners and land managers regarding the importance of and how to manage core forests and forested corridors in a way that will be beneficial for SGCN, particularly endangered, threatened and special concern species.
- 8.3.0.27 Develop educational outreach programs for public and private landowners and land managers regarding the importance of structural habitat diversity, methods to increase diversity, and/or incentive programs available to increase habitat diversity.
- 8.3.0.30 Develop educational outreach programs for private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.
- 8.3.0.32 Develop an educational outreach program for landowners and citizens on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

- 9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and SGCN inhabiting them.
- 9.1.0.2 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.1.0.3 Develop a plan that directs the creation of impervious surfaces away from and to minimize impacts on aquatic systems and critical terrestrial habitats. The plan should also include strategies to increase the resiliency of aquatic and critical terrestrial habitats to threats and stressors that would impact the reproduction and survival of wildlife.
- 9.1.0.5 Develop a plan that directs the creation or expansion of energy or utility rights-of-way in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.6 Develop a plan that directs the creation or expansion of roads and railroads or the re-establishment of abandoned railroads within and adjacent to critical forested habitats in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.8 Develop a plan that focuses on strategies for oil pipelines to avoid sensitive habitats that would be highly impacted by oil spills.
- 9.1.0.9 Develop a plan that focuses on strategies to minimize the creation of renewable energy farms (e.g., solar, wind) and related infrastructures within and their impacts on forested habitats and the wildlife community.
- 9.1.0.10 Develop a plan that focuses on strategies to minimize the impacts of mining on critical forested habitats.
- 9.1.0.11 Develop a plan that focuses on strategies to minimize the impacts of power plants on critical forested habitats and the wildlife community.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Northern Metalmark

- 9.1.0.13 Develop a plan to minimize agriculture that would result in groundwater withdrawal in critical forested areas.
- 9.1.0.15 Develop a plan to minimize fragmentation of terrestrial and aquatic habitats by roads.
- 9.1.0.16 Develop a plan to minimize new lawns and preserve natural vegetation within and adjacent to critical forest areas.
- 9.1.0.19 Develop a plan to minimize the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 9.1.0.21 Develop a plan to minimize the use of any-sized dam in critical forested areas.
- 9.1.0.22 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 9.1.0.28 Develop and coordinate state, regional and local plans for suitable lot layout and landscaping to minimize human-wildlife conflicts that also incorporates habitat connectivity and preservation of natural areas.
- 9.1.0.29 Provide GIS or related data, maps, resource inventories, as well as related training, pertaining to the SWAP and its recommended conservation actions for use or consideration by State, County or municipal planning agencies.
- 9.1.0.30 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and other related threats associated with development.
- 9.1.0.33 Review the species, threats, action successes, and habitats, and work with partners to revise the 2017 State Wildlife Action Plan for the 2025 resubmittal.

9.2 Organizational strategic and CMS planning

9.2.1 Organizational strategic and operational planning

- 9.2.1.1 Identify and codify legal ORV access areas on state lands.

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.3 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.1.4 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.3.1.5 Develop response plans to address disease outbreaks within wildlife populations, in particular SGCN.
- 9.3.1.7 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
- 9.3.1.9 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
- 9.3.1.10 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 9.3.1.13 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
- 9.3.1.15 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.

Northern Metalmark

- 9.3.1.16 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.

9.3.3 Habitat management planning

- 9.3.3.5 Develop a management plan using forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.
- 9.3.3.7 Develop a management plan to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 9.3.3.8 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 9.3.3.10 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
- 9.3.3.11 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.3.3.13 Develop a management plan that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas and prevents or ameliorates near-term impacts of climate change throughout the State, but in particular within the coastal and Delaware Bay areas.
- 9.3.3.15 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
- 9.3.3.16 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.3.18 In cooperation with species and habitat experts, develop management plans for significant natural and/or unique communities, in particular those supporting SGCN, and provide the information to the landowners/managers (federal, state and local government agencies or non-government organization) for review and implementation.
- 9.3.3.19 Develop management plans for SGCN inhabiting permanently protected natural lands using available baseline and population trend data.
- 9.3.3.21 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
- 9.3.3.28 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.
- 9.3.3.29 Develop habitat management plans aimed at reducing or eliminating negative impacts of ORVs.
- 9.3.3.32 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.
- 9.3.3.34 Include controlled burn prescriptions in forest and stewardship plans to improve wildlife habitat.

Northern Metalmark

9.3.3.35 Incorporate habitat connectivity, preservation of natural areas, and the implementation of BMPs into state and local land-use policy environmental review process and energy development plans to minimize habitat fragmentation and related threats associated with solar farms and altered habitats.

9.3.3.36 Integrate plans for properly located and timed habitat restoration and management along transportation, energy and service corridors to minimize risks to and benefit wildlife.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

11.1.1.1 Use Biotics database and Landscape Project Mapping in regulatory reviews to ensure protection by applicable laws and regulations.

11.1.1.2 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.

11.1.1.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.

11.1.1.5 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.

11.1.1.7 Review proposed construction or other work projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.

11.1.1.8 Review proposed research projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.

11.1.1.12 Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed solar farm projects to reduce habitat fragmentation and minimize impacts on wildlife.

11.1.2 Review of proposed policies and plans

11.1.2.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

11.2.0.1 Provide technical support to private and public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.

11.2.0.2 Provide technical support to public and private landowners and land managers for controlling invasive, native and non-native plant species in order to increase structural habitat diversity.

11.2.0.3 Develop state, regional and local BMPs that focus on minimizing habitat fragmentation and human-wildlife conflicts associated with development. Make information available to land developers and private and public landowners for implementation.

11.2.0.5 Provide educational resources, training programs, and expert guidance to private and public landowners and land managers on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

Northern Metalmark

- 11.2.0.6 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on habitat creation, enhancement and restoration within and adjacent to project areas, as well as away from and outside of project areas (depending on the target species), by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. Wind farms should address both terrestrial bound and low-flying species. Examples of habitat management include, but are not limited to, integrating short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 11.2.0.7 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on the importance of maintaining habitat connectivity, minimizing fragmentation, and the use of CHANJ products to help them target areas for such planning.
- 11.2.0.8 Provide educational resources, training programs, and on-the-ground guidance to public and private landowners and land managers on habitat creation and enhancement strategies that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 11.2.0.9 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and private landowners about the importance of leaving vegetation in place, especially along riparian areas and wildlife movement corridors.
- 11.2.0.10 Provide technical support to private landowners, consultants, and land managers to create customized management plans based on location and SGCN.
- 11.2.0.11 Provide educational resources, training programs, and on-the-ground guidance to private and public landowners and land managers on the benefits of and for creating young forest and early succession habitat for SGCN.
- 11.2.0.15 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and landowners about the importance of retaining and in an effort to protect, create, enhance and/or restore vegetation along aquatic habitats.
- 11.2.0.17 Provide educational resources and technical support to public and private landowners and land managers to promote the protection of vernal pools and the protection, enhancement and/or restoration of biologically appropriate buffers.
- 11.2.0.19 Provide educational resources and technical support to public and private landowners and land managers to promote the protection and/or enhancement of scrub-shrub habitats for SGCN.
- 11.2.0.22 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
- 11.2.0.23 Provide educational resources and technical support to public and private landowners and land managers of lands adjacent to SGCN habitats to promote the protection and/or enhancement of those adjacent habitats to increase the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and that connect conserved SGCN habitats.

Northern Metalmark

- 11.2.0.24 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers on how to manage vegetated roadside areas (e.g., mowing, brush-hogging, etc.) on a schedule that avoids peak activity periods for wildlife and therefore, minimizes harm.
- 11.2.0.25 Provide educational resources, training programs, and on-the-ground guidance to resource managers regarding the assessment of and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) related to residential and commercial development.
- 11.2.0.26 Make educational resources available to the public that encourage researchers to seek out guidance prior to finalizing proposals and submitting State permit applications to reduce potential impacts on sensitive species.

11.2.1 With individuals and groups involved in resource management decision making

- 11.2.1.1 Engage partners and stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 11.2.1.2 Provide professional training and technical assistance tools (e.g., mapping, guidance documents, justification, etc.) to agencies/divisions/programs within and outside of the NJ DEP regarding the SWAP, and the conservation actions recommended therein to help facilitate SWAP implementation.
- 11.2.1.3 Provide educational resources, training programs, and on-the-ground guidance to DOD to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop and implement forest management and other practices that minimize disturbances to SGCN (i.e., beyond their federal requirements).
- 11.2.1.5 Provide educational resources, training programs, and on-the-ground guidance to municipalities, state and federal agency resource managers on tasks such as writing and integrating Beach Management Plans into other management documents.
- 11.2.1.6 Provide educational resources, training programs, and on-the-ground guidance to resource agencies prior to project initiation to ensure wildlife and their habitats are protected to the highest degree possible during construction, and provisions are in place for post-construction habitat use.

11.2.2 With private landowners

- 11.2.2.1 Provide technical support to farming operations and woodland landowners on ways to decrease clean farming (edge-to-edge) practices and create ecotones to benefit bobwhite and other species dependent on early successional habitat.

100 Law and Policy

100. Legislation

100.1.3 Sub-national Level

- 100.1.3.3 Initiate legislative action to establish an annual budgetary line item designating funds to support programs focused on long-term research and monitoring of wildlife diseases.

100.1.4 County and Local

- 100.1.4.2 Secure and increase the effective size of SGCN habitats and connect conserved SGCN habitats through local ordinances.
- 100.1.4.3 Expand the acreages and enhance the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN through local ordinances.

Northern Metalmark

- 100.1.4.14 Adopt/pass local ordinances which require assessing and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 100.1.4.15 Incorporate habitat connectivity and the preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.

100.1.5 Scale Unspecified

- 100.1.5.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 100.1.5.5 Develop legislation to provide financial support for the New Jersey Invasive Species Strike Team.

100. State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.5 Develop policies that will promote improved and secure habitat connections between conserved SGCN habitats.
- 100.3.0.6 Develop policies that will promote expanding acreages and enhancing the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 100.3.0.8 Develop policies and/or regulations with the objective of protecting significant natural and/or unique communities in perpetuity.
- 100.3.0.9 Secure mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.12 Develop policies that promote the preservation and protection of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.
- 100.3.0.18 Develop policies for conserved lands that prohibit planting and supports the control of non-native vegetation and invasive, native vegetation.
- 100.3.0.23 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.31 Create or expand tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMPs.
- 100.3.0.32 Coordinate regulations across agencies to maximize availability of and enrollment in existing Forestry Stewardship Programs (e.g., "Woodland Stewards", Farm Bill, partners, etc.) to maintain and/or improve forest habitat.
- 100.3.0.38 Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.

Northern Metalmark

- 100.3.0.39 Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.3.0.40 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.3.0.41 Explore all State regulatory requirements for mitigation, restoration, habitat management, etc. to ensure they prohibit the use of specified invasive or other problematic plant species.
- 100.3.0.43 Identify and address (amend) regulatory impediments to beneficial habitat management.
- 100.3.0.44 Incorporate requirements for technical support and funding for mitigation or restoration efforts so as to be consistent with existing regulations.
- 100.3.0.45 Increase the controlled burn season to focus on restoring vegetative communities.
- 100.3.0.46 Investigate and/or develop inter-agency Memorandum of Agreements to share common data stored or managed in program-specific databases.
- 100.3.0.48 Propose new State law or regulation mandating that a State-level "development impact fee" be assessed on all new development approved by municipalities (via the Municipal Land Use Law processes), and dedicate such monies to the development and implementation of regional Habitat Conservation Plans (or existing plans/programs serving the same regional function).
- 100.3.0.50 Retain endangered, threatened and special concern wildlife and habitat protection measures in the Water Quality Management Program Rules.
- 100.3.0.52 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded energy sitings and facilities.
- 100.3.0.53 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded rights-of-way corridors associated with energy transport/transmission.
- 100.3.0.60 Develop regulations that when implemented will protect significant natural and/or unique communities in perpetuity.
- 100.3.0.65 Develop regulations that when implemented will protect and restore scrub-shrub habitats to benefit shrub-dependent SGCN.
- 100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.
- 100.3.0.73 Develop regulations that would exempt the conversion of lawns to native vegetation (beneficial to wildlife) from local lawn ordinances.

100.3.2 State Land Acquisition Programs

- 100.3.2.1 Increase opportunities for habitat restoration by making any necessary policy changes to state, federal and local land acquisition programs (e.g., Green Acres, Blue Acres, etc.) to allow for acquisition within abandoned or failing bay shore communities, including mechanisms to relocate displaced people and infrastructure.

100. State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

Northern Metalmark

- 100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).
- 100.4.0.2 Create a policy that requires the NJ DEP to incorporate scientific information regarding climate change and sea level rise (e.g., predictions, habitat management/acquisition efforts to enhance resilience to inundation) on their websites and to work with other government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 100.4.0.3 Develop policies for mandatory buffer strips on preserved farmlands and state-owned agricultural lands.
- 100.4.0.8 Develop a white paper addressing the impacts that existing, new or expanded rights-of-way have upon wildlife, wildlife habitats and habitat connectivity.
- 100.4.0.10 Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.
- 100.4.0.11 Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.4.0.12 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.4.0.13 Develop policies for different circumstances (e.g., roadsides and medians, riparian, aquatic and terrestrial habitats) that outline appropriate habitat/vegetation management strategies and schedules to minimize risks to and benefit wildlife.
- 100.4.0.16 Develop policies to implement habitat management strategies that will increase the structural diversity surrounding areas used for energy, mining, and transportation and service corridors which include but are not limited to the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-
- 100.4.0.17 Develop policies to implement habitat management strategies, including prescribed burns, that will increase the structural diversity on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies to control and reduce the impacts of invasive, non-native species in order to increase structural habitat diversity.
- 100.4.0.18 Develop policies to minimize the extent of infrastructure associated with energy and service corridors or areas (e.g., wind and solar farms, pipelines, utility lines) and that require the implementation of habitat management strategies that will increase the structural diversity in the area including (e.g., the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-asides).
- 100.4.0.19 Develop regulations that will minimize the creation of new barriers, remove or replace current barriers with appropriately-sized systems to accommodate wildlife dispersal, and to minimize road widening and traffic volume increases within critical wildlife habitat areas.

Northern Metalmark

- 100.4.0.20 Develop state regulations that require energy developers and utility service companies to implement habitat management strategies that will increase the structural diversity of the habitat, minimize habitat fragmentation and commercial infrastructure, and minimize the loss, alteration and/or degradation of the habitat and adjacent lands when working on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies.
- 100.4.0.24 Develop policies to provide financial support for the New Jersey Invasive Species Strike Team.
- 100.4.0.25 Develop policies that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

Papaipema harrisii

Focal species that comprise this Conservation Target:

Papaipema harrisii

Threats and Action Drivers associated with this Conservation Target:

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale) (Avg. Score: 3.00)

NJ Specific Threats: 1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.1.1.2 Loss, alteration and/or degradation of habitat.

1.1.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale) (Avg. Score: 3.00)

NJ Specific Threats: 1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.2.1.2 Loss, alteration and/or degradation of habitat.

1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale) (Avg. Score: 2.00)

NJ Specific Threats: 1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.3.1.2 Loss, alteration and/or degradation of habitat.

1.3.1.5 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

2 Agriculture and Aquaculture

2.1 Annual and Perennial Crops (non-timber)

2.1.2 Small-holder Farming (Avg. Score: 1.00)

NJ Specific Threats: 2.1.2.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.2.2 Fragments terrestrial and aquatic habitats.

2.1.3 Agro-industry (Avg. Score: 3.00)

NJ Specific Threats: 2.1.3.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.3.2 Fragments terrestrial and aquatic habitats.

Papaipema harrisii

2.2 Wood and Pulp Plantations

2.2.1 Small Holder (Avg. Score: 2.00)

NJ Specific Threats: 2.2.1.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.

2.2.2 Agro-industry Plantations (Avg. Score: 3.00)

NJ Specific Threats: 2.2.2.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.

2.3 Livestock Farming and Ranching

2.3.2 Small-holder Grazing (Avg. Score: 1.00)

NJ Specific Threats: 2.3.2.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.

2.3.2.2 Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.

2.3.2.3 Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

2.3.2.4 Livestock allowed to wade into waterbodies trample and degrade aquatic habitats.

2.3.3 Agro-industry Grazing (Avg. Score: 1.00)

NJ Specific Threats: 2.3.3.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.

2.3.3.2 Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.

2.3.3.3 Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

2.3.3.4 Livestock allowed to wade into waterbodies trample and degrade aquatic habitats.

3 Energy Production and Mining

3.2 Mining and Quarrying

3.2.2 Surface Mining - Rock Quarry (and sand quarries) (Avg. Score: 2.00)

NJ Specific Threats: 3.2.2.1 Fragments terrestrial and aquatic habitats.

3.2.2.2 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

3.3 Renewable Energy

3.3.1 Wind Power (Avg. Score: 1.00)

NJ Specific Threats: 3.3.1.2 Fragments terrestrial habitats.

3.3.1.3 Loss, alteration and/or degradation of habitat.

3.3.2 Solar Power (Avg. Score: 2.00)

NJ Specific Threats: 3.3.2.1 Fragments terrestrial habitats.

3.3.2.2 Loss, alteration and/or degradation of habitat.

4 Transportation and Service Corridors

4.1 Roads and Railroads

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale) (Avg. Score: 2.00)

NJ Specific Threats: 4.1.1.2 Loss, alteration and/or degradation of habitat associated with road and railroad construction and maintenance, and degradation of adjacent habitats.

4.2 Utility and Service Lines

Papaipema harrisii

4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads (Avg. Score: 1.00)

NJ Specific Threats: 4.2.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species, inhibiting dispersal of non-volant animals, reducing gene flow, and creating barriers to fish when service line-associated roads cross streams (e.g., bridges, culverts, fords, etc.).

4.2.1.2 Loss, alteration and/or degradation of habitat associated with rights-of-way construction and maintenance, and degradation of adjacent habitats.

4.2.2 Management of rights-of-way or communication tower facilities and/or their associated access roads (Avg. Score: 1.00)

NJ Specific Threats: 4.2.2.1 Improper or poorly scheduled vegetation management can cause direct mortality to and may reduce productivity of wildlife.

5 Biological Resource Use

5.1 Hunting and Collecting Terrestrial Animals

5.1.1 Intentional Use (Avg. Score: 1.00)

NJ Specific Threats: 5.1.1.1 Illegal collection of wildlife can have detrimental impacts on populations.

5.1.3 Persecution/Control (Avg. Score: 2.00)

NJ Specific Threats: 5.1.3.1 Wanton killing of perceived dangerous and/or undesirable animals.

5.3 Logging and Wood Harvesting

5.3.1 Intentional Use (subsistence/small scale) (Avg. Score: 2.00)

NJ Specific Threats: 5.3.1.1 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may fragment their terrestrial habitats.

5.3.1.2 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may cause the loss, alteration and/or degradation of wildlife habitat.

5.3.1.3 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase soil erosion, impacting SGCN habitats.

5.3.1.4 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase the risk of invasive species establishment, impacting SGCN habitats.

5.3.1.5 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may decrease structural diversity and biomass leading to reduced biodiversity and ecological integrity.

5.3.1.6 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices in Atlantic White Cedar stands may destroy a unique wildlife wetland habitat that is difficult, and takes time, to restore.

5.3.2 Intentional Use (large scale) (Avg. Score: 3.00)

NJ Specific Threats: 5.3.2.1 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may fragment their terrestrial habitats.

5.3.2.2 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may cause the loss, alteration and/or degradation of wildlife habitat.

5.3.2.3 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase soil erosion, impacting SGCN habitats.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Papaipema harrisii

5.3.2.4 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase the risk of invasive species establishment, impacting SGCN habitats.

5.3.2.5 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may decrease structural diversity and biomass leading to reduced biodiversity and ecological integrity.

5.3.2.6 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices in Atlantic White Cedar stands may destroy a unique wildlife wetland habitat that is difficult, and takes time, to restore.

5.3.3 Unintentional effects (subsistence/small scale) (Avg. Score: 2.00)

NJ Specific Threats: 5.3.3.1 Direct mortality of wildlife, direct loss of suitable habitats (roost, foraging, shelter, etc.), and can disrupt sensitive species, decreasing the likelihood of success and/or reproduction.

5.3.3.2 Poorly planned/implemented tree harvesting adjacent to waterways and vernal pools can lead to increased water temperatures, soil erosion and sedimentation, and reduces the potential for woody debris within the aquatic system, leading to negative impacts on wildlife.

5.3.4 Unintentional effects (large scale) (Avg. Score: 3.00)

NJ Specific Threats: 5.3.4.1 Direct mortality of wildlife, direct loss of suitable habitats (roost, foraging, shelter, etc.), and can disrupt sensitive species, decreasing the likelihood of success and/or reproduction.

5.3.4.3 Poorly planned/implemented tree harvesting adjacent to waterways and vernal pools can lead to increased water temperatures, soil erosion and sedimentation, and reduces the potential for woody debris within the aquatic system, leading to negative impacts on wildlife.

5.3.4.4 Infrastructure and/or equipment use may result in subtle changes to drainage patterns, adversely affecting vernal pool and wetland hydrology.

5.3.4.5 Lack of appropriate, sustainable forest management can lead to a decrease in forest habitat diversity, degraded habitat for many forest species, the loss of habitat for early-successional species, and/or the loss of unique habitats for species that need canopy breaks and multi-aged tree composition to fulfill various life history requirements.

6 Human Intrusions and Disturbance

6.1 Recreational Activities

6.1.1 Off-road vehicles (motorized and non-motorized) (Avg. Score: 2.00)

NJ Specific Threats: 6.1.1.2 Inappropriate use of off-road vehicles can degrade terrestrial and aquatic habitat and reduce the suitability of adjacent habitats for wildlife.

6.1.1.3 Increased risk of harassment that results in a change in wildlife behavior and/or direct mortality from vehicle strikes.

6.1.1.6 Off-road vehicles can be a mechanism of transference of wildlife diseases and invasive plant species if gear and apparel are not properly sanitized between sites.

7 Natural Systems Modifications

7.1 Fire and Fire Suppression

7.1.1 Increase in Fire Frequency/Intensity (Avg. Score: 2.00)

NJ Specific Threats: 7.1.1.1 Increase in frequency and intensity of wild fires as a result of droughts and heat waves drying out vegetation and litter.

7.1.1.2 Increase in frequency of wild fires as a result of illegal activities.

7.1.1.3 Unnatural fire regimes occurring as a result of military exercises.

7.1.1.4 Lack of diversity in age structure and composition of vegetation due to expansive, frequent fires.

7.1.2 Suppression of Fire Frequency/Intensity (Avg. Score: 2.00)

NJ Specific Threats: 7.1.2.1 Shift in vegetative communities as a result of suppression of natural fires.

7.1.2.2 Lack of diversity in age structure and composition of vegetation due to the suppression of fire.

7.3 Other Ecosystem Modifications

7.3.4 Lack of natural disturbance patterns or ecosystem functions due to species loss (Avg. Score: 2.00)

NJ Specific Threats: 7.3.4.5 The lack of forest disturbance minimizes the diversity of herbaceous vegetation and other shrubs and trees that need a lot of sunlight to grow.

7.3.5 Poor habitat management (Avg. Score: 3.00)

NJ Specific Threats: 7.3.5.1 Improper or poorly scheduled maintenance of man-made corridors (e.g., roadsides and medians) can cause direct mortality to and may reduce productivity of wildlife.

7.3.5.2 Shifting from natural vegetation to lawns can cause increased temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

7.3.5.3 Vegetation clearing removes terrestrial and riparian corridors for animal movement, shelter, and resting areas.

7.3.5.4 Vegetation clearing or inappropriate alteration adjacent to aquatic habitats threatens aquatic species by degrading habitat and water quality (altering temperature and dissolved oxygen, increasing siltation and desiccation, etc.).

7.3.5.5 Habitat management that alters or removes vegetation without implementing long-term management increases the risk of invasive and exotic plants establishing themselves, outcompeting native vegetation.

7.3.5.6 Habitat management, including that which occurs on public and private lands, that does not consider timing and species' behaviors can result in the direct mortality and/or alteration or loss of habitat.

7.3.5.12 Lack of diversity in age structure and composition of vegetation due to lack of natural disturbances and/or vegetation management.

7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.

8 Invasive and Other Problematic Species, Genes and Diseases

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.1 Unspecified Species (Avg. Score: 3.00)

NJ Specific Threats: 8.1.1.1 Displace or outcompete native species for resources.

8.1.1.2 Alters, degrades and/or reduces the structural diversity of the natural composition of the landscape, including aquatic systems.

8.1.1.3 Invasive, non-native insects can damage native vegetation at a large scale, leading to die-offs, altering the ecological community.

8.1.1.4 Invasive, non-native animals increase the risk of predation on native animals and/or herbivory on native vegetation.

8.1.1.6 Invasive, non-native plants may create physical barriers for some species.

8.1.4 Invasive non-native terrestrial/wetland animals (Avg. Score: 2.00)

NJ Specific Threats: 8.1.4.1 Displace or out-compete native species for resources (food, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.1.5 Invasive non-native terrestrial/wetland plants (Avg. Score: 3.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Papaipema harrisii

NJ Specific Threats: 8.1.5.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.1.6 Invasive non-native fungal/bacterial diseases (Avg. Score: 1.00)

NJ Specific Threats: 8.1.6.1 The introduction of non-native fungal and bacterial diseases threatens native populations and ecosystems.

8.2 Problematic Native Species/Diseases

8.2.2 Named Species (Avg. Score: 3.00)

NJ Specific Threats: 8.2.2.2 Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.

8.4 Problematic Species/Diseases of Unknown Origin

8.4.1 Unspecified Species (Avg. Score: 2.00)

NJ Specific Threats: 8.4.1.1 Non-native or poorly understood diseases and parasites could potentially impact native animals.

8.5 Viral/Prion-induced Diseases

8.5.1 Unspecified Species (Disease) (Avg. Score: 1.00)

NJ Specific Threats: 8.5.1.1 There is a large knowledge gap regarding the existence of, or potential for, other diseases impacting native wildlife.

8.6 Diseases of Unknown Cause

8.6.0 Unknown Diseases (Avg. Score: 1.00)

NJ Specific Threats: 8.6.0.1 Diseases yet to be identified by pathologists and virologists cause decreased fitness or mortality to native populations.

9 Pollution

9.2 Industrial and Military Effluents

9.2.4 Other: Hydrofracturing (Avg. Score: 1.00)

NJ Specific Threats: 9.2.4.1 Contaminants from hydrofracturing degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.

9.2.4.2 Uncontrolled effluents escaping from hydrofracturing facilities can cause injury to wildlife and alter normal behaviors.

9.3 Agricultural and Forestry Effluents

9.3.3 Herbicides and Pesticides (Avg. Score: 3.00)

NJ Specific Threats: 9.3.3.1 Pesticides degrade terrestrial and aquatic habitats, especially streams, ponds and wetlands. Aquatic wildlife are particularly sensitive to these contaminants, which can cause developmental and behavioral abnormalities and reproductive failure. Some contaminants may bioaccumulate in predatory fish and birds and disrupt reproduction.

9.3.3.3 Use of pesticides can directly harm non-target species through direct contact and/or by reducing and/or contaminating their food supply.

9.3.3.4 Use of herbicides can destroy beneficial food and nectar plants for insects.

9.3.5 Control of insect pests and plants leading to mortality of non-target species (Avg. Score: 3.00)
not associated with agriculture

NJ Specific Threats: 9.3.5.1 Use of pesticides, insecticides, and/or herbicides can directly harm non-target species, such as amphibians and beneficial invertebrates through direct contact and/or by reducing and/or contaminating their food supply.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Papaipema harrisii

- 9.3.5.2 Use of herbicides can destroy beneficial food and nectar plants for insects.
- 9.3.5.4 Improper use of current insecticides, such as those containing esfenvalerate, prallethrin, or piperonyl butoxide, or past use of pesticides containing chlordane still present in the soils, are toxic to various wildlife species, and can cause injury, mortality, or other effects that impair population viability.
- 9.3.5.5 Use of pesticides and herbicides can minimize the abundance of food sources for native wildlife populations.

9.5 Air-Bourne Pollutants

9.5.1 Acid Rain (Avg. Score: 1.00)

NJ Specific Threats: 9.5.1.1 Causes acidification of water bodies, resulting in changes to aquatic and marine communities and reducing biodiversity, and creating conditions that are unsuitable for some aquatic (freshwater and marine) and semi-aquatic species that are sensitive to pH shifts.

9.5.4 Other (Avg. Score: 1.00)

NJ Specific Threats: 9.5.4.1 Dust and/or airborne sedimentation from construction sites, agricultural operations or related earth disturbances can introduce mineral or organic sediments into adjacent wildlife habitats, degrading their quality and suitability for wildlife short-term and/or long-term.

9.5.6 Herbicides and Pesticides (Avg. Score: 3.00)

NJ Specific Threats: 9.5.6.1 May result in injury or direct mortality of non-target species.

11 Climate Change and Severe Weather

11.1 Habitat Shifting or Alteration

11.1.0 Macro- and Micro-Climate Alterations (Avg. Score: 3.00)

NJ Specific Threats: 11.1.0.1 Alters native terrestrial and aquatic habitats at the macro- and micro-climate levels that can affect suitability for wildlife, in particular specialist species.

11.2 Droughts

11.2.1 Droughts (Avg. Score: 2.00)

NJ Specific Threats: 11.2.1.1 Contribute to hardened soils, decreasing water recharge during rains and increasing the likelihood of flash floods during storms.

11.2.1.2 Lead to lower groundwater levels and therefore, less available water for people and habitats.

11.6 Phenology Shifting or Alteration

11.6.1 Phenology shifts related to pollination ecology (Avg. Score: 1.00)

NJ Specific Threats: 11.6.1.1 Alters inter-specific relationships of wildlife and vegetation, ultimately leading to detrimental impacts on the ecological system.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory (Avg. Score: 3.00)

NJ Specific Threats: 12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.1.2 Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.

12.1.2 Lack of up-to-date existing information (Avg. Score: 3.00)

NJ Specific Threats: 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

Papaipema harrisii

12.1.3 Need to answer research question (Avg. Score: 3.00)

NJ Specific Threats: 12.1.3.1 There are significant knowledge gaps regarding distribution, dispersal, diseases, population trends, etc. of SGCN.

12.1.4 Need to develop new technique (Avg. Score: 3.00)

NJ Specific Threats: 12.1.4.1 Improve and evaluate survey methods for SGCN and their habitats; alter as needed.

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms (Avg. Score: 1.00)

NJ Specific Threats: 12.3.0.1 Regulatory habitat protections within state land use regulations are spatially limited to specific geographic areas (e.g., Pinelands, Coastal Area) or geographic features (e.g., wetlands, streams) and so fail to protect critical habitats that exist outside of these regulated areas.

12.3.0.7 Activities that threaten SGCN, their food sources, and/or habitats are often regulated separately and without consideration for the cumulative and synergistic effects over time or over a larger spatial scale. Therefore, regulations can fail to protect SGCN populations over time.

12.3.0.10 Land use regulatory processes pertaining to habitat creation, enhancement or restoration projects can be costly and/or burdensome, precluding or discouraging the development or implementation of conservation projects.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform (Avg. Score: 1.00)

NJ Specific Threats: 12.4.0.1 A species-by-species management focus as opposed to ecological systems and biodiversity generally has greater opportunity for unintended consequences for other species and may be less efficient in developing appropriate management actions.

12.4.0.2 Policies and procedures for lands management that lack consideration of the impacts of activity timing can result in unintended impacts to wildlife during vulnerable periods.

12.4.0.5 Bureau of Forest Fire Management policy has traditionally implemented prescribed burns on State lands for the sole purpose of public safety (i.e., addressing hazard fuel reduction), missing opportunities to burn in a manner that would additionally manage habitat for ecological diversity.

12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats (Avg. Score: 3.00)

NJ Specific Threats: 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.

14.1.1.2 Lack of general knowledge of SGCN life histories and vulnerabilities as they relate to land management practices.

14.1.1.3 Lack of understanding of the need to manage both natural and anthropogenic (e.g., yards, lawns, hayfields, etc.) habitats to minimize impacts or increase benefits to SGCN and their habitats.

14.2 Outreach needs

14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions (Avg. Score: 3.00)

NJ Specific Threats: 14.2.1.1 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various forest management practices.

15 **Administrative Needs**

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

(Avg. Score: 1.00)

NJ Specific Threats: 15.2.3.1

State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Actions to address the Threats and Action Drivers associated with this Conservation Target:

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.2 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to increase the effective size of SGCN habitats by protecting/restoring adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats.
- 1.2.1.5 Secure and promote the protection/restoration of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through incentive programs.
- 1.2.1.6 Secure and promote the protection/restoration of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers through incentive programs.
- 1.2.1.8 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to municipalities, land developers, and other land managers to retain and/or enhance native vegetation adjacent to aquatic habitats, and along riparian areas and wildlife movement corridors.
- 1.2.1.9 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing Forestry Stewardship Programs.
- 1.2.1.10 Coordinate across government agencies and non-government organizations to maximize the availability of and enrollment in existing landowner incentive programs (e.g., "farm bill," partners, etc.) to maintain and/or improve habitat.
- 1.2.1.11 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Papaipema harrisii

- 1.2.1.12 Create incentives (non-monetary and/or monetary) for land developers to redevelop abandoned areas (e.g., shopping centers, office complexes) to minimize the loss of natural habitats and reduce the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 1.2.1.13 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to land developers to minimize the impacts of new residential and commercial developments on SGCN and their habitats.
- 1.2.1.14 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of herbicides and pesticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.15 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of rodenticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.16 Create incentives (non-monetary and/or monetary) within State regulations (mitigations requirements or credit, BMP satisfaction, etc.) to promote the use of retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.17 Develop a public-relations oriented certification program for private retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.18 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and land managers to control and reduce the impacts of invasive, native and non-native species in order to increase structural habitat diversity.
- 1.2.1.19 Create incentives for federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to farmers, woodland landowners, and private landowners to adopt and/or endorse consistent BMPs concerning controlled burns to maintain and/or improve wildlife habitat.
- 1.2.1.20 Coordinate across government agencies and non-government organizations to create or expand upon tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMP's.
- 1.2.1.21 Create and/or support market-based programs that subsidize or create branding for products derived sustainably from managed wildlife habitats.
- 1.2.1.22 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to horse/livestock farm owners and managers to increase structural habitat diversity in and around the farms by managing vegetation for a variety of species, in particular, farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 1.2.1.23 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to provide cost shares and/or plan approvals for management based on management approaches and prescriptions.
- 1.2.1.24 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners, with habitat of suitable patch size to support breeding grassland-dependent species, to alter the timing of vegetation management to benefit grassland and pollinator species.

Papaipema harrisii

- 1.2.1.26 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing landowner incentive programs.
- 1.2.1.28 Create incentives to implement dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.

2 Direct Management of Natural Resources

2.3 Fire management

2.3.2 Fuel reduction

- 2.3.2.1 Prevent wildfires by reducing natural fuel (e.g., leaf litter).

2.3.3 Prescribed burning

- 2.3.3.1 Evaluate different management techniques of prescribed burns that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 2.3.3.2 Conduct prescribed burning in Northern New Jersey forests to maintain and regenerate a mosaic of upland forest habitats.
- 2.3.3.3 Conduct prescribed burning to improve wildlife habitat.

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

- 2.8.0.1 Control invasive insect infestations by implementing BMP strategies through biological, chemical and/or mechanical means that will depress, or when appropriate, eradicate populations in a manner that avoids excessive harm to non-target species using BMPs to control infestations and limit their spread based on an inventory of invasive insect distribution and response to outbreaks.
- 2.8.0.2 Develop, implement, monitor and evaluate pest control/management strategies to reduce the impacts of over-abundant wildlife species (native and/or native, invasive species) on native vegetation and the degradation of habitats supporting SGCN. Over-abundant wildlife species include but are not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.
- 2.8.0.5 Implement biologically safe and appropriate control/management strategies, and where appropriate, eradication strategies to reduce the impacts and/or limit the distribution of invasive and/or non-native plant species within or near aquatic systems using methods that will provide the most protection to the aquatic and riparian ecological system, and minimize disturbance to the soil and wildlife. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.

Papaipema harrisii

- 2.8.0.6 Implement long-term management of invasive and/or non-native plants to help maintain functioning ecological systems and biological diversity, and to enhance travel corridors. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

- 2.10.0.1 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 2.10.0.2 Improve the availability of prey/food resources through terrestrial and aquatic plantings and habitat restoration for SGCN populations, in particular for those populations thought to be limited due wholly or in part to a lack of (or contaminated) food resources, and for migratory species (birds, bats, invertebrates).
- 2.10.0.3 Restore and/or enhance habitats to benefit urban-associated SGCN.
- 2.10.0.4 Restore and/or enhance suitable travel corridors connecting conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats.
- 2.10.0.5 Implement habitat restoration and/or enhancement activities that include the creation of vegetative buffers between sensitive habitats (e.g., aquatic systems) and human-inhabited areas (e.g., residences, parks, etc.) and that is conducted during appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.10.0.6 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats.
- 2.10.0.7 Restore/reclaim and enhance degraded rare species habitats through strategic revegetation and management efforts for documented/target SGCN.
- 2.10.0.8 Protect significant natural and/or unique communities by implementing best management practices when conducting habitat restoration strategies.
- 2.10.0.9 Restore and/or enhance riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation, alteration and/or changes in hydrology and subsequent disturbances to and behavioral changes of wildlife (e.g., restoring biologically appropriate buffers, revegetation or restoration efforts, etc.).
- 2.10.0.10 Minimize the loss of important habitats (e.g., coastal scrub-shrub and grassy habitats, high and low marsh habitats, etc.) that provide nesting, migrating, and wintering areas for SGCN birds and other coastal and marsh-dependent species through habitat restoration efforts.
- 2.10.0.11 Restore and/or enhance critical migratory terrestrial and aquatic habitats (e.g., beach, grasslands, forest, scrub-shrub, etc.) for songbirds, raptors, shorebirds, waterfowl, bats and invertebrates through habitat restoration efforts and expand habitat restoration to adjacent private lands to increase the effective size of the habitat.
- 2.10.0.12 Create and/or maintain scrub-shrub habitats through revegetation efforts with little to no impact on forested, wetland and grassland habitats to maintain populations of shrub-dependent SGCN.

Papaipema harrisii

- 2.10.0.14 Implement best management practices (BMPs), protective strategies and guidelines for restoring and enhancing healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.10.0.15 Restore and/or enhance terrestrial and aquatic habitats proximate to but not adjacent to roads and other transportation corridors for terrestrial-bound SGCN species whose behavior (i.e., dispersal across roads) may be altered by doing so, and therefore decrease road mortality of such species (e.g., amphibians, snakes, turtles, small mammals).
- 2.10.0.21 Restore and/or enhance understory habitats that suppress invasive species and provide critical resources and enhance sheltering, foraging, and nesting cover for wildlife.
- 2.10.0.22 Restore and/or enhance terrestrial and aquatic habitats to promote the regeneration of native vegetation and enhance structural diversity to benefit SGCN (e.g., vegetative buffers of aquatic systems, allow coarse, woody debris to remain in terrestrial, aquatic and riparian habitats to provide shelter, riparian stabilization and necessary microclimates, plant native trees, shrubs and grasses, etc.).

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.
- 2.11.0.2 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas for target SGCN and/or species groups; management should complement rare species needs in a targeted area.
- 2.11.0.3 Create suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats through vegetation management.
- 2.11.0.4 Implement vegetation management strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife, particularly SGCN.
- 2.11.0.5 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats through vegetation management.
- 2.11.0.6 Reclaim degraded rare species habitats by conducting vegetation management needed to restore habitat value for the documented/target SGCN.
- 2.11.0.7 Protect significant natural and/or unique communities by implementing best management practices through vegetation management.
- 2.11.0.23 Implement appropriate habitat management actions in areas where natural disturbances, such as wildfire, have been precluded.
- 2.11.0.24 Conduct vegetation management adjacent to aquatic habitats following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.25 Conduct vegetation management along access roads following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.26 Conduct vegetation management along roadsides and medians, avoiding peak activity periods for wildlife, that enhances wildlife dispersal naturally and safely across roads and similar barriers to/between terrestrial and/or aquatic habitats.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Papaipema harrisii

- 2.11.0.27 Conduct vegetation management for target shrub- or young forest-dependent SGCN following BMPs to minimize the risk of the establishment of invasive and non-native plants.
- 2.11.0.28 Conduct vegetation management in agricultural areas following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.29 Conduct vegetation management on transportation and service corridors (i.e., rights-of-way) following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.30 Identify and prioritize areas where various management tools (such as increasing salinity through the management of water levels or chemical applications) may be effective in reducing phragmites within and restoring marsh habitat.
- 2.11.0.31 In areas where vegetative communities are shifting due to fire suppression and controlled burns are not feasible, manage vegetation to improve wildlife habitat.
- 2.11.0.32 Increase structural habitat diversity around and when feasible, within agricultural landscapes by managing vegetation for a variety of species, in particular, those farms that have removed scrub-shrub habitat and/or fragmented forests, and by implementing ecologically best practices (e.g., no-till farming, maintaining hedgerows, buffer set-asides, etc.).
- 2.11.0.33 Increase structural habitat diversity by implementing long-term vegetation management to minimize the potential for the establishment of invasive and/or non-native plants that may outcompete native vegetation.
- 2.11.0.34 Increase structural habitat diversity by managing residential, commercial and recreational areas' landscapes for a variety of species. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.36 Increase structural habitat diversity by managing vegetation for a variety of species and considering their life history requirements (e.g., travel corridors, shelter, resting and breeding areas) to minimize the risk of harm.
- 2.11.0.38 Increase structural habitat diversity in and around horse/livestock farms by managing vegetation for a variety of species, in particular, in and around farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 2.11.0.39 Increase structural habitat diversity in and around solar farms by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.40 Increase structural habitat diversity surrounding areas used for energy, mining, and transportation and service corridors by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides, and avoid managing habitat during the breeding seasons for ground-nesting birds, reptiles, amphibians and small mammals.

Papaipema harrisii

- 2.11.0.41 Increase structural habitat diversity through the implementation of a variety of vegetation management practices such as prescribed burns (either increasing or decreasing their frequency depending on the site and objective), plantings, etc. that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.42 Increase structural habitat diversity within wind farms for terrestrial bound and low-flying species and around wind farms for other wildlife by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.43 Manage forests to increase variation in age structure and composition using BMPs that promote and maintain functioning ecological forest-based systems and biological diversity.
- 2.11.0.45 Regularly and/or rotationally create young forest habitat in targeted areas to maintain and regenerate a mosaic of upland forest habitats that will benefit shrub- and young forest-dependent species.

2.14 Wildlife disease management

2.14.0 Wildlife disease strategy development and investigation

- 2.14.0.1 Investigate diseases/pathogens impacting SGCN and/or their habitats.
- 2.14.0.2 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
- 2.14.0.3 Protect SGCN from exotic pathogen introduction or incident through implementation of a "rapid response plan"; DFW to give priority attention to these species in planning and/or implementing a response.
- 2.14.0.4 Conduct long-term monitoring of diseases in vulnerable wildlife to determine the magnitude of exposure within populations and around the State, the impacts to those species, in particular SGCN, and investigate the feasibility of mitigating for such impacts.
- 2.14.0.5 Assess the impacts of diseases on the life cycles of wildlife.

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

- 3.0.0.1 Conduct long-term monitoring of resident and migratory SGCN populations using standardized survey protocols to determine the variables that may impact their long-term persistence in the State (e.g., population viability, distribution, dispersal, home range and habitat use, travel corridors, food availability, vulnerability to pollutants and disease, etc.). Compile this information to determine the likely causes of population declines and to understand metapopulation dynamics. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.2 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) where data gaps exist regarding SGCN distribution, and their critical and supportive habitats. Conduct surveys using standardized survey protocols to acquire baseline data, and provide the data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Papaipema harrisii

- 3.0.0.3 Gather baseline data on SGCN inhabiting permanently protected natural lands regarding their distribution and population (e.g., abundance, dispersal, demography including productivity and survival, etc.), and identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) critical and supporting habitats within those landscapes.
- 3.0.0.4 Conduct long-term studies on SGCN inhabiting permanently protected natural lands to develop population trend data and changes in demography, and to determine if critical and/or supporting habitats are limited or changing; i.e., diminishing in value, acreage or connectivity.
- 3.0.0.5 Gather baseline data on resident and migratory SGCN (in particular migratory species for which New Jersey habitats are significant), terrestrial, freshwater and marine species, regarding the location and condition of their critical and supporting habitats (e.g., foraging, roosting, nesting/breeding, stopover, migration paths, etc.), and population demography (e.g., productivity, survival, dispersal). Compile this information into a database that includes descriptions of the conditions of the habitats and species, and a GIS component of the locations of these important habitats. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.6 Conduct long-term studies on resident and migratory SGCN to determine if there are changes to the populations' demography (productivity, survival, dispersal) and/or to their critical and/or supporting habitats (i.e., diminishing in value, acreage or connectivity, etc.), in particular changes that would not maintain SGCN at viable levels for species populations. Update data and GIS maps; provide updated information to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.7 Collect baseline data to document species distributions, in particular SGCN, and current habitat for future analysis of possible distribution shifting as a result of habitat shifting or alteration associated with climate change impacts.
- 3.0.0.8 Conduct long-term studies and compare baseline metrics of documented species distributions and associated habitats to identify possible species and/or habitat shifting or alteration associated with climate change impacts.
- 3.0.0.13 Investigate the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats. Evaluate and modify management practices as appropriate.
- 3.0.0.14 Identify areas with invasive, aquatic plants and animals and collect a detailed baseline assessment of the species' status and distribution. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort. Researchers and contractors performing Forest Stewardship Inventories and/or Plans on state lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.0.0.15 Conduct long-term monitoring of areas identified as having invasive, aquatic plants and animals to track the species' status/progress over time with or without the implementation of management strategies. Areas without management strategies should be assessed and prioritized for management/control. Areas where management strategies are being implemented should include an assessment of the management effort and identify/recommend and implement necessary changes to improve its success. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort.
- 3.0.0.26 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species including objectives and guidance pertaining to and the condition/status of critical and supporting habitats.

Papaipema harrisii

- 3.0.0.27 Evaluate the effectiveness of strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals through research and monitoring. Develop and provide NJ DEP and other appropriate governing agencies/commissions a summary of findings and recommendations to improve such efforts.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.1 Division of Fish and Wildlife should maintain a robust, up-to-date database and mapping of species occurrences.
- 3.2.0.7 Track (via a database that includes a GIS component) and research problematic species and diseases to determine their distribution, impacts on SGCN wildlife/wildlife communities, and develop potential control measures.
- 3.2.0.8 Implement and conduct long-term monitoring of control measures aimed at minimizing the impacts of problematic species and/or diseases to evaluate the effectiveness of such efforts and to identify and incorporate additional strategies as appropriate.
- 3.2.0.18 Conduct baseline surveys/inventories to better understand the distribution of fish and invertebrate (including freshwater mussels) populations.

3.2.1 Abundance determination

- 3.2.1.1 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) population abundance and trends for SGCN using standardized survey protocols. Provide data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
- 3.2.1.2 Conduct wildlife surveys on resident and migratory SGCN regarding their population abundance and trends.

3.2.2 Age, size and sex structure

- 3.2.2.1 Conduct wildlife surveys on resident and migratory SGCN regarding their survivorship.

3.2.3 Baseline inventory

- 3.2.3.9 Investigate hazardous environmental issues that may impact grassland invertebrates.

3.2.7 Population assessment

- 3.2.7.1 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
- 3.2.7.2 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species to meet and maintain recovery goals.

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

- 3.3.1.1 Conduct habitat assessments of significant natural and/or unique communities to identify threats to native terrestrial and aquatic habitats through systematic monitoring, review of available data, enlistment of habitat management and/or species experts, etc. Incorporate findings into a database that includes descriptions/qualifiers of the habitats, identifies and values/qualifies the threats, and includes a GIS component of the locations of the assessed areas. Share this information with landowners/managers (e.g., federal, state and local government agencies or non-government organization).

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Papaipema harrisii

- 3.3.1.2 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) resident and migratory SGCN habitats. Investigate their suitability for the various life history requirements of the species that dependent upon them to determine the ability for maintaining applicable SGCN populations in perpetuity.
- 3.3.1.4 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and investigate the suitability of corridors that connect large, contiguous tracts of similar habitats to increase their effective size (i.e., forest with forest, grassland with grassland, wetlands with wetlands, etc.) for dependent SGCN.
- 3.3.1.5 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) where habitat restoration and/or enhancement would benefit wildlife SGCN.
- 3.3.1.6 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) that could, through revegetation and/or enhancement efforts, become suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN.
- 3.3.1.7 Map and prioritize existing and potential areas for early succession forest management. Share the results with state, county and municipal planners.
- 3.3.1.9 Inventory forests throughout northern New Jersey to develop a baseline characterization of the structure and composition of habitats and identify deficient forest habitat types.
- 3.3.1.10 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and document fish SGCN habitats by plotting their distributions in GIS and submitting the data to the State for integration into the DEP's Biotics database.
- 3.3.1.16 Gather "best information" for spatial modeling and update/create a current model/depiction of anticipated habitat shifts from sea-level rise, flooding, etc.
- 3.3.1.17 Identify and map undeveloped roads and trails in all conserved forests, and create a database of locations. Integrate information regarding potentially sensitive areas.
- 3.3.1.18 Conduct an assessment using available data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels.
- 3.3.1.19 Identify and codify legal ORV access areas on state (and if appropriate, other conserved) lands. Provide GIS mapping to the landowner for potential use in directing such recreational activities.
- 3.3.1.20 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) where invasive, non-indigenous plants and animals are either already established or are becoming established. Create a system for reporting and qualifying new locations of invasive species and for prioritizing areas for control measures according to the potential level of impact on the ecosystem and SGCN and the likelihood of success. Researchers and contractors encountering invasive plant species while performing plant and/or forest inventories on state or other conserved lands and/or private lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.3.1.24 Conduct regular investigations of SGCN habitat health and biodiversity on public and private lands to identify locations in need of revegetation, reduction of over-abundant, native wildlife and/or exotic species, conservation focal areas requiring limitations on human activity, etc.

3.3.2 Monitoring

Papaipema harrisii

- 3.3.2.1 Evaluate the effectiveness of forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.
- 3.3.2.2 Conduct long-term monitoring of resident and migratory SGCN habitats using standardized survey protocols to determine changes in habitat quality/suitability and threats (e.g., habitat loss and degradation, increased edge habitat, water quality) and other variables that may impact their long-term persistence in the State and to provide information needed for determining causes of population declines and understanding metapopulation dynamics.
- 3.3.2.3 Continue to update wildlife and habitat databases and revise models of critical SGCN habitats using the most current data available and where lacking, develop new SGCN and/or habitat models as data on species habitat requirements and applicable GIS data layers become available.
- 3.3.2.9 Investigate the effectiveness of various silviculture techniques for enhancing forests for forest-dependent SGCN.
- 3.3.2.10 Evaluate the efficacy and success of different management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.3.2.15 Investigate the effectiveness of management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.3.2.16 Evaluate the effectiveness of best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 3.3.2.20 Once a system is developed for reporting and qualifying new locations of invasive species, develop, implement and monitor/evaluate invasive species removal strategies at identified locations. Priority should be given to those areas critical to SGCN and/or contain unique and/or rare plant communities supporting SGCN and/or other fish/wildlife species.
- 3.3.2.24 Conduct regular inventories of forests throughout northern New Jersey to characterize the changing structure and composition of habitats and monitor forest conditions.

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.1 Work with land management agencies to determine the appropriate actions needed to restore/reclaim degraded habitat for the documented/target SGCN.
- 3.5.3.3 Develop/improve management techniques that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.9 Develop strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 3.5.3.11 Develop strategies to protect native terrestrial and aquatic habitats and dependent SGCN species from the identified threats.
- 3.5.3.15 Modify management practices based on the effects of pesticides, herbicides and other biological controls on critical and supporting SGCN habitats.

Papaipema harrisii

- 3.5.3.16 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.
- 3.5.3.21 Develop management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.24 Based on research, modify management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.5.3.25 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to develop the necessary management strategies to reach or maintain viable population levels.

3.5.4 Fish and wildlife research, survey and management techniques

- 3.5.4.5 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
- 3.5.4.6 Investigate the feasibility of mitigating for the impacts of contaminants to vulnerable wildlife, particularly SGCN. Maintain records on exposure of vulnerable wildlife to environmental toxins (such as flame retardants and endocrine disruptors), so that sources may be identified and controlled or eliminated.
- 3.5.4.14 Develop and implement agreements, and update existing agreements, with government agencies regarding the protection of critical SGCN habitats (e.g., significant breeding populations of beach nesting birds, colonial waterbird nesting areas, bat colonies, etc.).
- 3.5.4.15 Investigate the success of management strategies used to protect and/or enhance SGCN populations and when appropriate, aid in identifying failures/resource problems and issues, and developing new strategies.
- 3.5.4.16 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels and develop the necessary management strategies.
- 3.5.4.18 Investigate the effectiveness of survey techniques through selected “ground truthing” and literature and peer review in order to increase efficacy of survey, minimize surveyor bias and error, and increase accuracy of trend data.
- 3.5.4.19 Develop reliable, standardized survey and monitoring protocols for SGCN species, for which none currently exist, and their habitats.
- 3.5.4.21 Develop BMPs to address problematic species and diseases of unknown origin.

4 Education

4.1 Educator/Instructor training

4.1.0 Public education

Papaipema harrisii

- 4.1.0.1 Provide educational resources and training programs to private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.

5 Facilities and Areas

5.15 Wildlife Management Areas

5.15.6 Roads

- 5.15.6.1 Clearly post areas/roads where vehicle access is permitted.
 - 5.15.6.2 Clearly post areas/trails where vehicle access is not permitted.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

- 6.0.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
 - 6.0.0.3 Secure and protect riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through an appropriate combination of fee title, non-fee title and landowner agreements.
 - 6.0.0.7 Secure and protect critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

6.3 Conservation area designation

6.3.0 Conservation area designation strategies

- 6.3.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN and/or connect conserved SGCN habitats through conservation area designations.
 - 6.3.0.3 Increase the protection of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through conservation area designations.

7 Law Enforcement

7.1 Law enforcement

7.1.3 Sub-national Level

- 7.1.3.2 Increase the number of law enforcement officers tending to wildlife issues to a reasonable number to sufficiently cover the State and marine waters.

7.1.4 Scale Unspecified

- 7.1.4.12 Implement policies and/or regulations that protect significant natural and/or unique communities in perpetuity.
 - 7.1.4.15 Implement policies that preserve and protect critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.

Papaipema harrisii

- 7.1.4.26 Educate law enforcement personnel that there may be unauthorized research projects taking place and to encourage them to investigate any activities that appear to be harmful to wildlife.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.2 Develop a team of personnel from government entities, conservation organizations and other stakeholders engaged in oil/gas spill response for marine and freshwater habitats to develop a feasible plan for oil spill response and/or to amend NJ's current oil spill response plan that clearly outlines each organizations responsibilities and an assessment and location list of available equipment for boom deployment during oil spills.
- 8.1.0.3 Develop an outreach team of personnel from government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 8.1.0.4 Engage government agencies, conservation partners and other stakeholders in constructive dialogues encouraging them to influence policy change and the creation of incentives through a habitat bill and/or municipal ordinances for backyard habitat.
- 8.1.0.15 Engage government agencies, conservation partners and other stakeholders in discussions encouraging and supporting the creation of laws and policies requiring vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 8.1.0.16 Engage local governments in discussions regarding the importance of them adopting/passing ordinances which require assessing and addressing secondary impacts (i.e., ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 8.1.0.17 Engage municipalities in constructive dialogue to identify and minimize destruction of areas prioritized for early succession forest management.
- 8.1.0.18 Engage NJDOT, NJ Transit Authority and other road management entities, wildlife conservation organizations/agencies (e.g., Division of Fish and Wildlife, New Jersey Conservation Foundation, Conserve Wildlife Foundation of NJ), and communities and citizens in discussions regarding the importance of and methods to enhance habitat connectivity, and work together to develop feasible strategies for ensuring that wildlife can disperse naturally and safely across roads and similar barriers to terrestrial and/or aquatic habitats.
- 8.1.0.19 Engage government agencies, conservation partners and other stakeholders to collaboratively develop a list of important projects, targeting SGCN and/or their habitat, as a guide for graduate student research. Distribute the list and contact information to all State colleges and universities.
- 8.1.0.20 Organize a small focal group of government and non-government agencies/organizations responsible for decisions regarding beach/dune management to share and coordinate their goals so that comprehensive planning can attempt to meet all needs.
- 8.1.0.21 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation human-subsidized and/or overabundant, native species cause to local nesting species, and provide expert guidance on how residents can help alleviate this threat.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Papaipema harrisii

- 8.1.0.22 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation invasive species cause to native nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.24 Engage government agencies, conservation partners and other stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.25 Provide technical support to public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.26 Coordinate across federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to woodland landowners to adopt or endorse consistent best management practices concerning controlled burns to maintain and/or improve forested habitat for wildlife.
- 8.1.0.30 Encourage government agencies and conservation partners to advise members of the relevant scientific community of the need for specific studies, reports or investigations targeting the data-deficiency regarding SGCN and/or their habitats.
- 8.1.0.34 Work with the NJ Education Association and Department of Education to design curriculum and outdoor experimental learning opportunities, and provide training to teachers on implementation of these activities.
- 8.1.0.37 Enlist landowners and NJ citizens in the protection of and survey efforts for SGCN, in particular rare species, by increasing enrollment in landowner incentives, forest stewardship, backyard habitat management and wildlife-related volunteer programs.
- 8.1.0.38 Engage partners, stakeholders and land managers in constructive dialogue promoting forest stewardship for SGCN that use core forests and forested corridors.
- 8.1.0.40 Encourage researchers, land managers, naturalists and enthusiasts to follow proper procedures for the coordination and/or permitting of research/management activities involving wildlife and sensitive habitats, and discourage activities that alter vegetation or wetlands, or cause harm or disturbance to wildlife.
- 8.1.0.42 Engage citizens, wildlife observers and photographers through discussions and distributable information regarding the importance of and encouraging implementing responsible and ethical behavior when observing wildlife by developing an alliance of wildlife photographers and widely circulating recommendations on how to reduce impact.
- 8.1.0.44 Engage conservation partners, stakeholders, government agencies and other land stewards in constructive dialogues encouraging their inclusion of controlled burns in forest and other stewardship plans.
- 8.1.0.47 Form cooperative partnerships with energy companies to facilitate habitat creation and enhancement away from and outside of project areas, the restoration of appropriate habitats within project areas (e.g., rights-of-way could benefit butterflies and some bird species), and to identify seasonal timing of activities that would minimize impacts to wildlife.
- 8.1.0.48 Form cooperative partnerships with transportation and shipment agencies and companies to facilitate habitat creation and enhancement away from and outside of project areas and to identify seasonal timing of activities that would minimize impacts to wildlife.

8.2 Recruitment and retention activities

8.2.3 For wildlife watching

Papaipema harrisii

- 8.2.3.1 Develop and implement nature-focused tourism opportunities including wildlife viewing sites, interpretive signage highlighting unique ecosystems/habitats, and wildlife-related recreational opportunities that do not negatively impact SGCN or their habitats.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.7 Develop and provide (or otherwise make publicly available) educational programs and/or materials that describe the negative impacts of off-road vehicles and watercraft use in and adjacent to critical SGCN habitats, and the importance of confining such activities to more appropriate locations and/or seasons.
- 8.3.0.8 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate recreationists and encourage landowners to eliminate garbage in the vicinity of suitable wildlife habitat, in particular SGCN habitat. Information should include the detrimental impacts garbage may have on various wildlife species.
- 8.3.0.9 Develop and provide (or otherwise make publicly available) educational programs and/or materials to enlist landowners and land managers to include only native plants in landscaping and restoration projects. Provide information to assist them in detecting problematic establishment of invasive, non-indigenous plants.
- 8.3.0.10 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate landowners and NJ citizens on threats to fish and wildlife (including marine animals).
- 8.3.0.11 Develop and provide (or otherwise make publicly available) educational programs and/or materials to the public, wildlife-related professionals, foresters, etc., that describe the value of species that are often feared (e.g., snakes, bats, spiders, Allegheny woodrat) and/or deemed a "nuisance" (e.g., squirrel, deer, snapping turtle), and therefore, persecuted by people. Include information on tolerance, proper identification, eviction from human dwellings, how to minimize the animal's presence on the property, and/or how to live in harmony with the animal.
- 8.3.0.12 Promote awareness of WSFR (Wildlife and Sportfish Restoration) Outreach/Awareness grants, an important funding source for conservation among hunters and anglers as well as the general public.
- 8.3.0.13 Conduct an educational campaign to encourage observer ethics and respect for wildlife and natural habitat.
- 8.3.0.24 Develop educational outreach programs for local decision-makers, land developers, landowners and citizens about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
- 8.3.0.25 Develop educational outreach programs for landowners, nurseries and the general public regarding the negative impacts of invasive and non-native plants on our natural communities.
- 8.3.0.26 Develop educational outreach programs for private and public landowners and land managers regarding the importance of and how to manage core forests and forested corridors in a way that will be beneficial for SGCN, particularly endangered, threatened and special concern species.
- 8.3.0.27 Develop educational outreach programs for public and private landowners and land managers regarding the importance of structural habitat diversity, methods to increase diversity, and/or incentive programs available to increase habitat diversity.
- 8.3.0.30 Develop educational outreach programs for private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.

Papaipema harrisii

- 8.3.0.32 Develop an educational outreach program for landowners and citizens on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

- 9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and SGCN inhabiting them.
- 9.1.0.2 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.1.0.3 Develop a plan that directs the creation of impervious surfaces away from and to minimize impacts on aquatic systems and critical terrestrial habitats. The plan should also include strategies to increase the resiliency of aquatic and critical terrestrial habitats to threats and stressors that would impact the reproduction and survival of wildlife.
- 9.1.0.5 Develop a plan that directs the creation or expansion of energy or utility rights-of-way in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.6 Develop a plan that directs the creation or expansion of roads and railroads or the re-establishment of abandoned railroads within and adjacent to critical forested habitats in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.8 Develop a plan that focuses on strategies for oil pipelines to avoid sensitive habitats that would be highly impacted by oil spills.
- 9.1.0.9 Develop a plan that focuses on strategies to minimize the creation of renewable energy farms (e.g., solar, wind) and related infrastructures within and their impacts on forested habitats and the wildlife community.
- 9.1.0.10 Develop a plan that focuses on strategies to minimize the impacts of mining on critical forested habitats.
- 9.1.0.11 Develop a plan that focuses on strategies to minimize the impacts of power plants on critical forested habitats and the wildlife community.
- 9.1.0.13 Develop a plan to minimize agriculture that would result in groundwater withdrawal in critical forested areas.
- 9.1.0.15 Develop a plan to minimize fragmentation of terrestrial and aquatic habitats by roads.
- 9.1.0.16 Develop a plan to minimize new lawns and preserve natural vegetation within and adjacent to critical forest areas.
- 9.1.0.19 Develop a plan to minimize the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 9.1.0.22 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 9.1.0.28 Develop and coordinate state, regional and local plans for suitable lot layout and landscaping to minimize human-wildlife conflicts that also incorporates habitat connectivity and preservation of natural areas.
- 9.1.0.29 Provide GIS or related data, maps, resource inventories, as well as related training, pertaining to the SWAP and its recommended conservation actions for use or consideration by State, County or municipal planning agencies.

Papaipema harrisii

9.1.0.30 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and other related threats associated with development.

9.1.0.33 Review the species, threats, action successes, and habitats, and work with partners to revise the 2017 State Wildlife Action Plan for the 2025 resubmittal.

9.2 Organizational strategic and CMS planning

9.2.1 Organizational strategic and operational planning

9.2.1.1 Identify and codify legal ORV access areas on state lands.

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.3 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.

9.3.1.4 Develop town plans that avoid impacts to SGCN species and their habitats.

9.3.1.5 Develop response plans to address disease outbreaks within wildlife populations, in particular SGCN.

9.3.1.7 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.

9.3.1.9 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.

9.3.1.10 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.

9.3.1.13 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.

9.3.1.15 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.

9.3.1.16 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.

9.3.3 Habitat management planning

9.3.3.5 Develop a management plan using forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.

9.3.3.7 Develop a management plan to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.

9.3.3.8 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.

9.3.3.10 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.

Papaipema harrisii

- 9.3.3.11 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.3.3.13 Develop a management plan that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas and prevents or ameliorates near-term impacts of climate change throughout the State, but in particular within the coastal and Delaware Bay areas.
- 9.3.3.15 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
- 9.3.3.16 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.3.18 In cooperation with species and habitat experts, develop management plans for significant natural and/or unique communities, in particular those supporting SGCN, and provide the information to the landowners/managers (federal, state and local government agencies or non-government organization) for review and implementation.
- 9.3.3.19 Develop management plans for SGCN inhabiting permanently protected natural lands using available baseline and population trend data.
- 9.3.3.21 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
- 9.3.3.28 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.
- 9.3.3.29 Develop habitat management plans aimed at reducing or eliminating negative impacts of ORVs.
- 9.3.3.32 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.
- 9.3.3.34 Include controlled burn prescriptions in forest and stewardship plans to improve wildlife habitat.
- 9.3.3.35 Incorporate habitat connectivity, preservation of natural areas, and the implementation of BMPs into state and local land-use policy environmental review process and energy development plans to minimize habitat fragmentation and related threats associated with solar farms and altered habitats.
- 9.3.3.36 Integrate plans for properly located and timed habitat restoration and management along transportation, energy and service corridors to minimize risks to and benefit wildlife.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

- 11.1.1.1 Use Biotics database and Landscape Project Mapping in regulatory reviews to ensure protection by applicable laws and regulations.
- 11.1.1.2 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.

Papaipema harrisii

- 11.1.1.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.
- 11.1.1.5 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 11.1.1.7 Review proposed construction or other work projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.8 Review proposed research projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.12 Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed solar farm projects to reduce habitat fragmentation and minimize impacts on wildlife.

11.1.2 Review of proposed policies and plans

- 11.1.2.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

- 11.2.0.1 Provide technical support to private and public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 11.2.0.2 Provide technical support to public and private landowners and land managers for controlling invasive, native and non-native plant species in order to increase structural habitat diversity.
- 11.2.0.3 Develop state, regional and local BMPs that focus on minimizing habitat fragmentation and human-wildlife conflicts associated with development. Make information available to land developers and private and public landowners for implementation.
- 11.2.0.5 Provide educational resources, training programs, and expert guidance to private and public landowners and land managers on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.
- 11.2.0.6 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on habitat creation, enhancement and restoration within and adjacent to project areas, as well as away from and outside of project areas (depending on the target species), by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. Wind farms should address both terrestrial bound and low-flying species. Examples of habitat management include, but are not limited to, integrating short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 11.2.0.7 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on the importance of maintaining habitat connectivity, minimizing fragmentation, and the use of CHANJ products to help them target areas for such planning.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Papaipema harrisii

- 11.2.0.8 Provide educational resources, training programs, and on-the-ground guidance to public and private landowners and land managers on habitat creation and enhancement strategies that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 11.2.0.9 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and private landowners about the importance of leaving vegetation in place, especially along riparian areas and wildlife movement corridors.
- 11.2.0.10 Provide technical support to private landowners, consultants, and land managers to create customized management plans based on location and SGCN.
- 11.2.0.11 Provide educational resources, training programs, and on-the-ground guidance to private and public landowners and land managers on the benefits of and for creating young forest and early succession habitat for SGCN.
- 11.2.0.15 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and landowners about the importance of retaining and in an effort to protect, create, enhance and/or restore vegetation along aquatic habitats.
- 11.2.0.17 Provide educational resources and technical support to public and private landowners and land managers to promote the protection of vernal pools and the protection, enhancement and/or restoration of biologically appropriate buffers.
- 11.2.0.22 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
- 11.2.0.23 Provide educational resources and technical support to public and private landowners and land managers of lands adjacent to SGCN habitats to promote the protection and/or enhancement of those adjacent habitats to increase the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and that connect conserved SGCN habitats.
- 11.2.0.24 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers on how to manage vegetated roadside areas (e.g., mowing, brush-hogging, etc.) on a schedule that avoids peak activity periods for wildlife and therefore, minimizes harm.
- 11.2.0.25 Provide educational resources, training programs, and on-the-ground guidance to resource managers regarding the assessment of and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) related to residential and commercial development.
- 11.2.0.26 Make educational resources available to the public that encourage researchers to seek out guidance prior to finalizing proposals and submitting State permit applications to reduce potential impacts on sensitive species.
- 11.2.1 With individuals and groups involved in resource management decision making
 - 11.2.1.1 Engage partners and stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
 - 11.2.1.2 Provide professional training and technical assistance tools (e.g., mapping, guidance documents, justification, etc.) to agencies/divisions/programs within and outside of the NJ DEP regarding the SWAP, and the conservation actions recommended therein to help facilitate SWAP implementation.

Papaipema harrisii

- 11.2.1.3 Provide educational resources, training programs, and on-the-ground guidance to DOD to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop and implement forest management and other practices that minimize disturbances to SGCN (i.e., beyond their federal requirements).
- 11.2.1.5 Provide educational resources, training programs, and on-the-ground guidance to municipalities, state and federal agency resource managers on tasks such as writing and integrating Beach Management Plans into other management documents.
- 11.2.1.6 Provide educational resources, training programs, and on-the-ground guidance to resource agencies prior to project initiation to ensure wildlife and their habitats are protected to the highest degree possible during construction, and provisions are in place for post-construction habitat use.
- 11.2.2 With private landowners
 - 11.2.2.1 Provide technical support to farming operations and woodland landowners on ways to decrease clean farming (edge-to-edge) practices and create ecotones to benefit bobwhite and other species dependent on early successional habitat.

100 Law and Policy

100. Legislation

100.1.3 Sub-national Level

- 100.1.3.3 Initiate legislative action to establish an annual budgetary line item designating funds to support programs focused on long-term research and monitoring of wildlife diseases.

100.1.4 County and Local

- 100.1.4.2 Secure and increase the effective size of SGCN habitats and connect conserved SGCN habitats through local ordinances.
- 100.1.4.3 Expand the acreages and enhance the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN through local ordinances.
- 100.1.4.14 Adopt/pass local ordinances which require assessing and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 100.1.4.15 Incorporate habitat connectivity and the preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.

100.1.5 Scale Unspecified

- 100.1.5.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 100.1.5.5 Develop legislation to provide financial support for the New Jersey Invasive Species Strike Team.

100. State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.5 Develop policies that will promote improved and secure habitat connections between conserved SGCN habitats.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Papaipema harrisii

- 100.3.0.6 Develop policies that will promote expanding acreages and enhancing the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 100.3.0.8 Develop policies and/or regulations with the objective of protecting significant natural and/or unique communities in perpetuity.
- 100.3.0.9 Secure mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.12 Develop policies that promote the preservation and protection of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.
- 100.3.0.18 Develop policies for conserved lands that prohibit planting and supports the control of non-native vegetation and invasive, native vegetation.
- 100.3.0.23 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.31 Create or expand tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMPs.
- 100.3.0.32 Coordinate regulations across agencies to maximize availability of and enrollment in existing Forestry Stewardship Programs (e.g., "Woodland Stewards", Farm Bill, partners, etc.) to maintain and/or improve forest habitat.
- 100.3.0.38 Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.
- 100.3.0.39 Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.3.0.40 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.3.0.41 Explore all State regulatory requirements for mitigation, restoration, habitat management, etc. to ensure they prohibit the use of specified invasive or other problematic plant species.
- 100.3.0.43 Identify and address (amend) regulatory impediments to beneficial habitat management.
- 100.3.0.44 Incorporate requirements for technical support and funding for mitigation or restoration efforts so as to be consistent with existing regulations.
- 100.3.0.45 Increase the controlled burn season to focus on restoring vegetative communities.
- 100.3.0.46 Investigate and/or develop inter-agency Memorandum of Agreements to share common data stored or managed in program-specific databases.
- 100.3.0.48 Propose new State law or regulation mandating that a State-level "development impact fee" be assessed on all new development approved by municipalities (via the Municipal Land Use Law processes), and dedicate such monies to the development and implementation of regional Habitat Conservation Plans (or existing plans/programs serving the same regional function).

Papaipema harrisii

- 100.3.0.50 Retain endangered, threatened and special concern wildlife and habitat protection measures in the Water Quality Management Program Rules.
- 100.3.0.52 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded energy sitings and facilities.
- 100.3.0.53 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded rights-of-way corridors associated with energy transport/transmission.
- 100.3.0.60 Develop regulations that when implemented will protect significant natural and/or unique communities in perpetuity.
- 100.3.0.63 Develop regulations that when implemented will preserve and protect critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.
- 100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.
- 100.3.0.73 Develop regulations that would exempt the conversion of lawns to native vegetation (beneficial to wildlife) from local lawn ordinances.

100.3.2 State Land Acquisition Programs

- 100.3.2.1 Increase opportunities for habitat restoration by making any necessary policy changes to state, federal and local land acquisition programs (e.g., Green Acres, Blue Acres, etc.) to allow for acquisition within abandoned or failing bay shore communities, including mechanisms to relocate displaced people and infrastructure.

100. State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).
- 100.4.0.2 Create a policy that requires the NJ DEP to incorporate scientific information regarding climate change and sea level rise (e.g., predictions, habitat management/acquisition efforts to enhance resilience to inundation) on their websites and to work with other government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 100.4.0.3 Develop policies for mandatory buffer strips on preserved farmlands and state-owned agricultural lands.
- 100.4.0.8 Develop a white paper addressing the impacts that existing, new or expanded rights-of-way have upon wildlife, wildlife habitats and habitat connectivity.
- 100.4.0.10 Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Papaipema harrisii

- 100.4.0.11 Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.4.0.12 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.4.0.13 Develop policies for different circumstances (e.g., roadsides and medians, riparian, aquatic and terrestrial habitats) that outline appropriate habitat/vegetation management strategies and schedules to minimize risks to and benefit wildlife.
- 100.4.0.16 Develop policies to implement habitat management strategies that will increase the structural diversity surrounding areas used for energy, mining, and transportation and service corridors which include but are not limited to the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-
- 100.4.0.17 Develop policies to implement habitat management strategies, including prescribed burns, that will increase the structural diversity on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies to control and reduce the impacts of invasive, non-native species in order to increase structural habitat diversity.
- 100.4.0.18 Develop policies to minimize the extent of infrastructure associated with energy and service corridors or areas (e.g., wind and solar farms, pipelines, utility lines) and that require the implementation of habitat management strategies that will increase the structural diversity in the area including (e.g., the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-asides).
- 100.4.0.19 Develop regulations that will minimize the creation of new barriers, remove or replace current barriers with appropriately-sized systems to accommodate wildlife dispersal, and to minimize road widening and traffic volume increases within critical wildlife habitat areas.
- 100.4.0.20 Develop state regulations that require energy developers and utility service companies to implement habitat management strategies that will increase the structural diversity of the habitat, minimize habitat fragmentation and commercial infrastructure, and minimize the loss, alteration and/or degradation of the habitat and adjacent lands when working on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies.
- 100.4.0.24 Develop policies to provide financial support for the New Jersey Invasive Species Strike Team.
- 100.4.0.25 Develop policies that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

Pinelands Moths

Focal species that comprise this Conservation Target:

A Notodontid Moth (<i>H. varia</i>)	Buchholz's Dart Moth	Buchholz's Gray
Carter's Noctuid Moth	Daecke's Pyralid Moth	Pink Sallow
Sand Myrtle Looper/Pink		

Threats and Action Drivers associated with this Conservation Target:

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale) (Avg. Score: 2.00)

NJ Specific Threats:	<u>1.1.1.1</u>	Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
	<u>1.1.1.2</u>	Loss, alteration and/or degradation of habitat.
	<u>1.1.1.6</u>	Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale) (Avg. Score: 2.00)

NJ Specific Threats:	<u>1.2.1.1</u>	Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
	<u>1.2.1.2</u>	Loss, alteration and/or degradation of habitat.
	<u>1.2.1.6</u>	Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale) (Avg. Score: 2.00)

NJ Specific Threats:	<u>1.3.1.1</u>	Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
	<u>1.3.1.2</u>	Loss, alteration and/or degradation of habitat.
	<u>1.3.1.5</u>	Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

2 Agriculture and Aquaculture

2.1 Annual and Perennial Crops (non-timber)

2.1.2 Small-holder Farming (Avg. Score: 1.00)

NJ Specific Threats:	<u>2.1.2.1</u>	Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.
	<u>2.1.2.2</u>	Fragments terrestrial and aquatic habitats.

2.1.3 Agro-industry (Avg. Score: 1.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Pinelands Moths

NJ Specific Threats: 2.1.3.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.3.2 Fragments terrestrial and aquatic habitats.

2.2 Wood and Pulp Plantations

2.2.1 Small Holder (Avg. Score: 1.00)

NJ Specific Threats: 2.2.1.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.

2.2.2 Agro-industry Plantations (Avg. Score: 1.00)

NJ Specific Threats: 2.2.2.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.

3 Energy Production and Mining

3.2 Mining and Quarrying

3.2.2 Surface Mining - Rock Quarry (and sand quarries) (Avg. Score: 1.00)

NJ Specific Threats: 3.2.2.1 Fragments terrestrial and aquatic habitats.

3.2.2.2 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

3.3 Renewable Energy

3.3.2 Solar Power (Avg. Score: 1.00)

NJ Specific Threats: 3.3.2.2 Loss, alteration and/or degradation of habitat.

4 Transportation and Service Corridors

4.1 Roads and Railroads

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale) (Avg. Score: 1.00)

NJ Specific Threats: 4.1.1.2 Loss, alteration and/or degradation of habitat associated with road and railroad construction and maintenance, and degradation of adjacent habitats.

4.2 Utility and Service Lines

4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads (Avg. Score: 1.00)

NJ Specific Threats: 4.2.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species, inhibiting dispersal of non-volant animals, reducing gene flow, and creating barriers to fish when service line-associated roads cross streams (e.g., bridges, culverts, fords, etc.).

4.2.1.2 Loss, alteration and/or degradation of habitat associated with rights-of-way construction and maintenance, and degradation of adjacent habitats.

4.2.2 Management of rights-of-way or communication tower facilities and/or their associated access roads (Avg. Score: 1.00)

NJ Specific Threats: 4.2.2.1 Improper or poorly scheduled vegetation management can cause direct mortality to and may reduce productivity of wildlife.

5 Biological Resource Use

5.1 Hunting and Collecting Terrestrial Animals

5.1.1 Intentional Use (Avg. Score: 1.00)

NJ Specific Threats: 5.1.1.1 Illegal collection of wildlife can have detrimental impacts on populations.

5.1.3 Persecution/Control (Avg. Score: 1.00)

NJ Specific Threats: 5.1.3.1 Wanton killing of perceived dangerous and/or undesirable animals.

5.3 Logging and Wood Harvesting

5.3.1 Intentional Use (subsistence/small scale) (Avg. Score: 2.00)

NJ Specific Threats: 5.3.1.1 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may fragment their terrestrial habitats.

5.3.1.2 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may cause the loss, alteration and/or degradation of wildlife habitat.

5.3.1.3 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase soil erosion, impacting SGCN habitats.

5.3.1.4 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase the risk of invasive species establishment, impacting SGCN habitats.

5.3.1.5 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may decrease structural diversity and biomass leading to reduced biodiversity and ecological integrity.

5.3.1.6 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices in Atlantic White Cedar stands may destroy a unique wildlife wetland habitat that is difficult, and takes time, to restore.

5.3.2 Intentional Use (large scale) (Avg. Score: 2.00)

NJ Specific Threats: 5.3.2.1 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may fragment their terrestrial habitats.

5.3.2.2 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may cause the loss, alteration and/or degradation of wildlife habitat.

5.3.2.3 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase soil erosion, impacting SGCN habitats.

5.3.2.4 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase the risk of invasive species establishment, impacting SGCN habitats.

5.3.2.5 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may decrease structural diversity and biomass leading to reduced biodiversity and ecological integrity.

5.3.2.6 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices in Atlantic White Cedar stands may destroy a unique wildlife wetland habitat that is difficult, and takes time, to restore.

5.3.3 Unintentional effects (subsistence/small scale) (Avg. Score: 1.00)

NJ Specific Threats: 5.3.3.1 Direct mortality of wildlife, direct loss of suitable habitats (roost, foraging, shelter, etc.), and can disrupt sensitive species, decreasing the likelihood of success and/or reproduction.

5.3.4 Unintentional effects (large scale) (Avg. Score: 2.00)

NJ Specific Threats: 5.3.4.1 Direct mortality of wildlife, direct loss of suitable habitats (roost, foraging, shelter, etc.), and can disrupt sensitive species, decreasing the likelihood of success and/or reproduction.

- 5.3.4.5 Lack of appropriate, sustainable forest management can lead to a decrease in forest habitat diversity, degraded habitat for many forest species, the loss of habitat for early-successional species, and/or the loss of unique habitats for species that need canopy breaks and multi-aged tree composition to fulfill various life history requirements.

6 Human Intrusions and Disturbance

6.1 Recreational Activities

6.1.1 Off-road vehicles (motorized and non-motorized) (Avg. Score: 2.00)

- NJ Specific Threats:** 6.1.1.2 Inappropriate use of off-road vehicles can degrade terrestrial and aquatic habitat and reduce the suitability of adjacent habitats for wildlife.
- 6.1.1.3 Increased risk of harassment that results in a change in wildlife behavior and/or direct mortality from vehicle strikes.
- 6.1.1.6 Off-road vehicles can be a mechanism of transference of wildlife diseases and invasive plant species if gear and apparel are not properly sanitized between sites.

7 Natural Systems Modifications

7.1 Fire and Fire Suppression

7.1.1 Increase in Fire Frequency/Intensity (Avg. Score: 3.00)

- NJ Specific Threats:** 7.1.1.1 Increase in frequency and intensity of wild fires as a result of droughts and heat waves drying out vegetation and litter.
- 7.1.1.2 Increase in frequency of wild fires as a result of illegal activities.
- 7.1.1.3 Unnatural fire regimes occurring as a result of military exercises.
- 7.1.1.4 Lack of diversity in age structure and composition of vegetation due to expansive, frequent fires.

7.1.2 Suppression of Fire Frequency/Intensity (Avg. Score: 3.00)

- NJ Specific Threats:** 7.1.2.1 Shift in vegetative communities as a result of suppression of natural fires.
- 7.1.2.2 Lack of diversity in age structure and composition of vegetation due to the suppression of fire.

7.2 Dams and Water Management/Use

7.2.5 Abstraction of Ground Water (domestic use) (Avg. Score: 1.00)

- NJ Specific Threats:** 7.2.5.1 Heavy withdrawal of ground water for domestic use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.6 Abstraction of Ground Water (commercial use) (Avg. Score: 1.00)

- NJ Specific Threats:** 7.2.6.1 Heavy withdrawal of ground water for industrial and commercial use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.7 Abstraction of Ground Water (agricultural use) (Avg. Score: 1.00)

- NJ Specific Threats:** 7.2.7.1 Heavy withdrawal of ground water for agricultural use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.3 Other Ecosystem Modifications

7.3.2 Inappropriate timing of mowing (Avg. Score: 1.00)

- NJ Specific Threats:** 7.3.2.1 Increased risk of direct mortality and/or reduced productivity of wildlife, as well as reduced use by migrating species.

7.3.4 Lack of natural disturbance patterns or ecosystem functions due to species loss (Avg. Score: 2.00)

Pinelands Moths

NJ Specific Threats: 7.3.4.5 The lack of forest disturbance minimizes the diversity of herbaceous vegetation and other shrubs and trees that need a lot of sunlight to grow.

7.3.5 Poor habitat management (Avg. Score: 2.00)

NJ Specific Threats: 7.3.5.1 Improper or poorly scheduled maintenance of man-made corridors (e.g., roadsides and medians) can cause direct mortality to and may reduce productivity of wildlife.

7.3.5.3 Vegetation clearing removes terrestrial and riparian corridors for animal movement, shelter, and resting areas.

7.3.5.4 Vegetation clearing or inappropriate alteration adjacent to aquatic habitats threatens aquatic species by degrading habitat and water quality (altering temperature and dissolved oxygen, increasing siltation and desiccation, etc.).

7.3.5.5 Habitat management that alters or removes vegetation without implementing long-term management increases the risk of invasive and exotic plants establishing themselves, outcompeting native vegetation.

7.3.5.6 Habitat management, including that which occurs on public and private lands, that does not consider timing and species' behaviors can result in the direct mortality and/or alteration or loss of habitat.

7.3.5.7 Improperly planned habitat management and/or mitigation efforts along roadsides and within the medians can attract wildlife and increase the risk of vehicle strikes.

7.3.5.12 Lack of diversity in age structure and composition of vegetation due to lack of natural disturbances and/or vegetation management.

7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.

8 **Invasive and Other Problematic Species, Genes and Diseases**

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.1 Unspecified Species (Avg. Score: 1.00)

NJ Specific Threats: 8.1.1.1 Displace or outcompete native species for resources.

8.1.1.2 Alters, degrades and/or reduces the structural diversity of the natural composition of the landscape, including aquatic systems.

8.1.1.3 Invasive, non-native insects can damage native vegetation at a large scale, leading to die-offs, altering the ecological community.

8.1.1.4 Invasive, non-native animals increase the risk of predation on native animals and/or herbivory on native vegetation.

8.1.1.5 Invasive, non-native animals and plants increase the risk of introduction and transference of diseases

8.1.1.6 Invasive, non-native plants may create physical barriers for some species.

8.1.4 Invasive non-native terrestrial/wetland animals (Avg. Score: 2.00)

NJ Specific Threats: 8.1.4.1 Displace or out-compete native species for resources (food, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.1.6 Invasive non-native fungal/bacterial diseases (Avg. Score: 1.00)

NJ Specific Threats: 8.1.6.1 The introduction of non-native fungal and bacterial diseases threatens native populations and ecosystems.

8.2 Problematic Native Species/Diseases

8.2.1 Unspecified Species (Avg. Score: 1.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Pinelands Moths

- NJ Specific Threats:** 8.2.1.1 Overabundant native insects can damage native vegetation at a large scale, leading to die-offs, altering the ecological community.
- 8.2.1.2 Invasive pathogens and insects may increase in range and abundance as limiting factors (such as temperature) are altered as a result of climate change.
- 8.2.1.4 Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.

8.2.2 Named Species (Avg. Score: 1.00)

- NJ Specific Threats:** 8.2.2.2 Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.

8.4 Problematic Species/Diseases of Unknown Origin

8.4.1 Unspecified Species (Avg. Score: 1.00)

- NJ Specific Threats:** 8.4.1.1 Non-native or poorly understood diseases and parasites could potentially impact native animals.

8.6 Diseases of Unknown Cause

8.6.0 Unknown Diseases (Avg. Score: 1.00)

- NJ Specific Threats:** 8.6.0.1 Diseases yet to be identified by pathologists and virologists cause decreased fitness or mortality to native populations.

9 Pollution

9.3 Agricultural and Forestry Effluents

9.3.3 Herbicides and Pesticides (Avg. Score: 3.00)

- NJ Specific Threats:** 9.3.3.1 Pesticides degrade terrestrial and aquatic habitats, especially streams, ponds and wetlands. Aquatic wildlife are particularly sensitive to these contaminants, which can cause developmental and behavioral abnormalities and reproductive failure. Some contaminants may bioaccumulate in predatory fish and birds and disrupt reproduction.

9.3.3.3 Use of pesticides can directly harm non-target species through direct contact and/or by reducing and/or contaminating their food supply.

9.3.3.4 Use of herbicides can destroy beneficial food and nectar plants for insects.

9.3.5 Control of insect pests and plants leading to mortality of non-target species (Avg. Score: 3.00)
not associated with agriculture

- NJ Specific Threats:** 9.3.5.1 Use of pesticides, insecticides, and/or herbicides can directly harm non-target species, such as amphibians and beneficial invertebrates through direct contact and/or by reducing and/or contaminating their food supply.

9.3.5.2 Use of herbicides can destroy beneficial food and nectar plants for insects.

9.3.5.4 Improper use of current insecticides, such as those containing esfenvalerate, prallethrin, or piperonyl butoxide, or past use of pesticides containing chlordane still present in the soils, are toxic to various wildlife species, and can cause injury, mortality, or other effects that impair population viability.

9.3.5.5 Use of pesticides and herbicides can minimize the abundance of food sources for native wildlife populations.

9.5 Air-Bourne Pollutants

9.5.4 Other (Avg. Score: 1.00)

- NJ Specific Threats:** 9.5.4.1 Dust and/or airborne sedimentation from construction sites, agricultural operations or related earth disturbances can introduce mineral or organic sediments into adjacent wildlife habitats, degrading their quality and suitability for wildlife short-term and/or long-term.

9.5.6 Herbicides and Pesticides (Avg. Score: 3.00)

NJ Specific Threats: 9.5.6.1 May result in injury or direct mortality of non-target species.

11 Climate Change and Severe Weather

11.1 Habitat Shifting or Alteration

11.1.0 Macro- and Micro-Climate Alterations (Avg. Score: 3.00)

NJ Specific Threats: 11.1.0.1 Alters native terrestrial and aquatic habitats at the macro- and micro-climate levels that can affect suitability for wildlife, in particular specialist species.

11.6 Phenology Shifting or Alteration

11.6.1 Phenology shifts related to pollination ecology (Avg. Score: 1.00)

NJ Specific Threats: 11.6.1.1 Alters inter-specific relationships of wildlife and vegetation, ultimately leading to detrimental impacts on the ecological system.

11.6.3 Phenology shifts related to species redistribution (Avg. Score: 1.00)

NJ Specific Threats: 11.6.3.1 Shifts in timing of species migration, breeding and hibernation, and available food resources, as a result of wildlife range shifts driven by climate change.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory (Avg. Score: 3.00)

NJ Specific Threats: 12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.1.2 Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.

12.1.2 Lack of up-to-date existing information (Avg. Score: 3.00)

NJ Specific Threats: 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

12.1.3 Need to answer research question (Avg. Score: 3.00)

NJ Specific Threats: 12.1.3.1 There are significant knowledge gaps regarding distribution, dispersal, diseases, population trends, etc. of SGCN.

12.1.4 Need to develop new technique (Avg. Score: 3.00)

NJ Specific Threats: 12.1.4.1 Improve and evaluate survey methods for SGCN and their habitats; alter as needed.

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms (Avg. Score: 1.00)

NJ Specific Threats: 12.3.0.1 Regulatory habitat protections within state land use regulations are spatially limited to specific geographic areas (e.g., Pinelands, Coastal Area) or geographic features (e.g., wetlands, streams) and so fail to protect critical habitats that exist outside of these regulated areas.

12.3.0.7 Activities that threaten SGCN, their food sources, and/or habitats are often regulated separately and without consideration for the cumulative and synergistic effects over time or over a larger spatial scale. Therefore, regulations can fail to protect SGCN populations over time.

12.3.0.9 Prescribed burns implemented by the NJ Forest Fire Service are constrained by State air quality regulations to a timeframe where seasonal weather conditions are less than ideal for effective burning. As a result, the Forest Fire Service is limited in the number of overall prescribed burns it can implement to restore habitat for wildlife.

12.3.0.10 Land use regulatory processes pertaining to habitat creation, enhancement or restoration projects can be costly and/or burdensome, precluding or discouraging the development or implementation of conservation projects.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform

(Avg. Score: 1.00)

- NJ Specific Threats:** 12.4.0.1 A species-by-species management focus as opposed to ecological systems and biodiversity generally has greater opportunity for unintended consequences for other species and may be less efficient in developing appropriate management actions.
- 12.4.0.2 Policies and procedures for lands management that lack consideration of the impacts of activity timing can result in unintended impacts to wildlife during vulnerable periods.
- 12.4.0.5 Bureau of Forest Fire Management policy has traditionally implemented prescribed burns on State lands for the sole purpose of public safety (i.e., addressing hazard fuel reduction), missing opportunities to burn in a manner that would additionally manage habitat for ecological diversity.
- 12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats

(Avg. Score: 3.00)

- NJ Specific Threats:** 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.
- 14.1.1.2 Lack of general knowledge of SGCN life histories and vulnerabilities as they relate to land management practices.
- 14.1.1.3 Lack of understanding of the need to manage both natural and anthropogenic (e.g., yards, lawns, hayfields, etc.) habitats to minimize impacts or increase benefits to SGCN and their habitats.

14.2 Outreach needs

14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions

(Avg. Score: 3.00)

- NJ Specific Threats:** 14.2.1.1 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various forest management practices.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

(Avg. Score: 1.00)

- NJ Specific Threats:** 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Actions to address the Threats and Action Drivers associated with this Conservation Target:

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.2 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to increase the effective size of SGCN habitats by protecting/restoring adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Pinelands Moths

- 1.2.1.5 Secure and promote the protection/restoration of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through incentive programs.
- 1.2.1.6 Secure and promote the protection/restoration of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers through incentive programs.
- 1.2.1.8 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to municipalities, land developers, and other land managers to retain and/or enhance native vegetation adjacent to aquatic habitats, and along riparian areas and wildlife movement corridors.
- 1.2.1.9 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing Forestry Stewardship Programs.
- 1.2.1.10 Coordinate across government agencies and non-government organizations to maximize the availability of and enrollment in existing landowner incentive programs (e.g., "farm bill," partners, etc.) to maintain and/or improve habitat.
- 1.2.1.11 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 1.2.1.12 Create incentives (non-monetary and/or monetary) for land developers to redevelop abandoned areas (e.g., shopping centers, office complexes) to minimize the loss of natural habitats and reduce the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 1.2.1.13 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to land developers to minimize the impacts of new residential and commercial developments on SGCN and their habitats.
- 1.2.1.14 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of herbicides and pesticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.15 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of rodenticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.16 Create incentives (non-monetary and/or monetary) within State regulations (mitigations requirements or credit, BMP satisfaction, etc.) to promote the use of retailers who refrain from selling specified invasive or other problematic plant species.

Pinelands Moths

- 1.2.1.17 Develop a public-relations oriented certification program for private retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.18 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and land managers to control and reduce the impacts of invasive, native and non-native species in order to increase structural habitat diversity.
- 1.2.1.19 Create incentives for federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to farmers, woodland landowners, and private landowners to adopt and/or endorse consistent BMPs concerning controlled burns to maintain and/or improve wildlife habitat.
- 1.2.1.20 Coordinate across government agencies and non-government organizations to create or expand upon tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMP's.
- 1.2.1.21 Create and/or support market-based programs that subsidize or create branding for products derived sustainably from managed wildlife habitats.
- 1.2.1.22 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to horse/livestock farm owners and managers to increase structural habitat diversity in and around the farms by managing vegetation for a variety of species, in particular, farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 1.2.1.23 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to provide cost shares and/or plan approvals for management based on management approaches and prescriptions.
- 1.2.1.24 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners, with habitat of suitable patch size to support breeding grassland-dependent species, to alter the timing of vegetation management to benefit grassland and pollinator species.
- 1.2.1.26 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing landowner incentive programs.
- 1.2.1.28 Create incentives to implement dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.

2 Direct Management of Natural Resources

2.3 Fire management

2.3.2 Fuel reduction

- 2.3.2.1 Prevent wildfires by reducing natural fuel (e.g., leaf litter).

2.3.3 Prescribed burning

- 2.3.3.1 Evaluate different management techniques of prescribed burns that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 2.3.3.2 Conduct prescribed burning in Northern New Jersey forests to maintain and regenerate a mosaic of upland forest habitats.
- 2.3.3.3 Conduct prescribed burning to improve wildlife habitat.

Pinelands Moths

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

- 2.8.0.1** Control invasive insect infestations by implementing BMP strategies through biological, chemical and/or mechanical means that will depress, or when appropriate, eradicate populations in a manner that avoids excessive harm to non-target species using BMPs to control infestations and limit their spread based on an inventory of invasive insect distribution and response to outbreaks.
- 2.8.0.2** Develop, implement, monitor and evaluate pest control/management strategies to reduce the impacts of over-abundant wildlife species (native and/or native, invasive species) on native vegetation and the degradation of habitats supporting SGCN. Over-abundant wildlife species include but are not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 2.8.0.4** Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.
- 2.8.0.5** Implement biologically safe and appropriate control/management strategies, and where appropriate, eradication strategies to reduce the impacts and/or limit the distribution of invasive and/or non-native plant species within or near aquatic systems using methods that will provide the most protection to the aquatic and riparian ecological system, and minimize disturbance to the soil and wildlife. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.
- 2.8.0.6** Implement long-term management of invasive and/or non-native plants to help maintain functioning ecological systems and biological diversity, and to enhance travel corridors. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

- 2.10.0.1** Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 2.10.0.2** Improve the availability of prey/food resources through terrestrial and aquatic plantings and habitat restoration for SGCN populations, in particular for those populations thought to be limited due wholly or in part to a lack of (or contaminated) food resources, and for migratory species (birds, bats, invertebrates).
- 2.10.0.3** Restore and/or enhance habitats to benefit urban-associated SGCN.
- 2.10.0.4** Restore and/or enhance suitable travel corridors connecting conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats.

Pinelands Moths

- 2.10.0.5 Implement habitat restoration and/or enhancement activities that include the creation of vegetative buffers between sensitive habitats (e.g., aquatic systems) and human-inhabited areas (e.g., residences, parks, etc.) and that is conducted during appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity
- 2.10.0.6 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats.
- 2.10.0.7 Restore/reclaim and enhance degraded rare species habitats through strategic revegetation and management efforts for documented/target SGCN.
- 2.10.0.8 Protect significant natural and/or unique communities by implementing best management practices when conducting habitat restoration strategies.
- 2.10.0.9 Restore and/or enhance riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation, alteration and/or changes in hydrology and subsequent disturbances to and behavioral changes of wildlife (e.g., restoring biologically appropriate buffers, revegetation or restoration efforts, etc.).
- 2.10.0.10 Minimize the loss of important habitats (e.g., coastal scrub-shrub and grassy habitats, high and low marsh habitats, etc.) that provide nesting, migrating, and wintering areas for SGCN birds and other coastal and marsh-dependent species through habitat restoration efforts.
- 2.10.0.11 Restore and/or enhance critical migratory terrestrial and aquatic habitats (e.g., beach, grasslands, forest, scrub-shrub, etc.) for songbirds, raptors, shorebirds, waterfowl, bats and invertebrates through habitat restoration efforts and expand habitat restoration to adjacent private lands to increase the effective size of the habitat.
- 2.10.0.12 Create and/or maintain scrub-shrub habitats through revegetation efforts with little to no impact on forested, wetland and grassland habitats to maintain populations of shrub-dependent SGCN.
- 2.10.0.14 Implement best management practices (BMPs), protective strategies and guidelines for restoring and enhancing healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.10.0.15 Restore and/or enhance terrestrial and aquatic habitats proximate to but not adjacent to roads and other transportation corridors for terrestrial-bound SGCN species whose behavior (i.e., dispersal across roads) may be altered by doing so, and therefore decrease road mortality of such species (e.g., amphibians, snakes, turtles, small mammals).
- 2.10.0.21 Restore and/or enhance understory habitats that suppress invasive species and provide critical resources and enhance sheltering, foraging, and nesting cover for wildlife.
- 2.10.0.22 Restore and/or enhance terrestrial and aquatic habitats to promote the regeneration of native vegetation and enhance structural diversity to benefit SGCN (e.g., vegetative buffers of aquatic systems, allow coarse, woody debris to remain in terrestrial, aquatic and riparian habitats to provide shelter, riparian stabilization and necessary microclimates, plant native trees, shrubs and grasses, etc.).

2.11 Vegetation management

- 2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Pinelands Moths

- 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.
- 2.11.0.2 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas for target SGCN and/or species groups; management should complement rare species needs in a targeted area.
- 2.11.0.3 Create suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats through vegetation management.
- 2.11.0.4 Implement vegetation management strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife, particularly SGCN.
- 2.11.0.5 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats through vegetation management.
- 2.11.0.6 Reclaim degraded rare species habitats by conducting vegetation management needed to restore habitat value for the documented/target SGCN.
- 2.11.0.7 Protect significant natural and/or unique communities by implementing best management practices through vegetation management.
- 2.11.0.23 Implement appropriate habitat management actions in areas where natural disturbances, such as wildfire, have been precluded.
- 2.11.0.24 Conduct vegetation management adjacent to aquatic habitats following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.25 Conduct vegetation management along access roads following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.26 Conduct vegetation management along roadsides and medians, avoiding peak activity periods for wildlife, that enhances wildlife dispersal naturally and safely across roads and similar barriers to/between terrestrial and/or aquatic habitats.
- 2.11.0.27 Conduct vegetation management for target shrub- or young forest-dependent SGCN following BMPs to minimize the risk of the establishment of invasive and non-native plants.
- 2.11.0.28 Conduct vegetation management in agricultural areas following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.29 Conduct vegetation management on transportation and service corridors (i.e., rights-of-way) following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.30 Identify and prioritize areas where various management tools (such as increasing salinity through the management of water levels or chemical applications) may be effective in reducing phragmites within and restoring marsh habitat.
- 2.11.0.31 In areas where vegetative communities are shifting due to fire suppression and controlled burns are not feasible, manage vegetation to improve wildlife habitat.
- 2.11.0.32 Increase structural habitat diversity around and when feasible, within agricultural landscapes by managing vegetation for a variety of species, in particular, those farms that have removed scrub-shrub habitat and/or fragmented forests, and by implementing ecologically best practices (e.g., no-till farming, maintaining hedgerows, buffer set-asides, etc.).

Pinelands Moths

- 2.11.0.33 Increase structural habitat diversity by implementing long-term vegetation management to minimize the potential for the establishment of invasive and/or non-native plants that may outcompete native vegetation.
- 2.11.0.34 Increase structural habitat diversity by managing residential, commercial and recreational areas' landscapes for a variety of species. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.36 Increase structural habitat diversity by managing vegetation for a variety of species and considering their life history requirements (e.g., travel corridors, shelter, resting and breeding areas) to minimize the risk of harm.
- 2.11.0.38 Increase structural habitat diversity in and around horse/livestock farms by managing vegetation for a variety of species, in particular, in and around farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 2.11.0.39 Increase structural habitat diversity in and around solar farms by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.40 Increase structural habitat diversity surrounding areas used for energy, mining, and transportation and service corridors by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides, and avoid managing habitat during the breeding seasons for ground-nesting birds, reptiles, amphibians and small mammals.
- 2.11.0.41 Increase structural habitat diversity through the implementation of a variety of vegetation management practices such as prescribed burns (either increasing or decreasing their frequency depending on the site and objective), plantings, etc. that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.42 Increase structural habitat diversity within wind farms for terrestrial bound and low-flying species and around wind farms for other wildlife by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.43 Manage forests to increase variation in age structure and composition using BMPs that promote and maintain functioning ecological forest-based systems and biological diversity.
- 2.11.0.45 Regularly and/or rotationally create young forest habitat in targeted areas to maintain and regenerate a mosaic of upland forest habitats that will benefit shrub- and young forest-dependent species.

2.14 Wildlife disease management

2.14.0 Wildlife disease strategy development and investigation

- 2.14.0.1 Investigate diseases/pathogens impacting SGCN and/or their habitats.
- 2.14.0.2 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.

Pinelands Moths

- 2.14.0.3 Protect SGCN from exotic pathogen introduction or incident through implementation of a "rapid response plan"; DFW to give priority attention to these species in planning and/or implementing a response.
- 2.14.0.4 Conduct long-term monitoring of diseases in vulnerable wildlife to determine the magnitude of exposure within populations and around the State, the impacts to those species, in particular SGCN, and investigate the feasibility of mitigating for such impacts.
- 2.14.0.5 Assess the impacts of diseases on the life cycles of wildlife.

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

- 3.0.0.1 Conduct long-term monitoring of resident and migratory SGCN populations using standardized survey protocols to determine the variables that may impact their long-term persistence in the State (e.g., population viability, distribution, dispersal, home range and habitat use, travel corridors, food availability, vulnerability to pollutants and disease, etc.). Compile this information to determine the likely causes of population declines and to understand metapopulation dynamics. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.2 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) where data gaps exist regarding SGCN distribution, and their critical and supportive habitats. Conduct surveys using standardized survey protocols to acquire baseline data, and provide the data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
- 3.0.0.3 Gather baseline data on SGCN inhabiting permanently protected natural lands regarding their distribution and population (e.g., abundance, dispersal, demography including productivity and survival, etc.), and identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) critical and supporting habitats within those landscapes.
- 3.0.0.4 Conduct long-term studies on SGCN inhabiting permanently protected natural lands to develop population trend data and changes in demography, and to determine if critical and/or supporting habitats are limited or changing; i.e., diminishing in value, acreage or connectivity.
- 3.0.0.5 Gather baseline data on resident and migratory SGCN (in particular migratory species for which New Jersey habitats are significant), terrestrial, freshwater and marine species, regarding the location and condition of their critical and supporting habitats (e.g., foraging, roosting, nesting/breeding, stopover, migration paths, etc.), and population demography (e.g., productivity, survival, dispersal). Compile this information into a database that includes descriptions of the conditions of the habitats and species, and a GIS component of the locations of these important habitats. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.6 Conduct long-term studies on resident and migratory SGCN to determine if there are changes to the populations' demography (productivity, survival, dispersal) and/or to their critical and/or supporting habitats (i.e., diminishing in value, acreage or connectivity, etc.), in particular changes that would not maintain SGCN at viable levels for species populations. Update data and GIS maps; provide updated information to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.7 Collect baseline data to document species distributions, in particular SGCN, and current habitat for future analysis of possible distribution shifting as a result of habitat shifting or alteration associated with climate change impacts.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Pinelands Moths

- 3.0.0.8 Conduct long-term studies and compare baseline metrics of documented species distributions and associated habitats to identify possible species and/or habitat shifting or alteration associated with climate change impacts.
- 3.0.0.13 Investigate the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats. Evaluate and modify management practices as appropriate.
- 3.0.0.14 Identify areas with invasive, aquatic plants and animals and collect a detailed baseline assessment of the species' status and distribution. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort. Researchers and contractors performing Forest Stewardship Inventories and/or Plans on state lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.0.0.15 Conduct long-term monitoring of areas identified as having invasive, aquatic plants and animals to track the species' status/progress over time with or without the implementation of management strategies. Areas without management strategies should be assessed and prioritized for management/control. Areas where management strategies are being implemented should include an assessment of the management effort and identify/recommend and implement necessary changes to improve its success. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort.
- 3.0.0.26 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species including objectives and guidance pertaining to and the condition/status of critical and supporting habitats.
- 3.0.0.27 Evaluate the effectiveness of strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals through research and monitoring. Develop and provide NJ DEP and other appropriate governing agencies/commissions a summary of findings and recommendations to improve such efforts.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.1 Division of Fish and Wildlife should maintain a robust, up-to-date database and mapping of species occurrences.
- 3.2.0.7 Track (via a database that includes a GIS component) and research problematic species and diseases to determine their distribution, impacts on SGCN wildlife/wildlife communities, and develop potential control measures.
- 3.2.0.8 Implement and conduct long-term monitoring of control measures aimed at minimizing the impacts of problematic species and/or diseases to evaluate the effectiveness of such efforts and to identify and incorporate additional strategies as appropriate.
- 3.2.0.18 Conduct baseline surveys/inventories to better understand the distribution of fish and invertebrate (including freshwater mussels) populations.

3.2.1 Abundance determination

- 3.2.1.1 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) population abundance and trends for SGCN using standardized survey protocols. Provide data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.

Pinelands Moths

- 3.2.1.2 Conduct wildlife surveys on resident and migratory SGCN regarding their population abundance and trends.
 - 3.2.2 Age, size and sex structure
 - 3.2.2.1 Conduct wildlife surveys on resident and migratory SGCN regarding their survivorship.
 - 3.2.3 Baseline inventory
 - 3.2.3.9 Investigate hazardous environmental issues that may impact grassland invertebrates.
 - 3.2.7 Population assessment
 - 3.2.7.1 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
 - 3.2.7.2 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species to meet and maintain recovery goals.
- 3.3 Research, survey or monitoring - habitat
 - 3.3.1 Baseline inventory
 - 3.3.1.1 Conduct habitat assessments of significant natural and/or unique communities to identify threats to native terrestrial and aquatic habitats through systematic monitoring, review of available data, enlistment of habitat management and/or species experts, etc. Incorporate findings into a database that includes descriptions/qualifiers of the habitats, identifies and values/qualifies the threats, and includes a GIS component of the locations of the assessed areas. Share this information with landowners/managers (e.g., federal, state and local government agencies or non-government organization).
 - 3.3.1.2 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) resident and migratory SGCN habitats. Investigate their suitability for the various life history requirements of the species that dependent upon them to determine the ability for maintaining applicable SGCN populations in perpetuity.
 - 3.3.1.4 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and investigate the suitability of corridors that connect large, contiguous tracts of similar habitats to increase their effective size (i.e., forest with forest, grassland with grassland, wetlands with wetlands, etc.) for dependent SGCN.
 - 3.3.1.5 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) where habitat restoration and/or enhancement would benefit wildlife SGCN.
 - 3.3.1.6 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) that could, through revegetation and/or enhancement efforts, become suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN.
 - 3.3.1.7 Map and prioritize existing and potential areas for early succession forest management. Share the results with state, county and municipal planners.
 - 3.3.1.8 Assess the availability and suitability of forest habitats for SGCN species (particularly reptiles and amphibians, birds, pollinators, and tiger beetles) in southern forests since Superstorm Sandy.
 - 3.3.1.10 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and document fish SGCN habitats by plotting their distributions in GIS and submitting the data to the State for integration into the DEP's Biotics database.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Pinelands Moths

- 3.3.1.16 Gather "best information" for spatial modeling and update/create a current model/depiction of anticipated habitat shifts from sea-level rise, flooding, etc.
- 3.3.1.17 Identify and map undeveloped roads and trails in all conserved forests, and create a database of locations. Integrate information regarding potentially sensitive areas.
- 3.3.1.18 Conduct an assessment using available data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels.
- 3.3.1.19 Identify and codify legal ORV access areas on state (and if appropriate, other conserved) lands. Provide GIS mapping to the landowner for potential use in directing such recreational activities.
- 3.3.1.20 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) where invasive, non-indigenous plants and animals are either already established or are becoming established. Create a system for reporting and qualifying new locations of invasive species and for prioritizing areas for control measures according to the potential level of impact on the ecosystem and SGCN and the likelihood of success. Researchers and contractors encountering invasive plant species while performing plant and/or forest inventories on state or other conserved lands and/or private lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.3.1.24 Conduct regular investigations of SGCN habitat health and biodiversity on public and private lands to identify locations in need of revegetation, reduction of over-abundant, native wildlife and/or exotic species, conservation focal areas requiring limitations on human activity, etc.

3.3.2 Monitoring

- 3.3.2.2 Conduct long-term monitoring of resident and migratory SGCN habitats using standardized survey protocols to determine changes in habitat quality/suitability and threats (e.g., habitat loss and degradation, increased edge habitat, water quality) and other variables that may impact their long-term persistence in the State and to provide information needed for determining causes of population declines and understanding metapopulation dynamics.
- 3.3.2.3 Continue to update wildlife and habitat databases and revise models of critical SGCN habitats using the most current data available and where lacking, develop new SGCN and/or habitat models as data on species habitat requirements and applicable GIS data layers become available.
- 3.3.2.8 Evaluate the effectiveness of current prescribed burning practices on Pinelands dependent species.
- 3.3.2.9 Investigate the effectiveness of various silviculture techniques for enhancing forests for forest-dependent SGCN.
- 3.3.2.10 Evaluate the efficacy and success of different management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.3.2.15 Investigate the effectiveness of management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.3.2.16 Evaluate the effectiveness of best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

Pinelands Moths

- 3.3.2.20 Once a system is developed for reporting and qualifying new locations of invasive species, develop, implement and monitor/evaluate invasive species removal strategies at identified locations. Priority should be given to those areas critical to SGCN and/or contain unique and/or rare plant communities supporting SGCN and/or other fish/wildlife species.

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.1 Work with land management agencies to determine the appropriate actions needed to restore/reclaim degraded habitat for the documented/target SGCN.
- 3.5.3.3 Develop/improve management techniques that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.9 Develop strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 3.5.3.11 Develop strategies to protect native terrestrial and aquatic habitats and dependent SGCN species from the identified threats.
- 3.5.3.15 Modify management practices based on the effects of pesticides, herbicides and other biological controls on critical and supporting SGCN habitats.
- 3.5.3.16 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.
- 3.5.3.19 Work with foresters to develop prescribed burning practices for Pinelands dependent species that increase or maintain habitat quality for these species in the Pinelands.
- 3.5.3.21 Develop management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.24 Based on research, modify management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.5.3.25 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to develop the necessary management strategies to reach or maintain viable population levels.

3.5.4 Fish and wildlife research, survey and management techniques

- 3.5.4.5 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
- 3.5.4.6 Investigate the feasibility of mitigating for the impacts of contaminants to vulnerable wildlife, particularly SGCN. Maintain records on exposure of vulnerable wildlife to environmental toxins (such as flame retardants and endocrine disruptors), so that sources may be identified and controlled or eliminated.

Pinelands Moths

- 3.5.4.14 Develop and implement agreements, and update existing agreements, with government agencies regarding the protection of critical SGCN habitats (e.g., significant breeding populations of beach nesting birds, colonial waterbird nesting areas, bat colonies, etc.).
- 3.5.4.15 Investigate the success of management strategies used to protect and/or enhance SGCN populations and when appropriate, aid in identifying failures/resource problems and issues, and developing new strategies.
- 3.5.4.16 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels and develop the necessary management strategies.
- 3.5.4.18 Investigate the effectiveness of survey techniques through selected "ground truthing" and literature and peer review in order to increase efficacy of survey, minimize surveyor bias and error, and increase accuracy of trend data.
- 3.5.4.19 Develop reliable, standardized survey and monitoring protocols for SGCN species, for which none currently exist, and their habitats.
- 3.5.4.21 Develop BMPs to address problematic species and diseases of unknown origin.

4 Education

4.1 Educator/Instructor training

4.1.0 Public education

- 4.1.0.1 Provide educational resources and training programs to private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.

5 Facilities and Areas

5.15 Wildlife Management Areas

5.15.6 Roads

- 5.15.6.1 Clearly post areas/roads where vehicle access is permitted.
- 5.15.6.2 Clearly post areas/trails where vehicle access is not permitted.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

- 6.0.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.7 Secure and protect critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.8 Secure and protect scrub-shrub habitats for SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

6.3 Conservation area designation

6.3.0 Conservation area designation strategies

Pinelands Moths

6.3.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN and/or connect conserved SGCN habitats through conservation area designations.

6.3.0.8 Promote the protection of scrub-shrub habitats for SGCN through conservation area designations.

6.4 Private lands agreements

6.4.0 Private land agreement strategies

6.4.0.1 Enter into private lands agreements to expand control burns on private lands, in particular those adjacent to conserved lands to improve SGCN habitats.

7 Law Enforcement

7.1 Law enforcement

7.1.3 Sub-national Level

7.1.3.2 Increase the number of law enforcement officers tending to wildlife issues to a reasonable number to sufficiently cover the State and marine waters.

7.1.4 Scale Unspecified

7.1.4.12 Implement policies and/or regulations that protect significant natural and/or unique communities in perpetuity.

7.1.4.19 Implement policies that protect and restore scrub-shrub habitats to benefit shrub-dependent SGCN.

7.1.4.26 Educate law enforcement personnel that there may be unauthorized research projects taking place and to encourage them to investigate any activities that appear to be harmful to wildlife.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

8.1.0.2 Develop a team of personnel from government entities, conservation organizations and other stakeholders engaged in oil/gas spill response for marine and freshwater habitats to develop a feasible plan for oil spill response and/or to amend NJ's current oil spill response plan that clearly outlines each organizations responsibilities and an assessment and location list of available equipment for boom deployment during oil spills.

8.1.0.3 Develop an outreach team of personnel from government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.

8.1.0.4 Engage government agencies, conservation partners and other stakeholders in constructive dialogues encouraging them to influence policy change and the creation of incentives through a habitat bill and/or municipal ordinances for backyard habitat.

8.1.0.15 Engage government agencies, conservation partners and other stakeholders in discussions encouraging and supporting the creation of laws and policies requiring vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Pinelands Moths

- 8.1.0.16 Engage local governments in discussions regarding the importance of them adopting/passing ordinances which require assessing and addressing secondary impacts (i.e., ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 8.1.0.17 Engage municipalities in constructive dialogue to identify and minimize destruction of areas prioritized for early succession forest management.
- 8.1.0.18 Engage NJDOT, NJ Transit Authority and other road management entities, wildlife conservation organizations/agencies (e.g., Division of Fish and Wildlife, New Jersey Conservation Foundation, Conserve Wildlife Foundation of NJ), and communities and citizens in discussions regarding the importance of and methods to enhance habitat connectivity, and work together to develop feasible strategies for ensuring that wildlife can disperse naturally and safely across roads and similar barriers to terrestrial and/or aquatic habitats.
- 8.1.0.19 Engage government agencies, conservation partners and other stakeholders to collaboratively develop a list of important projects, targeting SGCN and/or their habitat, as a guide for graduate student research. Distribute the list and contact information to all State colleges and universities.
- 8.1.0.20 Organize a small focal group of government and non-government agencies/organizations responsible for decisions regarding beach/dune management to share and coordinate their goals so that comprehensive planning can attempt to meet all needs.
- 8.1.0.21 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation human-subsidized and/or overabundant, native species cause to local nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.22 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation invasive species cause to native nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.24 Engage government agencies, conservation partners and other stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.25 Provide technical support to public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.26 Coordinate across federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to woodland landowners to adopt or endorse consistent best management practices concerning controlled burns to maintain and/or improve forested habitat for wildlife.
- 8.1.0.30 Encourage government agencies and conservation partners to advise members of the relevant scientific community of the need for specific studies, reports or investigations targeting the data-deficiency regarding SGCN and/or their habitats.
- 8.1.0.34 Work with the NJ Education Association and Department of Education to design curriculum and outdoor experimental learning opportunities, and provide training to teachers on implementation of these activities.
- 8.1.0.37 Enlist landowners and NJ citizens in the protection of and survey efforts for SGCN, in particular rare species, by increasing enrollment in landowner incentives, forest stewardship, backyard habitat management and wildlife-related volunteer programs.

Pinelands Moths

- 8.1.0.38 Engage partners, stakeholders and land managers in constructive dialogue promoting forest stewardship for SGCN that use core forests and forested corridors.
 - 8.1.0.40 Encourage researchers, land managers, naturalists and enthusiasts to follow proper procedures for the coordination and/or permitting of research/management activities involving wildlife and sensitive habitats, and discourage activities that alter vegetation or wetlands, or cause harm or disturbance to wildlife.
 - 8.1.0.42 Engage citizens, wildlife observers and photographers through discussions and distributable information regarding the importance of and encouraging implementing responsible and ethical behavior when observing wildlife by developing an alliance of wildlife photographers and widely circulating recommendations on how to reduce impact.
 - 8.1.0.44 Engage conservation partners, stakeholders, government agencies and other land stewards in constructive dialogues encouraging their inclusion of controlled burns in forest and other stewardship plans.
 - 8.1.0.47 Form cooperative partnerships with energy companies to facilitate habitat creation and enhancement away from and outside of project areas, the restoration of appropriate habitats within project areas (e.g., rights-of-way could benefit butterflies and some bird species), and to identify seasonal timing of activities that would minimize impacts to wildlife.
 - 8.1.0.48 Form cooperative partnerships with transportation and shipment agencies and companies to facilitate habitat creation and enhancement away from and outside of project areas and to identify seasonal timing of activities that would minimize impacts to wildlife.
 - 8.2 Recruitment and retention activities
 - 8.2.3 For wildlife watching
 - 8.2.3.1 Develop and implement nature-focused tourism opportunities including wildlife viewing sites, interpretive signage highlighting unique ecosystems/habitats, and wildlife-related recreational opportunities that do not negatively impact SGCN or their habitats.
- 8.3 WSFR program/subprogram outreach
 - 8.3.0 WSFR program/subprogram outreach strategies
 - 8.3.0.7 Develop and provide (or otherwise make publicly available) educational programs and/or materials that describe the negative impacts of off-road vehicles and watercraft use in and adjacent to critical SGCN habitats, and the importance of confining such activities to more appropriate locations and/or seasons.
 - 8.3.0.8 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate recreationists and encourage landowners to eliminate garbage in the vicinity of suitable wildlife habitat, in particular SGCN habitat. Information should include the detrimental impacts garbage may have on various wildlife species.
 - 8.3.0.9 Develop and provide (or otherwise make publicly available) educational programs and/or materials to enlist landowners and land managers to include only native plants in landscaping and restoration projects. Provide information to assist them in detecting problematic establishment of invasive, non-indigenous plants.
 - 8.3.0.10 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate landowners and NJ citizens on threats to fish and wildlife (including marine animals).

Pinelands Moths

- 8.3.0.11 Develop and provide (or otherwise make publicly available) educational programs and/or materials to the public, wildlife-related professionals, foresters, etc., that describe the value of species that are often feared (e.g., snakes, bats, spiders, Allegheny woodrat) and/or deemed a "nuisance" (e.g., squirrel, deer, snapping turtle), and therefore, persecuted by people. Include information on tolerance, proper identification, eviction from human dwellings, how to minimize the animal's presence on the property, and/or how to live in harmony with the animal.
- 8.3.0.12 Promote awareness of WSFR (Wildlife and Sportfish Restoration) Outreach/Awareness grants, an important funding source for conservation among hunters and anglers as well as the general public.
- 8.3.0.13 Conduct an educational campaign to encourage observer ethics and respect for wildlife and natural habitat.
- 8.3.0.24 Develop educational outreach programs for local decision-makers, land developers, landowners and citizens about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
- 8.3.0.25 Develop educational outreach programs for landowners, nurseries and the general public regarding the negative impacts of invasive and non-native plants on our natural communities.
- 8.3.0.26 Develop educational outreach programs for private and public landowners and land managers regarding the importance of and how to manage core forests and forested corridors in a way that will be beneficial for SGCN, particularly endangered, threatened and special concern species.
- 8.3.0.27 Develop educational outreach programs for public and private landowners and land managers regarding the importance of structural habitat diversity, methods to increase diversity, and/or incentive programs available to increase habitat diversity.
- 8.3.0.30 Develop educational outreach programs for private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.
- 8.3.0.32 Develop an educational outreach program for landowners and citizens on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

- 9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and SGCN inhabiting them.
- 9.1.0.2 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.1.0.3 Develop a plan that directs the creation of impervious surfaces away from and to minimize impacts on aquatic systems and critical terrestrial habitats. The plan should also include strategies to increase the resiliency of aquatic and critical terrestrial habitats to threats and stressors that would impact the reproduction and survival of wildlife.
- 9.1.0.5 Develop a plan that directs the creation or expansion of energy or utility rights-of-way in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.6 Develop a plan that directs the creation or expansion of roads and railroads or the re-establishment of abandoned railroads within and adjacent to critical forested habitats in a manner that minimizes the impacts on critical forested habitats and the wildlife community.

Pinelands Moths

- 9.1.0.8 Develop a plan that focuses on strategies for oil pipelines to avoid sensitive habitats that would be highly impacted by oil spills.
- 9.1.0.9 Develop a plan that focuses on strategies to minimize the creation of renewable energy farms (e.g., solar, wind) and related infrastructures within and their impacts on forested habitats and the wildlife community.
- 9.1.0.10 Develop a plan that focuses on strategies to minimize the impacts of mining on critical forested habitats.
- 9.1.0.11 Develop a plan that focuses on strategies to minimize the impacts of power plants on critical forested habitats and the wildlife community.
- 9.1.0.13 Develop a plan to minimize agriculture that would result in groundwater withdrawal in critical forested areas.
- 9.1.0.15 Develop a plan to minimize fragmentation of terrestrial and aquatic habitats by roads.
- 9.1.0.16 Develop a plan to minimize new lawns and preserve natural vegetation within and adjacent to critical forest areas.
- 9.1.0.19 Develop a plan to minimize the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 9.1.0.21 Develop a plan to minimize the use of any-sized dam in critical forested areas.
- 9.1.0.22 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 9.1.0.28 Develop and coordinate state, regional and local plans for suitable lot layout and landscaping to minimize human-wildlife conflicts that also incorporates habitat connectivity and preservation of natural areas.
- 9.1.0.29 Provide GIS or related data, maps, resource inventories, as well as related training, pertaining to the SWAP and its recommended conservation actions for use or consideration by State, County or municipal planning agencies.
- 9.1.0.30 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and other related threats associated with development.
- 9.1.0.33 Review the species, threats, action successes, and habitats, and work with partners to revise the 2017 State Wildlife Action Plan for the 2025 resubmittal.

9.2 Organizational strategic and CMS planning

9.2.1 Organizational strategic and operational planning

- 9.2.1.1 Identify and codify legal ORV access areas on state lands.

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.3 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.1.4 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.3.1.5 Develop response plans to address disease outbreaks within wildlife populations, in particular SGCN.

Pinelands Moths

- 9.3.1.7 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
 - 9.3.1.9 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
 - 9.3.1.10 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
 - 9.3.1.13 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
 - 9.3.1.15 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.
 - 9.3.1.16 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.
- 9.3.3 Habitat management planning
 - 9.3.3.5 Develop a management plan using forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.
 - 9.3.3.7 Develop a management plan to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.
 - 9.3.3.8 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
 - 9.3.3.10 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
 - 9.3.3.11 Develop town plans that avoid impacts to SGCN species and their habitats.
 - 9.3.3.13 Develop a management plan that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas and prevents or ameliorates near-term impacts of climate change throughout the State, but in particular within the coastal and Delaware Bay areas.
 - 9.3.3.15 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
 - 9.3.3.16 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
 - 9.3.3.17 Develop a management plan for prescribed burning that will benefit Pinelands dependent species and increase or maintain habitat quality for these species in the Pinelands.
 - 9.3.3.18 In cooperation with species and habitat experts, develop management plans for significant natural and/or unique communities, in particular those supporting SGCN, and provide the information to the landowners/managers (federal, state and local government agencies or non-government organization) for review and implementation.
 - 9.3.3.19 Develop management plans for SGCN inhabiting permanently protected natural lands using available baseline and population trend data.

Pinelands Moths

- 9.3.3.21 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
- 9.3.3.28 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.
- 9.3.3.29 Develop habitat management plans aimed at reducing or eliminating negative impacts of ORVs.
- 9.3.3.32 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.
- 9.3.3.34 Include controlled burn prescriptions in forest and stewardship plans to improve wildlife habitat.
- 9.3.3.35 Incorporate habitat connectivity, preservation of natural areas, and the implementation of BMPs into state and local land-use policy environmental review process and energy development plans to minimize habitat fragmentation and related threats associated with solar farms and altered habitats.
- 9.3.3.36 Integrate plans for properly located and timed habitat restoration and management along transportation, energy and service corridors to minimize risks to and benefit wildlife.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

- 11.1.1.1 Use Biotics database and Landscape Project Mapping in regulatory reviews to ensure protection by applicable laws and regulations.
- 11.1.1.2 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
- 11.1.1.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.
- 11.1.1.5 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 11.1.1.7 Review proposed construction or other work projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.8 Review proposed research projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.12 Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed solar farm projects to reduce habitat fragmentation and minimize impacts on wildlife.

11.1.2 Review of proposed policies and plans

- 11.1.2.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.

11.2 Technical assistance

Pinelands Moths

11.2.0 Assorted technical assistance strategies

- 11.2.0.1** Provide technical support to private and public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 11.2.0.2** Provide technical support to public and private landowners and land managers for controlling invasive, native and non-native plant species in order to increase structural habitat diversity.
- 11.2.0.3** Develop state, regional and local BMPs that focus on minimizing habitat fragmentation and human-wildlife conflicts associated with development. Make information available to land developers and private and public landowners for implementation.
- 11.2.0.5** Provide educational resources, training programs, and expert guidance to private and public landowners and land managers on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.
- 11.2.0.6** Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on habitat creation, enhancement and restoration within and adjacent to project areas, as well as away from and outside of project areas (depending on the target species), by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. Wind farms should address both terrestrial bound and low-flying species. Examples of habitat management include, but are not limited to, integrating short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 11.2.0.7** Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on the importance of maintaining habitat connectivity, minimizing fragmentation, and the use of CHANJ products to help them target areas for such planning.
- 11.2.0.8** Provide educational resources, training programs, and on-the-ground guidance to public and private landowners and land managers on habitat creation and enhancement strategies that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 11.2.0.9** Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and private landowners about the importance of leaving vegetation in place, especially along riparian areas and wildlife movement corridors.
- 11.2.0.10** Provide technical support to private landowners, consultants, and land managers to create customized management plans based on location and SGCN.
- 11.2.0.11** Provide educational resources, training programs, and on-the-ground guidance to private and public landowners and land managers on the benefits of and for creating young forest and early succession habitat for SGCN.
- 11.2.0.15** Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and landowners about the importance of retaining and in an effort to protect, create, enhance and/or restore vegetation along aquatic habitats.
- 11.2.0.17** Provide educational resources and technical support to public and private landowners and land managers to promote the protection of vernal pools and the protection, enhancement and/or restoration of biologically appropriate buffers.

Pinelands Moths

- 11.2.0.19 Provide educational resources and technical support to public and private landowners and land managers to promote the protection and/or enhancement of scrub-shrub habitats for SGCN.
- 11.2.0.22 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
- 11.2.0.23 Provide educational resources and technical support to public and private landowners and land managers of lands adjacent to SGCN habitats to promote the protection and/or enhancement of those adjacent habitats to increase the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and that connect conserved SGCN habitats.
- 11.2.0.24 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers on how to manage vegetated roadside areas (e.g., mowing, brush-hogging, etc.) on a schedule that avoids peak activity periods for wildlife and therefore, minimizes harm.
- 11.2.0.25 Provide educational resources, training programs, and on-the-ground guidance to resource managers regarding the assessment of and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) related to residential and commercial development.
- 11.2.0.26 Make educational resources available to the public that encourage researchers to seek out guidance prior to finalizing proposals and submitting State permit applications to reduce potential impacts on sensitive species.
- 11.2.1 With individuals and groups involved in resource management decision making
 - 11.2.1.1 Engage partners and stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
 - 11.2.1.2 Provide professional training and technical assistance tools (e.g., mapping, guidance documents, justification, etc.) to agencies/divisions/programs within and outside of the NJ DEP regarding the SWAP, and the conservation actions recommended therein to help facilitate SWAP implementation.
 - 11.2.1.3 Provide educational resources, training programs, and on-the-ground guidance to DOD to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop and implement forest management and other practices that minimize disturbances to SGCN (i.e., beyond their federal requirements).
 - 11.2.1.5 Provide educational resources, training programs, and on-the-ground guidance to municipalities, state and federal agency resource managers on tasks such as writing and integrating Beach Management Plans into other management documents.
 - 11.2.1.6 Provide educational resources, training programs, and on-the-ground guidance to resource agencies prior to project initiation to ensure wildlife and their habitats are protected to the highest degree possible during construction, and provisions are in place for post-construction habitat use.
- 11.2.2 With private landowners
 - 11.2.2.1 Provide technical support to farming operations and woodland landowners on ways to decrease clean farming (edge-to-edge) practices and create ecotones to benefit bobwhite and other species dependent on early successional habitat.

Pinelands Moths

100. Legislation

100.1.3 Sub-national Level

- 100.1.3.3 Initiate legislative action to establish an annual budgetary line item designating funds to support programs focused on long-term research and monitoring of wildlife diseases.

100.1.4 County and Local

- 100.1.4.2 Secure and increase the effective size of SGCN habitats and connect conserved SGCN habitats through local ordinances.
- 100.1.4.3 Expand the acreages and enhance the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN through local ordinances.
- 100.1.4.14 Adopt/pass local ordinances which require assessing and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 100.1.4.15 Incorporate habitat connectivity and the preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.

100.1.5 Scale Unspecified

- 100.1.5.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 100.1.5.5 Develop legislation to provide financial support for the New Jersey Invasive Species Strike Team.

100. State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.5 Develop policies that will promote improved and secure habitat connections between conserved SGCN habitats.
- 100.3.0.6 Develop policies that will promote expanding acreages and enhancing the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 100.3.0.8 Develop policies and/or regulations with the objective of protecting significant natural and/or unique communities in perpetuity.
- 100.3.0.9 Secure mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.12 Develop policies that promote the preservation and protection of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.
- 100.3.0.15 Develop policies that promote protecting and restoring scrub-shrub habitats to benefit shrub-dependent SGCN.
- 100.3.0.18 Develop policies for conserved lands that prohibit planting and supports the control of non-native vegetation and invasive, native vegetation.
- 100.3.0.23 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address mitigation that creates an environmental benefit for losses of SGCN and their habitats.

Pinelands Moths

- 100.3.0.31 Create or expand tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMPs.
- 100.3.0.32 Coordinate regulations across agencies to maximize availability of and enrollment in existing Forestry Stewardship Programs (e.g., "Woodland Stewards", Farm Bill, partners, etc.) to maintain and/or improve forest habitat.
- 100.3.0.38 Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.
- 100.3.0.39 Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.3.0.40 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.3.0.41 Explore all State regulatory requirements for mitigation, restoration, habitat management, etc. to ensure they prohibit the use of specified invasive or other problematic plant species.
- 100.3.0.43 Identify and address (amend) regulatory impediments to beneficial habitat management.
- 100.3.0.44 Incorporate requirements for technical support and funding for mitigation or restoration efforts so as to be consistent with existing regulations.
- 100.3.0.45 Increase the controlled burn season to focus on restoring vegetative communities.
- 100.3.0.46 Investigate and/or develop inter-agency Memorandum of Agreements to share common data stored or managed in program-specific databases.
- 100.3.0.48 Propose new State law or regulation mandating that a State-level "development impact fee" be assessed on all new development approved by municipalities (via the Municipal Land Use Law processes), and dedicate such monies to the development and implementation of regional Habitat Conservation Plans (or existing plans/programs serving the same regional function).
- 100.3.0.50 Retain endangered, threatened and special concern wildlife and habitat protection measures in the Water Quality Management Program Rules.
- 100.3.0.52 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded energy sitings and facilities.
- 100.3.0.53 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded rights-of-way corridors associated with energy transport/transmission.
- 100.3.0.60 Develop regulations that when implemented will protect significant natural and/or unique communities in perpetuity.
- 100.3.0.65 Develop regulations that when implemented will protect and restore scrub-shrub habitats to benefit shrub-dependent SGCN.
- 100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

Pinelands Moths

- 100.3.0.73 Develop regulations that would exempt the conversion of lawns to native vegetation (beneficial to wildlife) from local lawn ordinances.

100.3.2 State Land Acquisition Programs

- 100.3.2.1 Increase opportunities for habitat restoration by making any necessary policy changes to state, federal and local land acquisition programs (e.g., Green Acres, Blue Acres, etc.) to allow for acquisition within abandoned or failing bay shore communities, including mechanisms to relocate displaced people and infrastructure.

100. State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).
- 100.4.0.2 Create a policy that requires the NJ DEP to incorporate scientific information regarding climate change and sea level rise (e.g., predictions, habitat management/acquisition efforts to enhance resilience to inundation) on their websites and to work with other government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 100.4.0.3 Develop policies for mandatory buffer strips on preserved farmlands and state-owned agricultural lands.
- 100.4.0.8 Develop a white paper addressing the impacts that existing, new or expanded rights-of-way have upon wildlife, wildlife habitats and habitat connectivity.
- 100.4.0.10 Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.
- 100.4.0.11 Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.4.0.12 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.4.0.13 Develop policies for different circumstances (e.g., roadsides and medians, riparian, aquatic and terrestrial habitats) that outline appropriate habitat/vegetation management strategies and schedules to minimize risks to and benefit wildlife.
- 100.4.0.16 Develop policies to implement habitat management strategies that will increase the structural diversity surrounding areas used for energy, mining, and transportation and service corridors which include but are not limited to the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-

Pinelands Moths

- 100.4.0.17 Develop policies to implement habitat management strategies, including prescribed burns, that will increase the structural diversity on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies to control and reduce the impacts of invasive, non-native species in order to increase structural habitat diversity.
- 100.4.0.18 Develop policies to minimize the extent of infrastructure associated with energy and service corridors or areas (e.g., wind and solar farms, pipelines, utility lines) and that require the implementation of habitat management strategies that will increase the structural diversity in the area including (e.g., the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-asides).
- 100.4.0.19 Develop regulations that will minimize the creation of new barriers, remove or replace current barriers with appropriately-sized systems to accommodate wildlife dispersal, and to minimize road widening and traffic volume increases within critical wildlife habitat areas.
- 100.4.0.20 Develop state regulations that require energy developers and utility service companies to implement habitat management strategies that will increase the structural diversity of the habitat, minimize habitat fragmentation and commercial infrastructure, and minimize the loss, alteration and/or degradation of the habitat and adjacent lands when working on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies.
- 100.4.0.24 Develop policies to provide financial support for the New Jersey Invasive Species Strike Team.
- 100.4.0.25 Develop policies that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

Pond Odonates

Focal species that comprise this Conservation Target:

New England Bluet

Pine Barrens Bluet

Scarlet Bluet

Threats and Action Drivers associated with this Conservation Target:

1 **Residential and Commercial Development**

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (Avg. Score: 2.00)
(large and small scale)

NJ Specific Threats: 1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
1.1.1.2 Loss, alteration and/or degradation of habitat.
1.1.1.5 Impervious surfaces can lead to a decrease in water recharge.
1.1.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
1.1.1.7 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (Avg. Score: 2.00)
(large and small scale)

NJ Specific Threats: 1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
1.2.1.2 Loss, alteration and/or degradation of habitat.
1.2.1.5 Impervious surfaces can lead to a decrease in water recharge.
1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
1.2.1.7 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large (Avg. Score: 1.00)
and small scale)

NJ Specific Threats: 1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
1.3.1.2 Loss, alteration and/or degradation of habitat.
1.3.1.4 Impervious surfaces can lead to a decrease in water recharge.
1.3.1.5 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
1.3.1.6 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

2 **Agriculture and Aquaculture**

2.1 Annual and Perennial Crops (non-timber)

Pond Odonates

2.1.1 Shifting Agriculture (Avg. Score: 1.00)

NJ Specific Threats: 2.1.1.3 Conversion of agricultural landscape that results in increased erosion, runoff, and chemical and thermal pollution decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

2.1.2 Small-holder Farming (Avg. Score: 1.00)

NJ Specific Threats: 2.1.2.2 Fragments terrestrial and aquatic habitats.

2.1.3 Agro-industry (Avg. Score: 1.00)

NJ Specific Threats: 2.1.3.2 Fragments terrestrial and aquatic habitats.

2.3 Livestock Farming and Ranching

2.3.2 Small-holder Grazing (Avg. Score: 1.00)

NJ Specific Threats: 2.3.2.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.
2.3.2.2 Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.
2.3.2.3 Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.
2.3.2.4 Livestock allowed to wade into waterbodies trample and degrade aquatic habitats.

2.3.3 Agro-industry Grazing (Avg. Score: 1.00)

NJ Specific Threats: 2.3.3.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.
2.3.3.2 Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.
2.3.3.3 Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.
2.3.3.4 Livestock allowed to wade into waterbodies trample and degrade aquatic habitats.

3 Energy Production and Mining

3.4 Conventional Power Plants

3.4.0 Conventional Power Plants (Avg. Score: 1.00)

NJ Specific Threats: 3.4.0.3 Alteration of the temperature, pH and/or hydrology of aquatic ecosystems change plant communities and can harm wildlife and/or impact their behavior and survivorship.

4 Transportation and Service Corridors

4.1 Roads and Railroads

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale) (Avg. Score: 1.00)

NJ Specific Threats: 4.1.1.2 Loss, alteration and/or degradation of habitat associated with road and railroad construction and maintenance, and degradation of adjacent habitats.

4.2 Utility and Service Lines

4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads (Avg. Score: 1.00)

NJ Specific Threats: 4.2.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species, inhibiting dispersal of non-volant animals, reducing gene flow, and creating barriers to fish when service line-associated roads cross streams (e.g., bridges, culverts, fords, etc.).
4.2.1.2 Loss, alteration and/or degradation of habitat associated with rights-of-way construction and maintenance, and degradation of adjacent habitats.

Pond Odonates

- 4.2.1.4 Lines that cross or run parallel to streams result in a loss or reduction of vegetated riparian buffers and streamside shading, affecting water quality and in-stream habitat for aquatic biota.

4.2.2 Management of rights-of-way or communication tower facilities and/or their associated access roads (Avg. Score: 1.00)

- NJ Specific Threats:** 4.2.2.1 Improper or poorly scheduled vegetation management can cause direct mortality to and may reduce productivity of wildlife.

5 Biological Resource Use

5.1 Hunting and Collecting Terrestrial Animals

5.1.1 Intentional Use (Avg. Score: 1.00)

- NJ Specific Threats:** 5.1.1.1 Illegal collection of wildlife can have detrimental impacts on populations.

6 Human Intrusions and Disturbance

6.1 Recreational Activities

6.1.1 Off-road vehicles (motorized and non-motorized) (Avg. Score: 1.00)

- NJ Specific Threats:** 6.1.1.6 Off-road vehicles can be a mechanism of transference of wildlife diseases and invasive plant species if gear and apparel are not properly sanitized between sites.

7 Natural Systems Modifications

7.1 Fire and Fire Suppression

7.1.2 Suppression of Fire Frequency/Intensity (Avg. Score: 1.00)

- NJ Specific Threats:** 7.1.2.1 Shift in vegetative communities as a result of suppression of natural fires.

- 7.1.2.2 Lack of diversity in age structure and composition of vegetation due to the suppression of fire.

7.2 Dams and Water Management/Use

7.2.1 Abstraction of Surface Water (domestic use) (Avg. Score: 2.00)

- NJ Specific Threats:** 7.2.1.1 Changing water levels due to water body drawdowns (legal and illegal) may lower dissolved oxygen levels, increase water temperatures, expose wildlife to predation, and increase exposure to winter temperatures, altering wildlife behavior and survival.

- 7.2.1.2 Controlled water releases and/or improper water level management of water bodies may alter downstream dissolved oxygen levels, water temperatures, sediment deposition, and flow rates, altering wildlife behavior and survival.

- 7.2.1.3 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, and eliminates shallow water habitats.

7.2.2 Abstraction of Surface Water (commercial use) (Avg. Score: 2.00)

- NJ Specific Threats:** 7.2.2.1 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, eliminates shallow water habitats, and disrupts/removes stream bottom habitat.

- 7.2.2.2 Changing water levels due to water body drawdowns (legal and illegal) may lower dissolved oxygen levels, increase water temperatures, expose wildlife to predation, and increase exposure to winter temperatures, altering wildlife behavior and survival.

- 7.2.2.3 Controlled water releases and/or improper water level management of water bodies may alter downstream dissolved oxygen levels, water temperatures, sediment deposition, and flow rates, altering wildlife behavior and survival.

7.2.3 Abstraction of Surface Water (agricultural use) (Avg. Score: 2.00)

- NJ Specific Threats:** 7.2.3.1 Controlled water releases and/or improper water level management of water bodies may alter downstream dissolved oxygen levels, water temperatures, sediment deposition, and flow rates, altering wildlife behavior and survival.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Pond Odonates

7.2.3.2 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, and eliminates shallow water habitats.

7.2.3.3 Impounding water to create or expand bogs for cranberry farming leads to the loss of natural wetlands and the alteration of the natural hydrology in the area.

7.2.3.5 Changing water levels due to water body drawdowns (legal and illegal) may lower dissolved oxygen levels, increase water temperatures, expose wildlife to predation, and increase exposure to winter temperatures, altering wildlife behavior and survival.

7.2.5 Abstraction of Ground Water (domestic use) (Avg. Score: 2.00)

NJ Specific Threats: 7.2.5.1 Heavy withdrawal of ground water for domestic use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.6 Abstraction of Ground Water (commercial use) (Avg. Score: 2.00)

NJ Specific Threats: 7.2.6.1 Heavy withdrawal of ground water for industrial and commercial use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.7 Abstraction of Ground Water (agricultural use) (Avg. Score: 2.00)

NJ Specific Threats: 7.2.7.1 Heavy withdrawal of ground water for agricultural use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.9 Small Dams (Avg. Score: 1.00)

NJ Specific Threats: 7.2.9.1 Alter the physical, chemical and biological stream environment, causing changes in substrate composition, flow rates, dissolved oxygen, and water temperatures.

7.2.9.3 Dams act as a barrier to movement, limiting the ability of aquatic or semi-aquatic wildlife to move safely between habitats.

7.2.10 Large Dams (Avg. Score: 1.00)

NJ Specific Threats: 7.2.10.1 Alter the physical, chemical and biological stream environment, causing changes in substrate composition, flow rates, dissolved oxygen, and water temperatures.

7.2.11 Dams (size unknown) (Avg. Score: 1.00)

NJ Specific Threats: 7.2.11.1 Alter the physical, chemical and biological stream environment, causing changes in substrate composition, flow rates, dissolved oxygen, and water temperatures.

7.3 Other Ecosystem Modifications

7.3.2 Inappropriate timing of mowing (Avg. Score: 1.00)

NJ Specific Threats: 7.3.2.1 Increased risk of direct mortality and/or reduced productivity of wildlife, as well as reduced use by migrating species.

7.3.5 Poor habitat management (Avg. Score: 2.00)

NJ Specific Threats: 7.3.5.1 Improper or poorly scheduled maintenance of man-made corridors (e.g., roadsides and medians) can cause direct mortality to and may reduce productivity of wildlife.

7.3.5.3 Vegetation clearing removes terrestrial and riparian corridors for animal movement, shelter, and resting areas.

7.3.5.4 Vegetation clearing or inappropriate alteration adjacent to aquatic habitats threatens aquatic species by degrading habitat and water quality (altering temperature and dissolved oxygen, increasing siltation and desiccation, etc.).

7.3.5.5 Habitat management that alters or removes vegetation without implementing long-term management increases the risk of invasive and exotic plants establishing themselves, outcompeting native vegetation.

Pond Odonates

- 7.3.5.6 Habitat management, including that which occurs on public and private lands, that does not consider timing and species' behaviors can result in the direct mortality and/or alteration or loss of habitat.
- 7.3.5.9 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, eliminates shallow water habitats, and disrupts/removes stream bottom habitat.
- 7.3.5.10 Ditching, draining and filling of marshes and wetlands eliminates habitat and degrades the remaining surrounding areas for wildlife.
- 7.3.5.12 Lack of diversity in age structure and composition of vegetation due to lack of natural disturbances and/or vegetation management.
- 7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.

8 **Invasive and Other Problematic Species, Genes and Diseases**

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.1 Unspecified Species (Avg. Score: 1.00)

NJ Specific Threats: 8.1.1.1 Displace or outcompete native species for resources.

8.1.1.2 Alters, degrades and/or reduces the structural diversity of the natural composition of the landscape, including aquatic systems.

8.1.1.4 Invasive, non-native animals increase the risk of predation on native animals and/or herbivory on native vegetation.

8.1.1.6 Invasive, non-native plants may create physical barriers for some species.

8.1.2 Invasive non-native aquatic animals (Avg. Score: 2.00)

NJ Specific Threats: 8.1.2.2 Displace or out-compete native species for resources (food, shelter), alter the composition of the native landscapes/aquatic systems, diminishing habitat suitability and reducing ecological integrity of natural communities, and may introduce disease into a population.

8.1.3 Invasive non-native aquatic plants (Avg. Score: 2.00)

NJ Specific Threats: 8.1.3.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.1.4 Invasive non-native terrestrial/wetland animals (Avg. Score: 1.00)

NJ Specific Threats: 8.1.4.1 Displace or out-compete native species for resources (food, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.1.5 Invasive non-native terrestrial/wetland plants (Avg. Score: 2.00)

NJ Specific Threats: 8.1.5.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.1.6 Invasive non-native fungal/bacterial diseases (Avg. Score: 1.00)

NJ Specific Threats: 8.1.6.1 The introduction of non-native fungal and bacterial diseases threatens native populations and ecosystems.

8.4 Problematic Species/Diseases of Unknown Origin

8.4.1 Unspecified Species (Avg. Score: 1.00)

NJ Specific Threats: 8.4.1.1 Non-native or poorly understood diseases and parasites could potentially impact native animals.

8.6 Diseases of Unknown Cause

Pond Odonates

8.6.0 Unknown Diseases

(Avg. Score: 1.00)

NJ Specific Threats: 8.6.0.1 Diseases yet to be identified by pathologists and virologists cause decreased fitness or mortality to native populations.

9 Pollution

9.1 Domestic and Urban Waste Water

9.1.1 Sewage

(Avg. Score: 2.00)

NJ Specific Threats: 9.1.1.1 Degradation of aquatic and marine water quality and habitats by changing turbidity, flow and water chemistry.

9.1.1.3 Contaminants in sewage treatment effluents and Combined Sewer Overflows can cause developmental and behavioral abnormalities and reproductive failure in wildlife.

9.1.2 Run-off

(Avg. Score: 2.00)

NJ Specific Threats: 9.1.2.1 Chemical fertilizers and nutrient run-off changes the pH in streams and ponds and causes eutrophication in inland waters and estuaries, which can make habitat unsuitable for specialist species and increase the risk of invasive and generalist species.

9.1.2.2 Contaminants degrade aquatic and marine water quality and can bioaccumulate in benthic organisms, threatening wildlife by causing developmental and behavioral abnormalities and reproductive failure.

9.1.2.3 Contaminants from road runoff (oil, sediment, salt, etc.) impact native vegetation and the species that rely upon them, degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.

9.2 Industrial and Military Effluents

9.2.1 Oil Spills

(Avg. Score: 1.00)

NJ Specific Threats: 9.2.1.1 Oil spills render resting, breeding and foraging habitats temporarily unavailable to wildlife, altering normal wildlife behavior.

9.2.1.2 Oil spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.

9.2.1.3 Oil spills cause external oiling of wildlife and ingestion of oil, both of which can injure or kill wildlife.

9.2.2 Seepage from Mining

(Avg. Score: 1.00)

NJ Specific Threats: 9.2.2.1 Contaminants from mining degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.

9.2.3 Other

(Avg. Score: 1.00)

NJ Specific Threats: 9.2.3.1 Point and nonpoint source pollution such as polychlorinated biphenyls (PCBs), pesticides, heavy metals, and endocrine disrupting compounds (EDC's) into freshwater and marine systems pose threats to wildlife through direct contact and/or ingestion, and to aquatic species and their predators through bioaccumulation, impacting the reproductive success and neurological function of many avian and fish species.

9.2.3.2 Chemical spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.

9.2.3.3 Chemical spills may render resting, breeding and foraging habitats temporarily unavailable to wildlife, altering normal wildlife behavior.

9.2.4 Other: Hydrofracturing

(Avg. Score: 1.00)

NJ Specific Threats: 9.2.4.1 Contaminants from hydrofracturing degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Pond Odonates

- 9.2.4.2 Uncontrolled effluents escaping from hydrofracturing facilities can cause injury to wildlife and alter normal behaviors.

9.3 Agricultural and Forestry Effluents

9.3.1 Nutrient Loads (Avg. Score: 2.00)

NJ Specific Threats: 9.3.1.1 Chemical fertilizers and nutrient run-off changes the pH in streams, ponds and wetlands and causes eutrophication in inland waters and estuaries, which can make habitat unsuitable for specialist species and increase the risk of invasive and generalist species.

9.3.1.2 Animal waste degrades terrestrial and aquatic habitats, especially streams, ponds and wetlands, resulting in eutrophication, which disrupts oxygen and nutrient balances, and causes injury and mortality to aquatic organisms.

9.3.1.4 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades wetland and aquatic habitats with runoff, increasing sediment and nutrient loads and pH.

9.3.1.5 Conversion of native forests to plantations degrades wetland and aquatic habitats through increased runoff.

9.3.2 Soil Erosion and Sedimentation (Avg. Score: 2.00)

NJ Specific Threats: 9.3.2.1 Soil erosion, sedimentation and destruction of streambanks and riparian buffers degrade waters making them unsuitable for riparian-dependent wildlife.

9.3.2.3 Conversion of native forests to plantations degrades wetland and aquatic habitats through increased sedimentation.

9.3.3 Herbicides and Pesticides (Avg. Score: 3.00)

NJ Specific Threats: 9.3.3.1 Pesticides degrade terrestrial and aquatic habitats, especially streams, ponds and wetlands. Aquatic wildlife are particularly sensitive to these contaminants, which can cause developmental and behavioral abnormalities and reproductive failure. Some contaminants may bioaccumulate in predatory fish and birds and disrupt reproduction.

9.3.3.3 Use of pesticides can directly harm non-target species through direct contact and/or by reducing and/or contaminating their food supply.

9.3.5 Control of insect pests and plants leading to mortality of non-target species (Avg. Score: 3.00)
not associated with agriculture

NJ Specific Threats: 9.3.5.1 Use of pesticides, insecticides, and/or herbicides can directly harm non-target species, such as amphibians and beneficial invertebrates through direct contact and/or by reducing and/or contaminating their food supply.

9.3.5.4 Improper use of current insecticides, such as those containing esfenvalerate, prallethrin, or piperonyl butoxide, or past use of pesticides containing chlordane still present in the soils, are toxic to various wildlife species, and can cause injury, mortality, or other effects that impair population viability.

9.3.5.5 Use of pesticides and herbicides can minimize the abundance of food sources for native wildlife populations.

9.5 Air-Bourne Pollutants

9.5.1 Acid Rain (Avg. Score: 1.00)

NJ Specific Threats: 9.5.1.1 Causes acidification of water bodies, resulting in changes to aquatic and marine communities and reducing biodiversity, and creating conditions that are unsuitable for some aquatic (freshwater and marine) and semi-aquatic species that are sensitive to pH shifts.

9.5.4 Other (Avg. Score: 1.00)

NJ Specific Threats: 9.5.4.1 Dust and/or airborne sedimentation from construction sites, agricultural operations or related earth disturbances can introduce mineral or organic sediments into adjacent wildlife habitats, degrading their quality and suitability for wildlife short-term and/or long-term.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Pond Odonates

9.5.6 Herbicides and Pesticides (Avg. Score: 3.00)

NJ Specific Threats: 9.5.6.1 May result in injury or direct mortality of non-target species.

9.6 Excess Energy

9.6.2 Thermal Pollution (Avg. Score: 1.00)

NJ Specific Threats: 9.6.2.2 Water temperature changes to aquatic systems can deter or preclude use by SGCN (e.g., alter habitat suitability for wildlife species, reduce prey base) or present stressors that are harmful if not fatal to wildlife.

11 Climate Change and Severe Weather

11.1 Habitat Shifting or Alteration

11.1.0 Macro- and Micro-Climate Alterations (Avg. Score: 3.00)

NJ Specific Threats: 11.1.0.1 Alters native terrestrial and aquatic habitats at the macro- and micro-climate levels that can affect suitability for wildlife, in particular specialist species.

11.2 Droughts

11.2.1 Droughts (Avg. Score: 2.00)

NJ Specific Threats: 11.2.1.1 Contribute to hardened soils, decreasing water recharge during rains and increasing the likelihood of flash floods during storms.

11.2.1.2 Lead to lower groundwater levels and therefore, less available water for people and habitats.

11.2.1.3 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

11.3 Temperature Extremes

11.3.1 Temperature extremes (Avg. Score: 1.00)

NJ Specific Threats: 11.3.1.1 Increasing temperatures may cause habitat loss and degradation by desiccating and/or raising the temperatures of small wetlands and streams leading to the loss of freshwater mussels and other aquatic species and species reliant upon these habitats.

11.4 Storms and Flooding

11.4.1 Storms and flooding (Avg. Score: 1.00)

NJ Specific Threats: 11.4.1.1 Extreme storms and flooding events threaten aquatic and marine wildlife through habitat degradation and alteration, including alterations to off-shore or back-bay benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic and marine wildlife.

11.4.1.5 Storm damage can alter forest structure via blow-downs or micro-bursts, and can destroy bird nesting in the locales where the storms occur.

11.4.2 Increased rainfall (Avg. Score: 1.00)

NJ Specific Threats: 11.4.2.1 Extreme rain events threaten aquatic wildlife through habitat degradation and alteration, including alterations to benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic wildlife.

11.4.2.2 Extreme rain events can damage wildlife nesting and resting habitats, including impacts to avian eggs and chick and small mammal survivorship.

11.4.2.3 More frequent rain events can alter terrestrial and wetland vegetation communities as well as wetland hydrology, shifting wildlife community use.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory (Avg. Score: 3.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Pond Odonates

NJ Specific Threats: 12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.1.2 Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.

12.1.2 Lack of up-to-date existing information (Avg. Score: 3.00)

NJ Specific Threats: 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

12.1.3 Need to answer research question (Avg. Score: 3.00)

NJ Specific Threats: 12.1.3.1 There are significant knowledge gaps regarding distribution, dispersal, diseases, population trends, etc. of SGCN.

12.1.4 Need to develop new technique (Avg. Score: 3.00)

NJ Specific Threats: 12.1.4.1 Improve and evaluate survey methods for SGCN and their habitats; alter as needed.

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms (Avg. Score: 1.00)

NJ Specific Threats: 12.3.0.1 Regulatory habitat protections within state land use regulations are spatially limited to specific geographic areas (e.g., Pinelands, Coastal Area) or geographic features (e.g., wetlands, streams) and so fail to protect critical habitats that exist outside of these regulated areas.

12.3.0.6 Certain geographic or habitat features, such as vernal pools and headwater wetlands or streams, may be too small, mischaracterized, or misidentified to benefit from regulatory protection.

12.3.0.7 Activities that threaten SGCN, their food sources, and/or habitats are often regulated separately and without consideration for the cumulative and synergistic effects over time or over a larger spatial scale. Therefore, regulations can fail to protect SGCN populations over time.

12.3.0.10 Land use regulatory processes pertaining to habitat creation, enhancement or restoration projects can be costly and/or burdensome, precluding or discouraging the development or implementation of conservation projects.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform (Avg. Score: 1.00)

NJ Specific Threats: 12.4.0.1 A species-by-species management focus as opposed to ecological systems and biodiversity generally has greater opportunity for unintended consequences for other species and may be less efficient in developing appropriate management actions.

12.4.0.2 Policies and procedures for lands management that lack consideration of the impacts of activity timing can result in unintended impacts to wildlife during vulnerable periods.

12.4.0.5 Bureau of Forest Fire Management policy has traditionally implemented prescribed burns on State lands for the sole purpose of public safety (i.e., addressing hazard fuel reduction), missing opportunities to burn in a manner that would additionally manage habitat for ecological diversity.

12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats (Avg. Score: 3.00)

NJ Specific Threats: 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Pond Odonates

- 14.1.1.2 Lack of general knowledge of SGCN life histories and vulnerabilities as they relate to land management practices.
- 14.1.1.3 Lack of understanding of the need to manage both natural and anthropogenic (e.g., yards, lawns, hayfields, etc.) habitats to minimize impacts or increase benefits to SGCN and their habitats.

14.2 Outreach needs

- 14.2.1** Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions (Avg. Score: 3.00)

- NJ Specific Threats:**
- 14.2.1.1 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various forest management practices.
 - 14.2.1.2 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various aquatic and riparian management practices.
 - 14.2.1.5 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various wetland management practices.

15 Administrative Needs

15.2 Organizational/program planning needs

- 15.2.3** Need for multi-state, regional and landscape scale planning (Avg. Score: 1.00)

- NJ Specific Threats:**
- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Actions to address the Threats and Action Drivers associated with this Conservation Target:

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.2 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to increase the effective size of SGCN habitats by protecting/restoring adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats.
- 1.2.1.5 Secure and promote the protection/restoration of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through incentive programs.
- 1.2.1.6 Secure and promote the protection/restoration of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers through incentive programs.
- 1.2.1.8 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to municipalities, land developers, and other land managers to retain and/or enhance native vegetation adjacent to aquatic habitats, and along riparian areas and wildlife movement corridors.
- 1.2.1.9 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing Forestry Stewardship Programs.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Pond Odonates

- 1.2.1.10 Coordinate across government agencies and non-government organizations to maximize the availability of and enrollment in existing landowner incentive programs (e.g., "farm bill," partners, etc.) to maintain and/or improve habitat.
- 1.2.1.11 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 1.2.1.12 Create incentives (non-monetary and/or monetary) for land developers to redevelop abandoned areas (e.g., shopping centers, office complexes) to minimize the loss of natural habitats and reduce the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 1.2.1.13 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to land developers to minimize the impacts of new residential and commercial developments on SGCN and their habitats.
- 1.2.1.14 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of herbicides and pesticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.15 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of rodenticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.16 Create incentives (non-monetary and/or monetary) within State regulations (mitigations requirements or credit, BMP satisfaction, etc.) to promote the use of retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.17 Develop a public-relations oriented certification program for private retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.18 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and land managers to control and reduce the impacts of invasive, native and non-native species in order to increase structural habitat diversity.
- 1.2.1.19 Create incentives for federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to farmers, woodland landowners, and private landowners to adopt and/or endorse consistent BMPs concerning controlled burns to maintain and/or improve wildlife habitat.
- 1.2.1.20 Coordinate across government agencies and non-government organizations to create or expand upon tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMP's.

Pond Odonates

- 1.2.1.21 Create and/or support market-based programs that subsidize or create branding for products derived sustainably from managed wildlife habitats.
- 1.2.1.22 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to horse/livestock farm owners and managers to increase structural habitat diversity in and around the farms by managing vegetation for a variety of species, in particular, farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 1.2.1.23 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to provide cost shares and/or plan approvals for management based on management approaches and prescriptions.
- 1.2.1.24 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners, with habitat of suitable patch size to support breeding grassland-dependent species, to alter the timing of vegetation management to benefit grassland and pollinator species.
- 1.2.1.26 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing landowner incentive programs.
- 1.2.1.28 Create incentives to implement dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.

2 Direct Management of Natural Resources

2.3 Fire management

2.3.2 Fuel reduction

- 2.3.2.1 Prevent wildfires by reducing natural fuel (e.g., leaf litter).

2.3.3 Prescribed burning

- 2.3.3.1 Evaluate different management techniques of prescribed burns that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 2.3.3.2 Conduct prescribed burning in Northern New Jersey forests to maintain and regenerate a mosaic of upland forest habitats.
- 2.3.3.3 Conduct prescribed burning to improve wildlife habitat.

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

- 2.8.0.1 Control invasive insect infestations by implementing BMP strategies through biological, chemical and/or mechanical means that will depress, or when appropriate, eradicate populations in a manner that avoids excessive harm to non-target species using BMPs to control infestations and limit their spread based on an inventory of invasive insect distribution and response to outbreaks.
- 2.8.0.2 Develop, implement, monitor and evaluate pest control/management strategies to reduce the impacts of over-abundant wildlife species (native and/or native, invasive species) on native vegetation and the degradation of habitats supporting SGCN. Over-abundant wildlife species include but are not limited to mute swans, Canada geese, beaver and white-tailed deer.

Pond Odonates

- 2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.
- 2.8.0.5 Implement biologically safe and appropriate control/management strategies, and where appropriate, eradication strategies to reduce the impacts and/or limit the distribution of invasive and/or non-native plant species within or near aquatic systems using methods that will provide the most protection to the aquatic and riparian ecological system, and minimize disturbance to the soil and wildlife. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.
- 2.8.0.6 Implement long-term management of invasive and/or non-native plants to help maintain functioning ecological systems and biological diversity, and to enhance travel corridors. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

- 2.10.0.1 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 2.10.0.2 Improve the availability of prey/food resources through terrestrial and aquatic plantings and habitat restoration for SGCN populations, in particular for those populations thought to be limited due wholly or in part to a lack of (or contaminated) food resources, and for migratory species (birds, bats, invertebrates).
- 2.10.0.3 Restore and/or enhance habitats to benefit urban-associated SGCN.
- 2.10.0.4 Restore and/or enhance suitable travel corridors connecting conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats.
- 2.10.0.5 Implement habitat restoration and/or enhancement activities that include the creation of vegetative buffers between sensitive habitats (e.g., aquatic systems) and human-inhabited areas (e.g., residences, parks, etc.) and that is conducted during appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.10.0.6 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats.
- 2.10.0.7 Restore/reclaim and enhance degraded rare species habitats through strategic revegetation and management efforts for documented/target SGCN.
- 2.10.0.8 Protect significant natural and/or unique communities by implementing best management practices when conducting habitat restoration strategies.

Pond Odonates

- 2.10.0.9 Restore and/or enhance riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation, alteration and/or changes in hydrology and subsequent disturbances to and behavioral changes of wildlife (e.g., restoring biologically appropriate buffers, revegetation or restoration efforts, etc.).
- 2.10.0.10 Minimize the loss of important habitats (e.g., coastal scrub-shrub and grassy habitats, high and low marsh habitats, etc.) that provide nesting, migrating, and wintering areas for SGCN birds and other coastal and marsh-dependent species through habitat restoration efforts.
- 2.10.0.11 Restore and/or enhance critical migratory terrestrial and aquatic habitats (e.g., beach, grasslands, forest, scrub-shrub, etc.) for songbirds, raptors, shorebirds, waterfowl, bats and invertebrates through habitat restoration efforts and expand habitat restoration to adjacent private lands to increase the effective size of the habitat.
- 2.10.0.12 Create and/or maintain scrub-shrub habitats through revegetation efforts with little to no impact on forested, wetland and grassland habitats to maintain populations of shrub-dependent SGCN.
- 2.10.0.14 Implement best management practices (BMPs), protective strategies and guidelines for restoring and enhancing healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.10.0.15 Restore and/or enhance terrestrial and aquatic habitats proximate to but not adjacent to roads and other transportation corridors for terrestrial-bound SGCN species whose behavior (i.e., dispersal across roads) may be altered by doing so, and therefore decrease road mortality of such species (e.g., amphibians, snakes, turtles, small mammals).
- 2.10.0.21 Restore and/or enhance understory habitats that suppress invasive species and provide critical resources and enhance sheltering, foraging, and nesting cover for wildlife.
- 2.10.0.22 Restore and/or enhance terrestrial and aquatic habitats to promote the regeneration of native vegetation and enhance structural diversity to benefit SGCN (e.g., vegetative buffers of aquatic systems, allow coarse, woody debris to remain in terrestrial, aquatic and riparian habitats to provide shelter, riparian stabilization and necessary microclimates, plant native trees, shrubs and grasses, etc.).

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.
- 2.11.0.2 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas for target SGCN and/or species groups; management should complement rare species needs in a targeted area.
- 2.11.0.3 Create suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats through vegetation management.
- 2.11.0.4 Implement vegetation management strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife, particularly SGCN.
- 2.11.0.5 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats through vegetation management.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Pond Odonates

- 2.11.0.6 Reclaim degraded rare species habitats by conducting vegetation management needed to restore habitat value for the documented/target SGCN.
- 2.11.0.7 Protect significant natural and/or unique communities by implementing best management practices through vegetation management.
- 2.11.0.8 Maintain, enhance and/or restore biologically appropriate buffers for SGCN-inhabited/used freshwater wetlands through vegetation management.
- 2.11.0.23 Implement appropriate habitat management actions in areas where natural disturbances, such as wildfire, have been precluded.
- 2.11.0.24 Conduct vegetation management adjacent to aquatic habitats following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.25 Conduct vegetation management along access roads following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.26 Conduct vegetation management along roadsides and medians, avoiding peak activity periods for wildlife, that enhances wildlife dispersal naturally and safely across roads and similar barriers to/between terrestrial and/or aquatic habitats.
- 2.11.0.27 Conduct vegetation management for target shrub- or young forest-dependent SGCN following BMPs to minimize the risk of the establishment of invasive and non-native plants.
- 2.11.0.28 Conduct vegetation management in agricultural areas following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.29 Conduct vegetation management on transportation and service corridors (i.e., rights-of-way) following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.30 Identify and prioritize areas where various management tools (such as increasing salinity through the management of water levels or chemical applications) may be effective in reducing phragmites within and restoring marsh habitat.
- 2.11.0.31 In areas where vegetative communities are shifting due to fire suppression and controlled burns are not feasible, manage vegetation to improve wildlife habitat.
- 2.11.0.32 Increase structural habitat diversity around and when feasible, within agricultural landscapes by managing vegetation for a variety of species, in particular, those farms that have removed scrub-shrub habitat and/or fragmented forests, and by implementing ecologically best practices (e.g., no-till farming, maintaining hedgerows, buffer set-asides, etc.).
- 2.11.0.33 Increase structural habitat diversity by implementing long-term vegetation management to minimize the potential for the establishment of invasive and/or non-native plants that may outcompete native vegetation.
- 2.11.0.34 Increase structural habitat diversity by managing residential, commercial and recreational areas' landscapes for a variety of species. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.35 Increase structural habitat diversity by managing vegetation adjacent to aquatic habitats in a manner that provides a buffer from runoff and erosion and a microclimate to stabilize seasonal temperatures to benefit a variety of aquatic and semi-aquatic species.

Pond Odonates

- 2.11.0.36 Increase structural habitat diversity by managing vegetation for a variety of species and considering their life history requirements (e.g., travel corridors, shelter, resting and breeding areas) to minimize the risk of harm.
- 2.11.0.38 Increase structural habitat diversity in and around horse/livestock farms by managing vegetation for a variety of species, in particular, in and around farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 2.11.0.39 Increase structural habitat diversity in and around solar farms by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.40 Increase structural habitat diversity surrounding areas used for energy, mining, and transportation and service corridors by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides, and avoid managing habitat during the breeding seasons for ground-nesting birds, reptiles, amphibians and small mammals.
- 2.11.0.41 Increase structural habitat diversity through the implementation of a variety of vegetation management practices such as prescribed burns (either increasing or decreasing their frequency depending on the site and objective), plantings, etc. that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.42 Increase structural habitat diversity within wind farms for terrestrial bound and low-flying species and around wind farms for other wildlife by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.43 Manage forests to increase variation in age structure and composition using BMPs that promote and maintain functioning ecological forest-based systems and biological diversity.
- 2.11.0.45 Regularly and/or rotationally create young forest habitat in targeted areas to maintain and regenerate a mosaic of upland forest habitats that will benefit shrub- and young forest-dependent species.

2.12 Water management

2.12.1 Ditch plugs

- 2.12.1.1 Implement best management practices (BMPs), protective strategies, and guidelines for ditch plugging to maintain and enhance healthy, resident and migratory SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

2.12.3 Drainage

- 2.12.3.2 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) such as removing drainage ditches to restore natural stream flows and wetlands, that benefit wildlife inhabiting these areas.

Pond Odonates

- 2.12.3.3 Remove tile drains and drainage ditches to improve wetland hydrology and restore natural stream flows during appropriate times to avoid sensitive periods (e.g., nesting, denning, roosting) and minimizes harm to wildlife, particularly SGCN.
- 2.12.3.4 Expand the acreages and enhance the effective size of SGCN habitats by reclaiming/restoring adjacent, degraded habitats by removing tile drains and drainage ditches.
- 2.12.3.5 Remove drainage ditches adjacent to roads to decrease the attraction for amphibians, reptiles and small mammals, and thereby minimizing road mortality of such species (e.g., amphibians, snakes, turtles, small mammals).
- 2.12.3.6 Protect significant natural and/or unique communities by and when removing tile drains and drainage ditches.
- 2.12.3.7 Minimize habitat loss of critical coastal habitats that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas by removing drainage ditches.
- 2.12.3.8 Enhance critical migratory stopover beach habitats for songbirds, raptors, shorebirds, bats and invertebrates by removing drainage ditches and expanding management to adjacent private lands to increase the effective size of the habitat.
- 2.12.3.9 Implement drain removal on state and other conservation lands to enhance food availability for migratory species (birds, bats, invertebrates).
- 2.12.3.10 Use tile drain and drainage ditch removal to create feeding and roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.
- 2.12.3.11 Implement best management practices (BMPs), protective strategies, and guidelines when removing tile drains and drainage ditches to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

2.13 Wildlife damage management

2.13.0 Nuisance fish and wildlife damage

- 2.13.0.4 Investigate the effects of mosquito control methods on freshwater aquatic and semi-aquatic SGCN including but not limited to, amphibian, fish, dragonfly, and damselfly populations.

2.14 Wildlife disease management

2.14.0 Wildlife disease strategy development and investigation

- 2.14.0.1 Investigate diseases/pathogens impacting SGCN and/or their habitats.
- 2.14.0.2 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
- 2.14.0.3 Protect SGCN from exotic pathogen introduction or incident through implementation of a "rapid response plan"; DFW to give priority attention to these species in planning and/or implementing a response.
- 2.14.0.4 Conduct long-term monitoring of diseases in vulnerable wildlife to determine the magnitude of exposure within populations and around the State, the impacts to those species, in particular SGCN, and investigate the feasibility of mitigating for such impacts.
- 2.14.0.5 Assess the impacts of diseases on the life cycles of wildlife.

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

- 3.0.0.1** Conduct long-term monitoring of resident and migratory SGCN populations using standardized survey protocols to determine the variables that may impact their long-term persistence in the State (e.g., population viability, distribution, dispersal, home range and habitat use, travel corridors, food availability, vulnerability to pollutants and disease, etc.). Compile this information to determine the likely causes of population declines and to understand metapopulation dynamics. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.2** Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) where data gaps exist regarding SGCN distribution, and their critical and supportive habitats. Conduct surveys using standardized survey protocols to acquire baseline data, and provide the data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
- 3.0.0.3** Gather baseline data on SGCN inhabiting permanently protected natural lands regarding their distribution and population (e.g., abundance, dispersal, demography including productivity and survival, etc.), and identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) critical and supporting habitats within those landscapes.
- 3.0.0.4** Conduct long-term studies on SGCN inhabiting permanently protected natural lands to develop population trend data and changes in demography, and to determine if critical and/or supporting habitats are limited or changing; i.e., diminishing in value, acreage or connectivity.
- 3.0.0.5** Gather baseline data on resident and migratory SGCN (in particular migratory species for which New Jersey habitats are significant), terrestrial, freshwater and marine species, regarding the location and condition of their critical and supporting habitats (e.g., foraging, roosting, nesting/breeding, stopover, migration paths, etc.), and population demography (e.g., productivity, survival, dispersal). Compile this information into a database that includes descriptions of the conditions of the habitats and species, and a GIS component of the locations of these important habitats. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.6** Conduct long-term studies on resident and migratory SGCN to determine if there are changes to the populations' demography (productivity, survival, dispersal) and/or to their critical and/or supporting habitats (i.e., diminishing in value, acreage or connectivity, etc.), in particular changes that would not maintain SGCN at viable levels for species populations. Update data and GIS maps; provide updated information to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.7** Collect baseline data to document species distributions, in particular SGCN, and current habitat for future analysis of possible distribution shifting as a result of habitat shifting or alteration associated with climate change impacts.
- 3.0.0.8** Conduct long-term studies and compare baseline metrics of documented species distributions and associated habitats to identify possible species and/or habitat shifting or alteration associated with climate change impacts.
- 3.0.0.13** Investigate the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats. Evaluate and modify management practices as appropriate.

Pond Odonates

- 3.0.0.14 Identify areas with invasive, aquatic plants and animals and collect a detailed baseline assessment of the species' status and distribution. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort. Researchers and contractors performing Forest Stewardship Inventories and/or Plans on state lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.0.0.15 Conduct long-term monitoring of areas identified as having invasive, aquatic plants and animals to track the species' status/progress over time with or without the implementation of management strategies. Areas without management strategies should be assessed and prioritized for management/control. Areas where management strategies are being implemented should include an assessment of the management effort and identify/recommend and implement necessary changes to improve its success. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort.
- 3.0.0.19 Identify the presence and status (e.g., functioning, structure, slated for removal, etc.) of existing dams and culverts within and/or that may impact SGCN and their habitats, and create a database that includes a GIS component identifying the locations of such structures and their status. Share this information with appropriate organizations and/or agencies evaluating the benefits and risks of such structures on SGCN and their habitats.
- 3.0.0.20 Once baseline data identifying and describing the status of existing dams and culverts have been gathered, conduct evaluations at a variety of sites to determine whether the benefits of culvert and dam creation or removal outweigh the risks to SGCN species and their habitats, and if other variables/conditions specific to individual sites/locations result in a different outcome. Identify and target appropriate dams and culverts for removal and/or reconstruction to minimize harm to SGCN species and their habitats.
- 3.0.0.26 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species including objectives and guidance pertaining to and the condition/status of critical and supporting habitats.
- 3.0.0.27 Evaluate the effectiveness of strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals through research and monitoring. Develop and provide NJ DEP and other appropriate governing agencies/commissions a summary of findings and recommendations to improve such efforts.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.1 Division of Fish and Wildlife should maintain a robust, up-to-date database and mapping of species occurrences.
- 3.2.0.3 Survey for and monitor populations of freshwater aquatic focal SGCN to assess the populations' demography, trends, condition, distribution, etc.
- 3.2.0.7 Track (via a database that includes a GIS component) and research problematic species and diseases to determine their distribution, impacts on SGCN wildlife/wildlife communities, and develop potential control measures.
- 3.2.0.8 Implement and conduct long-term monitoring of control measures aimed at minimizing the impacts of problematic species and/or diseases to evaluate the effectiveness of such efforts and to identify and incorporate additional strategies as appropriate.

Pond Odonates

- 3.2.0.18 Conduct baseline surveys/inventories to better understand the distribution of fish and invertebrate (including freshwater mussels) populations.
 - 3.2.0.21 Investigate the effects of mosquito control methods on freshwater aquatic and semi-aquatic SGCN including but not limited to, amphibian, fish, dragonfly, and damselfly populations.
 - 3.2.1 Abundance determination
 - 3.2.1.1 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) population abundance and trends for SGCN using standardized survey protocols. Provide data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
 - 3.2.1.2 Conduct wildlife surveys on resident and migratory SGCN regarding their population abundance and trends.
 - 3.2.2 Age, size and sex structure
 - 3.2.2.1 Conduct wildlife surveys on resident and migratory SGCN regarding their survivorship.
 - 3.2.3 Baseline inventory
 - 3.2.3.9 Investigate hazardous environmental issues that may impact grassland invertebrates.
 - 3.2.7 Population assessment
 - 3.2.7.1 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
 - 3.2.7.2 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species to meet and maintain recovery goals.
- 3.3 Research, survey or monitoring - habitat
 - 3.3.1 Baseline inventory
 - 3.3.1.1 Conduct habitat assessments of significant natural and/or unique communities to identify threats to native terrestrial and aquatic habitats through systematic monitoring, review of available data, enlistment of habitat management and/or species experts, etc. Incorporate findings into a database that includes descriptions/qualifiers of the habitats, identifies and values/qualifies the threats, and includes a GIS component of the locations of the assessed areas. Share this information with landowners/managers (e.g., federal, state and local government agencies or non-government organization).
 - 3.3.1.2 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) resident and migratory SGCN habitats. Investigate their suitability for the various life history requirements of the species that dependent upon them to determine the ability for maintaining applicable SGCN populations in perpetuity.
 - 3.3.1.4 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and investigate the suitability of corridors that connect large, contiguous tracts of similar habitats to increase their effective size (i.e., forest with forest, grassland with grassland, wetlands with wetlands, etc.) for dependent SGCN.
 - 3.3.1.5 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) where habitat restoration and/or enhancement would benefit wildlife SGCN.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Pond Odonates

- 3.3.1.6 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) that could, through revegetation and/or enhancement efforts, become suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN.
- 3.3.1.7 Map and prioritize existing and potential areas for early succession forest management. Share the results with state, county and municipal planners.
- 3.3.1.8 Assess the availability and suitability of forest habitats for SGCN species (particularly reptiles and amphibians, birds, pollinators, and tiger beetles) in southern forests since Superstorm Sandy.
- 3.3.1.9 Inventory forests throughout northern New Jersey to develop a baseline characterization of the structure and composition of habitats and identify deficient forest habitat types.
- 3.3.1.10 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and document fish SGCN habitats by plotting their distributions in GIS and submitting the data to the State for integration into the DEP's Biotics database.
- 3.3.1.16 Gather "best information" for spatial modeling and update/create a current model/depiction of anticipated habitat shifts from sea-level rise, flooding, etc.
- 3.3.1.17 Identify and map undeveloped roads and trails in all conserved forests, and create a database of locations. Integrate information regarding potentially sensitive areas.
- 3.3.1.18 Conduct an assessment using available data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels.
- 3.3.1.19 Identify and codify legal ORV access areas on state (and if appropriate, other conserved) lands. Provide GIS mapping to the landowner for potential use in directing such recreational activities.
- 3.3.1.20 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) where invasive, non-indigenous plants and animals are either already established or are becoming established. Create a system for reporting and qualifying new locations of invasive species and for prioritizing areas for control measures according to the potential level of impact on the ecosystem and SGCN and the likelihood of success. Researchers and contractors encountering invasive plant species while performing plant and/or forest inventories on state or other conserved lands and/or private lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.3.1.24 Conduct regular investigations of SGCN habitat health and biodiversity on public and private lands to identify locations in need of revegetation, reduction of over-abundant, native wildlife and/or exotic species, conservation focal areas requiring limitations on human activity, etc.
- 3.3.1.26 Survey all historic locations and unsurveyed suitable habitats to identify populations of freshwater aquatic focal species.

3.3.2 Monitoring

- 3.3.2.2 Conduct long-term monitoring of resident and migratory SGCN habitats using standardized survey protocols to determine changes in habitat quality/suitability and threats (e.g., habitat loss and degradation, increased edge habitat, water quality) and other variables that may impact their long-term persistence in the State and to provide information needed for determining causes of population declines and understanding metapopulation dynamics.

Pond Odonates

- 3.3.2.3 Continue to update wildlife and habitat databases and revise models of critical SGCN habitats using the most current data available and where lacking, develop new SGCN and/or habitat models as data on species habitat requirements and applicable GIS data layers become available.
- 3.3.2.4 Protect water quality and aquatic-dependent species by appropriately designating Category 1 waters and enforcing protective regulations. Seek appropriate classifications for stream segments based on Endangered and Threatened Status and/or the Index of Biotic Integrity (IBI) results that do not fulfill Category One requirements.
- 3.3.2.5 Conduct long-term monitoring of water quality of SGCN aquatic habitats (and aquatic systems feeding into those habitats) to evaluate protection and management efforts to reduce, if not eliminate, chemical contamination, siltation, eutrophication, and other forms of pollution/contamination of aquatic systems.
- 3.3.2.8 Evaluate the effectiveness of current prescribed burning practices on Pinelands dependent species.
- 3.3.2.10 Evaluate the efficacy and success of different management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.3.2.14 Research and evaluate the effectiveness of water quality management practices on water-dependent and semi-dependent SGCN, particularly those practices associated with permitting or mitigation actions.
- 3.3.2.15 Investigate the effectiveness of management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.3.2.16 Evaluate the effectiveness of best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 3.3.2.20 Once a system is developed for reporting and qualifying new locations of invasive species, develop, implement and monitor/evaluate invasive species removal strategies at identified locations. Priority should be given to those areas critical to SGCN and/or contain unique and/or rare plant communities supporting SGCN and/or other fish/wildlife species.
- 3.3.2.24 Conduct regular inventories of forests throughout northern New Jersey to characterize the changing structure and composition of habitats and monitor forest conditions.

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.1 Work with land management agencies to determine the appropriate actions needed to restore/reclaim degraded habitat for the documented/target SGCN.
- 3.5.3.3 Develop/improve management techniques that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.8 Develop best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Pond Odonates

- 3.5.3.9 Develop strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 3.5.3.11 Develop strategies to protect native terrestrial and aquatic habitats and dependent SGCN species from the identified threats.
- 3.5.3.14 Develop aquaculture practices in the coastal areas that are compatible with the recovery of SGCN.
- 3.5.3.15 Modify management practices based on the effects of pesticides, herbicides and other biological controls on critical and supporting SGCN habitats.
- 3.5.3.16 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.
- 3.5.3.19 Work with foresters to develop prescribed burning practices for Pinelands dependent species that increase or maintain habitat quality for these species in the Pinelands.
- 3.5.3.21 Develop management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.23 Revise water quality management practices based on research on water-dependent and semi-dependent SGCN, particularly when associated with permitting or mitigation actions.
- 3.5.3.24 Based on research, modify management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.5.3.25 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to develop the necessary management strategies to reach or maintain viable population levels.
- 3.5.4 Fish and wildlife research, survey and management techniques
 - 3.5.4.4 Investigate the effects of mosquito control methods on freshwater aquatic and semi-aquatic SGCN including but not limited to, amphibian, fish, dragonfly, and damselfly populations.
 - 3.5.4.5 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
 - 3.5.4.6 Investigate the feasibility of mitigating for the impacts of contaminants to vulnerable wildlife, particularly SGCN. Maintain records on exposure of vulnerable wildlife to environmental toxins (such as flame retardants and endocrine disruptors), so that sources may be identified and controlled or eliminated.
 - 3.5.4.14 Develop and implement agreements, and update existing agreements, with government agencies regarding the protection of critical SGCN habitats (e.g., significant breeding populations of beach nesting birds, colonial waterbird nesting areas, bat colonies, etc.).
 - 3.5.4.15 Investigate the success of management strategies used to protect and/or enhance SGCN populations and when appropriate, aid in identifying failures/resource problems and issues, and developing new strategies.

Pond Odonates

- 3.5.4.16 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels and develop the necessary management strategies.
- 3.5.4.18 Investigate the effectiveness of survey techniques through selected “ground truthing” and literature and peer review in order to increase efficacy of survey, minimize surveyor bias and error, and increase accuracy of trend data.
- 3.5.4.19 Develop reliable, standardized survey and monitoring protocols for SGCN species, for which none currently exist, and their habitats.
- 3.5.4.21 Develop BMPs to address problematic species and diseases of unknown origin.

4 Education

4.1 Educator/Instructor training

4.1.0 Public education

- 4.1.0.1 Provide educational resources and training programs to private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.

5 Facilities and Areas

5.15 Wildlife Management Areas

5.15.6 Roads

- 5.15.6.1 Clearly post areas/roads where vehicle access is permitted.
- 5.15.6.2 Clearly post areas/trails where vehicle access is not permitted.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

- 6.0.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.3 Secure and protect riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.7 Secure and protect critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

6.3 Conservation area designation

6.3.0 Conservation area designation strategies

- 6.3.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN and/or connect conserved SGCN habitats through conservation area designations.

Pond Odonates

- 6.3.0.3 Increase the protection of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through conservation area designations.

6.4 Private lands agreements

6.4.0 Private land agreement strategies

- 6.4.0.1 Enter into private lands agreements to expand control burns on private lands, in particular those adjacent to conserved lands to improve SGCN habitats.

7 Law Enforcement

7.1 Law enforcement

7.1.3 Sub-national Level

- 7.1.3.2 Increase the number of law enforcement officers tending to wildlife issues to a reasonable number to sufficiently cover the State and marine waters.

7.1.4 Scale Unspecified

- 7.1.4.1 Improve enforcement of policies and/or regulations that promote the reduction of run-off and point and non-point source pollution into NJ's aquatic systems (streams, rivers, lakes/ponds, bays, ocean, wetlands, etc.).
 - 7.1.4.12 Implement policies and/or regulations that protect significant natural and/or unique communities in perpetuity.
 - 7.1.4.16 Implement policies that protect and restore riparian areas.
 - 7.1.4.17 Improve the enforcement of policies and/or regulations that protect wetlands, riparian and floodplain areas, and aquatic habitats (including open waters).
 - 7.1.4.26 Educate law enforcement personnel that there may be unauthorized research projects taking place and to encourage them to investigate any activities that appear to be harmful to wildlife.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.2 Develop a team of personnel from government entities, conservation organizations and other stakeholders engaged in oil/gas spill response for marine and freshwater habitats to develop a feasible plan for oil spill response and/or to amend NJ's current oil spill response plan that clearly outlines each organizations responsibilities and an assessment and location list of available equipment for boom deployment during oil spills.
 - 8.1.0.3 Develop an outreach team of personnel from government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
 - 8.1.0.4 Engage government agencies, conservation partners and other stakeholders in constructive dialogues encouraging them to influence policy change and the creation of incentives through a habitat bill and/or municipal ordinances for backyard habitat.
 - 8.1.0.15 Engage government agencies, conservation partners and other stakeholders in discussions encouraging and supporting the creation of laws and policies requiring vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Pond Odonates

- 8.1.0.16 Engage local governments in discussions regarding the importance of them adopting/passing ordinances which require assessing and addressing secondary impacts (i.e., ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 8.1.0.17 Engage municipalities in constructive dialogue to identify and minimize destruction of areas prioritized for early succession forest management.
- 8.1.0.18 Engage NJDOT, NJ Transit Authority and other road management entities, wildlife conservation organizations/agencies (e.g., Division of Fish and Wildlife, New Jersey Conservation Foundation, Conserve Wildlife Foundation of NJ), and communities and citizens in discussions regarding the importance of and methods to enhance habitat connectivity, and work together to develop feasible strategies for ensuring that wildlife can disperse naturally and safely across roads and similar barriers to terrestrial and/or aquatic habitats.
- 8.1.0.19 Engage government agencies, conservation partners and other stakeholders to collaboratively develop a list of important projects, targeting SGCN and/or their habitat, as a guide for graduate student research. Distribute the list and contact information to all State colleges and universities.
- 8.1.0.20 Organize a small focal group of government and non-government agencies/organizations responsible for decisions regarding beach/dune management to share and coordinate their goals so that comprehensive planning can attempt to meet all needs.
- 8.1.0.21 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation human-subsidized and/or overabundant, native species cause to local nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.22 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation invasive species cause to native nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.24 Engage government agencies, conservation partners and other stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.25 Provide technical support to public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.26 Coordinate across federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to woodland landowners to adopt or endorse consistent best management practices concerning controlled burns to maintain and/or improve forested habitat for wildlife.
- 8.1.0.30 Encourage government agencies and conservation partners to advise members of the relevant scientific community of the need for specific studies, reports or investigations targeting the data-deficiency regarding SGCN and/or their habitats.
- 8.1.0.33 Engage government agencies, conservation partners and other land managers, communities, landowners, and commercial and industrial stakeholders in discussions regarding the importance of protecting and methods to protect priority wetlands beyond the levels afforded through regulation by maintaining and/or restoring optimal biological buffers around wetlands.

Pond Odonates

- 8.1.0.34 Work with the NJ Education Association and Department of Education to design curriculum and outdoor experimental learning opportunities, and provide training to teachers on implementation of these activities.
- 8.1.0.37 Enlist landowners and NJ citizens in the protection of and survey efforts for SGCN, in particular rare species, by increasing enrollment in landowner incentives, forest stewardship, backyard habitat management and wildlife-related volunteer programs.
- 8.1.0.38 Engage partners, stakeholders and land managers in constructive dialogue promoting forest stewardship for SGCN that use core forests and forested corridors.
- 8.1.0.40 Encourage researchers, land managers, naturalists and enthusiasts to follow proper procedures for the coordination and/or permitting of research/management activities involving wildlife and sensitive habitats, and discourage activities that alter vegetation or wetlands, or cause harm or disturbance to wildlife.
- 8.1.0.42 Engage citizens, wildlife observers and photographers through discussions and distributable information regarding the importance of and encouraging implementing responsible and ethical behavior when observing wildlife by developing an alliance of wildlife photographers and widely circulating recommendations on how to reduce impact.
- 8.1.0.44 Engage conservation partners, stakeholders, government agencies and other land stewards in constructive dialogues encouraging their inclusion of controlled burns in forest and other stewardship plans.
- 8.1.0.47 Form cooperative partnerships with energy companies to facilitate habitat creation and enhancement away from and outside of project areas, the restoration of appropriate habitats within project areas (e.g., rights-of-way could benefit butterflies and some bird species), and to identify seasonal timing of activities that would minimize impacts to wildlife.
- 8.1.0.48 Form cooperative partnerships with transportation and shipment agencies and companies to facilitate habitat creation and enhancement away from and outside of project areas and to identify seasonal timing of activities that would minimize impacts to wildlife.

8.2 Recruitment and retention activities

8.2.3 For wildlife watching

- 8.2.3.1 Develop and implement nature-focused tourism opportunities including wildlife viewing sites, interpretive signage highlighting unique ecosystems/habitats, and wildlife-related recreational opportunities that do not negatively impact SGCN or their habitats.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.7 Develop and provide (or otherwise make publicly available) educational programs and/or materials that describe the negative impacts of off-road vehicles and watercraft use in and adjacent to critical SGCN habitats, and the importance of confining such activities to more appropriate locations and/or seasons.
- 8.3.0.8 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate recreationists and encourage landowners to eliminate garbage in the vicinity of suitable wildlife habitat, in particular SGCN habitat. Information should include the detrimental impacts garbage may have on various wildlife species.
- 8.3.0.9 Develop and provide (or otherwise make publicly available) educational programs and/or materials to enlist landowners and land managers to include only native plants in landscaping and restoration projects. Provide information to assist them in detecting problematic establishment of invasive, non-indigenous plants.

Pond Odonates

- 8.3.0.10 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate landowners and NJ citizens on threats to fish and wildlife (including marine animals).
- 8.3.0.11 Develop and provide (or otherwise make publicly available) educational programs and/or materials to the public, wildlife-related professionals, foresters, etc., that describe the value of species that are often feared (e.g., snakes, bats, spiders, Allegheny woodrat) and/or deemed a "nuisance" (e.g., squirrel, deer, snapping turtle), and therefore, persecuted by people. Include information on tolerance, proper identification, eviction from human dwellings, how to minimize the animal's presence on the property, and/or how to live in harmony with the animal.
- 8.3.0.12 Promote awareness of WSFR (Wildlife and Sportfish Restoration) Outreach/Awareness grants, an important funding source for conservation among hunters and anglers as well as the general public.
- 8.3.0.13 Conduct an educational campaign to encourage observer ethics and respect for wildlife and natural habitat.
- 8.3.0.24 Develop educational outreach programs for local decision-makers, land developers, landowners and citizens about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
- 8.3.0.25 Develop educational outreach programs for landowners, nurseries and the general public regarding the negative impacts of invasive and non-native plants on our natural communities.
- 8.3.0.26 Develop educational outreach programs for private and public landowners and land managers regarding the importance of and how to manage core forests and forested corridors in a way that will be beneficial for SGCN, particularly endangered, threatened and special concern species.
- 8.3.0.27 Develop educational outreach programs for public and private landowners and land managers regarding the importance of structural habitat diversity, methods to increase diversity, and/or incentive programs available to increase habitat diversity.
- 8.3.0.29 Develop educational outreach programs for local decision-makers, land developers, landowners and citizens about the importance of maintaining a vegetative buffer along riparian and aquatic habitats to intercept storm water runoff and minimize soil erosion.
- 8.3.0.30 Develop educational outreach programs for private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.
- 8.3.0.32 Develop an educational outreach program for landowners and citizens on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

- 9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and SGCN inhabiting them.
- 9.1.0.2 Develop town plans that avoid impacts to SGCN species and their habitats.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Pond Odonates

- 9.1.0.3 Develop a plan that directs the creation of impervious surfaces away from and to minimize impacts on aquatic systems and critical terrestrial habitats. The plan should also include strategies to increase the resiliency of aquatic and critical terrestrial habitats to threats and stressors that would impact the reproduction and survival of wildlife.
- 9.1.0.5 Develop a plan that directs the creation or expansion of energy or utility rights-of-way in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.6 Develop a plan that directs the creation or expansion of roads and railroads or the re-establishment of abandoned railroads within and adjacent to critical forested habitats in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.7 Develop a plan that directs the maintenance of or new channelization of forested streams and rivers in a manner that minimizes impacts of the aquatic ecological system and adjacent forest
- 9.1.0.8 Develop a plan that focuses on strategies for oil pipelines to avoid sensitive habitats that would be highly impacted by oil spills.
- 9.1.0.9 Develop a plan that focuses on strategies to minimize the creation of renewable energy farms (e.g., solar, wind) and related infrastructures within and their impacts on forested habitats and the wildlife community.
- 9.1.0.10 Develop a plan that focuses on strategies to minimize the impacts of mining on critical forested habitats.
- 9.1.0.11 Develop a plan that focuses on strategies to minimize the impacts of power plants on critical forested habitats and the wildlife community.
- 9.1.0.13 Develop a plan to minimize agriculture that would result in groundwater withdrawal in critical forested areas.
- 9.1.0.14 Develop a plan to minimize development that would result in groundwater withdrawal in critical forested areas.
- 9.1.0.15 Develop a plan to minimize fragmentation of terrestrial and aquatic habitats by roads.
- 9.1.0.16 Develop a plan to minimize new lawns and preserve natural vegetation within and adjacent to critical forest areas.
- 9.1.0.19 Develop a plan to minimize the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 9.1.0.22 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 9.1.0.28 Develop and coordinate state, regional and local plans for suitable lot layout and landscaping to minimize human-wildlife conflicts that also incorporates habitat connectivity and preservation of natural areas.
- 9.1.0.29 Provide GIS or related data, maps, resource inventories, as well as related training, pertaining to the SWAP and its recommended conservation actions for use or consideration by State, County or municipal planning agencies.
- 9.1.0.30 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and other related threats associated with development.
- 9.1.0.31 Develop wetland restoration plans that consider the life history and needs of wildlife occupying targeted habitats.
- 9.1.0.32 Incorporate aquatic habitat connectivity and water quality/effluent standards into local and state aquaculture plans and BMPs.

Pond Odonates

- 9.1.0.33 Review the species, threats, action successes, and habitats, and work with partners to revise the 2017 State Wildlife Action Plan for the 2025 resubmittal.

9.2 Organizational strategic and CMS planning

9.2.1 Organizational strategic and operational planning

- 9.2.1.1 Identify and codify legal ORV access areas on state lands.

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.3 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.1.4 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.3.1.5 Develop response plans to address disease outbreaks within wildlife populations, in particular SGCN.
- 9.3.1.7 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
- 9.3.1.9 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
- 9.3.1.10 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 9.3.1.13 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
- 9.3.1.15 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.
- 9.3.1.16 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.

9.3.3 Habitat management planning

- 9.3.3.5 Develop a management plan using forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.
- 9.3.3.7 Develop a management plan to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 9.3.3.8 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 9.3.3.10 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
- 9.3.3.11 Develop town plans that avoid impacts to SGCN species and their habitats.

Pond Odonates

- 9.3.3.13 Develop a management plan that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas and prevents or ameliorates near-term impacts of climate change throughout the State, but in particular within the coastal and Delaware Bay areas.
- 9.3.3.15 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
- 9.3.3.16 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.3.17 Develop a management plan for prescribed burning that will benefit Pinelands dependent species and increase or maintain habitat quality for these species in the Pinelands.
- 9.3.3.18 In cooperation with species and habitat experts, develop management plans for significant natural and/or unique communities, in particular those supporting SGCN, and provide the information to the landowners/managers (federal, state and local government agencies or non-government organization) for review and implementation.
- 9.3.3.19 Develop management plans for SGCN inhabiting permanently protected natural lands using available baseline and population trend data.
- 9.3.3.21 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
- 9.3.3.24 Develop a plan to improve the enforcement of policies and/or regulations that protect wetlands, riparian and floodplain areas, and aquatic habitats (including open waters).
- 9.3.3.28 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.
- 9.3.3.29 Develop habitat management plans aimed at reducing or eliminating negative impacts of ORVs.
- 9.3.3.32 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.
- 9.3.3.34 Include controlled burn prescriptions in forest and stewardship plans to improve wildlife habitat.
- 9.3.3.35 Incorporate habitat connectivity, preservation of natural areas, and the implementation of BMPs into state and local land-use policy environmental review process and energy development plans to minimize habitat fragmentation and related threats associated with solar farms and altered habitats.
- 9.3.3.36 Integrate plans for properly located and timed habitat restoration and management along transportation, energy and service corridors to minimize risks to and benefit wildlife.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

- 11.1.1.1 Use Biotics database and Landscape Project Mapping in regulatory reviews to ensure protection by applicable laws and regulations.

Pond Odonates

- 11.1.1.2 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
- 11.1.1.3 Government organizations to thoroughly review wetland restoration plans, applying the most current science for wildlife, habitats and aquatic systems, to assess the impacts to resident and migratory wildlife occupying the targeted habitats.
- 11.1.1.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.
- 11.1.1.5 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 11.1.1.7 Review proposed construction or other work projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.8 Review proposed research projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.12 Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed solar farm projects to reduce habitat fragmentation and minimize impacts on wildlife.

11.1.2 Review of proposed policies and plans

- 11.1.2.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
- 11.1.2.2 Government organizations to thoroughly review wetland restoration plans, applying the most current science for wildlife, habitats and aquatic systems, to assess the impacts to resident and migratory wildlife occupying the targeted habitats.
- 11.1.2.3 Incorporate aquatic habitat connectivity and water quality/effluent standards into the environmental review process to help establish policies and plans that minimize the impact of aquaculture on fish and wildlife.
- 11.1.2.4 Review strategies for creating or enhancing connectivity (e.g., installing appropriately-sized wildlife passages) between wetlands to allow wildlife to disperse naturally and safely.

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

- 11.2.0.1 Provide technical support to private and public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 11.2.0.2 Provide technical support to public and private landowners and land managers for controlling invasive, native and non-native plant species in order to increase structural habitat diversity.
- 11.2.0.3 Develop state, regional and local BMPs that focus on minimizing habitat fragmentation and human-wildlife conflicts associated with development. Make information available to land developers and private and public landowners for implementation.
- 11.2.0.5 Provide educational resources, training programs, and expert guidance to private and public landowners and land managers on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

Pond Odonates

- 11.2.0.6 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on habitat creation, enhancement and restoration within and adjacent to project areas, as well as away from and outside of project areas (depending on the target species), by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. Wind farms should address both terrestrial bound and low-flying species. Examples of habitat management include, but are not limited to, integrating short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 11.2.0.7 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on the importance of maintaining habitat connectivity, minimizing fragmentation, and the use of CHANJ products to help them target areas for such planning.
- 11.2.0.8 Provide educational resources, training programs, and on-the-ground guidance to public and private landowners and land managers on habitat creation and enhancement strategies that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 11.2.0.9 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and private landowners about the importance of leaving vegetation in place, especially along riparian areas and wildlife movement corridors.
- 11.2.0.10 Provide technical support to private landowners, consultants, and land managers to create customized management plans based on location and SGCN.
- 11.2.0.11 Provide educational resources, training programs, and on-the-ground guidance to private and public landowners and land managers on the benefits of and for creating young forest and early succession habitat for SGCN.
- 11.2.0.14 Provide educational resources and technical support to public and private landowners and land managers to promote the protection of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters), and to enhance or restore biologically appropriate buffers.
- 11.2.0.15 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and landowners about the importance of retaining and in an effort to protect, create, enhance and/or restore vegetation along aquatic habitats.
- 11.2.0.17 Provide educational resources and technical support to public and private landowners and land managers to promote the protection of vernal pools and the protection, enhancement and/or restoration of biologically appropriate buffers.
- 11.2.0.22 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
- 11.2.0.23 Provide educational resources and technical support to public and private landowners and land managers of lands adjacent to SGCN habitats to promote the protection and/or enhancement of those adjacent habitats to increase the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and that connect conserved SGCN habitats.

Pond Odonates

- 11.2.0.24 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers on how to manage vegetated roadside areas (e.g., mowing, brush-hogging, etc.) on a schedule that avoids peak activity periods for wildlife and therefore, minimizes harm.
- 11.2.0.25 Provide educational resources, training programs, and on-the-ground guidance to resource managers regarding the assessment of and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) related to residential and commercial development.
- 11.2.0.26 Make educational resources available to the public that encourage researchers to seek out guidance prior to finalizing proposals and submitting State permit applications to reduce potential impacts on sensitive species.

11.2.1 With individuals and groups involved in resource management decision making

- 11.2.1.1 Engage partners and stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 11.2.1.2 Provide professional training and technical assistance tools (e.g., mapping, guidance documents, justification, etc.) to agencies/divisions/programs within and outside of the NJ DEP regarding the SWAP, and the conservation actions recommended therein to help facilitate SWAP implementation.
- 11.2.1.3 Provide educational resources, training programs, and on-the-ground guidance to DOD to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop and implement forest management and other practices that minimize disturbances to SGCN (i.e., beyond their federal requirements).
- 11.2.1.5 Provide educational resources, training programs, and on-the-ground guidance to municipalities, state and federal agency resource managers on tasks such as writing and integrating Beach Management Plans into other management documents.
- 11.2.1.6 Provide educational resources, training programs, and on-the-ground guidance to resource agencies prior to project initiation to ensure wildlife and their habitats are protected to the highest degree possible during construction, and provisions are in place for post-construction habitat use.

11.2.2 With private landowners

- 11.2.2.1 Provide technical support to farming operations and woodland landowners on ways to decrease clean farming (edge-to-edge) practices and create ecotones to benefit bobwhite and other species dependent on early successional habitat.

100 Law and Policy

100. Legislation

100.1.3 Sub-national Level

- 100.1.3.1 Develop laws and policies to increase protection and biological buffers of wetlands.
- 100.1.3.2 Develop policies for wetland restoration plans that consider life history requirements and needs of wildlife occupying targeted habitats.
- 100.1.3.3 Initiate legislative action to establish an annual budgetary line item designating funds to support programs focused on long-term research and monitoring of wildlife diseases.

100.1.4 County and Local

Pond Odonates

- 100.1.4.2 Secure and increase the effective size of SGCN habitats and connect conserved SGCN habitats through local ordinances.
- 100.1.4.3 Expand the acreages and enhance the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN through local ordinances.
- 100.1.4.4 Secure wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) and biologically appropriate buffers through local ordinances.
- 100.1.4.5 Secure SGCN-inhabited/used freshwater wetlands and biologically appropriate buffers through local ordinances.
- 100.1.4.11 Secure riparian areas through local ordinances.
- 100.1.4.14 Adopt/pass local ordinances which require assessing and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 100.1.4.15 Incorporate habitat connectivity and the preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.

100.1.5 Scale Unspecified

- 100.1.5.1 Develop laws and policies to increase protection and biological buffers of wetlands.
- 100.1.5.2 Develop policies for wetland restoration plans that consider life history requirements and needs of wildlife occupying targeted habitats.
- 100.1.5.3 Incorporate aquatic habitat connectivity and water quality/effluent standards into state/local policy to minimize the impact of aquaculture on fish and wildlife.
- 100.1.5.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 100.1.5.5 Develop legislation to provide financial support for the New Jersey Invasive Species Strike Team.

100. State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.1 Develop (and/or improve) policies and/or regulations that will promote the reduction of run-off and point and non-point source pollution into NJ's aquatic systems (streams, rivers, lakes/ponds, bays, ocean, wetlands, etc.).
- 100.3.0.5 Develop policies that will promote improved and secure habitat connections between conserved SGCN habitats.
- 100.3.0.6 Develop policies that will promote expanding acreages and enhancing the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 100.3.0.8 Develop policies and/or regulations with the objective of protecting significant natural and/or unique communities in perpetuity.
- 100.3.0.9 Secure mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.12 Develop policies that promote the preservation and protection of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.

Pond Odonates

- 100.3.0.13 Develop policies that will promote protecting and restoring riparian areas.
- 100.3.0.14 Develop policies and/or regulations that increase the protective buffers of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) to biologically appropriate distances to benefit SGCN that rely upon these habitats and improve the function of the [associated] aquatic systems.
- 100.3.0.18 Develop policies for conserved lands that prohibit planting and supports the control of non-native vegetation and invasive, native vegetation.
- 100.3.0.23 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.26 Adopt regulations requiring the combined sewer overflow alternative analyses required by regulation address potential impacts to wildlife in watercourses or receiving water bodies.
- 100.3.0.31 Create or expand tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMPs.
- 100.3.0.32 Coordinate regulations across agencies to maximize availability of and enrollment in existing Forestry Stewardship Programs (e.g., "Woodland Stewards", Farm Bill, partners, etc.) to maintain and/or improve forest habitat.
- 100.3.0.38 Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.
- 100.3.0.39 Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.3.0.40 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.3.0.41 Explore all State regulatory requirements for mitigation, restoration, habitat management, etc. to ensure they prohibit the use of specified invasive or other problematic plant species.
- 100.3.0.43 Identify and address (amend) regulatory impediments to beneficial habitat management.
- 100.3.0.44 Incorporate requirements for technical support and funding for mitigation or restoration efforts so as to be consistent with existing regulations.
- 100.3.0.45 Increase the controlled burn season to focus on restoring vegetative communities.
- 100.3.0.46 Investigate and/or develop inter-agency Memorandum of Agreements to share common data stored or managed in program-specific databases.
- 100.3.0.48 Propose new State law or regulation mandating that a State-level "development impact fee" be assessed on all new development approved by municipalities (via the Municipal Land Use Law processes), and dedicate such monies to the development and implementation of regional Habitat Conservation Plans (or existing plans/programs serving the same regional function).
- 100.3.0.50 Retain endangered, threatened and special concern wildlife and habitat protection measures in the Water Quality Management Program Rules.

Pond Odonates

- 100.3.0.52 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded energy sitings and facilities.
- 100.3.0.53 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded rights-of-way corridors associated with energy transport/transmission.
- 100.3.0.60 Develop regulations that when implemented will protect significant natural and/or unique communities in perpetuity.
- 100.3.0.64 Develop regulations that when implemented will protect and restore riparian areas.
- 100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.
- 100.3.0.73 Develop regulations that would exempt the conversion of lawns to native vegetation (beneficial to wildlife) from local lawn ordinances.

100.3.2 State Land Acquisition Programs

- 100.3.2.1 Increase opportunities for habitat restoration by making any necessary policy changes to state, federal and local land acquisition programs (e.g., Green Acres, Blue Acres, etc.) to allow for acquisition within abandoned or failing bay shore communities, including mechanisms to relocate displaced people and infrastructure.

100. State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).
- 100.4.0.2 Create a policy that requires the NJ DEP to incorporate scientific information regarding climate change and sea level rise (e.g., predictions, habitat management/acquisition efforts to enhance resilience to inundation) on their websites and to work with other government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 100.4.0.3 Develop policies for mandatory buffer strips on preserved farmlands and state-owned agricultural lands.
- 100.4.0.8 Develop a white paper addressing the impacts that existing, new or expanded rights-of-way have upon wildlife, wildlife habitats and habitat connectivity.
- 100.4.0.10 Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.
- 100.4.0.11 Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.4.0.12 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.

Pond Odonates

- 100.4.0.13 Develop policies for different circumstances (e.g., roadsides and medians, riparian, aquatic and terrestrial habitats) that outline appropriate habitat/vegetation management strategies and schedules to minimize risks to and benefit wildlife.
- 100.4.0.16 Develop policies to implement habitat management strategies that will increase the structural diversity surrounding areas used for energy, mining, and transportation and service corridors which include but are not limited to the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-
- 100.4.0.17 Develop policies to implement habitat management strategies, including prescribed burns, that will increase the structural diversity on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies to control and reduce the impacts of invasive, non-native species in order to increase structural habitat diversity.
- 100.4.0.18 Develop policies to minimize the extent of infrastructure associated with energy and service corridors or areas (e.g., wind and solar farms, pipelines, utility lines) and that require the implementation of habitat management strategies that will increase the structural diversity in the area including (e.g., the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-asides).
- 100.4.0.19 Develop regulations that will minimize the creation of new barriers, remove or replace current barriers with appropriately-sized systems to accommodate wildlife dispersal, and to minimize road widening and traffic volume increases within critical wildlife habitat areas.
- 100.4.0.20 Develop state regulations that require energy developers and utility service companies to implement habitat management strategies that will increase the structural diversity of the habitat, minimize habitat fragmentation and commercial infrastructure, and minimize the loss, alteration and/or degradation of the habitat and adjacent lands when working on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies.
- 100.4.0.21 Ensure that Section 303(d) of the Clean Water Act and applicable State statutory/regulatory requirements for surface water pollutant budgets are being met by monitoring and enforcing regulatory Total Maximum Daily Load (TMDL) targets established within regional Water Quality Management Plans.
- 100.4.0.22 Work with NJ DEP's Division of Land Use Regulation to ensure protection of listed species and their habitats during stream cleaning events.
- 100.4.0.24 Develop policies to provide financial support for the New Jersey Invasive Species Strike Team.
- 100.4.0.25 Develop policies that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

Robust Baskettail

Focal species that comprise this Conservation Target:

Robust Baskettail

Threats and Action Drivers associated with this Conservation Target:

1 **Residential and Commercial Development**

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale) (Avg. Score: 3.00)

- NJ Specific Threats:**
- 1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
 - 1.1.1.2 Loss, alteration and/or degradation of habitat.
 - 1.1.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
 - 1.1.1.7 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale) (Avg. Score: 3.00)

- NJ Specific Threats:**
- 1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
 - 1.2.1.2 Loss, alteration and/or degradation of habitat.
 - 1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
 - 1.2.1.7 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale) (Avg. Score: 2.00)

- NJ Specific Threats:**
- 1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
 - 1.3.1.2 Loss, alteration and/or degradation of habitat.
 - 1.3.1.5 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
 - 1.3.1.6 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

2 **Agriculture and Aquaculture**

2.1 Annual and Perennial Crops (non-timber)

2.1.1 Shifting Agriculture (Avg. Score: 2.00)

- NJ Specific Threats:**
- 2.1.1.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Robust Baskettail

2.1.2 Small-holder Farming (Avg. Score: 1.00)

NJ Specific Threats: 2.1.2.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.2.2 Fragments terrestrial and aquatic habitats.

2.1.3 Agro-industry (Avg. Score: 1.00)

NJ Specific Threats: 2.1.3.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.3.2 Fragments terrestrial and aquatic habitats.

2.2 Wood and Pulp Plantations

2.2.1 Small Holder (Avg. Score: 1.00)

NJ Specific Threats: 2.2.1.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.

2.2.2 Agro-industry Plantations (Avg. Score: 1.00)

NJ Specific Threats: 2.2.2.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.

2.3 Livestock Farming and Ranching

2.3.2 Small-holder Grazing (Avg. Score: 1.00)

NJ Specific Threats: 2.3.2.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.

2.3.2.2 Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.

2.3.2.3 Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

2.3.2.4 Livestock allowed to wade into waterbodies trample and degrade aquatic habitats.

2.3.3 Agro-industry Grazing (Avg. Score: 1.00)

NJ Specific Threats: 2.3.3.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.

2.3.3.2 Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.

2.3.3.3 Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

2.3.3.4 Livestock allowed to wade into waterbodies trample and degrade aquatic habitats.

3 Energy Production and Mining

3.2 Mining and Quarrying

3.2.2 Surface Mining - Rock Quarry (and sand quarries) (Avg. Score: 1.00)

NJ Specific Threats: 3.2.2.1 Fragments terrestrial and aquatic habitats.

3.2.2.2 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

3.3 Renewable Energy

3.3.2 Solar Power (Avg. Score: 1.00)

NJ Specific Threats: 3.3.2.2 Loss, alteration and/or degradation of habitat.

3.4 Conventional Power Plants

3.4.0 Conventional Power Plants (Avg. Score: 1.00)

Robust Baskettail

NJ Specific Threats: 3.4.0.3 Alteration of the temperature, pH and/or hydrology of aquatic ecosystems change plant communities and can harm wildlife and/or impact their behavior and survivorship.

4 Transportation and Service Corridors

4.1 Roads and Railroads

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale) (Avg. Score: 1.00)

NJ Specific Threats: 4.1.1.2 Loss, alteration and/or degradation of habitat associated with road and railroad construction and maintenance, and degradation of adjacent habitats.

4.1.2 Movement of cars and other vehicles on roads and railroads (large and small scale) (Avg. Score: 1.00)

NJ Specific Threats: 4.1.2.1 Increased vehicle traffic increases the risk of wildlife mortality from strikes.

4.2 Utility and Service Lines

4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads (Avg. Score: 1.00)

NJ Specific Threats: 4.2.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species, inhibiting dispersal of non-volant animals, reducing gene flow, and creating barriers to fish when service line-associated roads cross streams (e.g., bridges, culverts, fords, etc.).

4.2.1.2 Loss, alteration and/or degradation of habitat associated with rights-of-way construction and maintenance, and degradation of adjacent habitats.

4.3 Shipping Lanes

4.3.2 Dredging impacts (Avg. Score: 2.00)

NJ Specific Threats: 4.3.2.1 Threatens wildlife by disrupting/removing stream bottom habitat.

5 Biological Resource Use

5.1 Hunting and Collecting Terrestrial Animals

5.1.1 Intentional Use (Avg. Score: 1.00)

NJ Specific Threats: 5.1.1.1 Illegal collection of wildlife can have detrimental impacts on populations.

5.4 Fishing and Harvesting of Aquatic Resources

5.4.4 Unintentional effects (large scale) (Avg. Score: 1.00)

NJ Specific Threats: 5.4.4.1 Fish introduced for sport fishing can negatively impact native species by competing for resources and/or altering the habitat (e.g., disrupting benthic communities and/or severely impacting aquatic vegetation).

6 Human Intrusions and Disturbance

6.1 Recreational Activities

6.1.1 Off-road vehicles (motorized and non-motorized) (Avg. Score: 2.00)

NJ Specific Threats: 6.1.1.2 Inappropriate use of off-road vehicles can degrade terrestrial and aquatic habitat and reduce the suitability of adjacent habitats for wildlife.

6.1.1.3 Increased risk of harassment that results in a change in wildlife behavior and/or direct mortality from vehicle strikes.

6.1.1.6 Off-road vehicles can be a mechanism of transference of wildlife diseases and invasive plant species if gear and apparel are not properly sanitized between sites.

7 Natural Systems Modifications

7.2 Dams and Water Management/Use

7.2.1 Abstraction of Surface Water (domestic use) (Avg. Score: 3.00)

- NJ Specific Threats:** 7.2.1.1 Changing water levels due to water body drawdowns (legal and illegal) may lower dissolved oxygen levels, increase water temperatures, expose wildlife to predation, and increase exposure to winter temperatures, altering wildlife behavior and survival.
- 7.2.1.2 Controlled water releases and/or improper water level management of water bodies may alter downstream dissolved oxygen levels, water temperatures, sediment deposition, and flow rates, altering wildlife behavior and survival.
- 7.2.1.3 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, and eliminates shallow water habitats.

7.2.2 Abstraction of Surface Water (commercial use) (Avg. Score: 3.00)

- NJ Specific Threats:** 7.2.2.1 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, eliminates shallow water habitats, and disrupts/removes stream bottom habitat.
- 7.2.2.2 Changing water levels due to water body drawdowns (legal and illegal) may lower dissolved oxygen levels, increase water temperatures, expose wildlife to predation, and increase exposure to winter temperatures, altering wildlife behavior and survival.
- 7.2.2.3 Controlled water releases and/or improper water level management of water bodies may alter downstream dissolved oxygen levels, water temperatures, sediment deposition, and flow rates, altering wildlife behavior and survival.

7.2.3 Abstraction of Surface Water (agricultural use) (Avg. Score: 3.00)

- NJ Specific Threats:** 7.2.3.1 Controlled water releases and/or improper water level management of water bodies may alter downstream dissolved oxygen levels, water temperatures, sediment deposition, and flow rates, altering wildlife behavior and survival.
- 7.2.3.2 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, and eliminates shallow water habitats.
- 7.2.3.3 Impounding water to create or expand bogs for cranberry farming leads to the loss of natural wetlands and the alteration of the natural hydrology in the area.
- 7.2.3.5 Changing water levels due to water body drawdowns (legal and illegal) may lower dissolved oxygen levels, increase water temperatures, expose wildlife to predation, and increase exposure to winter temperatures, altering wildlife behavior and survival.

7.2.5 Abstraction of Ground Water (domestic use) (Avg. Score: 3.00)

- NJ Specific Threats:** 7.2.5.1 Heavy withdrawal of ground water for domestic use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.6 Abstraction of Ground Water (commercial use) (Avg. Score: 3.00)

- NJ Specific Threats:** 7.2.6.1 Heavy withdrawal of ground water for industrial and commercial use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.7 Abstraction of Ground Water (agricultural use) (Avg. Score: 3.00)

- NJ Specific Threats:** 7.2.7.1 Heavy withdrawal of ground water for agricultural use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.9 Small Dams (Avg. Score: 3.00)

- NJ Specific Threats:** 7.2.9.1 Alter the physical, chemical and biological stream environment, causing changes in substrate composition, flow rates, dissolved oxygen, and water temperatures.

Robust Baskettail

7.2.10 Large Dams (Avg. Score: 3.00)

NJ Specific Threats: 7.2.10.1 Alter the physical, chemical and biological stream environment, causing changes in substrate composition, flow rates, dissolved oxygen, and water temperatures.

7.2.11 Dams (size unknown) (Avg. Score: 3.00)

NJ Specific Threats: 7.2.11.1 Alter the physical, chemical and biological stream environment, causing changes in substrate composition, flow rates, dissolved oxygen, and water temperatures.

7.2.13 Stream Burial (Avg. Score: 3.00)

NJ Specific Threats: 7.2.13.1 Eliminates riparian habitats.

7.2.13.3 Alters the hydrology and quality of downstream aquatic and riparian habitats.

7.2.14 Tidal Water Management (Avg. Score: 1.00)

NJ Specific Threats: 7.2.14.1 Freshwater tidal management for flood control alters water levels and salinity in tidal wetlands.

7.2.14.2 Tidal water management for the purpose of managing for select species may alter existing hydrologic or vegetative conditions to the detriment of other species.

7.2.14.3 Open marsh water management (and other techniques) to control mosquito populations may alter existing hydrologic or vegetative conditions to the detriment of other species.

7.3 Other Ecosystem Modifications

7.3.3 Removal of coarse woody debris (streams, forests, scrub-shrub habitats) (Avg. Score: 1.00)

NJ Specific Threats: 7.3.3.1 Decreases the available detritus that normally accumulates behind and within stream obstructions, minimizing or eliminating food sources and shelters for fishes, invertebrates and amphibians.

7.3.3.2 Decreases habitat and/or corridor suitability due to limited or absent shelter and foraging habitat.

7.3.5 Poor habitat management (Avg. Score: 2.00)

NJ Specific Threats: 7.3.5.1 Improper or poorly scheduled maintenance of man-made corridors (e.g., roadsides and medians) can cause direct mortality to and may reduce productivity of wildlife.

7.3.5.2 Shifting from natural vegetation to lawns can cause increased temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

7.3.5.4 Vegetation clearing or inappropriate alteration adjacent to aquatic habitats threatens aquatic species by degrading habitat and water quality (altering temperature and dissolved oxygen, increasing siltation and desiccation, etc.).

7.3.5.9 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, eliminates shallow water habitats, and disrupts/removes stream bottom habitat.

7.3.5.10 Ditching, draining and filling of marshes and wetlands eliminates habitat and degrades the remaining surrounding areas for wildlife.

7.3.5.12 Lack of diversity in age structure and composition of vegetation due to lack of natural disturbances and/or vegetation management.

8 Invasive and Other Problematic Species, Genes and Diseases

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.1 Unspecified Species (Avg. Score: 1.00)

NJ Specific Threats: 8.1.1.1 Displace or outcompete native species for resources.

8.1.1.2 Alters, degrades and/or reduces the structural diversity of the natural composition of the landscape, including aquatic systems.

8.1.1.3 Invasive, non-native insects can damage native vegetation at a large scale, leading to die-offs, altering the ecological community.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Robust Baskettail

- 8.1.1.4 Invasive, non-native animals increase the risk of predation on native animals and/or herbivory on native vegetation.
- 8.1.1.5 Invasive, non-native animals and plants increase the risk of introduction and transference of diseases
- 8.1.1.6 Invasive, non-native plants may create physical barriers for some species.

8.1.5 Invasive non-native terrestrial/wetland plants (Avg. Score: 2.00)

NJ Specific Threats: 8.1.5.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.6 Diseases of Unknown Cause

8.6.0 Unknown Diseases (Avg. Score: 1.00)

NJ Specific Threats: 8.6.0.1 Diseases yet to be identified by pathologists and virologists cause decreased fitness or mortality to native populations.

9 Pollution

9.1 Domestic and Urban Waste Water

9.1.1 Sewage (Avg. Score: 3.00)

NJ Specific Threats: 9.1.1.1 Degradation of aquatic and marine water quality and habitats by changing turbidity, flow and water chemistry.

9.1.1.2 Leads to increased eutrophication and algae blooms that result in oxygen depletion.

9.1.1.3 Contaminants in sewage treatment effluents and Combined Sewer Overflows can cause developmental and behavioral abnormalities and reproductive failure in wildlife.

9.1.2 Run-off (Avg. Score: 3.00)

NJ Specific Threats: 9.1.2.1 Chemical fertilizers and nutrient run-off changes the pH in streams and ponds and causes eutrophication in inland waters and estuaries, which can make habitat unsuitable for specialist species and increase the risk of invasive and generalist species.

9.1.2.2 Contaminants degrade aquatic and marine water quality and can bioaccumulate in benthic organisms, threatening wildlife by causing developmental and behavioral abnormalities and reproductive failure.

9.1.2.3 Contaminants from road runoff (oil, sediment, salt, etc.) impact native vegetation and the species that rely upon them, degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.

9.2 Industrial and Military Effluents

9.2.1 Oil Spills (Avg. Score: 3.00)

NJ Specific Threats: 9.2.1.1 Oil spills render resting, breeding and foraging habitats temporarily unavailable to wildlife, altering normal wildlife behavior.

9.2.1.2 Oil spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.

9.2.1.3 Oil spills cause external oiling of wildlife and ingestion of oil, both of which can injure or kill wildlife.

9.2.2 Seepage from Mining (Avg. Score: 1.00)

NJ Specific Threats: 9.2.2.1 Contaminants from mining degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.

9.2.3 Other (Avg. Score: 3.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Robust Baskettail

NJ Specific Threats: 9.2.3.1 Point and nonpoint source pollution such as polychlorinated biphenyls (PCBs), pesticides, heavy metals, and endocrine disrupting compounds (EDC's) into freshwater and marine systems pose threats to wildlife through direct contact and/or ingestion, and to aquatic species and their predators through bioaccumulation, impacting the reproductive success and neurological function of many avian and fish species.

9.2.3.2 Chemical spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.

9.2.3.3 Chemical spills may render resting, breeding and foraging habitats temporarily unavailable to wildlife, altering normal wildlife behavior.

9.2.5 Other: Industrial toxic settling ponds (Avg. Score: 1.00)

NJ Specific Threats: 9.2.5.1 Surficial or open industrial effluent ponds can cause injury or death to wildlife that become exposed through ingestion or submersion.

9.3 Agricultural and Forestry Effluents

9.3.1 Nutrient Loads (Avg. Score: 3.00)

NJ Specific Threats: 9.3.1.1 Chemical fertilizers and nutrient run-off changes the pH in streams, ponds and wetlands and causes eutrophication in inland waters and estuaries, which can make habitat unsuitable for specialist species and increase the risk of invasive and generalist species.

9.3.1.2 Animal waste degrades terrestrial and aquatic habitats, especially streams, ponds and wetlands, resulting in eutrophication, which disrupts oxygen and nutrient balances, and causes injury and mortality to aquatic organisms.

9.3.2 Soil Erosion and Sedimentation (Avg. Score: 3.00)

NJ Specific Threats: 9.3.2.1 Soil erosion, sedimentation and destruction of streambanks and riparian buffers degrade waters making them unsuitable for riparian-dependent wildlife.

9.3.3 Herbicides and Pesticides (Avg. Score: 3.00)

NJ Specific Threats: 9.3.3.1 Pesticides degrade terrestrial and aquatic habitats, especially streams, ponds and wetlands. Aquatic wildlife are particularly sensitive to these contaminants, which can cause developmental and behavioral abnormalities and reproductive failure. Some contaminants may bioaccumulate in predatory fish and birds and disrupt reproduction.

9.3.3.3 Use of pesticides can directly harm non-target species through direct contact and/or by reducing and/or contaminating their food supply.

9.3.5 Control of insect pests and plants leading to mortality of non-target species (Avg. Score: 3.00)
not associated with agriculture

NJ Specific Threats: 9.3.5.1 Use of pesticides, insecticides, and/or herbicides can directly harm non-target species, such as amphibians and beneficial invertebrates through direct contact and/or by reducing and/or contaminating their food supply.

9.3.5.4 Improper use of current insecticides, such as those containing esfenvalerate, prallethrin, or piperonyl butoxide, or past use of pesticides containing chlordane still present in the soils, are toxic to various wildlife species, and can cause injury, mortality, or other effects that impair population viability.

9.3.5.5 Use of pesticides and herbicides can minimize the abundance of food sources for native wildlife populations.

9.5 Air-Bourne Pollutants

9.5.1 Acid Rain (Avg. Score: 1.00)

NJ Specific Threats: 9.5.1.1 Causes acidification of water bodies, resulting in changes to aquatic and marine communities and reducing biodiversity, and creating conditions that are unsuitable for some aquatic (freshwater and marine) and semi-aquatic species that are sensitive to pH shifts.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Robust Baskettail

9.5.4 Other (Avg. Score: 1.00)

NJ Specific Threats: 9.5.4.1 Dust and/or airborne sedimentation from construction sites, agricultural operations or related earth disturbances can introduce mineral or organic sediments into adjacent wildlife habitats, degrading their quality and suitability for wildlife short-term and/or long-term.

9.5.6 Herbicides and Pesticides (Avg. Score: 3.00)

NJ Specific Threats: 9.5.6.1 May result in injury or direct mortality of non-target species.

9.6 Excess Energy

9.6.2 Thermal Pollution (Avg. Score: 1.00)

NJ Specific Threats: 9.6.2.2 Water temperature changes to aquatic systems can deter or preclude use by SGCN (e.g., alter habitat suitability for wildlife species, reduce prey base) or present stressors that are harmful if not fatal to wildlife.

11 Climate Change and Severe Weather

11.1 Habitat Shifting or Alteration

11.1.0 Macro- and Micro-Climate Alterations (Avg. Score: 3.00)

NJ Specific Threats: 11.1.0.1 Alters native terrestrial and aquatic habitats at the macro- and micro-climate levels that can affect suitability for wildlife, in particular specialist species.

11.2 Droughts

11.2.1 Droughts (Avg. Score: 3.00)

NJ Specific Threats: 11.2.1.1 Contribute to hardened soils, decreasing water recharge during rains and increasing the likelihood of flash floods during storms.

11.2.1.2 Lead to lower groundwater levels and therefore, less available water for people and habitats.

11.2.1.3 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

11.3 Temperature Extremes

11.3.1 Temperature extremes (Avg. Score: 1.00)

NJ Specific Threats: 11.3.1.1 Increasing temperatures may cause habitat loss and degradation by desiccating and/or raising the temperatures of small wetlands and streams leading to the loss of freshwater mussels and other aquatic species and species reliant upon these habitats.

11.3.1.2 Increased temperatures can negatively impact wetland, riverine, lacustrine and vernal pool-associated or -dependent wildlife by reducing flows, increasing water temperatures, lowering water levels and causing premature drying of vernal habitats.

11.3.1.3 Temperature extremes of surface water and air degrades marine habitats and ecosystems, threatening marine wildlife. Such extremes also disrupt offshore currents and migratory patterns, species' ranges, and/or impact communities/food chains, all of which further impact the ecosystem.

11.4 Storms and Flooding

11.4.1 Storms and flooding (Avg. Score: 3.00)

NJ Specific Threats: 11.4.1.1 Extreme storms and flooding events threaten aquatic and marine wildlife through habitat degradation and alteration, including alterations to off-shore or back-bay benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic and marine wildlife.

11.4.1.5 Storm damage can alter forest structure via blow-downs or micro-bursts, and can destroy bird nesting in the locales where the storms occur.

11.4.2 Increased rainfall (Avg. Score: 2.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Robust Baskettail

- NJ Specific Threats:** 11.4.2.1 Extreme rain events threaten aquatic wildlife through habitat degradation and alteration, including alterations to benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic wildlife.
- 11.4.2.2 Extreme rain events can damage wildlife nesting and resting habitats, including impacts to avian eggs and chick and small mammal survivorship.
- 11.4.2.3 More frequent rain events can alter terrestrial and wetland vegetation communities as well as wetland hydrology, shifting wildlife community use.

11.6 Phenology Shifting or Alteration

- 11.6.3 Phenology shifts related to species redistribution (Avg. Score: 1.00)

- NJ Specific Threats:** 11.6.3.1 Shifts in timing of species migration, breeding and hibernation, and available food resources, as a result of wildlife range shifts driven by climate change.

12 Resource Management Needs

12.1 Resource information collection needs

- 12.1.1 Lack of initial baseline inventory (Avg. Score: 3.00)

- NJ Specific Threats:** 12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.
- 12.1.1.2 Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.

- 12.1.2 Lack of up-to-date existing information (Avg. Score: 3.00)

- NJ Specific Threats:** 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

- 12.1.3 Need to answer research question (Avg. Score: 3.00)

- NJ Specific Threats:** 12.1.3.1 There are significant knowledge gaps regarding distribution, dispersal, diseases, population trends, etc. of SGCN.

- 12.1.4 Need to develop new technique (Avg. Score: 3.00)

- NJ Specific Threats:** 12.1.4.1 Improve and evaluate survey methods for SGCN and their habitats; alter as needed.

12.3 Regulatory Reform

- 12.3.0 State Regulatory Reforms (Avg. Score: 1.00)

- NJ Specific Threats:** 12.3.0.1 Regulatory habitat protections within state land use regulations are spatially limited to specific geographic areas (e.g., Pinelands, Coastal Area) or geographic features (e.g., wetlands, streams) and so fail to protect critical habitats that exist outside of these regulated areas.
- 12.3.0.6 Certain geographic or habitat features, such as vernal pools and headwater wetlands or streams, may be too small, mischaracterized, or misidentified to benefit from regulatory protection.
- 12.3.0.7 Activities that threaten SGCN, their food sources, and/or habitats are often regulated separately and without consideration for the cumulative and synergistic effects over time or over a larger spatial scale. Therefore, regulations can fail to protect SGCN populations over time.
- 12.3.0.10 Land use regulatory processes pertaining to habitat creation, enhancement or restoration projects can be costly and/or burdensome, precluding or discouraging the development or implementation of conservation projects.

12.4 Internal Policy & Procedures Reform

- 12.4.0 State Policy and Procedure Reform (Avg. Score: 1.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Robust Baskettail

- NJ Specific Threats:** 12.4.0.1 A species-by-species management focus as opposed to ecological systems and biodiversity generally has greater opportunity for unintended consequences for other species and may be less efficient in developing appropriate management actions.
- 12.4.0.2 Policies and procedures for lands management that lack consideration of the impacts of activity timing can result in unintended impacts to wildlife during vulnerable periods.
- 12.4.0.5 Bureau of Forest Fire Management policy has traditionally implemented prescribed burns on State lands for the sole purpose of public safety (i.e., addressing hazard fuel reduction), missing opportunities to burn in a manner that would additionally manage habitat for ecological diversity.
- 12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats (Avg. Score: 3.00)

- NJ Specific Threats:** 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.
- 14.1.1.2 Lack of general knowledge of SGCN life histories and vulnerabilities as they relate to land management practices.
- 14.1.1.3 Lack of understanding of the need to manage both natural and anthropogenic (e.g., yards, lawns, hayfields, etc.) habitats to minimize impacts or increase benefits to SGCN and their habitats.

14.2 Outreach needs

14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions (Avg. Score: 3.00)

- NJ Specific Threats:** 14.2.1.1 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various forest management practices.
- 14.2.1.2 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various aquatic and riparian management practices.
- 14.2.1.5 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various wetland management practices.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning (Avg. Score: 1.00)

- NJ Specific Threats:** 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Actions to address the Threats and Action Drivers associated with this Conservation Target:

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

Robust Baskettail

- 1.2.1.2 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to increase the effective size of SGCN habitats by protecting/restoring adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats.
- 1.2.1.6 Secure and promote the protection/restoration of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers through incentive programs.
- 1.2.1.7 Secure and promote the protection/restoration of fish SGCN habitats by protecting lands adjacent to fish SGCN habitats and/or aquatic systems feeding into such habitats through incentive programs.
- 1.2.1.8 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to municipalities, land developers, and other land managers to retain and/or enhance native vegetation adjacent to aquatic habitats, and along riparian areas and wildlife movement corridors.
- 1.2.1.9 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing Forestry Stewardship Programs.
- 1.2.1.10 Coordinate across government agencies and non-government organizations to maximize the availability of and enrollment in existing landowner incentive programs (e.g., "farm bill," partners, etc.) to maintain and/or improve habitat.
- 1.2.1.11 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 1.2.1.12 Create incentives (non-monetary and/or monetary) for land developers to redevelop abandoned areas (e.g., shopping centers, office complexes) to minimize the loss of natural habitats and reduce the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 1.2.1.13 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to land developers to minimize the impacts of new residential and commercial developments on SGCN and their habitats.
- 1.2.1.14 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of herbicides and pesticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.15 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of rodenticides, and implementing more ecologically safe strategies when using such products.

Robust Baskettail

- 1.2.1.16 Create incentives (non-monetary and/or monetary) within State regulations (mitigations requirements or credit, BMP satisfaction, etc.) to promote the use of retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.17 Develop a public-relations oriented certification program for private retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.18 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and land managers to control and reduce the impacts of invasive, native and non-native species in order to increase structural habitat diversity.
- 1.2.1.19 Create incentives for federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to farmers, woodland landowners, and private landowners to adopt and/or endorse consistent BMPs concerning controlled burns to maintain and/or improve wildlife habitat.
- 1.2.1.20 Coordinate across government agencies and non-government organizations to create or expand upon tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMP's.
- 1.2.1.21 Create and/or support market-based programs that subsidize or create branding for products derived sustainably from managed wildlife habitats.
- 1.2.1.22 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to horse/livestock farm owners and managers to increase structural habitat diversity in and around the farms by managing vegetation for a variety of species, in particular, farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 1.2.1.23 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to provide cost shares and/or plan approvals for management based on management approaches and prescriptions.
- 1.2.1.24 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners, with habitat of suitable patch size to support breeding grassland-dependent species, to alter the timing of vegetation management to benefit grassland and pollinator species.
- 1.2.1.26 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing landowner incentive programs.

2 Direct Management of Natural Resources

2.3 Fire management

2.3.2 Fuel reduction

- 2.3.2.1 Prevent wildfires by reducing natural fuel (e.g., leaf litter).

2.3.3 Prescribed burning

- 2.3.3.1 Evaluate different management techniques of prescribed burns that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 2.3.3.2 Conduct prescribed burning in Northern New Jersey forests to maintain and regenerate a mosaic of upland forest habitats.
- 2.3.3.3 Conduct prescribed burning to improve wildlife habitat.

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

- 2.8.0.1 Control invasive insect infestations by implementing BMP strategies through biological, chemical and/or mechanical means that will depress, or when appropriate, eradicate populations in a manner that avoids excessive harm to non-target species using BMPs to control infestations and limit their spread based on an inventory of invasive insect distribution and response to outbreaks.
- 2.8.0.2 Develop, implement, monitor and evaluate pest control/management strategies to reduce the impacts of over-abundant wildlife species (native and/or native, invasive species) on native vegetation and the degradation of habitats supporting SGCN. Over-abundant wildlife species include but are not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.
- 2.8.0.5 Implement biologically safe and appropriate control/management strategies, and where appropriate, eradication strategies to reduce the impacts and/or limit the distribution of invasive and/or non-native plant species within or near aquatic systems using methods that will provide the most protection to the aquatic and riparian ecological system, and minimize disturbance to the soil and wildlife. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.
- 2.8.0.6 Implement long-term management of invasive and/or non-native plants to help maintain functioning ecological systems and biological diversity, and to enhance travel corridors. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

- 2.10.0.1 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 2.10.0.2 Improve the availability of prey/food resources through terrestrial and aquatic plantings and habitat restoration for SGCN populations, in particular for those populations thought to be limited due wholly or in part to a lack of (or contaminated) food resources, and for migratory species (birds, bats, invertebrates).
- 2.10.0.3 Restore and/or enhance habitats to benefit urban-associated SGCN.
- 2.10.0.4 Restore and/or enhance suitable travel corridors connecting conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats.

Robust Baskettail

- 2.10.0.5 Implement habitat restoration and/or enhancement activities that include the creation of vegetative buffers between sensitive habitats (e.g., aquatic systems) and human-inhabited areas (e.g., residences, parks, etc.) and that is conducted during appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity
- 2.10.0.6 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats.
- 2.10.0.7 Restore/reclaim and enhance degraded rare species habitats through strategic revegetation and management efforts for documented/target SGCN.
- 2.10.0.8 Protect significant natural and/or unique communities by implementing best management practices when conducting habitat restoration strategies.
- 2.10.0.9 Restore and/or enhance riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation, alteration and/or changes in hydrology and subsequent disturbances to and behavioral changes of wildlife (e.g., restoring biologically appropriate buffers, revegetation or restoration efforts, etc.).
- 2.10.0.10 Minimize the loss of important habitats (e.g., coastal scrub-shrub and grassy habitats, high and low marsh habitats, etc.) that provide nesting, migrating, and wintering areas for SGCN birds and other coastal and marsh-dependent species through habitat restoration efforts.
- 2.10.0.11 Restore and/or enhance critical migratory terrestrial and aquatic habitats (e.g., beach, grasslands, forest, scrub-shrub, etc.) for songbirds, raptors, shorebirds, waterfowl, bats and invertebrates through habitat restoration efforts and expand habitat restoration to adjacent private lands to increase the effective size of the habitat.
- 2.10.0.12 Create and/or maintain scrub-shrub habitats through revegetation efforts with little to no impact on forested, wetland and grassland habitats to maintain populations of shrub-dependent SGCN.
- 2.10.0.14 Implement best management practices (BMPs), protective strategies and guidelines for restoring and enhancing healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.10.0.15 Restore and/or enhance terrestrial and aquatic habitats proximate to but not adjacent to roads and other transportation corridors for terrestrial-bound SGCN species whose behavior (i.e., dispersal across roads) may be altered by doing so, and therefore decrease road mortality of such species (e.g., amphibians, snakes, turtles, small mammals).
- 2.10.0.21 Restore and/or enhance understory habitats that suppress invasive species and provide critical resources and enhance sheltering, foraging, and nesting cover for wildlife.
- 2.10.0.22 Restore and/or enhance terrestrial and aquatic habitats to promote the regeneration of native vegetation and enhance structural diversity to benefit SGCN (e.g., vegetative buffers of aquatic systems, allow coarse, woody debris to remain in terrestrial, aquatic and riparian habitats to provide shelter, riparian stabilization and necessary microclimates, plant native trees, shrubs and grasses, etc.).

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Robust Baskettail

- 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.
- 2.11.0.2 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas for target SGCN and/or species groups; management should complement rare species needs in a targeted area.
- 2.11.0.3 Create suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats through vegetation management.
- 2.11.0.4 Implement vegetation management strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife, particularly SGCN.
- 2.11.0.5 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats through vegetation management.
- 2.11.0.6 Reclaim degraded rare species habitats by conducting vegetation management needed to restore habitat value for the documented/target SGCN.
- 2.11.0.7 Protect significant natural and/or unique communities by implementing best management practices through vegetation management.
- 2.11.0.8 Maintain, enhance and/or restore biologically appropriate buffers for SGCN-inhabited/used freshwater wetlands through vegetation management.
- 2.11.0.23 Implement appropriate habitat management actions in areas where natural disturbances, such as wildfire, have been precluded.
- 2.11.0.24 Conduct vegetation management adjacent to aquatic habitats following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.25 Conduct vegetation management along access roads following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.26 Conduct vegetation management along roadsides and medians, avoiding peak activity periods for wildlife, that enhances wildlife dispersal naturally and safely across roads and similar barriers to/between terrestrial and/or aquatic habitats.
- 2.11.0.27 Conduct vegetation management for target shrub- or young forest-dependent SGCN following BMPs to minimize the risk of the establishment of invasive and non-native plants.
- 2.11.0.28 Conduct vegetation management in agricultural areas following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.29 Conduct vegetation management on transportation and service corridors (i.e., rights-of-way) following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.30 Identify and prioritize areas where various management tools (such as increasing salinity through the management of water levels or chemical applications) may be effective in reducing phragmites within and restoring marsh habitat.
- 2.11.0.31 In areas where vegetative communities are shifting due to fire suppression and controlled burns are not feasible, manage vegetation to improve wildlife habitat.

Robust Baskettail

- 2.11.0.32 Increase structural habitat diversity around and when feasible, within agricultural landscapes by managing vegetation for a variety of species, in particular, those farms that have removed scrub-shrub habitat and/or fragmented forests, and by implementing ecologically best practices (e.g., no-till farming, maintaining hedgerows, buffer set-asides, etc.).
- 2.11.0.33 Increase structural habitat diversity by implementing long-term vegetation management to minimize the potential for the establishment of invasive and/or non-native plants that may outcompete native vegetation.
- 2.11.0.34 Increase structural habitat diversity by managing residential, commercial and recreational areas' landscapes for a variety of species. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.35 Increase structural habitat diversity by managing vegetation adjacent to aquatic habitats in a manner that provides a buffer from runoff and erosion and a microclimate to stabilize seasonal temperatures to benefit a variety of aquatic and semi-aquatic species.
- 2.11.0.36 Increase structural habitat diversity by managing vegetation for a variety of species and considering their life history requirements (e.g., travel corridors, shelter, resting and breeding areas) to minimize the risk of harm.
- 2.11.0.38 Increase structural habitat diversity in and around horse/livestock farms by managing vegetation for a variety of species, in particular, in and around farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 2.11.0.39 Increase structural habitat diversity in and around solar farms by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.40 Increase structural habitat diversity surrounding areas used for energy, mining, and transportation and service corridors by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides, and avoid managing habitat during the breeding seasons for ground-nesting birds, reptiles, amphibians and small mammals.
- 2.11.0.41 Increase structural habitat diversity through the implementation of a variety of vegetation management practices such as prescribed burns (either increasing or decreasing their frequency depending on the site and objective), plantings, etc. that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.42 Increase structural habitat diversity within wind farms for terrestrial bound and low-flying species and around wind farms for other wildlife by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.43 Manage forests to increase variation in age structure and composition using BMPs that promote and maintain functioning ecological forest-based systems and biological diversity.
- 2.11.0.45 Regularly and/or rotationally create young forest habitat in targeted areas to maintain and regenerate a mosaic of upland forest habitats that will benefit shrub- and young forest-dependent species.

Robust Baskettail

2.12 Water management

2.12.1 Ditch plugs

- 2.12.1.1 Implement best management practices (BMPs), protective strategies, and guidelines for ditch plugging to maintain and enhance healthy, resident and migratory SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

2.12.3 Drainage

- 2.12.3.2 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) such as removing drainage ditches to restore natural stream flows and wetlands, that benefit wildlife inhabiting these areas.
- 2.12.3.3 Remove tile drains and drainage ditches to improve wetland hydrology and restore natural stream flows during appropriate times to avoid sensitive periods (e.g., nesting, denning, roosting) and minimizes harm to wildlife, particularly SGCN.
- 2.12.3.4 Expand the acreages and enhance the effective size of SGCN habitats by reclaiming/restoring adjacent, degraded habitats by removing tile drains and drainage ditches.
- 2.12.3.5 Remove drainage ditches adjacent to roads to decrease the attraction for amphibians, reptiles and small mammals, and thereby minimizing road mortality of such species (e.g., amphibians, snakes, turtles, small mammals).
- 2.12.3.6 Protect significant natural and/or unique communities by and when removing tile drains and drainage ditches.
- 2.12.3.7 Minimize habitat loss of critical coastal habitats that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas by removing drainage ditches.
- 2.12.3.8 Enhance critical migratory stopover beach habitats for songbirds, raptors, shorebirds, bats and invertebrates by removing drainage ditches and expanding management to adjacent private lands to increase the effective size of the habitat.
- 2.12.3.9 Implement drain removal on state and other conservation lands to enhance food availability for migratory species (birds, bats, invertebrates).
- 2.12.3.10 Use tile drain and drainage ditch removal to create feeding and roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.
- 2.12.3.11 Implement best management practices (BMPs), protective strategies, and guidelines when removing tile drains and drainage ditches to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

2.13 Wildlife damage management

2.13.0 Nuisance fish and wildlife damage

- 2.13.0.4 Investigate the effects of mosquito control methods on freshwater aquatic and semi-aquatic SGCN including but not limited to, amphibian, fish, dragonfly, and damselfly populations.

2.14 Wildlife disease management

Robust Baskettail

2.14.0 Wildlife disease strategy development and investigation

- 2.14.0.1** Investigate diseases/pathogens impacting SGCN and/or their habitats.
- 2.14.0.2** Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
- 2.14.0.3** Protect SGCN from exotic pathogen introduction or incident through implementation of a "rapid response plan"; DFW to give priority attention to these species in planning and/or implementing a response.
- 2.14.0.4** Conduct long-term monitoring of diseases in vulnerable wildlife to determine the magnitude of exposure within populations and around the State, the impacts to those species, in particular SGCN, and investigate the feasibility of mitigating for such impacts.
- 2.14.0.5** Assess the impacts of diseases on the life cycles of wildlife.

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

- 3.0.0.1** Conduct long-term monitoring of resident and migratory SGCN populations using standardized survey protocols to determine the variables that may impact their long-term persistence in the State (e.g., population viability, distribution, dispersal, home range and habitat use, travel corridors, food availability, vulnerability to pollutants and disease, etc.). Compile this information to determine the likely causes of population declines and to understand metapopulation dynamics. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.2** Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) where data gaps exist regarding SGCN distribution, and their critical and supportive habitats. Conduct surveys using standardized survey protocols to acquire baseline data, and provide the data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
- 3.0.0.3** Gather baseline data on SGCN inhabiting permanently protected natural lands regarding their distribution and population (e.g., abundance, dispersal, demography including productivity and survival, etc.), and identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) critical and supporting habitats within those landscapes.
- 3.0.0.4** Conduct long-term studies on SGCN inhabiting permanently protected natural lands to develop population trend data and changes in demography, and to determine if critical and/or supporting habitats are limited or changing; i.e., diminishing in value, acreage or connectivity.
- 3.0.0.7** Collect baseline data to document species distributions, in particular SGCN, and current habitat for future analysis of possible distribution shifting as a result of habitat shifting or alteration associated with climate change impacts.
- 3.0.0.8** Conduct long-term studies and compare baseline metrics of documented species distributions and associated habitats to identify possible species and/or habitat shifting or alteration associated with climate change impacts.
- 3.0.0.13** Investigate the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats. Evaluate and modify management practices as appropriate.

Robust Baskettail

- 3.0.0.14 Identify areas with invasive, aquatic plants and animals and collect a detailed baseline assessment of the species' status and distribution. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort. Researchers and contractors performing Forest Stewardship Inventories and/or Plans on state lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.0.0.15 Conduct long-term monitoring of areas identified as having invasive, aquatic plants and animals to track the species' status/progress over time with or without the implementation of management strategies. Areas without management strategies should be assessed and prioritized for management/control. Areas where management strategies are being implemented should include an assessment of the management effort and identify/recommend and implement necessary changes to improve its success. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort.
- 3.0.0.19 Identify the presence and status (e.g., functioning, structure, slated for removal, etc.) of existing dams and culverts within and/or that may impact SGCN and their habitats, and create a database that includes a GIS component identifying the locations of such structures and their status. Share this information with appropriate organizations and/or agencies evaluating the benefits and risks of such structures on SGCN and their habitats.
- 3.0.0.20 Once baseline data identifying and describing the status of existing dams and culverts have been gathered, conduct evaluations at a variety of sites to determine whether the benefits of culvert and dam creation or removal outweigh the risks to SGCN species and their habitats, and if other variables/conditions specific to individual sites/locations result in a different outcome. Identify and target appropriate dams and culverts for removal and/or reconstruction to minimize harm to SGCN species and their habitats.
- 3.0.0.23 Identify (through wildlife and aquatic system surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and research water quality parameters for all [types of] aquatic systems for various SGCN populations.
- 3.0.0.26 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species including objectives and guidance pertaining to and the condition/status of critical and supporting habitats.
- 3.0.0.27 Evaluate the effectiveness of strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals through research and monitoring. Develop and provide NJ DEP and other appropriate governing agencies/commissions a summary of findings and recommendations to improve such efforts.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.1 Division of Fish and Wildlife should maintain a robust, up-to-date database and mapping of species occurrences.
- 3.2.0.3 Survey for and monitor populations of freshwater aquatic focal SGCN to assess the populations' demography, trends, condition, distribution, etc.
- 3.2.0.7 Track (via a database that includes a GIS component) and research problematic species and diseases to determine their distribution, impacts on SGCN wildlife/wildlife communities, and develop potential control measures.

Robust Baskettail

- 3.2.0.8 Implement and conduct long-term monitoring of control measures aimed at minimizing the impacts of problematic species and/or diseases to evaluate the effectiveness of such efforts and to identify and incorporate additional strategies as appropriate.
 - 3.2.0.18 Conduct baseline surveys/inventories to better understand the distribution of fish and invertebrate (including freshwater mussels) populations.
 - 3.2.0.21 Investigate the effects of mosquito control methods on freshwater aquatic and semi-aquatic SGCN including but not limited to, amphibian, fish, dragonfly, and damselfly populations.
 - 3.2.1 Abundance determination
 - 3.2.1.1 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) population abundance and trends for SGCN using standardized survey protocols. Provide data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
 - 3.2.1.2 Conduct wildlife surveys on resident and migratory SGCN regarding their population abundance and trends.
 - 3.2.2 Age, size and sex structure
 - 3.2.2.1 Conduct wildlife surveys on resident and migratory SGCN regarding their survivorship.
 - 3.2.3 Baseline inventory
 - 3.2.3.9 Investigate hazardous environmental issues that may impact grassland invertebrates.
 - 3.2.7 Population assessment
 - 3.2.7.1 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
 - 3.2.7.2 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species to meet and maintain recovery goals.
 - 3.3 Research, survey or monitoring - habitat
 - 3.3.1 Baseline inventory
 - 3.3.1.1 Conduct habitat assessments of significant natural and/or unique communities to identify threats to native terrestrial and aquatic habitats through systematic monitoring, review of available data, enlistment of habitat management and/or species experts, etc. Incorporate findings into a database that includes descriptions/qualifiers of the habitats, identifies and values/qualifies the threats, and includes a GIS component of the locations of the assessed areas. Share this information with landowners/managers (e.g., federal, state and local government agencies or non-government organization).
 - 3.3.1.2 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) resident and migratory SGCN habitats. Investigate their suitability for the various life history requirements of the species that dependent upon them to determine the ability for maintaining applicable SGCN populations in perpetuity.
 - 3.3.1.4 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and investigate the suitability of corridors that connect large, contiguous tracts of similar habitats to increase their effective size (i.e., forest with forest, grassland with grassland, wetlands with wetlands, etc.) for dependent SGCN.
 - 3.3.1.5 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) where habitat restoration and/or enhancement would benefit wildlife SGCN.

Robust Baskettail

- 3.3.1.6 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) that could, through revegetation and/or enhancement efforts, become suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN.
- 3.3.1.7 Map and prioritize existing and potential areas for early succession forest management. Share the results with state, county and municipal planners.
- 3.3.1.8 Assess the availability and suitability of forest habitats for SGCN species (particularly reptiles and amphibians, birds, pollinators, and tiger beetles) in southern forests since Superstorm Sandy.
- 3.3.1.10 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and document fish SGCN habitats by plotting their distributions in GIS and submitting the data to the State for integration into the DEP's Biotics database.
- 3.3.1.16 Gather "best information" for spatial modeling and update/create a current model/depiction of anticipated habitat shifts from sea-level rise, flooding, etc.
- 3.3.1.17 Identify and map undeveloped roads and trails in all conserved forests, and create a database of locations. Integrate information regarding potentially sensitive areas.
- 3.3.1.18 Conduct an assessment using available data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels.
- 3.3.1.19 Identify and codify legal ORV access areas on state (and if appropriate, other conserved) lands. Provide GIS mapping to the landowner for potential use in directing such recreational activities.
- 3.3.1.20 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) where invasive, non-indigenous plants and animals are either already established or are becoming established. Create a system for reporting and qualifying new locations of invasive species and for prioritizing areas for control measures according to the potential level of impact on the ecosystem and SGCN and the likelihood of success. Researchers and contractors encountering invasive plant species while performing plant and/or forest inventories on state or other conserved lands and/or private lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.3.1.24 Conduct regular investigations of SGCN habitat health and biodiversity on public and private lands to identify locations in need of revegetation, reduction of over-abundant, native wildlife and/or exotic species, conservation focal areas requiring limitations on human activity, etc.
- 3.3.1.26 Survey all historic locations and unsurveyed suitable habitats to identify populations of freshwater aquatic focal species.
- 3.3.2 Monitoring
 - 3.3.2.2 Conduct long-term monitoring of resident and migratory SGCN habitats using standardized survey protocols to determine changes in habitat quality/suitability and threats (e.g., habitat loss and degradation, increased edge habitat, water quality) and other variables that may impact their long-term persistence in the State and to provide information needed for determining causes of population declines and understanding metapopulation dynamics.
 - 3.3.2.3 Continue to update wildlife and habitat databases and revise models of critical SGCN habitats using the most current data available and where lacking, develop new SGCN and/or habitat models as data on species habitat requirements and applicable GIS data layers become available.

Robust Baskettail

- 3.3.2.4 Protect water quality and aquatic-dependent species by appropriately designating Category 1 waters and enforcing protective regulations. Seek appropriate classifications for stream segments based on Endangered and Threatened Status and/or the Index of Biotic Integrity (IBI) results that do not fulfill Category One requirements.
- 3.3.2.5 Conduct long-term monitoring of water quality of SGCN aquatic habitats (and aquatic systems feeding into those habitats) to evaluate protection and management efforts to reduce, if not eliminate, chemical contamination, siltation, eutrophication, and other forms of pollution/contamination of aquatic systems.
- 3.3.2.8 Evaluate the effectiveness of current prescribed burning practices on Pinelands dependent species.
- 3.3.2.10 Evaluate the efficacy and success of different management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.3.2.14 Research and evaluate the effectiveness of water quality management practices on water-dependent and semi-dependent SGCN, particularly those practices associated with permitting or mitigation actions.
- 3.3.2.15 Investigate the effectiveness of management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.3.2.16 Evaluate the effectiveness of best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 3.3.2.20 Once a system is developed for reporting and qualifying new locations of invasive species, develop, implement and monitor/evaluate invasive species removal strategies at identified locations. Priority should be given to those areas critical to SGCN and/or contain unique and/or rare plant communities supporting SGCN and/or other fish/wildlife species.

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.1 Work with land management agencies to determine the appropriate actions needed to restore/reclaim degraded habitat for the documented/target SGCN.
- 3.5.3.3 Develop/improve management techniques that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.8 Develop best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 3.5.3.9 Develop strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 3.5.3.11 Develop strategies to protect native terrestrial and aquatic habitats and dependent SGCN species from the identified threats.
- 3.5.3.14 Develop aquaculture practices in the coastal areas that are compatible with the recovery of SGCN.

Robust Baskettail

- 3.5.3.15 Modify management practices based on the effects of pesticides, herbicides and other biological controls on critical and supporting SGCN habitats.
- 3.5.3.16 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.
- 3.5.3.19 Work with foresters to develop prescribed burning practices for Pinelands dependent species that increase or maintain habitat quality for these species in the Pinelands.
- 3.5.3.21 Develop management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.23 Revise water quality management practices based on research on water-dependent and semi-dependent SGCN, particularly when associated with permitting or mitigation actions.
- 3.5.3.24 Based on research, modify management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.5.3.25 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to develop the necessary management strategies to reach or maintain viable population levels.
- 3.5.4 Fish and wildlife research, survey and management techniques
 - 3.5.4.4 Investigate the effects of mosquito control methods on freshwater aquatic and semi-aquatic SGCN including but not limited to, amphibian, fish, dragonfly, and damselfly populations.
 - 3.5.4.5 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
 - 3.5.4.6 Investigate the feasibility of mitigating for the impacts of contaminants to vulnerable wildlife, particularly SGCN. Maintain records on exposure of vulnerable wildlife to environmental toxins (such as flame retardants and endocrine disruptors), so that sources may be identified and controlled or eliminated.
 - 3.5.4.14 Develop and implement agreements, and update existing agreements, with government agencies regarding the protection of critical SGCN habitats (e.g., significant breeding populations of beach nesting birds, colonial waterbird nesting areas, bat colonies, etc.).
 - 3.5.4.15 Investigate the success of management strategies used to protect and/or enhance SGCN populations and when appropriate, aid in identifying failures/resource problems and issues, and developing new strategies.
 - 3.5.4.16 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels and develop the necessary management strategies.
 - 3.5.4.18 Investigate the effectiveness of survey techniques through selected “ground truthing” and literature and peer review in order to increase efficacy of survey, minimize surveyor bias and error, and increase accuracy of trend data.

Robust Baskettail

3.5.4.19 Develop reliable, standardized survey and monitoring protocols for SGCN species, for which none currently exist, and their habitats.

3.5.4.21 Develop BMPs to address problematic species and diseases of unknown origin.

4 Education

4.1 Educator/Instructor training

4.1.0 Public education

4.1.0.1 Provide educational resources and training programs to private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.

5 Facilities and Areas

5.15 Wildlife Management Areas

5.15.6 Roads

5.15.6.1 Clearly post areas/roads where vehicle access is permitted.

5.15.6.2 Clearly post areas/trails where vehicle access is not permitted.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

6.0.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats through an appropriate combination of fee title, non-fee title and landowner agreements.

6.0.0.3 Secure and protect riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through an appropriate combination of fee title, non-fee title and landowner agreements.

6.0.0.7 Secure and protect critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

6.3 Conservation area designation

6.3.0 Conservation area designation strategies

6.3.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN and/or connect conserved SGCN habitats through conservation area designations.

6.3.0.3 Increase the protection of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through conservation area designations.

7 Law Enforcement

7.1 Law enforcement

7.1.3 Sub-national Level

Robust Baskettail

- 7.1.3.2 Increase the number of law enforcement officers tending to wildlife issues to a reasonable number to sufficiently cover the State and marine waters.

7.1.4 Scale Unspecified

- 7.1.4.1 Improve enforcement of policies and/or regulations that promote the reduction of run-off and point and non-point source pollution into NJ's aquatic systems (streams, rivers, lakes/ponds, bays, ocean, wetlands, etc.).
- 7.1.4.12 Implement policies and/or regulations that protect significant natural and/or unique communities in perpetuity.
- 7.1.4.16 Implement policies that protect and restore riparian areas.
- 7.1.4.17 Improve the enforcement of policies and/or regulations that protect wetlands, riparian and floodplain areas, and aquatic habitats (including open waters).
- 7.1.4.26 Educate law enforcement personnel that there may be unauthorized research projects taking place and to encourage them to investigate any activities that appear to be harmful to wildlife.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.2 Develop a team of personnel from government entities, conservation organizations and other stakeholders engaged in oil/gas spill response for marine and freshwater habitats to develop a feasible plan for oil spill response and/or to amend NJ's current oil spill response plan that clearly outlines each organizations responsibilities and an assessment and location list of available equipment for boom deployment during oil spills.
- 8.1.0.3 Develop an outreach team of personnel from government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 8.1.0.4 Engage government agencies, conservation partners and other stakeholders in constructive dialogues encouraging them to influence policy change and the creation of incentives through a habitat bill and/or municipal ordinances for backyard habitat.
- 8.1.0.15 Engage government agencies, conservation partners and other stakeholders in discussions encouraging and supporting the creation of laws and policies requiring vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 8.1.0.16 Engage local governments in discussions regarding the importance of them adopting/passing ordinances which require assessing and addressing secondary impacts (i.e., ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 8.1.0.17 Engage municipalities in constructive dialogue to identify and minimize destruction of areas prioritized for early succession forest management.
- 8.1.0.18 Engage NJDOT, NJ Transit Authority and other road management entities, wildlife conservation organizations/agencies (e.g., Division of Fish and Wildlife, New Jersey Conservation Foundation, Conserve Wildlife Foundation of NJ), and communities and citizens in discussions regarding the importance of and methods to enhance habitat connectivity, and work together to develop feasible strategies for ensuring that wildlife can disperse naturally and safely across roads and similar barriers to terrestrial and/or aquatic habitats.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Robust Baskettail

- 8.1.0.19 Engage government agencies, conservation partners and other stakeholders to collaboratively develop a list of important projects, targeting SGCN and/or their habitat, as a guide for graduate student research. Distribute the list and contact information to all State colleges and universities.
- 8.1.0.20 Organize a small focal group of government and non-government agencies/organizations responsible for decisions regarding beach/dune management to share and coordinate their goals so that comprehensive planning can attempt to meet all needs.
- 8.1.0.21 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation human-subsidized and/or overabundant, native species cause to local nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.22 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation invasive species cause to native nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.24 Engage government agencies, conservation partners and other stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.25 Provide technical support to public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.26 Coordinate across federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to woodland landowners to adopt or endorse consistent best management practices concerning controlled burns to maintain and/or improve forested habitat for wildlife.
- 8.1.0.30 Encourage government agencies and conservation partners to advise members of the relevant scientific community of the need for specific studies, reports or investigations targeting the data-deficiency regarding SGCN and/or their habitats.
- 8.1.0.33 Engage government agencies, conservation partners and other land managers, communities, landowners, and commercial and industrial stakeholders in discussions regarding the importance of protecting and methods to protect priority wetlands beyond the levels afforded through regulation by maintaining and/or restoring optimal biological buffers around wetlands.
- 8.1.0.34 Work with the NJ Education Association and Department of Education to design curriculum and outdoor experimental learning opportunities, and provide training to teachers on implementation of these activities.
- 8.1.0.37 Enlist landowners and NJ citizens in the protection of and survey efforts for SGCN, in particular rare species, by increasing enrollment in landowner incentives, forest stewardship, backyard habitat management and wildlife-related volunteer programs.
- 8.1.0.38 Engage partners, stakeholders and land managers in constructive dialogue promoting forest stewardship for SGCN that use core forests and forested corridors.
- 8.1.0.40 Encourage researchers, land managers, naturalists and enthusiasts to follow proper procedures for the coordination and/or permitting of research/management activities involving wildlife and sensitive habitats, and discourage activities that alter vegetation or wetlands, or cause harm or disturbance to wildlife.

Robust Baskettail

- 8.1.0.42 Engage citizens, wildlife observers and photographers through discussions and distributable information regarding the importance of and encouraging implementing responsible and ethical behavior when observing wildlife by developing an alliance of wildlife photographers and widely circulating recommendations on how to reduce impact.
- 8.1.0.44 Engage conservation partners, stakeholders, government agencies and other land stewards in constructive dialogues encouraging their inclusion of controlled burns in forest and other stewardship plans.
- 8.1.0.47 Form cooperative partnerships with energy companies to facilitate habitat creation and enhancement away from and outside of project areas, the restoration of appropriate habitats within project areas (e.g., rights-of-way could benefit butterflies and some bird species), and to identify seasonal timing of activities that would minimize impacts to wildlife.
- 8.1.0.48 Form cooperative partnerships with transportation and shipment agencies and companies to facilitate habitat creation and enhancement away from and outside of project areas and to identify seasonal timing of activities that would minimize impacts to wildlife.

8.2 Recruitment and retention activities

8.2.3 For wildlife watching

- 8.2.3.1 Develop and implement nature-focused tourism opportunities including wildlife viewing sites, interpretive signage highlighting unique ecosystems/habitats, and wildlife-related recreational opportunities that do not negatively impact SGCN or their habitats.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.7 Develop and provide (or otherwise make publicly available) educational programs and/or materials that describe the negative impacts of off-road vehicles and watercraft use in and adjacent to critical SGCN habitats, and the importance of confining such activities to more appropriate locations and/or seasons.
- 8.3.0.8 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate recreationists and encourage landowners to eliminate garbage in the vicinity of suitable wildlife habitat, in particular SGCN habitat. Information should include the detrimental impacts garbage may have on various wildlife species.
- 8.3.0.9 Develop and provide (or otherwise make publicly available) educational programs and/or materials to enlist landowners and land managers to include only native plants in landscaping and restoration projects. Provide information to assist them in detecting problematic establishment of invasive, non-indigenous plants.
- 8.3.0.10 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate landowners and NJ citizens on threats to fish and wildlife (including marine animals).
- 8.3.0.11 Develop and provide (or otherwise make publicly available) educational programs and/or materials to the public, wildlife-related professionals, foresters, etc., that describe the value of species that are often feared (e.g., snakes, bats, spiders, Allegheny woodrat) and/or deemed a "nuisance" (e.g., squirrel, deer, snapping turtle), and therefore, persecuted by people. Include information on tolerance, proper identification, eviction from human dwellings, how to minimize the animal's presence on the property, and/or how to live in harmony with the animal.
- 8.3.0.12 Promote awareness of WSFR (Wildlife and Sportfish Restoration) Outreach/Awareness grants, an important funding source for conservation among hunters and anglers as well as the general public.

Robust Baskettail

- 8.3.0.13 Conduct an educational campaign to encourage observer ethics and respect for wildlife and natural habitat.
- 8.3.0.24 Develop educational outreach programs for local decision-makers, land developers, landowners and citizens about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
- 8.3.0.25 Develop educational outreach programs for landowners, nurseries and the general public regarding the negative impacts of invasive and non-native plants on our natural communities.
- 8.3.0.26 Develop educational outreach programs for private and public landowners and land managers regarding the importance of and how to manage core forests and forested corridors in a way that will be beneficial for SGCN, particularly endangered, threatened and special concern species.
- 8.3.0.27 Develop educational outreach programs for public and private landowners and land managers regarding the importance of structural habitat diversity, methods to increase diversity, and/or incentive programs available to increase habitat diversity.
- 8.3.0.29 Develop educational outreach programs for local decision-makers, land developers, landowners and citizens about the importance of maintaining a vegetative buffer along riparian and aquatic habitats to intercept storm water runoff and minimize soil erosion.
- 8.3.0.30 Develop educational outreach programs for private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.
- 8.3.0.32 Develop an educational outreach program for landowners and citizens on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

- 9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and SGCN inhabiting them.
- 9.1.0.2 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.1.0.3 Develop a plan that directs the creation of impervious surfaces away from and to minimize impacts on aquatic systems and critical terrestrial habitats. The plan should also include strategies to increase the resiliency of aquatic and critical terrestrial habitats to threats and stressors that would impact the reproduction and survival of wildlife.
- 9.1.0.5 Develop a plan that directs the creation or expansion of energy or utility rights-of-way in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.6 Develop a plan that directs the creation or expansion of roads and railroads or the re-establishment of abandoned railroads within and adjacent to critical forested habitats in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.7 Develop a plan that directs the maintenance of or new channelization of forested streams and rivers in a manner that minimizes impacts of the aquatic ecological system and adjacent forest
- 9.1.0.8 Develop a plan that focuses on strategies for oil pipelines to avoid sensitive habitats that would be highly impacted by oil spills.
- 9.1.0.9 Develop a plan that focuses on strategies to minimize the creation of renewable energy farms (e.g., solar, wind) and related infrastructures within and their impacts on forested habitats and the wildlife community.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Robust Baskettail

- 9.1.0.10 Develop a plan that focuses on strategies to minimize the impacts of mining on critical forested habitats.
- 9.1.0.11 Develop a plan that focuses on strategies to minimize the impacts of power plants on critical forested habitats and the wildlife community.
- 9.1.0.12 Develop a plan to avoid freshwater tidal management.
- 9.1.0.13 Develop a plan to minimize agriculture that would result in groundwater withdrawal in critical forested areas.
- 9.1.0.14 Develop a plan to minimize development that would result in groundwater withdrawal in critical forested areas.
- 9.1.0.15 Develop a plan to minimize fragmentation of terrestrial and aquatic habitats by roads.
- 9.1.0.16 Develop a plan to minimize new lawns and preserve natural vegetation within and adjacent to critical forest areas.
- 9.1.0.19 Develop a plan to minimize the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 9.1.0.22 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 9.1.0.28 Develop and coordinate state, regional and local plans for suitable lot layout and landscaping to minimize human-wildlife conflicts that also incorporates habitat connectivity and preservation of natural areas.
- 9.1.0.29 Provide GIS or related data, maps, resource inventories, as well as related training, pertaining to the SWAP and its recommended conservation actions for use or consideration by State, County or municipal planning agencies.
- 9.1.0.30 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and other related threats associated with development.
- 9.1.0.31 Develop wetland restoration plans that consider the life history and needs of wildlife occupying targeted habitats.
- 9.1.0.32 Incorporate aquatic habitat connectivity and water quality/effluent standards into local and state aquaculture plans and BMPs.
- 9.1.0.33 Review the species, threats, action successes, and habitats, and work with partners to revise the 2017 State Wildlife Action Plan for the 2025 resubmittal.

9.2 Organizational strategic and CMS planning

9.2.1 Organizational strategic and operational planning

- 9.2.1.1 Identify and codify legal ORV access areas on state lands.

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.3 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.1.4 Develop town plans that avoid impacts to SGCN species and their habitats.

Robust Baskettail

- 9.3.1.5 Develop response plans to address disease outbreaks within wildlife populations, in particular SGCN.
- 9.3.1.7 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
- 9.3.1.9 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
- 9.3.1.10 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 9.3.1.13 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
- 9.3.1.15 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.
- 9.3.1.16 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.

9.3.3 Habitat management planning

- 9.3.3.5 Develop a management plan using forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.
- 9.3.3.7 Develop a management plan to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 9.3.3.8 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 9.3.3.10 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
- 9.3.3.11 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.3.3.13 Develop a management plan that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas and prevents or ameliorates near-term impacts of climate change throughout the State, but in particular within the coastal and Delaware Bay areas.
- 9.3.3.15 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
- 9.3.3.16 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.3.17 Develop a management plan for prescribed burning that will benefit Pinelands dependent species and increase or maintain habitat quality for these species in the Pinelands.
- 9.3.3.18 In cooperation with species and habitat experts, develop management plans for significant natural and/or unique communities, in particular those supporting SGCN, and provide the information to the landowners/managers (federal, state and local government agencies or non-government organization) for review and implementation.

Robust Baskettail

- 9.3.3.19 Develop management plans for SGCN inhabiting permanently protected natural lands using available baseline and population trend data.
- 9.3.3.21 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
- 9.3.3.24 Develop a plan to improve the enforcement of policies and/or regulations that protect wetlands, riparian and floodplain areas, and aquatic habitats (including open waters).
- 9.3.3.28 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.
- 9.3.3.29 Develop habitat management plans aimed at reducing or eliminating negative impacts of ORVs.
- 9.3.3.32 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.
- 9.3.3.34 Include controlled burn prescriptions in forest and stewardship plans to improve wildlife habitat.
- 9.3.3.35 Incorporate habitat connectivity, preservation of natural areas, and the implementation of BMPs into state and local land-use policy environmental review process and energy development plans to minimize habitat fragmentation and related threats associated with solar farms and altered habitats.
- 9.3.3.36 Integrate plans for properly located and timed habitat restoration and management along transportation, energy and service corridors to minimize risks to and benefit wildlife.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

- 11.1.1.1 Use Biotics database and Landscape Project Mapping in regulatory reviews to ensure protection by applicable laws and regulations.
- 11.1.1.2 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
- 11.1.1.3 Government organizations to thoroughly review wetland restoration plans, applying the most current science for wildlife, habitats and aquatic systems, to assess the impacts to resident and migratory wildlife occupying the targeted habitats.
- 11.1.1.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.
- 11.1.1.5 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 11.1.1.7 Review proposed construction or other work projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.8 Review proposed research projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.

Robust Baskettail

- 11.1.1.12 Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed solar farm projects to reduce habitat fragmentation and minimize impacts on wildlife.

11.1.2 Review of proposed policies and plans

- 11.1.2.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
- 11.1.2.2 Government organizations to thoroughly review wetland restoration plans, applying the most current science for wildlife, habitats and aquatic systems, to assess the impacts to resident and migratory wildlife occupying the targeted habitats.
- 11.1.2.3 Incorporate aquatic habitat connectivity and water quality/effluent standards into the environmental review process to help establish policies and plans that minimize the impact of aquaculture on fish and wildlife.
- 11.1.2.4 Review strategies for creating or enhancing connectivity (e.g., installing appropriately-sized wildlife passages) between wetlands to allow wildlife to disperse naturally and safely.

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

- 11.2.0.1 Provide technical support to private and public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 11.2.0.2 Provide technical support to public and private landowners and land managers for controlling invasive, native and non-native plant species in order to increase structural habitat diversity.
- 11.2.0.3 Develop state, regional and local BMPs that focus on minimizing habitat fragmentation and human-wildlife conflicts associated with development. Make information available to land developers and private and public landowners for implementation.
- 11.2.0.5 Provide educational resources, training programs, and expert guidance to private and public landowners and land managers on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.
- 11.2.0.6 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on habitat creation, enhancement and restoration within and adjacent to project areas, as well as away from and outside of project areas (depending on the target species), by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. Wind farms should address both terrestrial bound and low-flying species. Examples of habitat management include, but are not limited to, integrating short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 11.2.0.7 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on the importance of maintaining habitat connectivity, minimizing fragmentation, and the use of CHANJ products to help them target areas for such planning.
- 11.2.0.8 Provide educational resources, training programs, and on-the-ground guidance to public and private landowners and land managers on habitat creation and enhancement strategies that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Robust Baskettail

- 11.2.0.9 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and private landowners about the importance of leaving vegetation in place, especially along riparian areas and wildlife movement corridors.
- 11.2.0.10 Provide technical support to private landowners, consultants, and land managers to create customized management plans based on location and SGCN.
- 11.2.0.11 Provide educational resources, training programs, and on-the-ground guidance to private and public landowners and land managers on the benefits of and for creating young forest and early succession habitat for SGCN.
- 11.2.0.14 Provide educational resources and technical support to public and private landowners and land managers to promote the protection of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters), and to enhance or restore biologically appropriate buffers.
- 11.2.0.15 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and landowners about the importance of retaining and in an effort to protect, create, enhance and/or restore vegetation along aquatic habitats.
- 11.2.0.17 Provide educational resources and technical support to public and private landowners and land managers to promote the protection of vernal pools and the protection, enhancement and/or restoration of biologically appropriate buffers.
- 11.2.0.22 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
- 11.2.0.23 Provide educational resources and technical support to public and private landowners and land managers of lands adjacent to SGCN habitats to promote the protection and/or enhancement of those adjacent habitats to increase the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and that connect conserved SGCN habitats.
- 11.2.0.24 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers on how to manage vegetated roadside areas (e.g., mowing, brush-hogging, etc.) on a schedule that avoids peak activity periods for wildlife and therefore, minimizes harm.
- 11.2.0.25 Provide educational resources, training programs, and on-the-ground guidance to resource managers regarding the assessment of and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) related to residential and commercial development.
- 11.2.0.26 Make educational resources available to the public that encourage researchers to seek out guidance prior to finalizing proposals and submitting State permit applications to reduce potential impacts on sensitive species.
- 11.2.1 With individuals and groups involved in resource management decision making
 - 11.2.1.1 Engage partners and stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
 - 11.2.1.2 Provide professional training and technical assistance tools (e.g., mapping, guidance documents, justification, etc.) to agencies/divisions/programs within and outside of the NJ DEP regarding the SWAP, and the conservation actions recommended therein to help facilitate SWAP implementation.

Robust Baskettail

- 11.2.1.3 Provide educational resources, training programs, and on-the-ground guidance to DOD to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop and implement forest management and other practices that minimize disturbances to SGCN (i.e., beyond their federal requirements).
- 11.2.1.5 Provide educational resources, training programs, and on-the-ground guidance to municipalities, state and federal agency resource managers on tasks such as writing and integrating Beach Management Plans into other management documents.
- 11.2.1.6 Provide educational resources, training programs, and on-the-ground guidance to resource agencies prior to project initiation to ensure wildlife and their habitats are protected to the highest degree possible during construction, and provisions are in place for post-construction habitat use.
- 11.2.2 With private landowners
 - 11.2.2.1 Provide technical support to farming operations and woodland landowners on ways to decrease clean farming (edge-to-edge) practices and create ecotones to benefit bobwhite and other species dependent on early successional habitat.

100 Law and Policy

100. Legislation

100.1.3 Sub-national Level

- 100.1.3.1 Develop laws and policies to increase protection and biological buffers of wetlands.
- 100.1.3.2 Develop policies for wetland restoration plans that consider life history requirements and needs of wildlife occupying targeted habitats.
- 100.1.3.3 Initiate legislative action to establish an annual budgetary line item designating funds to support programs focused on long-term research and monitoring of wildlife diseases.

100.1.4 County and Local

- 100.1.4.2 Secure and increase the effective size of SGCN habitats and connect conserved SGCN habitats through local ordinances.
- 100.1.4.3 Expand the acreages and enhance the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN through local ordinances.
- 100.1.4.4 Secure wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) and biologically appropriate buffers through local ordinances.
- 100.1.4.5 Secure SGCN-inhabited/used freshwater wetlands and biologically appropriate buffers through local ordinances.
- 100.1.4.11 Secure riparian areas through local ordinances.
- 100.1.4.14 Adopt/pass local ordinances which require assessing and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 100.1.4.15 Incorporate habitat connectivity and the preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.

100.1.5 Scale Unspecified

- 100.1.5.1 Develop laws and policies to increase protection and biological buffers of wetlands.

Robust Baskettail

- 100.1.5.2 Develop policies for wetland restoration plans that consider life history requirements and needs of wildlife occupying targeted habitats.
- 100.1.5.3 Incorporate aquatic habitat connectivity and water quality/effluent standards into state/local policy to minimize the impact of aquaculture on fish and wildlife.
- 100.1.5.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 100.1.5.5 Develop legislation to provide financial support for the New Jersey Invasive Species Strike Team.

100. State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.1 Develop (and/or improve) policies and/or regulations that will promote the reduction of run-off and point and non-point source pollution into NJ's aquatic systems (streams, rivers, lakes/ponds, bays, ocean, wetlands, etc.).
- 100.3.0.5 Develop policies that will promote improved and secure habitat connections between conserved SGCN habitats.
- 100.3.0.6 Develop policies that will promote expanding acreages and enhancing the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 100.3.0.8 Develop policies and/or regulations with the objective of protecting significant natural and/or unique communities in perpetuity.
- 100.3.0.9 Secure mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.12 Develop policies that promote the preservation and protection of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.
- 100.3.0.13 Develop policies that will promote protecting and restoring riparian areas.
- 100.3.0.14 Develop policies and/or regulations that increase the protective buffers of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) to biologically appropriate distances to benefit SGCN that rely upon these habitats and improve the function of the [associated] aquatic systems.
- 100.3.0.18 Develop policies for conserved lands that prohibit planting and supports the control of non-native vegetation and invasive, native vegetation.
- 100.3.0.23 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.26 Adopt regulations requiring the combined sewer overflow alternative analyses required by regulation address potential impacts to wildlife in watercourses or receiving water bodies.
- 100.3.0.31 Create or expand tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMPs.
- 100.3.0.32 Coordinate regulations across agencies to maximize availability of and enrollment in existing Forestry Stewardship Programs (e.g., "Woodland Stewards", Farm Bill, partners, etc.) to maintain and/or improve forest habitat.

Robust Baskettail

- 100.3.0.38 Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.
- 100.3.0.39 Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.3.0.40 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.3.0.41 Explore all State regulatory requirements for mitigation, restoration, habitat management, etc. to ensure they prohibit the use of specified invasive or other problematic plant species.
- 100.3.0.43 Identify and address (amend) regulatory impediments to beneficial habitat management.
- 100.3.0.44 Incorporate requirements for technical support and funding for mitigation or restoration efforts so as to be consistent with existing regulations.
- 100.3.0.45 Increase the controlled burn season to focus on restoring vegetative communities.
- 100.3.0.46 Investigate and/or develop inter-agency Memorandum of Agreements to share common data stored or managed in program-specific databases.
- 100.3.0.48 Propose new State law or regulation mandating that a State-level "development impact fee" be assessed on all new development approved by municipalities (via the Municipal Land Use Law processes), and dedicate such monies to the development and implementation of regional Habitat Conservation Plans (or existing plans/programs serving the same regional function).
- 100.3.0.50 Retain endangered, threatened and special concern wildlife and habitat protection measures in the Water Quality Management Program Rules.
- 100.3.0.52 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded energy sitings and facilities.
- 100.3.0.53 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded rights-of-way corridors associated with energy transport/transmission.
- 100.3.0.60 Develop regulations that when implemented will protect significant natural and/or unique communities in perpetuity.
- 100.3.0.64 Develop regulations that when implemented will protect and restore riparian areas.
- 100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.
- 100.3.0.73 Develop regulations that would exempt the conversion of lawns to native vegetation (beneficial to wildlife) from local lawn ordinances.

100.3.2 State Land Acquisition Programs

- 100.3.2.1 Increase opportunities for habitat restoration by making any necessary policy changes to state, federal and local land acquisition programs (e.g., Green Acres, Blue Acres, etc.) to allow for acquisition within abandoned or failing bay shore communities, including mechanisms to relocate displaced people and infrastructure.

100. State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.1** Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).
- 100.4.0.2** Create a policy that requires the NJ DEP to incorporate scientific information regarding climate change and sea level rise (e.g., predictions, habitat management/acquisition efforts to enhance resilience to inundation) on their websites and to work with other government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 100.4.0.3** Develop policies for mandatory buffer strips on preserved farmlands and state-owned agricultural lands.
- 100.4.0.8** Develop a white paper addressing the impacts that existing, new or expanded rights-of-way have upon wildlife, wildlife habitats and habitat connectivity.
- 100.4.0.10** Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.
- 100.4.0.11** Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.4.0.12** Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.4.0.13** Develop policies for different circumstances (e.g., roadsides and medians, riparian, aquatic and terrestrial habitats) that outline appropriate habitat/vegetation management strategies and schedules to minimize risks to and benefit wildlife.
- 100.4.0.16** Develop policies to implement habitat management strategies that will increase the structural diversity surrounding areas used for energy, mining, and transportation and service corridors which include but are not limited to the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-
- 100.4.0.17** Develop policies to implement habitat management strategies, including prescribed burns, that will increase the structural diversity on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies to control and reduce the impacts of invasive, non-native species in order to increase structural habitat diversity.
- 100.4.0.18** Develop policies to minimize the extent of infrastructure associated with energy and service corridors or areas (e.g., wind and solar farms, pipelines, utility lines) and that require the implementation of habitat management strategies that will increase the structural diversity in the area including (e.g., the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-asides).

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Robust Baskettail

- 100.4.0.19 Develop regulations that will minimize the creation of new barriers, remove or replace current barriers with appropriately-sized systems to accommodate wildlife dispersal, and to minimize road widening and traffic volume increases within critical wildlife habitat areas.
- 100.4.0.20 Develop state regulations that require energy developers and utility service companies to implement habitat management strategies that will increase the structural diversity of the habitat, minimize habitat fragmentation and commercial infrastructure, and minimize the loss, alteration and/or degradation of the habitat and adjacent lands when working on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies.
- 100.4.0.21 Ensure that Section 303(d) of the Clean Water Act and applicable State statutory/regulatory requirements for surface water pollutant budgets are being met by monitoring and enforcing regulatory Total Maximum Daily Load (TMDL) targets established within regional Water Quality Management Plans.
- 100.4.0.22 Work with NJ DEP's Division of Land Use Regulation to ensure protection of listed species and their habitats during stream cleaning events.
- 100.4.0.24 Develop policies to provide financial support for the New Jersey Invasive Species Strike Team.
- 100.4.0.25 Develop policies that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

Septima's Clubtail

Focal species that comprise this Conservation Target:

Septima's Clubtail

Threats and Action Drivers associated with this Conservation Target:

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale) (Avg. Score: 3.00)

NJ Specific Threats: 1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.1.1.2 Loss, alteration and/or degradation of habitat.

1.1.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.1.1.7 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale) (Avg. Score: 3.00)

NJ Specific Threats: 1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.2.1.2 Loss, alteration and/or degradation of habitat.

1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.2.1.7 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale) (Avg. Score: 2.00)

NJ Specific Threats: 1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.3.1.2 Loss, alteration and/or degradation of habitat.

1.3.1.5 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.3.1.6 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

2 Agriculture and Aquaculture

2.1 Annual and Perennial Crops (non-timber)

2.1.1 Shifting Agriculture (Avg. Score: 2.00)

NJ Specific Threats: 2.1.1.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

Septima's Clubtail

2.1.2 Small-holder Farming (Avg. Score: 1.00)

NJ Specific Threats: 2.1.2.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.2.2 Fragments terrestrial and aquatic habitats.

2.1.3 Agro-industry (Avg. Score: 1.00)

NJ Specific Threats: 2.1.3.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.3.2 Fragments terrestrial and aquatic habitats.

2.2 Wood and Pulp Plantations

2.2.1 Small Holder (Avg. Score: 1.00)

NJ Specific Threats: 2.2.1.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.

2.2.2 Agro-industry Plantations (Avg. Score: 1.00)

NJ Specific Threats: 2.2.2.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.

2.3 Livestock Farming and Ranching

2.3.2 Small-holder Grazing (Avg. Score: 1.00)

NJ Specific Threats: 2.3.2.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.

2.3.2.2 Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.

2.3.2.3 Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

2.3.2.4 Livestock allowed to wade into waterbodies trample and degrade aquatic habitats.

2.3.3 Agro-industry Grazing (Avg. Score: 1.00)

NJ Specific Threats: 2.3.3.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.

2.3.3.2 Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.

2.3.3.3 Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

2.3.3.4 Livestock allowed to wade into waterbodies trample and degrade aquatic habitats.

3 Energy Production and Mining

3.2 Mining and Quarrying

3.2.2 Surface Mining - Rock Quarry (and sand quarries) (Avg. Score: 1.00)

NJ Specific Threats: 3.2.2.1 Fragments terrestrial and aquatic habitats.

3.2.2.2 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

3.3 Renewable Energy

3.3.2 Solar Power (Avg. Score: 1.00)

NJ Specific Threats: 3.3.2.2 Loss, alteration and/or degradation of habitat.

3.4 Conventional Power Plants

3.4.0 Conventional Power Plants (Avg. Score: 1.00)

Septima's Clubtail

NJ Specific Threats: 3.4.0.3 Alteration of the temperature, pH and/or hydrology of aquatic ecosystems change plant communities and can harm wildlife and/or impact their behavior and survivorship.

4 Transportation and Service Corridors

4.1 Roads and Railroads

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale) (Avg. Score: 1.00)

NJ Specific Threats: 4.1.1.2 Loss, alteration and/or degradation of habitat associated with road and railroad construction and maintenance, and degradation of adjacent habitats.

4.1.2 Movement of cars and other vehicles on roads and railroads (large and small scale) (Avg. Score: 1.00)

NJ Specific Threats: 4.1.2.1 Increased vehicle traffic increases the risk of wildlife mortality from strikes.

4.2 Utility and Service Lines

4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads (Avg. Score: 1.00)

NJ Specific Threats: 4.2.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species, inhibiting dispersal of non-volant animals, reducing gene flow, and creating barriers to fish when service line-associated roads cross streams (e.g., bridges, culverts, fords, etc.).

4.2.1.2 Loss, alteration and/or degradation of habitat associated with rights-of-way construction and maintenance, and degradation of adjacent habitats.

4.3 Shipping Lanes

4.3.2 Dredging impacts (Avg. Score: 2.00)

NJ Specific Threats: 4.3.2.1 Threatens wildlife by disrupting/removing stream bottom habitat.

5 Biological Resource Use

5.1 Hunting and Collecting Terrestrial Animals

5.1.1 Intentional Use (Avg. Score: 1.00)

NJ Specific Threats: 5.1.1.1 Illegal collection of wildlife can have detrimental impacts on populations.

5.4 Fishing and Harvesting of Aquatic Resources

5.4.4 Unintentional effects (large scale) (Avg. Score: 1.00)

NJ Specific Threats: 5.4.4.1 Fish introduced for sport fishing can negatively impact native species by competing for resources and/or altering the habitat (e.g., disrupting benthic communities and/or severely impacting aquatic vegetation).

6 Human Intrusions and Disturbance

6.1 Recreational Activities

6.1.1 Off-road vehicles (motorized and non-motorized) (Avg. Score: 2.00)

NJ Specific Threats: 6.1.1.2 Inappropriate use of off-road vehicles can degrade terrestrial and aquatic habitat and reduce the suitability of adjacent habitats for wildlife.

6.1.1.3 Increased risk of harassment that results in a change in wildlife behavior and/or direct mortality from vehicle strikes.

6.1.1.6 Off-road vehicles can be a mechanism of transference of wildlife diseases and invasive plant species if gear and apparel are not properly sanitized between sites.

7 Natural Systems Modifications

7.2 Dams and Water Management/Use

7.2.1 Abstraction of Surface Water (domestic use)

(Avg. Score: 3.00)

- NJ Specific Threats:** 7.2.1.1 Changing water levels due to water body drawdowns (legal and illegal) may lower dissolved oxygen levels, increase water temperatures, expose wildlife to predation, and increase exposure to winter temperatures, altering wildlife behavior and survival.
- 7.2.1.2 Controlled water releases and/or improper water level management of water bodies may alter downstream dissolved oxygen levels, water temperatures, sediment deposition, and flow rates, altering wildlife behavior and survival.
- 7.2.1.3 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, and eliminates shallow water habitats.

7.2.2 Abstraction of Surface Water (commercial use)

(Avg. Score: 3.00)

- NJ Specific Threats:** 7.2.2.1 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, eliminates shallow water habitats, and disrupts/removes stream bottom habitat.
- 7.2.2.2 Changing water levels due to water body drawdowns (legal and illegal) may lower dissolved oxygen levels, increase water temperatures, expose wildlife to predation, and increase exposure to winter temperatures, altering wildlife behavior and survival.
- 7.2.2.3 Controlled water releases and/or improper water level management of water bodies may alter downstream dissolved oxygen levels, water temperatures, sediment deposition, and flow rates, altering wildlife behavior and survival.

7.2.3 Abstraction of Surface Water (agricultural use)

(Avg. Score: 3.00)

- NJ Specific Threats:** 7.2.3.1 Controlled water releases and/or improper water level management of water bodies may alter downstream dissolved oxygen levels, water temperatures, sediment deposition, and flow rates, altering wildlife behavior and survival.
- 7.2.3.2 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, and eliminates shallow water habitats.
- 7.2.3.3 Impounding water to create or expand bogs for cranberry farming leads to the loss of natural wetlands and the alteration of the natural hydrology in the area.
- 7.2.3.5 Changing water levels due to water body drawdowns (legal and illegal) may lower dissolved oxygen levels, increase water temperatures, expose wildlife to predation, and increase exposure to winter temperatures, altering wildlife behavior and survival.

7.2.5 Abstraction of Ground Water (domestic use)

(Avg. Score: 3.00)

- NJ Specific Threats:** 7.2.5.1 Heavy withdrawal of ground water for domestic use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.6 Abstraction of Ground Water (commercial use)

(Avg. Score: 3.00)

- NJ Specific Threats:** 7.2.6.1 Heavy withdrawal of ground water for industrial and commercial use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.7 Abstraction of Ground Water (agricultural use)

(Avg. Score: 3.00)

- NJ Specific Threats:** 7.2.7.1 Heavy withdrawal of ground water for agricultural use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.9 Small Dams

(Avg. Score: 3.00)

- NJ Specific Threats:** 7.2.9.1 Alter the physical, chemical and biological stream environment, causing changes in substrate composition, flow rates, dissolved oxygen, and water temperatures.

7.2.10 Large Dams (Avg. Score: 3.00)

NJ Specific Threats: 7.2.10.1 Alter the physical, chemical and biological stream environment, causing changes in substrate composition, flow rates, dissolved oxygen, and water temperatures.

7.2.11 Dams (size unknown) (Avg. Score: 3.00)

NJ Specific Threats: 7.2.11.1 Alter the physical, chemical and biological stream environment, causing changes in substrate composition, flow rates, dissolved oxygen, and water temperatures.

7.2.13 Stream Burial (Avg. Score: 3.00)

NJ Specific Threats: 7.2.13.1 Eliminates riparian habitats.

7.2.13.3 Alters the hydrology and quality of downstream aquatic and riparian habitats.

7.3 Other Ecosystem Modifications

7.3.3 Removal of coarse woody debris (streams, forests, scrub-shrub habitats) (Avg. Score: 1.00)

NJ Specific Threats: 7.3.3.1 Decreases the available detritus that normally accumulates behind and within stream obstructions, minimizing or eliminating food sources and shelters for fishes, invertebrates and amphibians.

7.3.3.2 Decreases habitat and/or corridor suitability due to limited or absent shelter and foraging habitat.

7.3.5 Poor habitat management (Avg. Score: 2.00)

NJ Specific Threats: 7.3.5.1 Improper or poorly scheduled maintenance of man-made corridors (e.g., roadsides and medians) can cause direct mortality to and may reduce productivity of wildlife.

7.3.5.2 Shifting from natural vegetation to lawns can cause increased temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

7.3.5.4 Vegetation clearing or inappropriate alteration adjacent to aquatic habitats threatens aquatic species by degrading habitat and water quality (altering temperature and dissolved oxygen, increasing siltation and desiccation, etc.).

7.3.5.9 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, eliminates shallow water habitats, and disrupts/removes stream bottom habitat.

7.3.5.10 Ditching, draining and filling of marshes and wetlands eliminates habitat and degrades the remaining surrounding areas for wildlife.

7.3.5.12 Lack of diversity in age structure and composition of vegetation due to lack of natural disturbances and/or vegetation management.

8 Invasive and Other Problematic Species, Genes and Diseases

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.1 Unspecified Species (Avg. Score: 1.00)

NJ Specific Threats: 8.1.1.1 Displace or outcompete native species for resources.

8.1.1.2 Alters, degrades and/or reduces the structural diversity of the natural composition of the landscape, including aquatic systems.

8.1.1.3 Invasive, non-native insects can damage native vegetation at a large scale, leading to die-offs, altering the ecological community.

8.1.1.4 Invasive, non-native animals increase the risk of predation on native animals and/or herbivory on native vegetation.

8.1.1.5 Invasive, non-native animals and plants increase the risk of introduction and transference of diseases

8.1.1.6 Invasive, non-native plants may create physical barriers for some species.

8.1.5 Invasive non-native terrestrial/wetland plants (Avg. Score: 2.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Septima's Clubtail

NJ Specific Threats: 8.1.5.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.6 Diseases of Unknown Cause

8.6.0 Unknown Diseases (Avg. Score: 1.00)

NJ Specific Threats: 8.6.0.1 Diseases yet to be identified by pathologists and virologists cause decreased fitness or mortality to native populations.

9 Pollution

9.1 Domestic and Urban Waste Water

9.1.1 Sewage (Avg. Score: 3.00)

NJ Specific Threats: 9.1.1.1 Degradation of aquatic and marine water quality and habitats by changing turbidity, flow and water chemistry.

9.1.1.2 Leads to increased eutrophication and algae blooms that result in oxygen depletion.

9.1.1.3 Contaminants in sewage treatment effluents and Combined Sewer Overflows can cause developmental and behavioral abnormalities and reproductive failure in wildlife.

9.1.2 Run-off (Avg. Score: 3.00)

NJ Specific Threats: 9.1.2.1 Chemical fertilizers and nutrient run-off changes the pH in streams and ponds and causes eutrophication in inland waters and estuaries, which can make habitat unsuitable for specialist species and increase the risk of invasive and generalist species.

9.1.2.2 Contaminants degrade aquatic and marine water quality and can bioaccumulate in benthic organisms, threatening wildlife by causing developmental and behavioral abnormalities and reproductive failure.

9.1.2.3 Contaminants from road runoff (oil, sediment, salt, etc.) impact native vegetation and the species that rely upon them, degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.

9.2 Industrial and Military Effluents

9.2.1 Oil Spills (Avg. Score: 3.00)

NJ Specific Threats: 9.2.1.1 Oil spills render resting, breeding and foraging habitats temporarily unavailable to wildlife, altering normal wildlife behavior.

9.2.1.2 Oil spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.

9.2.1.3 Oil spills cause external oiling of wildlife and ingestion of oil, both of which can injure or kill wildlife.

9.2.2 Seepage from Mining (Avg. Score: 1.00)

NJ Specific Threats: 9.2.2.1 Contaminants from mining degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.

9.2.3 Other (Avg. Score: 3.00)

NJ Specific Threats: 9.2.3.1 Point and nonpoint source pollution such as polychlorinated biphenyls (PCBs), pesticides, heavy metals, and endocrine disrupting compounds (EDC's) into freshwater and marine systems pose threats to wildlife through direct contact and/or ingestion, and to aquatic species and their predators through bioaccumulation, impacting the reproductive success and neurological function of many avian and fish species.

9.2.3.2 Chemical spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Septima's Clubtail

- 9.2.3.3 Chemical spills may render resting, breeding and foraging habitats temporarily unavailable to wildlife, altering normal wildlife behavior.

9.2.5 Other: Industrial toxic settling ponds (Avg. Score: 1.00)

- NJ Specific Threats:** 9.2.5.1 Surficial or open industrial effluent ponds can cause injury or death to wildlife that become exposed through ingestion or submersion.

9.3 Agricultural and Forestry Effluents

9.3.1 Nutrient Loads (Avg. Score: 3.00)

- NJ Specific Threats:** 9.3.1.1 Chemical fertilizers and nutrient run-off changes the pH in streams, ponds and wetlands and causes eutrophication in inland waters and estuaries, which can make habitat unsuitable for specialist species and increase the risk of invasive and generalist species.

- 9.3.1.2 Animal waste degrades terrestrial and aquatic habitats, especially streams, ponds and wetlands, resulting in eutrophication, which disrupts oxygen and nutrient balances, and causes injury and mortality to aquatic organisms.

9.3.2 Soil Erosion and Sedimentation (Avg. Score: 3.00)

- NJ Specific Threats:** 9.3.2.1 Soil erosion, sedimentation and destruction of streambanks and riparian buffers degrade waters making them unsuitable for riparian-dependent wildlife.

9.3.3 Herbicides and Pesticides (Avg. Score: 3.00)

- NJ Specific Threats:** 9.3.3.1 Pesticides degrade terrestrial and aquatic habitats, especially streams, ponds and wetlands. Aquatic wildlife are particularly sensitive to these contaminants, which can cause developmental and behavioral abnormalities and reproductive failure. Some contaminants may bioaccumulate in predatory fish and birds and disrupt reproduction.

- 9.3.3.3 Use of pesticides can directly harm non-target species through direct contact and/or by reducing and/or contaminating their food supply.

9.3.5 Control of insect pests and plants leading to mortality of non-target species not associated with agriculture (Avg. Score: 3.00)

- NJ Specific Threats:** 9.3.5.1 Use of pesticides, insecticides, and/or herbicides can directly harm non-target species, such as amphibians and beneficial invertebrates through direct contact and/or by reducing and/or contaminating their food supply.

- 9.3.5.4 Improper use of current insecticides, such as those containing esfenvalerate, prallethrin, or piperonyl butoxide, or past use of pesticides containing chlordane still present in the soils, are toxic to various wildlife species, and can cause injury, mortality, or other effects that impair population viability.

- 9.3.5.5 Use of pesticides and herbicides can minimize the abundance of food sources for native wildlife populations.

9.5 Air-Bourne Pollutants

9.5.1 Acid Rain (Avg. Score: 1.00)

- NJ Specific Threats:** 9.5.1.1 Causes acidification of water bodies, resulting in changes to aquatic and marine communities and reducing biodiversity, and creating conditions that are unsuitable for some aquatic (freshwater and marine) and semi-aquatic species that are sensitive to pH shifts.

9.5.4 Other (Avg. Score: 1.00)

- NJ Specific Threats:** 9.5.4.1 Dust and/or airborne sedimentation from construction sites, agricultural operations or related earth disturbances can introduce mineral or organic sediments into adjacent wildlife habitats, degrading their quality and suitability for wildlife short-term and/or long-term.

9.5.6 Herbicides and Pesticides (Avg. Score: 3.00)

- NJ Specific Threats:** 9.5.6.1 May result in injury or direct mortality of non-target species.

9.6 Excess Energy

9.6.2 Thermal Pollution

(Avg. Score: 1.00)

NJ Specific Threats: 9.6.2.2 Water temperature changes to aquatic systems can deter or preclude use by SGCN (e.g., alter habitat suitability for wildlife species, reduce prey base) or present stressors that are harmful if not fatal to wildlife.

11 Climate Change and Severe Weather

11.1 Habitat Shifting or Alteration

11.1.0 Macro- and Micro-Climate Alterations

(Avg. Score: 3.00)

NJ Specific Threats: 11.1.0.1 Alters native terrestrial and aquatic habitats at the macro- and micro-climate levels that can affect suitability for wildlife, in particular specialist species.

11.2 Droughts

11.2.1 Droughts

(Avg. Score: 3.00)

NJ Specific Threats: 11.2.1.1 Contribute to hardened soils, decreasing water recharge during rains and increasing the likelihood of flash floods during storms.

11.2.1.2 Lead to lower groundwater levels and therefore, less available water for people and habitats.

11.2.1.3 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

11.3 Temperature Extremes

11.3.1 Temperature extremes

(Avg. Score: 1.00)

NJ Specific Threats: 11.3.1.1 Increasing temperatures may cause habitat loss and degradation by desiccating and/or raising the temperatures of small wetlands and streams leading to the loss of freshwater mussels and other aquatic species and species reliant upon these habitats.

11.3.1.2 Increased temperatures can negatively impact wetland, riverine, lacustrine and vernal pool-associated or -dependent wildlife by reducing flows, increasing water temperatures, lowering water levels and causing premature drying of vernal habitats.

11.3.1.3 Temperature extremes of surface water and air degrades marine habitats and ecosystems, threatening marine wildlife. Such extremes also disrupt offshore currents and migratory patterns, species' ranges, and/or impact communities/food chains, all of which further impact the ecosystem.

11.4 Storms and Flooding

11.4.1 Storms and flooding

(Avg. Score: 3.00)

NJ Specific Threats: 11.4.1.1 Extreme storms and flooding events threaten aquatic and marine wildlife through habitat degradation and alteration, including alterations to off-shore or back-bay benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic and marine wildlife.

11.4.1.5 Storm damage can alter forest structure via blow-downs or micro-bursts, and can destroy bird nesting in the locales where the storms occur.

11.4.2 Increased rainfall

(Avg. Score: 2.00)

NJ Specific Threats: 11.4.2.1 Extreme rain events threaten aquatic wildlife through habitat degradation and alteration, including alterations to benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic wildlife.

11.4.2.2 Extreme rain events can damage wildlife nesting and resting habitats, including impacts to avian eggs and chick and small mammal survivorship.

11.4.2.3 More frequent rain events can alter terrestrial and wetland vegetation communities as well as wetland hydrology, shifting wildlife community use.

11.6 Phenology Shifting or Alteration

11.6.3 Phenology shifts related to species redistribution (Avg. Score: 1.00)

NJ Specific Threats: 11.6.3.1 Shifts in timing of species migration, breeding and hibernation, and available food resources, as a result of wildlife range shifts driven by climate change.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory (Avg. Score: 3.00)

NJ Specific Threats: 12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.1.2 Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.

12.1.2 Lack of up-to-date existing information (Avg. Score: 3.00)

NJ Specific Threats: 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

12.1.3 Need to answer research question (Avg. Score: 3.00)

NJ Specific Threats: 12.1.3.1 There are significant knowledge gaps regarding distribution, dispersal, diseases, population trends, etc. of SGCN.

12.1.4 Need to develop new technique (Avg. Score: 3.00)

NJ Specific Threats: 12.1.4.1 Improve and evaluate survey methods for SGCN and their habitats; alter as needed.

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms (Avg. Score: 1.00)

NJ Specific Threats: 12.3.0.1 Regulatory habitat protections within state land use regulations are spatially limited to specific geographic areas (e.g., Pinelands, Coastal Area) or geographic features (e.g., wetlands, streams) and so fail to protect critical habitats that exist outside of these regulated areas.

12.3.0.6 Certain geographic or habitat features, such as vernal pools and headwater wetlands or streams, may be too small, mischaracterized, or misidentified to benefit from regulatory protection.

12.3.0.7 Activities that threaten SGCN, their food sources, and/or habitats are often regulated separately and without consideration for the cumulative and synergistic effects over time or over a larger spatial scale. Therefore, regulations can fail to protect SGCN populations over time.

12.3.0.10 Land use regulatory processes pertaining to habitat creation, enhancement or restoration projects can be costly and/or burdensome, precluding or discouraging the development or implementation of conservation projects.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform (Avg. Score: 1.00)

NJ Specific Threats: 12.4.0.1 A species-by-species management focus as opposed to ecological systems and biodiversity generally has greater opportunity for unintended consequences for other species and may be less efficient in developing appropriate management actions.

12.4.0.2 Policies and procedures for lands management that lack consideration of the impacts of activity timing can result in unintended impacts to wildlife during vulnerable periods.

12.4.0.5 Bureau of Forest Fire Management policy has traditionally implemented prescribed burns on State lands for the sole purpose of public safety (i.e., addressing hazard fuel reduction), missing opportunities to burn in a manner that would additionally manage habitat for ecological diversity.

Septima's Clubtail

- 12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

14 **Education/ Outreach Needs**

14.1 Education needs

- 14.1.1 Need for improved knowledge of fish and wildlife and their habitats (Avg. Score: 3.00)

- NJ Specific Threats:** 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.
- 14.1.1.2 Lack of general knowledge of SGCN life histories and vulnerabilities as they relate to land management practices.
- 14.1.1.3 Lack of understanding of the need to manage both natural and anthropogenic (e.g., yards, lawns, hayfields, etc.) habitats to minimize impacts or increase benefits to SGCN and their habitats.

14.2 Outreach needs

- 14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions (Avg. Score: 3.00)

- NJ Specific Threats:** 14.2.1.1 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various forest management practices.
- 14.2.1.2 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various aquatic and riparian management practices.
- 14.2.1.5 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various wetland management practices.

15 **Administrative Needs**

15.2 Organizational/program planning needs

- 15.2.3 Need for multi-state, regional and landscape scale planning (Avg. Score: 1.00)

- NJ Specific Threats:** 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Actions to address the Threats and Action Drivers associated with this Conservation Target:

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.2 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to increase the effective size of SGCN habitats by protecting/restoring adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats.
- 1.2.1.6 Secure and promote the protection/restoration of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers through incentive programs.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Septima's Clubtail

- 1.2.1.7 Secure and promote the protection/restoration of fish SGCN habitats by protecting lands adjacent to fish SGCN habitats and/or aquatic systems feeding into such habitats through incentive programs.
- 1.2.1.8 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to municipalities, land developers, and other land managers to retain and/or enhance native vegetation adjacent to aquatic habitats, and along riparian areas and wildlife movement corridors.
- 1.2.1.9 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing Forestry Stewardship Programs.
- 1.2.1.10 Coordinate across government agencies and non-government organizations to maximize the availability of and enrollment in existing landowner incentive programs (e.g., "farm bill," partners, etc.) to maintain and/or improve habitat.
- 1.2.1.11 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 1.2.1.12 Create incentives (non-monetary and/or monetary) for land developers to redevelop abandoned areas (e.g., shopping centers, office complexes) to minimize the loss of natural habitats and reduce the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 1.2.1.13 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to land developers to minimize the impacts of new residential and commercial developments on SGCN and their habitats.
- 1.2.1.14 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of herbicides and pesticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.15 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of rodenticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.16 Create incentives (non-monetary and/or monetary) within State regulations (mitigations requirements or credit, BMP satisfaction, etc.) to promote the use of retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.17 Develop a public-relations oriented certification program for private retailers who refrain from selling specified invasive or other problematic plant species.

Septima's Clubtail

- 1.2.1.18 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and land managers to control and reduce the impacts of invasive, native and non-native species in order to increase structural habitat diversity.
- 1.2.1.19 Create incentives for federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to farmers, woodland landowners, and private landowners to adopt and/or endorse consistent BMPs concerning controlled burns to maintain and/or improve wildlife habitat.
- 1.2.1.20 Coordinate across government agencies and non-government organizations to create or expand upon tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMP's.
- 1.2.1.21 Create and/or support market-based programs that subsidize or create branding for products derived sustainably from managed wildlife habitats.
- 1.2.1.22 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to horse/livestock farm owners and managers to increase structural habitat diversity in and around the farms by managing vegetation for a variety of species, in particular, farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 1.2.1.23 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to provide cost shares and/or plan approvals for management based on management approaches and prescriptions.
- 1.2.1.24 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners, with habitat of suitable patch size to support breeding grassland-dependent species, to alter the timing of vegetation management to benefit grassland and pollinator species.
- 1.2.1.26 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing landowner incentive programs.

2 Direct Management of Natural Resources

2.3 Fire management

2.3.2 Fuel reduction

- 2.3.2.1 Prevent wildfires by reducing natural fuel (e.g., leaf litter).

2.3.3 Prescribed burning

- 2.3.3.1 Evaluate different management techniques of prescribed burns that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 2.3.3.2 Conduct prescribed burning in Northern New Jersey forests to maintain and regenerate a mosaic of upland forest habitats.
- 2.3.3.3 Conduct prescribed burning to improve wildlife habitat.

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

Septima's Clubtail

- 2.8.0.1 Control invasive insect infestations by implementing BMP strategies through biological, chemical and/or mechanical means that will depress, or when appropriate, eradicate populations in a manner that avoids excessive harm to non-target species using BMPs to control infestations and limit their spread based on an inventory of invasive insect distribution and response to outbreaks.
- 2.8.0.2 Develop, implement, monitor and evaluate pest control/management strategies to reduce the impacts of over-abundant wildlife species (native and/or native, invasive species) on native vegetation and the degradation of habitats supporting SGCN. Over-abundant wildlife species include but are not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.
- 2.8.0.5 Implement biologically safe and appropriate control/management strategies, and where appropriate, eradication strategies to reduce the impacts and/or limit the distribution of invasive and/or non-native plant species within or near aquatic systems using methods that will provide the most protection to the aquatic and riparian ecological system, and minimize disturbance to the soil and wildlife. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.
- 2.8.0.6 Implement long-term management of invasive and/or non-native plants to help maintain functioning ecological systems and biological diversity, and to enhance travel corridors. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

- 2.10.0.1 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 2.10.0.2 Improve the availability of prey/food resources through terrestrial and aquatic plantings and habitat restoration for SGCN populations, in particular for those populations thought to be limited due wholly or in part to a lack of (or contaminated) food resources, and for migratory species (birds, bats, invertebrates).
- 2.10.0.3 Restore and/or enhance habitats to benefit urban-associated SGCN.
- 2.10.0.4 Restore and/or enhance suitable travel corridors connecting conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats.

Septima's Clubtail

- 2.10.0.5 Implement habitat restoration and/or enhancement activities that include the creation of vegetative buffers between sensitive habitats (e.g., aquatic systems) and human-inhabited areas (e.g., residences, parks, etc.) and that is conducted during appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity
- 2.10.0.6 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats.
- 2.10.0.7 Restore/reclaim and enhance degraded rare species habitats through strategic revegetation and management efforts for documented/target SGCN.
- 2.10.0.8 Protect significant natural and/or unique communities by implementing best management practices when conducting habitat restoration strategies.
- 2.10.0.9 Restore and/or enhance riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation, alteration and/or changes in hydrology and subsequent disturbances to and behavioral changes of wildlife (e.g., restoring biologically appropriate buffers, revegetation or restoration efforts, etc.).
- 2.10.0.10 Minimize the loss of important habitats (e.g., coastal scrub-shrub and grassy habitats, high and low marsh habitats, etc.) that provide nesting, migrating, and wintering areas for SGCN birds and other coastal and marsh-dependent species through habitat restoration efforts.
- 2.10.0.11 Restore and/or enhance critical migratory terrestrial and aquatic habitats (e.g., beach, grasslands, forest, scrub-shrub, etc.) for songbirds, raptors, shorebirds, waterfowl, bats and invertebrates through habitat restoration efforts and expand habitat restoration to adjacent private lands to increase the effective size of the habitat.
- 2.10.0.12 Create and/or maintain scrub-shrub habitats through revegetation efforts with little to no impact on forested, wetland and grassland habitats to maintain populations of shrub-dependent SGCN.
- 2.10.0.14 Implement best management practices (BMPs), protective strategies and guidelines for restoring and enhancing healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.10.0.15 Restore and/or enhance terrestrial and aquatic habitats proximate to but not adjacent to roads and other transportation corridors for terrestrial-bound SGCN species whose behavior (i.e., dispersal across roads) may be altered by doing so, and therefore decrease road mortality of such species (e.g., amphibians, snakes, turtles, small mammals).
- 2.10.0.21 Restore and/or enhance understory habitats that suppress invasive species and provide critical resources and enhance sheltering, foraging, and nesting cover for wildlife.
- 2.10.0.22 Restore and/or enhance terrestrial and aquatic habitats to promote the regeneration of native vegetation and enhance structural diversity to benefit SGCN (e.g., vegetative buffers of aquatic systems, allow coarse, woody debris to remain in terrestrial, aquatic and riparian habitats to provide shelter, riparian stabilization and necessary microclimates, plant native trees, shrubs and grasses, etc.).

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Septima's Clubtail

- 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.
- 2.11.0.2 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas for target SGCN and/or species groups; management should complement rare species needs in a targeted area.
- 2.11.0.3 Create suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats through vegetation management.
- 2.11.0.4 Implement vegetation management strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife, particularly SGCN.
- 2.11.0.5 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats through vegetation management.
- 2.11.0.6 Reclaim degraded rare species habitats by conducting vegetation management needed to restore habitat value for the documented/target SGCN.
- 2.11.0.7 Protect significant natural and/or unique communities by implementing best management practices through vegetation management.
- 2.11.0.8 Maintain, enhance and/or restore biologically appropriate buffers for SGCN-inhabited/used freshwater wetlands through vegetation management.
- 2.11.0.23 Implement appropriate habitat management actions in areas where natural disturbances, such as wildfire, have been precluded.
- 2.11.0.24 Conduct vegetation management adjacent to aquatic habitats following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.25 Conduct vegetation management along access roads following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.26 Conduct vegetation management along roadsides and medians, avoiding peak activity periods for wildlife, that enhances wildlife dispersal naturally and safely across roads and similar barriers to/between terrestrial and/or aquatic habitats.
- 2.11.0.27 Conduct vegetation management for target shrub- or young forest-dependent SGCN following BMPs to minimize the risk of the establishment of invasive and non-native plants.
- 2.11.0.28 Conduct vegetation management in agricultural areas following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.29 Conduct vegetation management on transportation and service corridors (i.e., rights-of-way) following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.30 Identify and prioritize areas where various management tools (such as increasing salinity through the management of water levels or chemical applications) may be effective in reducing phragmites within and restoring marsh habitat.
- 2.11.0.31 In areas where vegetative communities are shifting due to fire suppression and controlled burns are not feasible, manage vegetation to improve wildlife habitat.

Septima's Clubtail

- 2.11.0.32 Increase structural habitat diversity around and when feasible, within agricultural landscapes by managing vegetation for a variety of species, in particular, those farms that have removed scrub-shrub habitat and/or fragmented forests, and by implementing ecologically best practices (e.g., no-till farming, maintaining hedgerows, buffer set-asides, etc.).
- 2.11.0.33 Increase structural habitat diversity by implementing long-term vegetation management to minimize the potential for the establishment of invasive and/or non-native plants that may outcompete native vegetation.
- 2.11.0.34 Increase structural habitat diversity by managing residential, commercial and recreational areas' landscapes for a variety of species. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.35 Increase structural habitat diversity by managing vegetation adjacent to aquatic habitats in a manner that provides a buffer from runoff and erosion and a microclimate to stabilize seasonal temperatures to benefit a variety of aquatic and semi-aquatic species.
- 2.11.0.36 Increase structural habitat diversity by managing vegetation for a variety of species and considering their life history requirements (e.g., travel corridors, shelter, resting and breeding areas) to minimize the risk of harm.
- 2.11.0.38 Increase structural habitat diversity in and around horse/livestock farms by managing vegetation for a variety of species, in particular, in and around farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 2.11.0.39 Increase structural habitat diversity in and around solar farms by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.40 Increase structural habitat diversity surrounding areas used for energy, mining, and transportation and service corridors by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides, and avoid managing habitat during the breeding seasons for ground-nesting birds, reptiles, amphibians and small mammals.
- 2.11.0.41 Increase structural habitat diversity through the implementation of a variety of vegetation management practices such as prescribed burns (either increasing or decreasing their frequency depending on the site and objective), plantings, etc. that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.42 Increase structural habitat diversity within wind farms for terrestrial bound and low-flying species and around wind farms for other wildlife by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.43 Manage forests to increase variation in age structure and composition using BMPs that promote and maintain functioning ecological forest-based systems and biological diversity.
- 2.11.0.45 Regularly and/or rotationally create young forest habitat in targeted areas to maintain and regenerate a mosaic of upland forest habitats that will benefit shrub- and young forest-dependent species.

2.12 Water management

2.12.1 Ditch plugs

- 2.12.1.1** Implement best management practices (BMPs), protective strategies, and guidelines for ditch plugging to maintain and enhance healthy, resident and migratory SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

2.12.3 Drainage

- 2.12.3.2** Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) such as removing drainage ditches to restore natural stream flows and wetlands, that benefit wildlife inhabiting these areas.
- 2.12.3.3** Remove tile drains and drainage ditches to improve wetland hydrology and restore natural stream flows during appropriate times to avoid sensitive periods (e.g., nesting, denning, roosting) and minimizes harm to wildlife, particularly SGCN.
- 2.12.3.4** Expand the acreages and enhance the effective size of SGCN habitats by reclaiming/restoring adjacent, degraded habitats by removing tile drains and drainage ditches.
- 2.12.3.5** Remove drainage ditches adjacent to roads to decrease the attraction for amphibians, reptiles and small mammals, and thereby minimizing road mortality of such species (e.g., amphibians, snakes, turtles, small mammals).
- 2.12.3.6** Protect significant natural and/or unique communities by and when removing tile drains and drainage ditches.
- 2.12.3.7** Minimize habitat loss of critical coastal habitats that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas by removing drainage ditches.
- 2.12.3.8** Enhance critical migratory stopover beach habitats for songbirds, raptors, shorebirds, bats and invertebrates by removing drainage ditches and expanding management to adjacent private lands to increase the effective size of the habitat.
- 2.12.3.9** Implement drain removal on state and other conservation lands to enhance food availability for migratory species (birds, bats, invertebrates).
- 2.12.3.10** Use tile drain and drainage ditch removal to create feeding and roosting habitats for migratory species (shorebirds, raptors, bats, songbirds and invertebrates) in appropriate areas along documented migratory corridors around the State.
- 2.12.3.11** Implement best management practices (BMPs), protective strategies, and guidelines when removing tile drains and drainage ditches to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

2.13 Wildlife damage management

2.13.0 Nuisance fish and wildlife damage

- 2.13.0.4** Investigate the effects of mosquito control methods on freshwater aquatic and semi-aquatic SGCN including but not limited to, amphibian, fish, dragonfly, and damselfly populations.

2.14 Wildlife disease management

2.14.0 Wildlife disease strategy development and investigation

- 2.14.0.1** Investigate diseases/pathogens impacting SGCN and/or their habitats.
- 2.14.0.2** Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
- 2.14.0.3** Protect SGCN from exotic pathogen introduction or incident through implementation of a "rapid response plan"; DFW to give priority attention to these species in planning and/or implementing a response.
- 2.14.0.4** Conduct long-term monitoring of diseases in vulnerable wildlife to determine the magnitude of exposure within populations and around the State, the impacts to those species, in particular SGCN, and investigate the feasibility of mitigating for such impacts.
- 2.14.0.5** Assess the impacts of diseases on the life cycles of wildlife.

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

- 3.0.0.1** Conduct long-term monitoring of resident and migratory SGCN populations using standardized survey protocols to determine the variables that may impact their long-term persistence in the State (e.g., population viability, distribution, dispersal, home range and habitat use, travel corridors, food availability, vulnerability to pollutants and disease, etc.). Compile this information to determine the likely causes of population declines and to understand metapopulation dynamics. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.2** Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) where data gaps exist regarding SGCN distribution, and their critical and supportive habitats. Conduct surveys using standardized survey protocols to acquire baseline data, and provide the data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
- 3.0.0.3** Gather baseline data on SGCN inhabiting permanently protected natural lands regarding their distribution and population (e.g., abundance, dispersal, demography including productivity and survival, etc.), and identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) critical and supporting habitats within those landscapes.
- 3.0.0.4** Conduct long-term studies on SGCN inhabiting permanently protected natural lands to develop population trend data and changes in demography, and to determine if critical and/or supporting habitats are limited or changing; i.e., diminishing in value, acreage or connectivity.
- 3.0.0.7** Collect baseline data to document species distributions, in particular SGCN, and current habitat for future analysis of possible distribution shifting as a result of habitat shifting or alteration associated with climate change impacts.
- 3.0.0.8** Conduct long-term studies and compare baseline metrics of documented species distributions and associated habitats to identify possible species and/or habitat shifting or alteration associated with climate change impacts.
- 3.0.0.13** Investigate the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats. Evaluate and modify management practices as appropriate.

Septima's Clubtail

- 3.0.0.14 Identify areas with invasive, aquatic plants and animals and collect a detailed baseline assessment of the species' status and distribution. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort. Researchers and contractors performing Forest Stewardship Inventories and/or Plans on state lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.0.0.15 Conduct long-term monitoring of areas identified as having invasive, aquatic plants and animals to track the species' status/progress over time with or without the implementation of management strategies. Areas without management strategies should be assessed and prioritized for management/control. Areas where management strategies are being implemented should include an assessment of the management effort and identify/recommend and implement necessary changes to improve its success. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort.
- 3.0.0.19 Identify the presence and status (e.g., functioning, structure, slated for removal, etc.) of existing dams and culverts within and/or that may impact SGCN and their habitats, and create a database that includes a GIS component identifying the locations of such structures and their status. Share this information with appropriate organizations and/or agencies evaluating the benefits and risks of such structures on SGCN and their habitats.
- 3.0.0.20 Once baseline data identifying and describing the status of existing dams and culverts have been gathered, conduct evaluations at a variety of sites to determine whether the benefits of culvert and dam creation or removal outweigh the risks to SGCN species and their habitats, and if other variables/conditions specific to individual sites/locations result in a different outcome. Identify and target appropriate dams and culverts for removal and/or reconstruction to minimize harm to SGCN species and their habitats.
- 3.0.0.23 Identify (through wildlife and aquatic system surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and research water quality parameters for all [types of] aquatic systems for various SGCN populations.
- 3.0.0.26 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species including objectives and guidance pertaining to and the condition/status of critical and supporting habitats.
- 3.0.0.27 Evaluate the effectiveness of strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals through research and monitoring. Develop and provide NJ DEP and other appropriate governing agencies/commissions a summary of findings and recommendations to improve such efforts.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.1 Division of Fish and Wildlife should maintain a robust, up-to-date database and mapping of species occurrences.
- 3.2.0.3 Survey for and monitor populations of freshwater aquatic focal SGCN to assess the populations' demography, trends, condition, distribution, etc.
- 3.2.0.7 Track (via a database that includes a GIS component) and research problematic species and diseases to determine their distribution, impacts on SGCN wildlife/wildlife communities, and develop potential control measures.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Septima's Clubtail

- 3.2.0.8 Implement and conduct long-term monitoring of control measures aimed at minimizing the impacts of problematic species and/or diseases to evaluate the effectiveness of such efforts and to identify and incorporate additional strategies as appropriate.
 - 3.2.0.18 Conduct baseline surveys/inventories to better understand the distribution of fish and invertebrate (including freshwater mussels) populations.
 - 3.2.0.21 Investigate the effects of mosquito control methods on freshwater aquatic and semi-aquatic SGCN including but not limited to, amphibian, fish, dragonfly, and damselfly populations.
 - 3.2.1 Abundance determination
 - 3.2.1.1 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) population abundance and trends for SGCN using standardized survey protocols. Provide data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
 - 3.2.1.2 Conduct wildlife surveys on resident and migratory SGCN regarding their population abundance and trends.
 - 3.2.2 Age, size and sex structure
 - 3.2.2.1 Conduct wildlife surveys on resident and migratory SGCN regarding their survivorship.
 - 3.2.3 Baseline inventory
 - 3.2.3.9 Investigate hazardous environmental issues that may impact grassland invertebrates.
 - 3.2.7 Population assessment
 - 3.2.7.1 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
 - 3.2.7.2 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species to meet and maintain recovery goals.
- 3.3 Research, survey or monitoring - habitat
 - 3.3.1 Baseline inventory
 - 3.3.1.1 Conduct habitat assessments of significant natural and/or unique communities to identify threats to native terrestrial and aquatic habitats through systematic monitoring, review of available data, enlistment of habitat management and/or species experts, etc. Incorporate findings into a database that includes descriptions/qualifiers of the habitats, identifies and values/qualifies the threats, and includes a GIS component of the locations of the assessed areas. Share this information with landowners/managers (e.g., federal, state and local government agencies or non-government organization).
 - 3.3.1.2 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) resident and migratory SGCN habitats. Investigate their suitability for the various life history requirements of the species that dependent upon them to determine the ability for maintaining applicable SGCN populations in perpetuity.
 - 3.3.1.4 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and investigate the suitability of corridors that connect large, contiguous tracts of similar habitats to increase their effective size (i.e., forest with forest, grassland with grassland, wetlands with wetlands, etc.) for dependent SGCN.
 - 3.3.1.5 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) where habitat restoration and/or enhancement would benefit wildlife SGCN.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Septima's Clubtail

- 3.3.1.6 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) that could, through revegetation and/or enhancement efforts, become suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN.
- 3.3.1.7 Map and prioritize existing and potential areas for early succession forest management. Share the results with state, county and municipal planners.
- 3.3.1.9 Inventory forests throughout northern New Jersey to develop a baseline characterization of the structure and composition of habitats and identify deficient forest habitat types.
- 3.3.1.10 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and document fish SGCN habitats by plotting their distributions in GIS and submitting the data to the State for integration into the DEP's Biotics database.
- 3.3.1.16 Gather "best information" for spatial modeling and update/create a current model/depiction of anticipated habitat shifts from sea-level rise, flooding, etc.
- 3.3.1.17 Identify and map undeveloped roads and trails in all conserved forests, and create a database of locations. Integrate information regarding potentially sensitive areas.
- 3.3.1.18 Conduct an assessment using available data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels.
- 3.3.1.19 Identify and codify legal ORV access areas on state (and if appropriate, other conserved) lands. Provide GIS mapping to the landowner for potential use in directing such recreational activities.
- 3.3.1.20 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) where invasive, non-indigenous plants and animals are either already established or are becoming established. Create a system for reporting and qualifying new locations of invasive species and for prioritizing areas for control measures according to the potential level of impact on the ecosystem and SGCN and the likelihood of success. Researchers and contractors encountering invasive plant species while performing plant and/or forest inventories on state or other conserved lands and/or private lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.3.1.24 Conduct regular investigations of SGCN habitat health and biodiversity on public and private lands to identify locations in need of revegetation, reduction of over-abundant, native wildlife and/or exotic species, conservation focal areas requiring limitations on human activity, etc.
- 3.3.1.26 Survey all historic locations and unsurveyed suitable habitats to identify populations of freshwater aquatic focal species.

3.3.2 Monitoring

- 3.3.2.2 Conduct long-term monitoring of resident and migratory SGCN habitats using standardized survey protocols to determine changes in habitat quality/suitability and threats (e.g., habitat loss and degradation, increased edge habitat, water quality) and other variables that may impact their long-term persistence in the State and to provide information needed for determining causes of population declines and understanding metapopulation dynamics.
- 3.3.2.3 Continue to update wildlife and habitat databases and revise models of critical SGCN habitats using the most current data available and where lacking, develop new SGCN and/or habitat models as data on species habitat requirements and applicable GIS data layers become available.

Septima's Clubtail

- 3.3.2.4 Protect water quality and aquatic-dependent species by appropriately designating Category 1 waters and enforcing protective regulations. Seek appropriate classifications for stream segments based on Endangered and Threatened Status and/or the Index of Biotic Integrity (IBI) results that do not fulfill Category One requirements.
- 3.3.2.5 Conduct long-term monitoring of water quality of SGCN aquatic habitats (and aquatic systems feeding into those habitats) to evaluate protection and management efforts to reduce, if not eliminate, chemical contamination, siltation, eutrophication, and other forms of pollution/contamination of aquatic systems.
- 3.3.2.10 Evaluate the efficacy and success of different management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.3.2.14 Research and evaluate the effectiveness of water quality management practices on water-dependent and semi-dependent SGCN, particularly those practices associated with permitting or mitigation actions.
- 3.3.2.15 Investigate the effectiveness of management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.3.2.16 Evaluate the effectiveness of best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 3.3.2.20 Once a system is developed for reporting and qualifying new locations of invasive species, develop, implement and monitor/evaluate invasive species removal strategies at identified locations. Priority should be given to those areas critical to SGCN and/or contain unique and/or rare plant communities supporting SGCN and/or other fish/wildlife species.
- 3.3.2.24 Conduct regular inventories of forests throughout northern New Jersey to characterize the changing structure and composition of habitats and monitor forest conditions.

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.1 Work with land management agencies to determine the appropriate actions needed to restore/reclaim degraded habitat for the documented/target SGCN.
- 3.5.3.3 Develop/improve management techniques that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.8 Develop best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 3.5.3.9 Develop strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 3.5.3.11 Develop strategies to protect native terrestrial and aquatic habitats and dependent SGCN species from the identified threats.
- 3.5.3.14 Develop aquaculture practices in the coastal areas that are compatible with the recovery of SGCN.

Septima's Clutail

- 3.5.3.15 Modify management practices based on the effects of pesticides, herbicides and other biological controls on critical and supporting SGCN habitats.
- 3.5.3.16 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.
- 3.5.3.21 Develop management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.23 Revise water quality management practices based on research on water-dependent and semi-dependent SGCN, particularly when associated with permitting or mitigation actions.
- 3.5.3.24 Based on research, modify management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.5.3.25 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to develop the necessary management strategies to reach or maintain viable population levels.
- 3.5.4 Fish and wildlife research, survey and management techniques
 - 3.5.4.4 Investigate the effects of mosquito control methods on freshwater aquatic and semi-aquatic SGCN including but not limited to, amphibian, fish, dragonfly, and damselfly populations.
 - 3.5.4.5 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
 - 3.5.4.6 Investigate the feasibility of mitigating for the impacts of contaminants to vulnerable wildlife, particularly SGCN. Maintain records on exposure of vulnerable wildlife to environmental toxins (such as flame retardants and endocrine disruptors), so that sources may be identified and controlled or eliminated.
 - 3.5.4.14 Develop and implement agreements, and update existing agreements, with government agencies regarding the protection of critical SGCN habitats (e.g., significant breeding populations of beach nesting birds, colonial waterbird nesting areas, bat colonies, etc.).
 - 3.5.4.15 Investigate the success of management strategies used to protect and/or enhance SGCN populations and when appropriate, aid in identifying failures/resource problems and issues, and developing new strategies.
 - 3.5.4.16 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels and develop the necessary management strategies.
 - 3.5.4.18 Investigate the effectiveness of survey techniques through selected "ground truthing" and literature and peer review in order to increase efficacy of survey, minimize surveyor bias and error, and increase accuracy of trend data.
 - 3.5.4.19 Develop reliable, standardized survey and monitoring protocols for SGCN species, for which none currently exist, and their habitats.

- 3.5.4.21 Develop BMPs to address problematic species and diseases of unknown origin.

4 Education

4.1 Educator/Instructor training

4.1.0 Public education

- 4.1.0.1 Provide educational resources and training programs to private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.

5 Facilities and Areas

5.15 Wildlife Management Areas

5.15.6 Roads

- 5.15.6.1 Clearly post areas/roads where vehicle access is permitted.
- 5.15.6.2 Clearly post areas/trails where vehicle access is not permitted.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

- 6.0.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.3 Secure and protect riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.7 Secure and protect critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

6.3 Conservation area designation

6.3.0 Conservation area designation strategies

- 6.3.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN and/or connect conserved SGCN habitats through conservation area designations.
- 6.3.0.3 Increase the protection of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through conservation area designations.

7 Law Enforcement

7.1 Law enforcement

7.1.3 Sub-national Level

- 7.1.3.2 Increase the number of law enforcement officers tending to wildlife issues to a reasonable number to sufficiently cover the State and marine waters.

7.1.4 Scale Unspecified

Septima's Clubtail

- 7.1.4.1 Improve enforcement of policies and/or regulations that promote the reduction of run-off and point and non-point source pollution into NJ's aquatic systems (streams, rivers, lakes/ponds, bays, ocean, wetlands, etc.).
- 7.1.4.12 Implement policies and/or regulations that protect significant natural and/or unique communities in perpetuity.
- 7.1.4.16 Implement policies that protect and restore riparian areas.
- 7.1.4.17 Improve the enforcement of policies and/or regulations that protect wetlands, riparian and floodplain areas, and aquatic habitats (including open waters).
- 7.1.4.26 Educate law enforcement personnel that there may be unauthorized research projects taking place and to encourage them to investigate any activities that appear to be harmful to wildlife.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.2 Develop a team of personnel from government entities, conservation organizations and other stakeholders engaged in oil/gas spill response for marine and freshwater habitats to develop a feasible plan for oil spill response and/or to amend NJ's current oil spill response plan that clearly outlines each organizations responsibilities and an assessment and location list of available equipment for boom deployment during oil spills.
- 8.1.0.3 Develop an outreach team of personnel from government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 8.1.0.4 Engage government agencies, conservation partners and other stakeholders in constructive dialogues encouraging them to influence policy change and the creation of incentives through a habitat bill and/or municipal ordinances for backyard habitat.
- 8.1.0.15 Engage government agencies, conservation partners and other stakeholders in discussions encouraging and supporting the creation of laws and policies requiring vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 8.1.0.16 Engage local governments in discussions regarding the importance of them adopting/passing ordinances which require assessing and addressing secondary impacts (i.e., ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 8.1.0.17 Engage municipalities in constructive dialogue to identify and minimize destruction of areas prioritized for early succession forest management.
- 8.1.0.18 Engage NJDOT, NJ Transit Authority and other road management entities, wildlife conservation organizations/agencies (e.g., Division of Fish and Wildlife, New Jersey Conservation Foundation, Conserve Wildlife Foundation of NJ), and communities and citizens in discussions regarding the importance of and methods to enhance habitat connectivity, and work together to develop feasible strategies for ensuring that wildlife can disperse naturally and safely across roads and similar barriers to terrestrial and/or aquatic habitats.
- 8.1.0.19 Engage government agencies, conservation partners and other stakeholders to collaboratively develop a list of important projects, targeting SGCN and/or their habitat, as a guide for graduate student research. Distribute the list and contact information to all State colleges and universities.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Septima's Clubtail

- 8.1.0.20 Organize a small focal group of government and non-government agencies/organizations responsible for decisions regarding beach/dune management to share and coordinate their goals so that comprehensive planning can attempt to meet all needs.
- 8.1.0.21 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation human-subsidized and/or overabundant, native species cause to local nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.22 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation invasive species cause to native nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.24 Engage government agencies, conservation partners and other stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.25 Provide technical support to public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.26 Coordinate across federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to woodland landowners to adopt or endorse consistent best management practices concerning controlled burns to maintain and/or improve forested habitat for wildlife.
- 8.1.0.30 Encourage government agencies and conservation partners to advise members of the relevant scientific community of the need for specific studies, reports or investigations targeting the data-deficiency regarding SGCN and/or their habitats.
- 8.1.0.33 Engage government agencies, conservation partners and other land managers, communities, landowners, and commercial and industrial stakeholders in discussions regarding the importance of protecting and methods to protect priority wetlands beyond the levels afforded through regulation by maintaining and/or restoring optimal biological buffers around wetlands.
- 8.1.0.34 Work with the NJ Education Association and Department of Education to design curriculum and outdoor experimental learning opportunities, and provide training to teachers on implementation of these activities.
- 8.1.0.37 Enlist landowners and NJ citizens in the protection of and survey efforts for SGCN, in particular rare species, by increasing enrollment in landowner incentives, forest stewardship, backyard habitat management and wildlife-related volunteer programs.
- 8.1.0.38 Engage partners, stakeholders and land managers in constructive dialogue promoting forest stewardship for SGCN that use core forests and forested corridors.
- 8.1.0.40 Encourage researchers, land managers, naturalists and enthusiasts to follow proper procedures for the coordination and/or permitting of research/management activities involving wildlife and sensitive habitats, and discourage activities that alter vegetation or wetlands, or cause harm or disturbance to wildlife.
- 8.1.0.42 Engage citizens, wildlife observers and photographers through discussions and distributable information regarding the importance of and encouraging implementing responsible and ethical behavior when observing wildlife by developing an alliance of wildlife photographers and widely circulating recommendations on how to reduce impact.

Septima's Clubtail

8.1.0.44 Engage conservation partners, stakeholders, government agencies and other land stewards in constructive dialogues encouraging their inclusion of controlled burns in forest and other stewardship plans.

8.1.0.47 Form cooperative partnerships with energy companies to facilitate habitat creation and enhancement away from and outside of project areas, the restoration of appropriate habitats within project areas (e.g., rights-of-way could benefit butterflies and some bird species), and to identify seasonal timing of activities that would minimize impacts to wildlife.

8.1.0.48 Form cooperative partnerships with transportation and shipment agencies and companies to facilitate habitat creation and enhancement away from and outside of project areas and to identify seasonal timing of activities that would minimize impacts to wildlife.

8.2 Recruitment and retention activities

8.2.3 For wildlife watching

8.2.3.1 Develop and implement nature-focused tourism opportunities including wildlife viewing sites, interpretive signage highlighting unique ecosystems/habitats, and wildlife-related recreational opportunities that do not negatively impact SGCN or their habitats.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

8.3.0.7 Develop and provide (or otherwise make publicly available) educational programs and/or materials that describe the negative impacts of off-road vehicles and watercraft use in and adjacent to critical SGCN habitats, and the importance of confining such activities to more appropriate locations and/or seasons.

8.3.0.8 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate recreationists and encourage landowners to eliminate garbage in the vicinity of suitable wildlife habitat, in particular SGCN habitat. Information should include the detrimental impacts garbage may have on various wildlife species.

8.3.0.9 Develop and provide (or otherwise make publicly available) educational programs and/or materials to enlist landowners and land managers to include only native plants in landscaping and restoration projects. Provide information to assist them in detecting problematic establishment of invasive, non-indigenous plants.

8.3.0.10 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate landowners and NJ citizens on threats to fish and wildlife (including marine animals).

8.3.0.11 Develop and provide (or otherwise make publicly available) educational programs and/or materials to the public, wildlife-related professionals, foresters, etc., that describe the value of species that are often feared (e.g., snakes, bats, spiders, Allegheny woodrat) and/or deemed a "nuisance" (e.g., squirrel, deer, snapping turtle), and therefore, persecuted by people. Include information on tolerance, proper identification, eviction from human dwellings, how to minimize the animal's presence on the property, and/or how to live in harmony with the animal.

8.3.0.12 Promote awareness of WSFR (Wildlife and Sportfish Restoration) Outreach/Awareness grants, an important funding source for conservation among hunters and anglers as well as the general public.

8.3.0.13 Conduct an educational campaign to encourage observer ethics and respect for wildlife and natural habitat.

Septima's Clubtail

- 8.3.0.24 Develop educational outreach programs for local decision-makers, land developers, landowners and citizens about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
- 8.3.0.25 Develop educational outreach programs for landowners, nurseries and the general public regarding the negative impacts of invasive and non-native plants on our natural communities.
- 8.3.0.26 Develop educational outreach programs for private and public landowners and land managers regarding the importance of and how to manage core forests and forested corridors in a way that will be beneficial for SGCN, particularly endangered, threatened and special concern species.
- 8.3.0.27 Develop educational outreach programs for public and private landowners and land managers regarding the importance of structural habitat diversity, methods to increase diversity, and/or incentive programs available to increase habitat diversity.
- 8.3.0.29 Develop educational outreach programs for local decision-makers, land developers, landowners and citizens about the importance of maintaining a vegetative buffer along riparian and aquatic habitats to intercept storm water runoff and minimize soil erosion.
- 8.3.0.30 Develop educational outreach programs for private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.
- 8.3.0.32 Develop an educational outreach program for landowners and citizens on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

- 9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and SGCN inhabiting them.
- 9.1.0.2 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.1.0.3 Develop a plan that directs the creation of impervious surfaces away from and to minimize impacts on aquatic systems and critical terrestrial habitats. The plan should also include strategies to increase the resiliency of aquatic and critical terrestrial habitats to threats and stressors that would impact the reproduction and survival of wildlife.
- 9.1.0.5 Develop a plan that directs the creation or expansion of energy or utility rights-of-way in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.6 Develop a plan that directs the creation or expansion of roads and railroads or the re-establishment of abandoned railroads within and adjacent to critical forested habitats in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.7 Develop a plan that directs the maintenance of or new channelization of forested streams and rivers in a manner that minimizes impacts of the aquatic ecological system and adjacent forest
- 9.1.0.8 Develop a plan that focuses on strategies for oil pipelines to avoid sensitive habitats that would be highly impacted by oil spills.
- 9.1.0.9 Develop a plan that focuses on strategies to minimize the creation of renewable energy farms (e.g., solar, wind) and related infrastructures within and their impacts on forested habitats and the wildlife community.
- 9.1.0.10 Develop a plan that focuses on strategies to minimize the impacts of mining on critical forested habitats.

Septima's Clubtail

- 9.1.0.11 Develop a plan that focuses on strategies to minimize the impacts of power plants on critical forested habitats and the wildlife community.
- 9.1.0.13 Develop a plan to minimize agriculture that would result in groundwater withdrawal in critical forested areas.
- 9.1.0.14 Develop a plan to minimize development that would result in groundwater withdrawal in critical forested areas.
- 9.1.0.15 Develop a plan to minimize fragmentation of terrestrial and aquatic habitats by roads.
- 9.1.0.16 Develop a plan to minimize new lawns and preserve natural vegetation within and adjacent to critical forest areas.
- 9.1.0.19 Develop a plan to minimize the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 9.1.0.22 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 9.1.0.28 Develop and coordinate state, regional and local plans for suitable lot layout and landscaping to minimize human-wildlife conflicts that also incorporates habitat connectivity and preservation of natural areas.
- 9.1.0.29 Provide GIS or related data, maps, resource inventories, as well as related training, pertaining to the SWAP and its recommended conservation actions for use or consideration by State, County or municipal planning agencies.
- 9.1.0.30 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and other related threats associated with development.
- 9.1.0.31 Develop wetland restoration plans that consider the life history and needs of wildlife occupying targeted habitats.
- 9.1.0.32 Incorporate aquatic habitat connectivity and water quality/effluent standards into local and state aquaculture plans and BMPs.
- 9.1.0.33 Review the species, threats, action successes, and habitats, and work with partners to revise the 2017 State Wildlife Action Plan for the 2025 resubmittal.

9.2 Organizational strategic and CMS planning

9.2.1 Organizational strategic and operational planning

- 9.2.1.1 Identify and codify legal ORV access areas on state lands.

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.3 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.1.4 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.3.1.5 Develop response plans to address disease outbreaks within wildlife populations, in particular SGCN.
- 9.3.1.7 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.

Septima's Clubtail

- 9.3.1.9 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
 - 9.3.1.10 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
 - 9.3.1.13 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
 - 9.3.1.15 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.
 - 9.3.1.16 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.
- 9.3.3 Habitat management planning
 - 9.3.3.5 Develop a management plan using forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.
 - 9.3.3.7 Develop a management plan to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.
 - 9.3.3.8 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
 - 9.3.3.10 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
 - 9.3.3.11 Develop town plans that avoid impacts to SGCN species and their habitats.
 - 9.3.3.13 Develop a management plan that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas and prevents or ameliorates near-term impacts of climate change throughout the State, but in particular within the coastal and Delaware Bay areas.
 - 9.3.3.15 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
 - 9.3.3.16 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
 - 9.3.3.18 In cooperation with species and habitat experts, develop management plans for significant natural and/or unique communities, in particular those supporting SGCN, and provide the information to the landowners/managers (federal, state and local government agencies or non-government organization) for review and implementation.
 - 9.3.3.19 Develop management plans for SGCN inhabiting permanently protected natural lands using available baseline and population trend data.
 - 9.3.3.21 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.

Septima's Clubtail

- 9.3.3.24 Develop a plan to improve the enforcement of policies and/or regulations that protect wetlands, riparian and floodplain areas, and aquatic habitats (including open waters).
- 9.3.3.28 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.
- 9.3.3.29 Develop habitat management plans aimed at reducing or eliminating negative impacts of ORVs.
- 9.3.3.32 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.
- 9.3.3.34 Include controlled burn prescriptions in forest and stewardship plans to improve wildlife habitat.
- 9.3.3.35 Incorporate habitat connectivity, preservation of natural areas, and the implementation of BMPs into state and local land-use policy environmental review process and energy development plans to minimize habitat fragmentation and related threats associated with solar farms and altered habitats.
- 9.3.3.36 Integrate plans for properly located and timed habitat restoration and management along transportation, energy and service corridors to minimize risks to and benefit wildlife.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

- 11.1.1.1 Use Biotics database and Landscape Project Mapping in regulatory reviews to ensure protection by applicable laws and regulations.
- 11.1.1.2 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
- 11.1.1.3 Government organizations to thoroughly review wetland restoration plans, applying the most current science for wildlife, habitats and aquatic systems, to assess the impacts to resident and migratory wildlife occupying the targeted habitats.
- 11.1.1.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.
- 11.1.1.5 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 11.1.1.7 Review proposed construction or other work projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.8 Review proposed research projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.12 Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed solar farm projects to reduce habitat fragmentation and minimize impacts on wildlife.

11.1.2 Review of proposed policies and plans

Septima's Clubtail

- 11.1.2.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
- 11.1.2.2 Government organizations to thoroughly review wetland restoration plans, applying the most current science for wildlife, habitats and aquatic systems, to assess the impacts to resident and migratory wildlife occupying the targeted habitats.
- 11.1.2.3 Incorporate aquatic habitat connectivity and water quality/effluent standards into the environmental review process to help establish policies and plans that minimize the impact of aquaculture on fish and wildlife.
- 11.1.2.4 Review strategies for creating or enhancing connectivity (e.g., installing appropriately-sized wildlife passages) between wetlands to allow wildlife to disperse naturally and safely.

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

- 11.2.0.1 Provide technical support to private and public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 11.2.0.2 Provide technical support to public and private landowners and land managers for controlling invasive, native and non-native plant species in order to increase structural habitat diversity.
- 11.2.0.3 Develop state, regional and local BMPs that focus on minimizing habitat fragmentation and human-wildlife conflicts associated with development. Make information available to land developers and private and public landowners for implementation.
- 11.2.0.5 Provide educational resources, training programs, and expert guidance to private and public landowners and land managers on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.
- 11.2.0.6 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on habitat creation, enhancement and restoration within and adjacent to project areas, as well as away from and outside of project areas (depending on the target species), by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. Wind farms should address both terrestrial bound and low-flying species. Examples of habitat management include, but are not limited to, integrating short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 11.2.0.7 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on the importance of maintaining habitat connectivity, minimizing fragmentation, and the use of CHANJ products to help them target areas for such planning.
- 11.2.0.8 Provide educational resources, training programs, and on-the-ground guidance to public and private landowners and land managers on habitat creation and enhancement strategies that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 11.2.0.9 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and private landowners about the importance of leaving vegetation in place, especially along riparian areas and wildlife movement corridors.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Septima's Clubtail

- 11.2.0.10 Provide technical support to private landowners, consultants, and land managers to create customized management plans based on location and SGCN.
- 11.2.0.14 Provide educational resources and technical support to public and private landowners and land managers to promote the protection of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters), and to enhance or restore biologically appropriate buffers.
- 11.2.0.15 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and landowners about the importance of retaining and in an effort to protect, create, enhance and/or restore vegetation along aquatic habitats.
- 11.2.0.17 Provide educational resources and technical support to public and private landowners and land managers to promote the protection of vernal pools and the protection, enhancement and/or restoration of biologically appropriate buffers.
- 11.2.0.22 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
- 11.2.0.23 Provide educational resources and technical support to public and private landowners and land managers of lands adjacent to SGCN habitats to promote the protection and/or enhancement of those adjacent habitats to increase the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and that connect conserved SGCN habitats.
- 11.2.0.24 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers on how to manage vegetated roadside areas (e.g., mowing, brush-hogging, etc.) on a schedule that avoids peak activity periods for wildlife and therefore, minimizes harm.
- 11.2.0.25 Provide educational resources, training programs, and on-the-ground guidance to resource managers regarding the assessment of and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) related to residential and commercial development.
- 11.2.0.26 Make educational resources available to the public that encourage researchers to seek out guidance prior to finalizing proposals and submitting State permit applications to reduce potential impacts on sensitive species.
- 11.2.1 With individuals and groups involved in resource management decision making
 - 11.2.1.1 Engage partners and stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
 - 11.2.1.2 Provide professional training and technical assistance tools (e.g., mapping, guidance documents, justification, etc.) to agencies/divisions/programs within and outside of the NJ DEP regarding the SWAP, and the conservation actions recommended therein to help facilitate SWAP implementation.
 - 11.2.1.3 Provide educational resources, training programs, and on-the-ground guidance to DOD to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop and implement forest management and other practices that minimize disturbances to SGCN (i.e., beyond their federal requirements).
 - 11.2.1.5 Provide educational resources, training programs, and on-the-ground guidance to municipalities, state and federal agency resource managers on tasks such as writing and integrating Beach Management Plans into other management documents.

Septima's Clubtail

11.2.1.6 Provide educational resources, training programs, and on-the-ground guidance to resource agencies prior to project initiation to ensure wildlife and their habitats are protected to the highest degree possible during construction, and provisions are in place for post-construction habitat use.

11.2.2 With private landowners

11.2.2.1 Provide technical support to farming operations and woodland landowners on ways to decrease clean farming (edge-to-edge) practices and create ecotones to benefit bobwhite and other species dependent on early successional habitat.

100 Law and Policy

100. Legislation

100.1.3 Sub-national Level

100.1.3.1 Develop laws and policies to increase protection and biological buffers of wetlands.

100.1.3.2 Develop policies for wetland restoration plans that consider life history requirements and needs of wildlife occupying targeted habitats.

100.1.3.3 Initiate legislative action to establish an annual budgetary line item designating funds to support programs focused on long-term research and monitoring of wildlife diseases.

100.1.4 County and Local

100.1.4.2 Secure and increase the effective size of SGCN habitats and connect conserved SGCN habitats through local ordinances.

100.1.4.3 Expand the acreages and enhance the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN through local ordinances.

100.1.4.4 Secure wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) and biologically appropriate buffers through local ordinances.

100.1.4.5 Secure SGCN-inhabited/used freshwater wetlands and biologically appropriate buffers through local ordinances.

100.1.4.11 Secure riparian areas through local ordinances.

100.1.4.14 Adopt/pass local ordinances which require assessing and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.

100.1.4.15 Incorporate habitat connectivity and the preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.

100.1.5 Scale Unspecified

100.1.5.1 Develop laws and policies to increase protection and biological buffers of wetlands.

100.1.5.2 Develop policies for wetland restoration plans that consider life history requirements and needs of wildlife occupying targeted habitats.

100.1.5.3 Incorporate aquatic habitat connectivity and water quality/effluent standards into state/local policy to minimize the impact of aquaculture on fish and wildlife.

100.1.5.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.

- 100.1.5.5 Develop legislation to provide financial support for the New Jersey Invasive Species Strike Team.

100. State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.1 Develop (and/or improve) policies and/or regulations that will promote the reduction of run-off and point and non-point source pollution into NJ's aquatic systems (streams, rivers, lakes/ponds, bays, ocean, wetlands, etc.).
- 100.3.0.5 Develop policies that will promote improved and secure habitat connections between conserved SGCN habitats.
- 100.3.0.6 Develop policies that will promote expanding acreages and enhancing the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 100.3.0.8 Develop policies and/or regulations with the objective of protecting significant natural and/or unique communities in perpetuity.
- 100.3.0.9 Secure mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.12 Develop policies that promote the preservation and protection of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.
- 100.3.0.13 Develop policies that will promote protecting and restoring riparian areas.
- 100.3.0.14 Develop policies and/or regulations that increase the protective buffers of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) to biologically appropriate distances to benefit SGCN that rely upon these habitats and improve the function of the [associated] aquatic systems.
- 100.3.0.18 Develop policies for conserved lands that prohibit planting and supports the control of non-native vegetation and invasive, native vegetation.
- 100.3.0.23 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.26 Adopt regulations requiring the combined sewer overflow alternative analyses required by regulation address potential impacts to wildlife in watercourses or receiving water bodies.
- 100.3.0.31 Create or expand tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMPs.
- 100.3.0.32 Coordinate regulations across agencies to maximize availability of and enrollment in existing Forestry Stewardship Programs (e.g., "Woodland Stewards", Farm Bill, partners, etc.) to maintain and/or improve forest habitat.
- 100.3.0.38 Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.

Septima's Clubtail

- 100.3.0.39 Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.3.0.40 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.3.0.41 Explore all State regulatory requirements for mitigation, restoration, habitat management, etc. to ensure they prohibit the use of specified invasive or other problematic plant species.
- 100.3.0.43 Identify and address (amend) regulatory impediments to beneficial habitat management.
- 100.3.0.44 Incorporate requirements for technical support and funding for mitigation or restoration efforts so as to be consistent with existing regulations.
- 100.3.0.45 Increase the controlled burn season to focus on restoring vegetative communities.
- 100.3.0.46 Investigate and/or develop inter-agency Memorandum of Agreements to share common data stored or managed in program-specific databases.
- 100.3.0.48 Propose new State law or regulation mandating that a State-level "development impact fee" be assessed on all new development approved by municipalities (via the Municipal Land Use Law processes), and dedicate such monies to the development and implementation of regional Habitat Conservation Plans (or existing plans/programs serving the same regional function).
- 100.3.0.50 Retain endangered, threatened and special concern wildlife and habitat protection measures in the Water Quality Management Program Rules.
- 100.3.0.52 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded energy sitings and facilities.
- 100.3.0.53 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded rights-of-way corridors associated with energy transport/transmission.
- 100.3.0.60 Develop regulations that when implemented will protect significant natural and/or unique communities in perpetuity.
- 100.3.0.64 Develop regulations that when implemented will protect and restore riparian areas.
- 100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.
- 100.3.0.73 Develop regulations that would exempt the conversion of lawns to native vegetation (beneficial to wildlife) from local lawn ordinances.

100.3.2 State Land Acquisition Programs

- 100.3.2.1 Increase opportunities for habitat restoration by making any necessary policy changes to state, federal and local land acquisition programs (e.g., Green Acres, Blue Acres, etc.) to allow for acquisition within abandoned or failing bay shore communities, including mechanisms to relocate displaced people and infrastructure.

100. State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

Septima's Clubtail

- 100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).
- 100.4.0.2 Create a policy that requires the NJ DEP to incorporate scientific information regarding climate change and sea level rise (e.g., predictions, habitat management/acquisition efforts to enhance resilience to inundation) on their websites and to work with other government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 100.4.0.3 Develop policies for mandatory buffer strips on preserved farmlands and state-owned agricultural lands.
- 100.4.0.8 Develop a white paper addressing the impacts that existing, new or expanded rights-of-way have upon wildlife, wildlife habitats and habitat connectivity.
- 100.4.0.10 Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.
- 100.4.0.11 Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.4.0.12 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.4.0.13 Develop policies for different circumstances (e.g., roadsides and medians, riparian, aquatic and terrestrial habitats) that outline appropriate habitat/vegetation management strategies and schedules to minimize risks to and benefit wildlife.
- 100.4.0.16 Develop policies to implement habitat management strategies that will increase the structural diversity surrounding areas used for energy, mining, and transportation and service corridors which include but are not limited to the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-
- 100.4.0.17 Develop policies to implement habitat management strategies, including prescribed burns, that will increase the structural diversity on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies to control and reduce the impacts of invasive, non-native species in order to increase structural habitat diversity.
- 100.4.0.18 Develop policies to minimize the extent of infrastructure associated with energy and service corridors or areas (e.g., wind and solar farms, pipelines, utility lines) and that require the implementation of habitat management strategies that will increase the structural diversity in the area including (e.g., the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-asides).
- 100.4.0.19 Develop regulations that will minimize the creation of new barriers, remove or replace current barriers with appropriately-sized systems to accommodate wildlife dispersal, and to minimize road widening and traffic volume increases within critical wildlife habitat areas.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Septima's Clubtail

- 100.4.0.20 Develop state regulations that require energy developers and utility service companies to implement habitat management strategies that will increase the structural diversity of the habitat, minimize habitat fragmentation and commercial infrastructure, and minimize the loss, alteration and/or degradation of the habitat and adjacent lands when working on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies.
- 100.4.0.21 Ensure that Section 303(d) of the Clean Water Act and applicable State statutory/regulatory requirements for surface water pollutant budgets are being met by monitoring and enforcing regulatory Total Maximum Daily Load (TMDL) targets established within regional Water Quality Management Plans.
- 100.4.0.22 Work with NJ DEP's Division of Land Use Regulation to ensure protection of listed species and their habitats during stream cleaning events.
- 100.4.0.24 Develop policies to provide financial support for the New Jersey Invasive Species Strike Team.
- 100.4.0.25 Develop policies that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

Superb Jewelwing

Focal species that comprise this Conservation Target:

Superb Jewelwing

Threats and Action Drivers associated with this Conservation Target:

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale) (Avg. Score: 3.00)

- NJ Specific Threats:**
- 1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
 - 1.1.1.2 Loss, alteration and/or degradation of habitat.
 - 1.1.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
 - 1.1.1.7 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale) (Avg. Score: 3.00)

- NJ Specific Threats:**
- 1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
 - 1.2.1.2 Loss, alteration and/or degradation of habitat.
 - 1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
 - 1.2.1.7 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale) (Avg. Score: 2.00)

- NJ Specific Threats:**
- 1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
 - 1.3.1.2 Loss, alteration and/or degradation of habitat.
 - 1.3.1.5 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
 - 1.3.1.6 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

2 Agriculture and Aquaculture

2.1 Annual and Perennial Crops (non-timber)

2.1.1 Shifting Agriculture (Avg. Score: 2.00)

- NJ Specific Threats:**
- 2.1.1.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Superb Jewelwing

2.1.2 Small-holder Farming (Avg. Score: 1.00)

NJ Specific Threats: 2.1.2.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.2.2 Fragments terrestrial and aquatic habitats.

2.1.3 Agro-industry (Avg. Score: 1.00)

NJ Specific Threats: 2.1.3.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.3.2 Fragments terrestrial and aquatic habitats.

2.2 Wood and Pulp Plantations

2.2.1 Small Holder (Avg. Score: 1.00)

NJ Specific Threats: 2.2.1.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.

2.2.2 Agro-industry Plantations (Avg. Score: 1.00)

NJ Specific Threats: 2.2.2.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.

2.3 Livestock Farming and Ranching

2.3.2 Small-holder Grazing (Avg. Score: 1.00)

NJ Specific Threats: 2.3.2.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.

2.3.2.2 Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.

2.3.2.3 Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

2.3.2.4 Livestock allowed to wade into waterbodies trample and degrade aquatic habitats.

2.3.3 Agro-industry Grazing (Avg. Score: 1.00)

NJ Specific Threats: 2.3.3.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.

2.3.3.2 Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.

2.3.3.3 Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

2.3.3.4 Livestock allowed to wade into waterbodies trample and degrade aquatic habitats.

3 Energy Production and Mining

3.2 Mining and Quarrying

3.2.2 Surface Mining - Rock Quarry (and sand quarries) (Avg. Score: 1.00)

NJ Specific Threats: 3.2.2.1 Fragments terrestrial and aquatic habitats.

3.2.2.2 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

3.3 Renewable Energy

3.3.2 Solar Power (Avg. Score: 1.00)

NJ Specific Threats: 3.3.2.2 Loss, alteration and/or degradation of habitat.

3.4 Conventional Power Plants

3.4.0 Conventional Power Plants (Avg. Score: 1.00)

Superb Jewelwing

NJ Specific Threats: 3.4.0.3 Alteration of the temperature, pH and/or hydrology of aquatic ecosystems change plant communities and can harm wildlife and/or impact their behavior and survivorship.

4 Transportation and Service Corridors

4.1 Roads and Railroads

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale) (Avg. Score: 1.00)

NJ Specific Threats: 4.1.1.2 Loss, alteration and/or degradation of habitat associated with road and railroad construction and maintenance, and degradation of adjacent habitats.

4.1.2 Movement of cars and other vehicles on roads and railroads (large and small scale) (Avg. Score: 1.00)

NJ Specific Threats: 4.1.2.1 Increased vehicle traffic increases the risk of wildlife mortality from strikes.

4.2 Utility and Service Lines

4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads (Avg. Score: 1.00)

NJ Specific Threats: 4.2.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species, inhibiting dispersal of non-volant animals, reducing gene flow, and creating barriers to fish when service line-associated roads cross streams (e.g., bridges, culverts, fords, etc.).

4.2.1.2 Loss, alteration and/or degradation of habitat associated with rights-of-way construction and maintenance, and degradation of adjacent habitats.

4.3 Shipping Lanes

4.3.2 Dredging impacts (Avg. Score: 2.00)

NJ Specific Threats: 4.3.2.1 Threatens wildlife by disrupting/removing stream bottom habitat.

5 Biological Resource Use

5.1 Hunting and Collecting Terrestrial Animals

5.1.1 Intentional Use (Avg. Score: 1.00)

NJ Specific Threats: 5.1.1.1 Illegal collection of wildlife can have detrimental impacts on populations.

5.4 Fishing and Harvesting of Aquatic Resources

5.4.4 Unintentional effects (large scale) (Avg. Score: 1.00)

NJ Specific Threats: 5.4.4.1 Fish introduced for sport fishing can negatively impact native species by competing for resources and/or altering the habitat (e.g., disrupting benthic communities and/or severely impacting aquatic vegetation).

6 Human Intrusions and Disturbance

6.1 Recreational Activities

6.1.1 Off-road vehicles (motorized and non-motorized) (Avg. Score: 2.00)

NJ Specific Threats: 6.1.1.2 Inappropriate use of off-road vehicles can degrade terrestrial and aquatic habitat and reduce the suitability of adjacent habitats for wildlife.

6.1.1.3 Increased risk of harassment that results in a change in wildlife behavior and/or direct mortality from vehicle strikes.

6.1.1.6 Off-road vehicles can be a mechanism of transference of wildlife diseases and invasive plant species if gear and apparel are not properly sanitized between sites.

7 Natural Systems Modifications

7.2 Dams and Water Management/Use

7.2.1 Abstraction of Surface Water (domestic use) (Avg. Score: 3.00)

- NJ Specific Threats:** 7.2.1.1 Changing water levels due to water body drawdowns (legal and illegal) may lower dissolved oxygen levels, increase water temperatures, expose wildlife to predation, and increase exposure to winter temperatures, altering wildlife behavior and survival.
- 7.2.1.2 Controlled water releases and/or improper water level management of water bodies may alter downstream dissolved oxygen levels, water temperatures, sediment deposition, and flow rates, altering wildlife behavior and survival.
- 7.2.1.3 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, and eliminates shallow water habitats.

7.2.2 Abstraction of Surface Water (commercial use) (Avg. Score: 3.00)

- NJ Specific Threats:** 7.2.2.1 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, eliminates shallow water habitats, and disrupts/removes stream bottom habitat.
- 7.2.2.2 Changing water levels due to water body drawdowns (legal and illegal) may lower dissolved oxygen levels, increase water temperatures, expose wildlife to predation, and increase exposure to winter temperatures, altering wildlife behavior and survival.
- 7.2.2.3 Controlled water releases and/or improper water level management of water bodies may alter downstream dissolved oxygen levels, water temperatures, sediment deposition, and flow rates, altering wildlife behavior and survival.

7.2.3 Abstraction of Surface Water (agricultural use) (Avg. Score: 3.00)

- NJ Specific Threats:** 7.2.3.1 Controlled water releases and/or improper water level management of water bodies may alter downstream dissolved oxygen levels, water temperatures, sediment deposition, and flow rates, altering wildlife behavior and survival.
- 7.2.3.2 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, and eliminates shallow water habitats.
- 7.2.3.3 Impounding water to create or expand bogs for cranberry farming leads to the loss of natural wetlands and the alteration of the natural hydrology in the area.
- 7.2.3.5 Changing water levels due to water body drawdowns (legal and illegal) may lower dissolved oxygen levels, increase water temperatures, expose wildlife to predation, and increase exposure to winter temperatures, altering wildlife behavior and survival.

7.2.5 Abstraction of Ground Water (domestic use) (Avg. Score: 3.00)

- NJ Specific Threats:** 7.2.5.1 Heavy withdrawal of ground water for domestic use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.6 Abstraction of Ground Water (commercial use) (Avg. Score: 3.00)

- NJ Specific Threats:** 7.2.6.1 Heavy withdrawal of ground water for industrial and commercial use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.7 Abstraction of Ground Water (agricultural use) (Avg. Score: 3.00)

- NJ Specific Threats:** 7.2.7.1 Heavy withdrawal of ground water for agricultural use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.9 Small Dams (Avg. Score: 3.00)

- NJ Specific Threats:** 7.2.9.1 Alter the physical, chemical and biological stream environment, causing changes in substrate composition, flow rates, dissolved oxygen, and water temperatures.

Superb Jewelwing

7.2.10 Large Dams (Avg. Score: 3.00)

NJ Specific Threats: 7.2.10.1 Alter the physical, chemical and biological stream environment, causing changes in substrate composition, flow rates, dissolved oxygen, and water temperatures.

7.2.11 Dams (size unknown) (Avg. Score: 3.00)

NJ Specific Threats: 7.2.11.1 Alter the physical, chemical and biological stream environment, causing changes in substrate composition, flow rates, dissolved oxygen, and water temperatures.

7.2.13 Stream Burial (Avg. Score: 3.00)

NJ Specific Threats: 7.2.13.1 Eliminates riparian habitats.

7.2.13.3 Alters the hydrology and quality of downstream aquatic and riparian habitats.

7.3 Other Ecosystem Modifications

7.3.3 Removal of coarse woody debris (streams, forests, scrub-shrub habitats) (Avg. Score: 1.00)

NJ Specific Threats: 7.3.3.1 Decreases the available detritus that normally accumulates behind and within stream obstructions, minimizing or eliminating food sources and shelters for fishes, invertebrates and amphibians.

7.3.3.2 Decreases habitat and/or corridor suitability due to limited or absent shelter and foraging habitat.

7.3.5 Poor habitat management (Avg. Score: 2.00)

NJ Specific Threats: 7.3.5.1 Improper or poorly scheduled maintenance of man-made corridors (e.g., roadsides and medians) can cause direct mortality to and may reduce productivity of wildlife.

7.3.5.2 Shifting from natural vegetation to lawns can cause increased temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

7.3.5.4 Vegetation clearing or inappropriate alteration adjacent to aquatic habitats threatens aquatic species by degrading habitat and water quality (altering temperature and dissolved oxygen, increasing siltation and desiccation, etc.).

7.3.5.9 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, eliminates shallow water habitats, and disrupts/removes stream bottom habitat.

7.3.5.10 Ditching, draining and filling of marshes and wetlands eliminates habitat and degrades the remaining surrounding areas for wildlife.

7.3.5.12 Lack of diversity in age structure and composition of vegetation due to lack of natural disturbances and/or vegetation management.

8 Invasive and Other Problematic Species, Genes and Diseases

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.1 Unspecified Species (Avg. Score: 1.00)

NJ Specific Threats: 8.1.1.1 Displace or outcompete native species for resources.

8.1.1.2 Alters, degrades and/or reduces the structural diversity of the natural composition of the landscape, including aquatic systems.

8.1.1.3 Invasive, non-native insects can damage native vegetation at a large scale, leading to die-offs, altering the ecological community.

8.1.1.4 Invasive, non-native animals increase the risk of predation on native animals and/or herbivory on native vegetation.

8.1.1.5 Invasive, non-native animals and plants increase the risk of introduction and transference of diseases

8.1.1.6 Invasive, non-native plants may create physical barriers for some species.

8.1.5 Invasive non-native terrestrial/wetland plants (Avg. Score: 2.00)

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Superb Jewelwing

NJ Specific Threats: 8.1.5.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.6 Diseases of Unknown Cause

8.6.0 Unknown Diseases (Avg. Score: 1.00)

NJ Specific Threats: 8.6.0.1 Diseases yet to be identified by pathologists and virologists cause decreased fitness or mortality to native populations.

9 Pollution

9.1 Domestic and Urban Waste Water

9.1.1 Sewage (Avg. Score: 3.00)

NJ Specific Threats: 9.1.1.1 Degradation of aquatic and marine water quality and habitats by changing turbidity, flow and water chemistry.

9.1.1.2 Leads to increased eutrophication and algae blooms that result in oxygen depletion.

9.1.1.3 Contaminants in sewage treatment effluents and Combined Sewer Overflows can cause developmental and behavioral abnormalities and reproductive failure in wildlife.

9.1.2 Run-off (Avg. Score: 3.00)

NJ Specific Threats: 9.1.2.1 Chemical fertilizers and nutrient run-off changes the pH in streams and ponds and causes eutrophication in inland waters and estuaries, which can make habitat unsuitable for specialist species and increase the risk of invasive and generalist species.

9.1.2.2 Contaminants degrade aquatic and marine water quality and can bioaccumulate in benthic organisms, threatening wildlife by causing developmental and behavioral abnormalities and reproductive failure.

9.1.2.3 Contaminants from road runoff (oil, sediment, salt, etc.) impact native vegetation and the species that rely upon them, degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.

9.2 Industrial and Military Effluents

9.2.1 Oil Spills (Avg. Score: 3.00)

NJ Specific Threats: 9.2.1.1 Oil spills render resting, breeding and foraging habitats temporarily unavailable to wildlife, altering normal wildlife behavior.

9.2.1.2 Oil spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.

9.2.1.3 Oil spills cause external oiling of wildlife and ingestion of oil, both of which can injure or kill wildlife.

9.2.2 Seepage from Mining (Avg. Score: 1.00)

NJ Specific Threats: 9.2.2.1 Contaminants from mining degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.

9.2.3 Other (Avg. Score: 3.00)

NJ Specific Threats: 9.2.3.1 Point and nonpoint source pollution such as polychlorinated biphenyls (PCBs), pesticides, heavy metals, and endocrine disrupting compounds (EDC's) into freshwater and marine systems pose threats to wildlife through direct contact and/or ingestion, and to aquatic species and their predators through bioaccumulation, impacting the reproductive success and neurological function of many avian and fish species.

9.2.3.2 Chemical spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Superb Jewelwing

- 9.2.3.3 Chemical spills may render resting, breeding and foraging habitats temporarily unavailable to wildlife, altering normal wildlife behavior.

9.2.5 Other: Industrial toxic settling ponds (Avg. Score: 1.00)

- NJ Specific Threats:** 9.2.5.1 Surficial or open industrial effluent ponds can cause injury or death to wildlife that become exposed through ingestion or submersion.

9.3 Agricultural and Forestry Effluents

9.3.1 Nutrient Loads (Avg. Score: 3.00)

- NJ Specific Threats:** 9.3.1.1 Chemical fertilizers and nutrient run-off changes the pH in streams, ponds and wetlands and causes eutrophication in inland waters and estuaries, which can make habitat unsuitable for specialist species and increase the risk of invasive and generalist species.

- 9.3.1.2 Animal waste degrades terrestrial and aquatic habitats, especially streams, ponds and wetlands, resulting in eutrophication, which disrupts oxygen and nutrient balances, and causes injury and mortality to aquatic organisms.

9.3.2 Soil Erosion and Sedimentation (Avg. Score: 3.00)

- NJ Specific Threats:** 9.3.2.1 Soil erosion, sedimentation and destruction of streambanks and riparian buffers degrade waters making them unsuitable for riparian-dependent wildlife.

9.3.3 Herbicides and Pesticides (Avg. Score: 3.00)

- NJ Specific Threats:** 9.3.3.1 Pesticides degrade terrestrial and aquatic habitats, especially streams, ponds and wetlands. Aquatic wildlife are particularly sensitive to these contaminants, which can cause developmental and behavioral abnormalities and reproductive failure. Some contaminants may bioaccumulate in predatory fish and birds and disrupt reproduction.

- 9.3.3.3 Use of pesticides can directly harm non-target species through direct contact and/or by reducing and/or contaminating their food supply.

9.3.5 Control of insect pests and plants leading to mortality of non-target species not associated with agriculture (Avg. Score: 3.00)

- NJ Specific Threats:** 9.3.5.1 Use of pesticides, insecticides, and/or herbicides can directly harm non-target species, such as amphibians and beneficial invertebrates through direct contact and/or by reducing and/or contaminating their food supply.

- 9.3.5.4 Improper use of current insecticides, such as those containing esfenvalerate, prallethrin, or piperonyl butoxide, or past use of pesticides containing chlordane still present in the soils, are toxic to various wildlife species, and can cause injury, mortality, or other effects that impair population viability.

- 9.3.5.5 Use of pesticides and herbicides can minimize the abundance of food sources for native wildlife populations.

9.5 Air-Bourne Pollutants

9.5.1 Acid Rain (Avg. Score: 1.00)

- NJ Specific Threats:** 9.5.1.1 Causes acidification of water bodies, resulting in changes to aquatic and marine communities and reducing biodiversity, and creating conditions that are unsuitable for some aquatic (freshwater and marine) and semi-aquatic species that are sensitive to pH shifts.

9.5.4 Other (Avg. Score: 1.00)

- NJ Specific Threats:** 9.5.4.1 Dust and/or airborne sedimentation from construction sites, agricultural operations or related earth disturbances can introduce mineral or organic sediments into adjacent wildlife habitats, degrading their quality and suitability for wildlife short-term and/or long-term.

9.5.6 Herbicides and Pesticides (Avg. Score: 3.00)

- NJ Specific Threats:** 9.5.6.1 May result in injury or direct mortality of non-target species.

Superb Jewelwing

9.6 Excess Energy

9.6.2 Thermal Pollution

(Avg. Score: 1.00)

NJ Specific Threats: 9.6.2.2 Water temperature changes to aquatic systems can deter or preclude use by SGCN (e.g., alter habitat suitability for wildlife species, reduce prey base) or present stressors that are harmful if not fatal to wildlife.

11 Climate Change and Severe Weather

11.1 Habitat Shifting or Alteration

11.1.0 Macro- and Micro-Climate Alterations

(Avg. Score: 3.00)

NJ Specific Threats: 11.1.0.1 Alters native terrestrial and aquatic habitats at the macro- and micro-climate levels that can affect suitability for wildlife, in particular specialist species.

11.2 Droughts

11.2.1 Droughts

(Avg. Score: 3.00)

NJ Specific Threats: 11.2.1.1 Contribute to hardened soils, decreasing water recharge during rains and increasing the likelihood of flash floods during storms.

11.2.1.2 Lead to lower groundwater levels and therefore, less available water for people and habitats.

11.2.1.3 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

11.3 Temperature Extremes

11.3.1 Temperature extremes

(Avg. Score: 1.00)

NJ Specific Threats: 11.3.1.1 Increasing temperatures may cause habitat loss and degradation by desiccating and/or raising the temperatures of small wetlands and streams leading to the loss of freshwater mussels and other aquatic species and species reliant upon these habitats.

11.3.1.2 Increased temperatures can negatively impact wetland, riverine, lacustrine and vernal pool-associated or -dependent wildlife by reducing flows, increasing water temperatures, lowering water levels and causing premature drying of vernal habitats.

11.3.1.3 Temperature extremes of surface water and air degrades marine habitats and ecosystems, threatening marine wildlife. Such extremes also disrupt offshore currents and migratory patterns, species' ranges, and/or impact communities/food chains, all of which further impact the ecosystem.

11.4 Storms and Flooding

11.4.1 Storms and flooding

(Avg. Score: 3.00)

NJ Specific Threats: 11.4.1.1 Extreme storms and flooding events threaten aquatic and marine wildlife through habitat degradation and alteration, including alterations to off-shore or back-bay benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic and marine wildlife.

11.4.1.5 Storm damage can alter forest structure via blow-downs or micro-bursts, and can destroy bird nesting in the locales where the storms occur.

11.4.2 Increased rainfall

(Avg. Score: 2.00)

NJ Specific Threats: 11.4.2.1 Extreme rain events threaten aquatic wildlife through habitat degradation and alteration, including alterations to benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic wildlife.

11.4.2.2 Extreme rain events can damage wildlife nesting and resting habitats, including impacts to avian eggs and chick and small mammal survivorship.

11.4.2.3 More frequent rain events can alter terrestrial and wetland vegetation communities as well as wetland hydrology, shifting wildlife community use.

11.6 Phenology Shifting or Alteration

11.6.3 Phenology shifts related to species redistribution (Avg. Score: 1.00)

NJ Specific Threats: 11.6.3.1 Shifts in timing of species migration, breeding and hibernation, and available food resources, as a result of wildlife range shifts driven by climate change.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory (Avg. Score: 3.00)

NJ Specific Threats: 12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.1.2 Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.

12.1.2 Lack of up-to-date existing information (Avg. Score: 3.00)

NJ Specific Threats: 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

12.1.3 Need to answer research question (Avg. Score: 3.00)

NJ Specific Threats: 12.1.3.1 There are significant knowledge gaps regarding distribution, dispersal, diseases, population trends, etc. of SGCN.

12.1.4 Need to develop new technique (Avg. Score: 3.00)

NJ Specific Threats: 12.1.4.1 Improve and evaluate survey methods for SGCN and their habitats; alter as needed.

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms (Avg. Score: 1.00)

NJ Specific Threats: 12.3.0.1 Regulatory habitat protections within state land use regulations are spatially limited to specific geographic areas (e.g., Pinelands, Coastal Area) or geographic features (e.g., wetlands, streams) and so fail to protect critical habitats that exist outside of these regulated areas.

12.3.0.6 Certain geographic or habitat features, such as vernal pools and headwater wetlands or streams, may be too small, mischaracterized, or misidentified to benefit from regulatory protection.

12.3.0.7 Activities that threaten SGCN, their food sources, and/or habitats are often regulated separately and without consideration for the cumulative and synergistic effects over time or over a larger spatial scale. Therefore, regulations can fail to protect SGCN populations over time.

12.3.0.10 Land use regulatory processes pertaining to habitat creation, enhancement or restoration projects can be costly and/or burdensome, precluding or discouraging the development or implementation of conservation projects.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform (Avg. Score: 1.00)

NJ Specific Threats: 12.4.0.1 A species-by-species management focus as opposed to ecological systems and biodiversity generally has greater opportunity for unintended consequences for other species and may be less efficient in developing appropriate management actions.

12.4.0.2 Policies and procedures for lands management that lack consideration of the impacts of activity timing can result in unintended impacts to wildlife during vulnerable periods.

12.4.0.5 Bureau of Forest Fire Management policy has traditionally implemented prescribed burns on State lands for the sole purpose of public safety (i.e., addressing hazard fuel reduction), missing opportunities to burn in a manner that would additionally manage habitat for ecological diversity.

Superb Jewelwing

- 12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

14 **Education/ Outreach Needs**

14.1 Education needs

- 14.1.1 Need for improved knowledge of fish and wildlife and their habitats (Avg. Score: 3.00)

NJ Specific Threats: 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.

14.1.1.2 Lack of general knowledge of SGCN life histories and vulnerabilities as they relate to land management practices.

14.1.1.3 Lack of understanding of the need to manage both natural and anthropogenic (e.g., yards, lawns, hayfields, etc.) habitats to minimize impacts or increase benefits to SGCN and their habitats.

14.2 Outreach needs

- 14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions (Avg. Score: 3.00)

NJ Specific Threats: 14.2.1.1 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various forest management practices.

14.2.1.2 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various aquatic and riparian management practices.

14.2.1.5 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various wetland management practices.

15 **Administrative Needs**

15.2 Organizational/program planning needs

- 15.2.3 Need for multi-state, regional and landscape scale planning (Avg. Score: 1.00)

NJ Specific Threats: 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Actions to address the Threats and Action Drivers associated with this Conservation Target:

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

1.2.1.2 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to increase the effective size of SGCN habitats by protecting/restoring adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats.

1.2.1.6 Secure and promote the protection/restoration of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers through incentive programs.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Superb Jewelwing

- 1.2.1.7 Secure and promote the protection/restoration of fish SGCN habitats by protecting lands adjacent to fish SGCN habitats and/or aquatic systems feeding into such habitats through incentive programs.
- 1.2.1.8 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to municipalities, land developers, and other land managers to retain and/or enhance native vegetation adjacent to aquatic habitats, and along riparian areas and wildlife movement corridors.
- 1.2.1.9 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing Forestry Stewardship Programs.
- 1.2.1.10 Coordinate across government agencies and non-government organizations to maximize the availability of and enrollment in existing landowner incentive programs (e.g., "farm bill," partners, etc.) to maintain and/or improve habitat.
- 1.2.1.11 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 1.2.1.12 Create incentives (non-monetary and/or monetary) for land developers to redevelop abandoned areas (e.g., shopping centers, office complexes) to minimize the loss of natural habitats and reduce the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 1.2.1.13 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to land developers to minimize the impacts of new residential and commercial developments on SGCN and their habitats.
- 1.2.1.14 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of herbicides and pesticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.15 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of rodenticides, and implementing more ecologically safe strategies when using such products.
- 1.2.1.16 Create incentives (non-monetary and/or monetary) within State regulations (mitigations requirements or credit, BMP satisfaction, etc.) to promote the use of retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.17 Develop a public-relations oriented certification program for private retailers who refrain from selling specified invasive or other problematic plant species.

Superb Jewelwing

- 1.2.1.18 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and land managers to control and reduce the impacts of invasive, native and non-native species in order to increase structural habitat diversity.
- 1.2.1.19 Create incentives for federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to farmers, woodland landowners, and private landowners to adopt and/or endorse consistent BMPs concerning controlled burns to maintain and/or improve wildlife habitat.
- 1.2.1.20 Coordinate across government agencies and non-government organizations to create or expand upon tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMP's.
- 1.2.1.21 Create and/or support market-based programs that subsidize or create branding for products derived sustainably from managed wildlife habitats.
- 1.2.1.22 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to horse/livestock farm owners and managers to increase structural habitat diversity in and around the farms by managing vegetation for a variety of species, in particular, farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 1.2.1.23 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to provide cost shares and/or plan approvals for management based on management approaches and prescriptions.
- 1.2.1.24 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners, with habitat of suitable patch size to support breeding grassland-dependent species, to alter the timing of vegetation management to benefit grassland and pollinator species.
- 1.2.1.26 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing landowner incentive programs.

2 Direct Management of Natural Resources

2.3 Fire management

2.3.2 Fuel reduction

- 2.3.2.1 Prevent wildfires by reducing natural fuel (e.g., leaf litter).

2.3.3 Prescribed burning

- 2.3.3.1 Evaluate different management techniques of prescribed burns that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 2.3.3.2 Conduct prescribed burning in Northern New Jersey forests to maintain and regenerate a mosaic of upland forest habitats.
- 2.3.3.3 Conduct prescribed burning to improve wildlife habitat.

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Superb Jewelwing

- 2.8.0.1 Control invasive insect infestations by implementing BMP strategies through biological, chemical and/or mechanical means that will depress, or when appropriate, eradicate populations in a manner that avoids excessive harm to non-target species using BMPs to control infestations and limit their spread based on an inventory of invasive insect distribution and response to outbreaks.
- 2.8.0.2 Develop, implement, monitor and evaluate pest control/management strategies to reduce the impacts of over-abundant wildlife species (native and/or native, invasive species) on native vegetation and the degradation of habitats supporting SGCN. Over-abundant wildlife species include but are not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.
- 2.8.0.5 Implement biologically safe and appropriate control/management strategies, and where appropriate, eradication strategies to reduce the impacts and/or limit the distribution of invasive and/or non-native plant species within or near aquatic systems using methods that will provide the most protection to the aquatic and riparian ecological system, and minimize disturbance to the soil and wildlife. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.
- 2.8.0.6 Implement long-term management of invasive and/or non-native plants to help maintain functioning ecological systems and biological diversity, and to enhance travel corridors. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

- 2.10.0.1 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 2.10.0.2 Improve the availability of prey/food resources through terrestrial and aquatic plantings and habitat restoration for SGCN populations, in particular for those populations thought to be limited due wholly or in part to a lack of (or contaminated) food resources, and for migratory species (birds, bats, invertebrates).
- 2.10.0.3 Restore and/or enhance habitats to benefit urban-associated SGCN.
- 2.10.0.4 Restore and/or enhance suitable travel corridors connecting conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats.

Superb Jewelwing

- 2.10.0.5 Implement habitat restoration and/or enhancement activities that include the creation of vegetative buffers between sensitive habitats (e.g., aquatic systems) and human-inhabited areas (e.g., residences, parks, etc.) and that is conducted during appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity
- 2.10.0.6 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats.
- 2.10.0.7 Restore/reclaim and enhance degraded rare species habitats through strategic revegetation and management efforts for documented/target SGCN.
- 2.10.0.8 Protect significant natural and/or unique communities by implementing best management practices when conducting habitat restoration strategies.
- 2.10.0.9 Restore and/or enhance riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation, alteration and/or changes in hydrology and subsequent disturbances to and behavioral changes of wildlife (e.g., restoring biologically appropriate buffers, revegetation or restoration efforts, etc.).
- 2.10.0.10 Minimize the loss of important habitats (e.g., coastal scrub-shrub and grassy habitats, high and low marsh habitats, etc.) that provide nesting, migrating, and wintering areas for SGCN birds and other coastal and marsh-dependent species through habitat restoration efforts.
- 2.10.0.11 Restore and/or enhance critical migratory terrestrial and aquatic habitats (e.g., beach, grasslands, forest, scrub-shrub, etc.) for songbirds, raptors, shorebirds, waterfowl, bats and invertebrates through habitat restoration efforts and expand habitat restoration to adjacent private lands to increase the effective size of the habitat.
- 2.10.0.12 Create and/or maintain scrub-shrub habitats through revegetation efforts with little to no impact on forested, wetland and grassland habitats to maintain populations of shrub-dependent SGCN.
- 2.10.0.14 Implement best management practices (BMPs), protective strategies and guidelines for restoring and enhancing healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.10.0.15 Restore and/or enhance terrestrial and aquatic habitats proximate to but not adjacent to roads and other transportation corridors for terrestrial-bound SGCN species whose behavior (i.e., dispersal across roads) may be altered by doing so, and therefore decrease road mortality of such species (e.g., amphibians, snakes, turtles, small mammals).
- 2.10.0.21 Restore and/or enhance understory habitats that suppress invasive species and provide critical resources and enhance sheltering, foraging, and nesting cover for wildlife.
- 2.10.0.22 Restore and/or enhance terrestrial and aquatic habitats to promote the regeneration of native vegetation and enhance structural diversity to benefit SGCN (e.g., vegetative buffers of aquatic systems, allow coarse, woody debris to remain in terrestrial, aquatic and riparian habitats to provide shelter, riparian stabilization and necessary microclimates, plant native trees, shrubs and grasses, etc.).

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Superb Jewelwing

- 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.
- 2.11.0.2 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas for target SGCN and/or species groups; management should complement rare species needs in a targeted area.
- 2.11.0.3 Create suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats through vegetation management.
- 2.11.0.4 Implement vegetation management strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife, particularly SGCN.
- 2.11.0.5 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats through vegetation management.
- 2.11.0.6 Reclaim degraded rare species habitats by conducting vegetation management needed to restore habitat value for the documented/target SGCN.
- 2.11.0.7 Protect significant natural and/or unique communities by implementing best management practices through vegetation management.
- 2.11.0.8 Maintain, enhance and/or restore biologically appropriate buffers for SGCN-inhabited/used freshwater wetlands through vegetation management.
- 2.11.0.23 Implement appropriate habitat management actions in areas where natural disturbances, such as wildfire, have been precluded.
- 2.11.0.24 Conduct vegetation management adjacent to aquatic habitats following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.25 Conduct vegetation management along access roads following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.26 Conduct vegetation management along roadsides and medians, avoiding peak activity periods for wildlife, that enhances wildlife dispersal naturally and safely across roads and similar barriers to/between terrestrial and/or aquatic habitats.
- 2.11.0.27 Conduct vegetation management for target shrub- or young forest-dependent SGCN following BMPs to minimize the risk of the establishment of invasive and non-native plants.
- 2.11.0.28 Conduct vegetation management in agricultural areas following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.29 Conduct vegetation management on transportation and service corridors (i.e., rights-of-way) following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.30 Identify and prioritize areas where various management tools (such as increasing salinity through the management of water levels or chemical applications) may be effective in reducing phragmites within and restoring marsh habitat.
- 2.11.0.31 In areas where vegetative communities are shifting due to fire suppression and controlled burns are not feasible, manage vegetation to improve wildlife habitat.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Superb Jewelwing

- 2.11.0.32 Increase structural habitat diversity around and when feasible, within agricultural landscapes by managing vegetation for a variety of species, in particular, those farms that have removed scrub-shrub habitat and/or fragmented forests, and by implementing ecologically best practices (e.g., no-till farming, maintaining hedgerows, buffer set-asides, etc.).
- 2.11.0.33 Increase structural habitat diversity by implementing long-term vegetation management to minimize the potential for the establishment of invasive and/or non-native plants that may outcompete native vegetation.
- 2.11.0.34 Increase structural habitat diversity by managing residential, commercial and recreational areas' landscapes for a variety of species. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.35 Increase structural habitat diversity by managing vegetation adjacent to aquatic habitats in a manner that provides a buffer from runoff and erosion and a microclimate to stabilize seasonal temperatures to benefit a variety of aquatic and semi-aquatic species.
- 2.11.0.36 Increase structural habitat diversity by managing vegetation for a variety of species and considering their life history requirements (e.g., travel corridors, shelter, resting and breeding areas) to minimize the risk of harm.
- 2.11.0.38 Increase structural habitat diversity in and around horse/livestock farms by managing vegetation for a variety of species, in particular, in and around farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 2.11.0.39 Increase structural habitat diversity in and around solar farms by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.40 Increase structural habitat diversity surrounding areas used for energy, mining, and transportation and service corridors by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides, and avoid managing habitat during the breeding seasons for ground-nesting birds, reptiles, amphibians and small mammals.
- 2.11.0.41 Increase structural habitat diversity through the implementation of a variety of vegetation management practices such as prescribed burns (either increasing or decreasing their frequency depending on the site and objective), plantings, etc. that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.42 Increase structural habitat diversity within wind farms for terrestrial bound and low-flying species and around wind farms for other wildlife by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.43 Manage forests to increase variation in age structure and composition using BMPs that promote and maintain functioning ecological forest-based systems and biological diversity.
- 2.11.0.45 Regularly and/or rotationally create young forest habitat in targeted areas to maintain and regenerate a mosaic of upland forest habitats that will benefit shrub- and young forest-dependent species.

2.12 Water management

2.12.1 Ditch plugs

- 2.12.1.1** Implement best management practices (BMPs), protective strategies, and guidelines for ditch plugging to maintain and enhance healthy, resident and migratory SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

2.12.3 Drainage

- 2.12.3.2** Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) such as removing drainage ditches to restore natural stream flows and wetlands, that benefit wildlife inhabiting these areas.
- 2.12.3.3** Remove tile drains and drainage ditches to improve wetland hydrology and restore natural stream flows during appropriate times to avoid sensitive periods (e.g., nesting, denning, roosting) and minimizes harm to wildlife, particularly SGCN.
- 2.12.3.4** Expand the acreages and enhance the effective size of SGCN habitats by reclaiming/restoring adjacent, degraded habitats by removing tile drains and drainage ditches.
- 2.12.3.5** Remove drainage ditches adjacent to roads to decrease the attraction for amphibians, reptiles and small mammals, and thereby minimizing road mortality of such species (e.g., amphibians, snakes, turtles, small mammals).
- 2.12.3.6** Protect significant natural and/or unique communities by and when removing tile drains and drainage ditches.
- 2.12.3.7** Minimize habitat loss of critical coastal habitats that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas by removing drainage ditches.
- 2.12.3.11** Implement best management practices (BMPs), protective strategies, and guidelines when removing tile drains and drainage ditches to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

2.13 Wildlife damage management

2.13.0 Nuisance fish and wildlife damage

- 2.13.0.4** Investigate the effects of mosquito control methods on freshwater aquatic and semi-aquatic SGCN including but not limited to, amphibian, fish, dragonfly, and damselfly populations.

2.14 Wildlife disease management

2.14.0 Wildlife disease strategy development and investigation

- 2.14.0.1** Investigate diseases/pathogens impacting SGCN and/or their habitats.
- 2.14.0.2** Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
- 2.14.0.3** Protect SGCN from exotic pathogen introduction or incident through implementation of a "rapid response plan"; DFW to give priority attention to these species in planning and/or implementing a response.

- 2.14.0.4 Conduct long-term monitoring of diseases in vulnerable wildlife to determine the magnitude of exposure within populations and around the State, the impacts to those species, in particular SGCN, and investigate the feasibility of mitigating for such impacts.
- 2.14.0.5 Assess the impacts of diseases on the life cycles of wildlife.

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

- 3.0.0.1 Conduct long-term monitoring of resident and migratory SGCN populations using standardized survey protocols to determine the variables that may impact their long-term persistence in the State (e.g., population viability, distribution, dispersal, home range and habitat use, travel corridors, food availability, vulnerability to pollutants and disease, etc.). Compile this information to determine the likely causes of population declines and to understand metapopulation dynamics. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.2 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) where data gaps exist regarding SGCN distribution, and their critical and supportive habitats. Conduct surveys using standardized survey protocols to acquire baseline data, and provide the data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
- 3.0.0.3 Gather baseline data on SGCN inhabiting permanently protected natural lands regarding their distribution and population (e.g., abundance, dispersal, demography including productivity and survival, etc.), and identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) critical and supporting habitats within those landscapes.
- 3.0.0.4 Conduct long-term studies on SGCN inhabiting permanently protected natural lands to develop population trend data and changes in demography, and to determine if critical and/or supporting habitats are limited or changing; i.e., diminishing in value, acreage or connectivity.
- 3.0.0.7 Collect baseline data to document species distributions, in particular SGCN, and current habitat for future analysis of possible distribution shifting as a result of habitat shifting or alteration associated with climate change impacts.
- 3.0.0.8 Conduct long-term studies and compare baseline metrics of documented species distributions and associated habitats to identify possible species and/or habitat shifting or alteration associated with climate change impacts.
- 3.0.0.13 Investigate the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats. Evaluate and modify management practices as appropriate.
- 3.0.0.14 Identify areas with invasive, aquatic plants and animals and collect a detailed baseline assessment of the species' status and distribution. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort. Researchers and contractors performing Forest Stewardship Inventories and/or Plans on state lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.

Superb Jewelwing

- 3.0.0.15 Conduct long-term monitoring of areas identified as having invasive, aquatic plants and animals to track the species' status/progress over time with or without the implementation of management strategies. Areas without management strategies should be assessed and prioritized for management/control. Areas where management strategies are being implemented should include an assessment of the management effort and identify/recommend and implement necessary changes to improve its success. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort.
- 3.0.0.19 Identify the presence and status (e.g., functioning, structure, slated for removal, etc.) of existing dams and culverts within and/or that may impact SGCN and their habitats, and create a database that includes a GIS component identifying the locations of such structures and their status. Share this information with appropriate organizations and/or agencies evaluating the benefits and risks of such structures on SGCN and their habitats.
- 3.0.0.20 Once baseline data identifying and describing the status of existing dams and culverts have been gathered, conduct evaluations at a variety of sites to determine whether the benefits of culvert and dam creation or removal outweigh the risks to SGCN species and their habitats, and if other variables/conditions specific to individual sites/locations result in a different outcome. Identify and target appropriate dams and culverts for removal and/or reconstruction to minimize harm to SGCN species and their habitats.
- 3.0.0.23 Identify (through wildlife and aquatic system surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and research water quality parameters for all [types of] aquatic systems for various SGCN populations.
- 3.0.0.26 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species including objectives and guidance pertaining to and the condition/status of critical and supporting habitats.
- 3.0.0.27 Evaluate the effectiveness of strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals through research and monitoring. Develop and provide NJ DEP and other appropriate governing agencies/commissions a summary of findings and recommendations to improve such efforts.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.1 Division of Fish and Wildlife should maintain a robust, up-to-date database and mapping of species occurrences.
- 3.2.0.3 Survey for and monitor populations of freshwater aquatic focal SGCN to assess the populations' demography, trends, condition, distribution, etc.
- 3.2.0.7 Track (via a database that includes a GIS component) and research problematic species and diseases to determine their distribution, impacts on SGCN wildlife/wildlife communities, and develop potential control measures.
- 3.2.0.8 Implement and conduct long-term monitoring of control measures aimed at minimizing the impacts of problematic species and/or diseases to evaluate the effectiveness of such efforts and to identify and incorporate additional strategies as appropriate.
- 3.2.0.18 Conduct baseline surveys/inventories to better understand the distribution of fish and invertebrate (including freshwater mussels) populations.
- 3.2.0.21 Investigate the effects of mosquito control methods on freshwater aquatic and semi-aquatic SGCN including but not limited to, amphibian, fish, dragonfly, and damselfly populations.

Superb Jewelwing

3.2.1 Abundance determination

3.2.1.1 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) population abundance and trends for SGCN using standardized survey protocols. Provide data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.

3.2.1.2 Conduct wildlife surveys on resident and migratory SGCN regarding their population abundance and trends.

3.2.2 Age, size and sex structure

3.2.2.1 Conduct wildlife surveys on resident and migratory SGCN regarding their survivorship.

3.2.3 Baseline inventory

3.2.3.9 Investigate hazardous environmental issues that may impact grassland invertebrates.

3.2.7 Population assessment

3.2.7.1 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.

3.2.7.2 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species to meet and maintain recovery goals.

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

3.3.1.1 Conduct habitat assessments of significant natural and/or unique communities to identify threats to native terrestrial and aquatic habitats through systematic monitoring, review of available data, enlistment of habitat management and/or species experts, etc. Incorporate findings into a database that includes descriptions/qualifiers of the habitats, identifies and values/qualifies the threats, and includes a GIS component of the locations of the assessed areas. Share this information with landowners/managers (e.g., federal, state and local government agencies or non-government organization).

3.3.1.2 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) resident and migratory SGCN habitats. Investigate their suitability for the various life history requirements of the species that dependent upon them to determine the ability for maintaining applicable SGCN populations in perpetuity.

3.3.1.4 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and investigate the suitability of corridors that connect large, contiguous tracts of similar habitats to increase their effective size (i.e., forest with forest, grassland with grassland, wetlands with wetlands, etc.) for dependent SGCN.

3.3.1.5 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) where habitat restoration and/or enhancement would benefit wildlife SGCN.

3.3.1.6 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) that could, through revegetation and/or enhancement efforts, become suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN.

3.3.1.7 Map and prioritize existing and potential areas for early succession forest management. Share the results with state, county and municipal planners.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Superb Jewelwing

- 3.3.1.9 Inventory forests throughout northern New Jersey to develop a baseline characterization of the structure and composition of habitats and identify deficient forest habitat types.
- 3.3.1.10 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and document fish SGCN habitats by plotting their distributions in GIS and submitting the data to the State for integration into the DEP's Biotics database.
- 3.3.1.16 Gather "best information" for spatial modeling and update/create a current model/depiction of anticipated habitat shifts from sea-level rise, flooding, etc.
- 3.3.1.17 Identify and map undeveloped roads and trails in all conserved forests, and create a database of locations. Integrate information regarding potentially sensitive areas.
- 3.3.1.18 Conduct an assessment using available data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels.
- 3.3.1.19 Identify and codify legal ORV access areas on state (and if appropriate, other conserved) lands. Provide GIS mapping to the landowner for potential use in directing such recreational activities.
- 3.3.1.20 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) where invasive, non-indigenous plants and animals are either already established or are becoming established. Create a system for reporting and qualifying new locations of invasive species and for prioritizing areas for control measures according to the potential level of impact on the ecosystem and SGCN and the likelihood of success. Researchers and contractors encountering invasive plant species while performing plant and/or forest inventories on state or other conserved lands and/or private lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.3.1.24 Conduct regular investigations of SGCN habitat health and biodiversity on public and private lands to identify locations in need of revegetation, reduction of over-abundant, native wildlife and/or exotic species, conservation focal areas requiring limitations on human activity, etc.
- 3.3.1.26 Survey all historic locations and unsurveyed suitable habitats to identify populations of freshwater aquatic focal species.

3.3.2 Monitoring

- 3.3.2.2 Conduct long-term monitoring of resident and migratory SGCN habitats using standardized survey protocols to determine changes in habitat quality/suitability and threats (e.g., habitat loss and degradation, increased edge habitat, water quality) and other variables that may impact their long-term persistence in the State and to provide information needed for determining causes of population declines and understanding metapopulation dynamics.
- 3.3.2.3 Continue to update wildlife and habitat databases and revise models of critical SGCN habitats using the most current data available and where lacking, develop new SGCN and/or habitat models as data on species habitat requirements and applicable GIS data layers become available.
- 3.3.2.4 Protect water quality and aquatic-dependent species by appropriately designating Category 1 waters and enforcing protective regulations. Seek appropriate classifications for stream segments based on Endangered and Threatened Status and/or the Index of Biotic Integrity (IBI) results that do not fulfill Category One requirements.
- 3.3.2.5 Conduct long-term monitoring of water quality of SGCN aquatic habitats (and aquatic systems feeding into those habitats) to evaluate protection and management efforts to reduce, if not eliminate, chemical contamination, siltation, eutrophication, and other forms of pollution/contamination of aquatic systems.

Superb Jewelwing

- 3.3.2.10 Evaluate the efficacy and success of different management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.3.2.14 Research and evaluate the effectiveness of water quality management practices on water-dependent and semi-dependent SGCN, particularly those practices associated with permitting or mitigation actions.
- 3.3.2.15 Investigate the effectiveness of management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.3.2.16 Evaluate the effectiveness of best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 3.3.2.20 Once a system is developed for reporting and qualifying new locations of invasive species, develop, implement and monitor/evaluate invasive species removal strategies at identified locations. Priority should be given to those areas critical to SGCN and/or contain unique and/or rare plant communities supporting SGCN and/or other fish/wildlife species.
- 3.3.2.24 Conduct regular inventories of forests throughout northern New Jersey to characterize the changing structure and composition of habitats and monitor forest conditions.

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.1 Work with land management agencies to determine the appropriate actions needed to restore/reclaim degraded habitat for the documented/target SGCN.
- 3.5.3.3 Develop/improve management techniques that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.8 Develop best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 3.5.3.9 Develop strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 3.5.3.11 Develop strategies to protect native terrestrial and aquatic habitats and dependent SGCN species from the identified threats.
- 3.5.3.14 Develop aquaculture practices in the coastal areas that are compatible with the recovery of SGCN.
- 3.5.3.15 Modify management practices based on the effects of pesticides, herbicides and other biological controls on critical and supporting SGCN habitats.

Superb Jewelwing

- 3.5.3.16 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.
- 3.5.3.21 Develop management techniques (e.g., ecologically-based forestry activities, prescribed burns) that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 3.5.3.23 Revise water quality management practices based on research on water-dependent and semi-dependent SGCN, particularly when associated with permitting or mitigation actions.
- 3.5.3.24 Based on research, modify management techniques implemented to eliminate invasive terrestrial and aquatic plant species on private and public lands, and/or within sensitive and/or important habitats for SGCN.
- 3.5.3.25 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to develop the necessary management strategies to reach or maintain viable population levels.

3.5.4 Fish and wildlife research, survey and management techniques

- 3.5.4.4 Investigate the effects of mosquito control methods on freshwater aquatic and semi-aquatic SGCN including but not limited to, amphibian, fish, dragonfly, and damselfly populations.
- 3.5.4.5 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
- 3.5.4.6 Investigate the feasibility of mitigating for the impacts of contaminants to vulnerable wildlife, particularly SGCN. Maintain records on exposure of vulnerable wildlife to environmental toxins (such as flame retardants and endocrine disruptors), so that sources may be identified and controlled or eliminated.
- 3.5.4.14 Develop and implement agreements, and update existing agreements, with government agencies regarding the protection of critical SGCN habitats (e.g., significant breeding populations of beach nesting birds, colonial waterbird nesting areas, bat colonies, etc.).
- 3.5.4.15 Investigate the success of management strategies used to protect and/or enhance SGCN populations and when appropriate, aid in identifying failures/resource problems and issues, and developing new strategies.
- 3.5.4.16 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels and develop the necessary management strategies.
- 3.5.4.18 Investigate the effectiveness of survey techniques through selected “ground truthing” and literature and peer review in order to increase efficacy of survey, minimize surveyor bias and error, and increase accuracy of trend data.
- 3.5.4.19 Develop reliable, standardized survey and monitoring protocols for SGCN species, for which none currently exist, and their habitats.
- 3.5.4.21 Develop BMPs to address problematic species and diseases of unknown origin.

4 Education

4.1 Educator/Instructor training

4.1.0 Public education

- 4.1.0.1** Provide educational resources and training programs to private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.

5 Facilities and Areas

5.15 Wildlife Management Areas

5.15.6 Roads

- 5.15.6.1** Clearly post areas/roads where vehicle access is permitted.
- 5.15.6.2** Clearly post areas/trails where vehicle access is not permitted.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

- 6.0.0.2** Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.3** Secure and protect riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.7** Secure and protect critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

6.3 Conservation area designation

6.3.0 Conservation area designation strategies

- 6.3.0.2** Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN and/or connect conserved SGCN habitats through conservation area designations.
- 6.3.0.3** Increase the protection of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through conservation area designations.

7 Law Enforcement

7.1 Law enforcement

7.1.3 Sub-national Level

- 7.1.3.2** Increase the number of law enforcement officers tending to wildlife issues to a reasonable number to sufficiently cover the State and marine waters.

7.1.4 Scale Unspecified

- 7.1.4.1** Improve enforcement of policies and/or regulations that promote the reduction of run-off and point and non-point source pollution into NJ's aquatic systems (streams, rivers, lakes/ponds, bays, ocean, wetlands, etc.).

- 7.1.4.12 Implement policies and/or regulations that protect significant natural and/or unique communities in perpetuity.
- 7.1.4.16 Implement policies that protect and restore riparian areas.
- 7.1.4.17 Improve the enforcement of policies and/or regulations that protect wetlands, riparian and floodplain areas, and aquatic habitats (including open waters).
- 7.1.4.26 Educate law enforcement personnel that there may be unauthorized research projects taking place and to encourage them to investigate any activities that appear to be harmful to wildlife.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.2 Develop a team of personnel from government entities, conservation organizations and other stakeholders engaged in oil/gas spill response for marine and freshwater habitats to develop a feasible plan for oil spill response and/or to amend NJ's current oil spill response plan that clearly outlines each organizations responsibilities and an assessment and location list of available equipment for boom deployment during oil spills.
- 8.1.0.3 Develop an outreach team of personnel from government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 8.1.0.4 Engage government agencies, conservation partners and other stakeholders in constructive dialogues encouraging them to influence policy change and the creation of incentives through a habitat bill and/or municipal ordinances for backyard habitat.
- 8.1.0.15 Engage government agencies, conservation partners and other stakeholders in discussions encouraging and supporting the creation of laws and policies requiring vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 8.1.0.16 Engage local governments in discussions regarding the importance of them adopting/passing ordinances which require assessing and addressing secondary impacts (i.e., ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.
- 8.1.0.17 Engage municipalities in constructive dialogue to identify and minimize destruction of areas prioritized for early succession forest management.
- 8.1.0.18 Engage NJDOT, NJ Transit Authority and other road management entities, wildlife conservation organizations/agencies (e.g., Division of Fish and Wildlife, New Jersey Conservation Foundation, Conserve Wildlife Foundation of NJ), and communities and citizens in discussions regarding the importance of and methods to enhance habitat connectivity, and work together to develop feasible strategies for ensuring that wildlife can disperse naturally and safely across roads and similar barriers to terrestrial and/or aquatic habitats.
- 8.1.0.19 Engage government agencies, conservation partners and other stakeholders to collaboratively develop a list of important projects, targeting SGCN and/or their habitat, as a guide for graduate student research. Distribute the list and contact information to all State colleges and universities.
- 8.1.0.20 Organize a small focal group of government and non-government agencies/organizations responsible for decisions regarding beach/dune management to share and coordinate their goals so that comprehensive planning can attempt to meet all needs.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Superb Jewelwing

- 8.1.0.21 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation human-subsidized and/or overabundant, native species cause to local nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.22 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation invasive species cause to native nesting species, and provide expert guidance on how residents can help alleviate this threat.
- 8.1.0.24 Engage government agencies, conservation partners and other stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.25 Provide technical support to public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.26 Coordinate across federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to woodland landowners to adopt or endorse consistent best management practices concerning controlled burns to maintain and/or improve forested habitat for wildlife.
- 8.1.0.30 Encourage government agencies and conservation partners to advise members of the relevant scientific community of the need for specific studies, reports or investigations targeting the data-deficiency regarding SGCN and/or their habitats.
- 8.1.0.33 Engage government agencies, conservation partners and other land managers, communities, landowners, and commercial and industrial stakeholders in discussions regarding the importance of protecting and methods to protect priority wetlands beyond the levels afforded through regulation by maintaining and/or restoring optimal biological buffers around wetlands.
- 8.1.0.34 Work with the NJ Education Association and Department of Education to design curriculum and outdoor experimental learning opportunities, and provide training to teachers on implementation of these activities.
- 8.1.0.37 Enlist landowners and NJ citizens in the protection of and survey efforts for SGCN, in particular rare species, by increasing enrollment in landowner incentives, forest stewardship, backyard habitat management and wildlife-related volunteer programs.
- 8.1.0.38 Engage partners, stakeholders and land managers in constructive dialogue promoting forest stewardship for SGCN that use core forests and forested corridors.
- 8.1.0.40 Encourage researchers, land managers, naturalists and enthusiasts to follow proper procedures for the coordination and/or permitting of research/management activities involving wildlife and sensitive habitats, and discourage activities that alter vegetation or wetlands, or cause harm or disturbance to wildlife.
- 8.1.0.42 Engage citizens, wildlife observers and photographers through discussions and distributable information regarding the importance of and encouraging implementing responsible and ethical behavior when observing wildlife by developing an alliance of wildlife photographers and widely circulating recommendations on how to reduce impact.
- 8.1.0.44 Engage conservation partners, stakeholders, government agencies and other land stewards in constructive dialogues encouraging their inclusion of controlled burns in forest and other stewardship plans.

Superb Jewelwing

- 8.1.0.47 Form cooperative partnerships with energy companies to facilitate habitat creation and enhancement away from and outside of project areas, the restoration of appropriate habitats within project areas (e.g., rights-of-way could benefit butterflies and some bird species), and to identify seasonal timing of activities that would minimize impacts to wildlife.
- 8.1.0.48 Form cooperative partnerships with transportation and shipment agencies and companies to facilitate habitat creation and enhancement away from and outside of project areas and to identify seasonal timing of activities that would minimize impacts to wildlife.

8.2 Recruitment and retention activities

8.2.3 For wildlife watching

- 8.2.3.1 Develop and implement nature-focused tourism opportunities including wildlife viewing sites, interpretive signage highlighting unique ecosystems/habitats, and wildlife-related recreational opportunities that do not negatively impact SGCN or their habitats.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.7 Develop and provide (or otherwise make publicly available) educational programs and/or materials that describe the negative impacts of off-road vehicles and watercraft use in and adjacent to critical SGCN habitats, and the importance of confining such activities to more appropriate locations and/or seasons.
- 8.3.0.8 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate recreationists and encourage landowners to eliminate garbage in the vicinity of suitable wildlife habitat, in particular SGCN habitat. Information should include the detrimental impacts garbage may have on various wildlife species.
- 8.3.0.9 Develop and provide (or otherwise make publicly available) educational programs and/or materials to enlist landowners and land managers to include only native plants in landscaping and restoration projects. Provide information to assist them in detecting problematic establishment of invasive, non-indigenous plants.
- 8.3.0.10 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate landowners and NJ citizens on threats to fish and wildlife (including marine animals).
- 8.3.0.11 Develop and provide (or otherwise make publicly available) educational programs and/or materials to the public, wildlife-related professionals, foresters, etc., that describe the value of species that are often feared (e.g., snakes, bats, spiders, Allegheny woodrat) and/or deemed a "nuisance" (e.g., squirrel, deer, snapping turtle), and therefore, persecuted by people. Include information on tolerance, proper identification, eviction from human dwellings, how to minimize the animal's presence on the property, and/or how to live in harmony with the animal.
- 8.3.0.12 Promote awareness of WSFR (Wildlife and Sportfish Restoration) Outreach/Awareness grants, an important funding source for conservation among hunters and anglers as well as the general public.
- 8.3.0.13 Conduct an educational campaign to encourage observer ethics and respect for wildlife and natural habitat.
- 8.3.0.24 Develop educational outreach programs for local decision-makers, land developers, landowners and citizens about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
- 8.3.0.25 Develop educational outreach programs for landowners, nurseries and the general public regarding the negative impacts of invasive and non-native plants on our natural communities.

Superb Jewelwing

- 8.3.0.26 Develop educational outreach programs for private and public landowners and land managers regarding the importance of and how to manage core forests and forested corridors in a way that will be beneficial for SGCN, particularly endangered, threatened and special concern species.
- 8.3.0.27 Develop educational outreach programs for public and private landowners and land managers regarding the importance of structural habitat diversity, methods to increase diversity, and/or incentive programs available to increase habitat diversity.
- 8.3.0.29 Develop educational outreach programs for local decision-makers, land developers, landowners and citizens about the importance of maintaining a vegetative buffer along riparian and aquatic habitats to intercept storm water runoff and minimize soil erosion.
- 8.3.0.30 Develop educational outreach programs for private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.
- 8.3.0.32 Develop an educational outreach program for landowners and citizens on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

- 9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and SGCN inhabiting them.
- 9.1.0.2 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.1.0.3 Develop a plan that directs the creation of impervious surfaces away from and to minimize impacts on aquatic systems and critical terrestrial habitats. The plan should also include strategies to increase the resiliency of aquatic and critical terrestrial habitats to threats and stressors that would impact the reproduction and survival of wildlife.
- 9.1.0.5 Develop a plan that directs the creation or expansion of energy or utility rights-of-way in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.6 Develop a plan that directs the creation or expansion of roads and railroads or the re-establishment of abandoned railroads within and adjacent to critical forested habitats in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.7 Develop a plan that directs the maintenance of or new channelization of forested streams and rivers in a manner that minimizes impacts of the aquatic ecological system and adjacent forest
- 9.1.0.8 Develop a plan that focuses on strategies for oil pipelines to avoid sensitive habitats that would be highly impacted by oil spills.
- 9.1.0.9 Develop a plan that focuses on strategies to minimize the creation of renewable energy farms (e.g., solar, wind) and related infrastructures within and their impacts on forested habitats and the wildlife community.
- 9.1.0.10 Develop a plan that focuses on strategies to minimize the impacts of mining on critical forested habitats.
- 9.1.0.11 Develop a plan that focuses on strategies to minimize the impacts of power plants on critical forested habitats and the wildlife community.
- 9.1.0.13 Develop a plan to minimize agriculture that would result in groundwater withdrawal in critical forested areas.

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Superb Jewelwing

- 9.1.0.14 Develop a plan to minimize development that would result in groundwater withdrawal in critical forested areas.
- 9.1.0.15 Develop a plan to minimize fragmentation of terrestrial and aquatic habitats by roads.
- 9.1.0.16 Develop a plan to minimize new lawns and preserve natural vegetation within and adjacent to critical forest areas.
- 9.1.0.19 Develop a plan to minimize the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 9.1.0.22 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 9.1.0.28 Develop and coordinate state, regional and local plans for suitable lot layout and landscaping to minimize human-wildlife conflicts that also incorporates habitat connectivity and preservation of natural areas.
- 9.1.0.29 Provide GIS or related data, maps, resource inventories, as well as related training, pertaining to the SWAP and its recommended conservation actions for use or consideration by State, County or municipal planning agencies.
- 9.1.0.30 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and other related threats associated with development.
- 9.1.0.31 Develop wetland restoration plans that consider the life history and needs of wildlife occupying targeted habitats.
- 9.1.0.32 Incorporate aquatic habitat connectivity and water quality/effluent standards into local and state aquaculture plans and BMPs.
- 9.1.0.33 Review the species, threats, action successes, and habitats, and work with partners to revise the 2017 State Wildlife Action Plan for the 2025 resubmittal.

9.2 Organizational strategic and CMS planning

9.2.1 Organizational strategic and operational planning

- 9.2.1.1 Identify and codify legal ORV access areas on state lands.

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.3 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.1.4 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.3.1.5 Develop response plans to address disease outbreaks within wildlife populations, in particular SGCN.
- 9.3.1.7 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
- 9.3.1.9 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
- 9.3.1.10 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.

Superb Jewelwing

- 9.3.1.13 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
- 9.3.1.15 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.
- 9.3.1.16 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.

9.3.3 Habitat management planning

- 9.3.3.5 Develop a management plan using forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.
- 9.3.3.7 Develop a management plan to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 9.3.3.8 Develop a management plan to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats.
- 9.3.3.10 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
- 9.3.3.11 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.3.3.13 Develop a management plan that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas and prevents or ameliorates near-term impacts of climate change throughout the State, but in particular within the coastal and Delaware Bay areas.
- 9.3.3.15 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
- 9.3.3.16 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.3.18 In cooperation with species and habitat experts, develop management plans for significant natural and/or unique communities, in particular those supporting SGCN, and provide the information to the landowners/managers (federal, state and local government agencies or non-government organization) for review and implementation.
- 9.3.3.19 Develop management plans for SGCN inhabiting permanently protected natural lands using available baseline and population trend data.
- 9.3.3.21 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
- 9.3.3.24 Develop a plan to improve the enforcement of policies and/or regulations that protect wetlands, riparian and floodplain areas, and aquatic habitats (including open waters).
- 9.3.3.28 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.
- 9.3.3.29 Develop habitat management plans aimed at reducing or eliminating negative impacts of ORVs.

Superb Jewelwing

- 9.3.3.32 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.
- 9.3.3.34 Include controlled burn prescriptions in forest and stewardship plans to improve wildlife habitat.
- 9.3.3.35 Incorporate habitat connectivity, preservation of natural areas, and the implementation of BMPs into state and local land-use policy environmental review process and energy development plans to minimize habitat fragmentation and related threats associated with solar farms and altered habitats.
- 9.3.3.36 Integrate plans for properly located and timed habitat restoration and management along transportation, energy and service corridors to minimize risks to and benefit wildlife.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

- 11.1.1.1 Use Biotics database and Landscape Project Mapping in regulatory reviews to ensure protection by applicable laws and regulations.
- 11.1.1.2 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
- 11.1.1.3 Government organizations to thoroughly review wetland restoration plans, applying the most current science for wildlife, habitats and aquatic systems, to assess the impacts to resident and migratory wildlife occupying the targeted habitats.
- 11.1.1.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.
- 11.1.1.5 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 11.1.1.7 Review proposed construction or other work projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.8 Review proposed research projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.
- 11.1.1.12 Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed solar farm projects to reduce habitat fragmentation and minimize impacts on wildlife.

11.1.2 Review of proposed policies and plans

- 11.1.2.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.
- 11.1.2.2 Government organizations to thoroughly review wetland restoration plans, applying the most current science for wildlife, habitats and aquatic systems, to assess the impacts to resident and migratory wildlife occupying the targeted habitats.

Superb Jewelwing

- 11.1.2.3 Incorporate aquatic habitat connectivity and water quality/effluent standards into the environmental review process to help establish policies and plans that minimize the impact of aquaculture on fish and wildlife.
- 11.1.2.4 Review strategies for creating or enhancing connectivity (e.g., installing appropriately-sized wildlife passages) between wetlands to allow wildlife to disperse naturally and safely.

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

- 11.2.0.1 Provide technical support to private and public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 11.2.0.2 Provide technical support to public and private landowners and land managers for controlling invasive, native and non-native plant species in order to increase structural habitat diversity.
- 11.2.0.3 Develop state, regional and local BMPs that focus on minimizing habitat fragmentation and human-wildlife conflicts associated with development. Make information available to land developers and private and public landowners for implementation.
- 11.2.0.5 Provide educational resources, training programs, and expert guidance to private and public landowners and land managers on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.
- 11.2.0.6 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on habitat creation, enhancement and restoration within and adjacent to project areas, as well as away from and outside of project areas (depending on the target species), by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. Wind farms should address both terrestrial bound and low-flying species. Examples of habitat management include, but are not limited to, integrating short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 11.2.0.7 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on the importance of maintaining habitat connectivity, minimizing fragmentation, and the use of CHANJ products to help them target areas for such planning.
- 11.2.0.8 Provide educational resources, training programs, and on-the-ground guidance to public and private landowners and land managers on habitat creation and enhancement strategies that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 11.2.0.9 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and private landowners about the importance of leaving vegetation in place, especially along riparian areas and wildlife movement corridors.
- 11.2.0.10 Provide technical support to private landowners, consultants, and land managers to create customized management plans based on location and SGCN.
- 11.2.0.11 Provide educational resources, training programs, and on-the-ground guidance to private and public landowners and land managers on the benefits of and for creating young forest and early succession habitat for SGCN.

Superb Jewelwing

- 11.2.0.14 Provide educational resources and technical support to public and private landowners and land managers to promote the protection of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters), and to enhance or restore biologically appropriate buffers.
- 11.2.0.15 Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and landowners about the importance of retaining and in an effort to protect, create, enhance and/or restore vegetation along aquatic habitats.
- 11.2.0.17 Provide educational resources and technical support to public and private landowners and land managers to promote the protection of vernal pools and the protection, enhancement and/or restoration of biologically appropriate buffers.
- 11.2.0.22 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.
- 11.2.0.23 Provide educational resources and technical support to public and private landowners and land managers of lands adjacent to SGCN habitats to promote the protection and/or enhancement of those adjacent habitats to increase the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and that connect conserved SGCN habitats.
- 11.2.0.24 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers on how to manage vegetated roadside areas (e.g., mowing, brush-hogging, etc.) on a schedule that avoids peak activity periods for wildlife and therefore, minimizes harm.
- 11.2.0.25 Provide educational resources, training programs, and on-the-ground guidance to resource managers regarding the assessment of and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) related to residential and commercial development.
- 11.2.0.26 Make educational resources available to the public that encourage researchers to seek out guidance prior to finalizing proposals and submitting State permit applications to reduce potential impacts on sensitive species.
- 11.2.1 With individuals and groups involved in resource management decision making
 - 11.2.1.1 Engage partners and stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
 - 11.2.1.2 Provide professional training and technical assistance tools (e.g., mapping, guidance documents, justification, etc.) to agencies/divisions/programs within and outside of the NJ DEP regarding the SWAP, and the conservation actions recommended therein to help facilitate SWAP implementation.
 - 11.2.1.3 Provide educational resources, training programs, and on-the-ground guidance to DOD to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop and implement forest management and other practices that minimize disturbances to SGCN (i.e., beyond their federal requirements).
 - 11.2.1.5 Provide educational resources, training programs, and on-the-ground guidance to municipalities, state and federal agency resource managers on tasks such as writing and integrating Beach Management Plans into other management documents.

Superb Jewelwing

11.2.1.6 Provide educational resources, training programs, and on-the-ground guidance to resource agencies prior to project initiation to ensure wildlife and their habitats are protected to the highest degree possible during construction, and provisions are in place for post-construction habitat use.

11.2.2 With private landowners

11.2.2.1 Provide technical support to farming operations and woodland landowners on ways to decrease clean farming (edge-to-edge) practices and create ecotones to benefit bobwhite and other species dependent on early successional habitat.

100 Law and Policy

100. Legislation

100.1.3 Sub-national Level

100.1.3.1 Develop laws and policies to increase protection and biological buffers of wetlands.

100.1.3.2 Develop policies for wetland restoration plans that consider life history requirements and needs of wildlife occupying targeted habitats.

100.1.3.3 Initiate legislative action to establish an annual budgetary line item designating funds to support programs focused on long-term research and monitoring of wildlife diseases.

100.1.4 County and Local

100.1.4.2 Secure and increase the effective size of SGCN habitats and connect conserved SGCN habitats through local ordinances.

100.1.4.3 Expand the acreages and enhance the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN through local ordinances.

100.1.4.4 Secure wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) and biologically appropriate buffers through local ordinances.

100.1.4.5 Secure SGCN-inhabited/used freshwater wetlands and biologically appropriate buffers through local ordinances.

100.1.4.11 Secure riparian areas through local ordinances.

100.1.4.14 Adopt/pass local ordinances which require assessing and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.

100.1.4.15 Incorporate habitat connectivity and the preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.

100.1.5 Scale Unspecified

100.1.5.1 Develop laws and policies to increase protection and biological buffers of wetlands.

100.1.5.2 Develop policies for wetland restoration plans that consider life history requirements and needs of wildlife occupying targeted habitats.

100.1.5.3 Incorporate aquatic habitat connectivity and water quality/effluent standards into state/local policy to minimize the impact of aquaculture on fish and wildlife.

100.1.5.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.

- 100.1.5.5 Develop legislation to provide financial support for the New Jersey Invasive Species Strike Team.

100. State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.1 Develop (and/or improve) policies and/or regulations that will promote the reduction of run-off and point and non-point source pollution into NJ's aquatic systems (streams, rivers, lakes/ponds, bays, ocean, wetlands, etc.).
- 100.3.0.5 Develop policies that will promote improved and secure habitat connections between conserved SGCN habitats.
- 100.3.0.6 Develop policies that will promote expanding acreages and enhancing the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 100.3.0.8 Develop policies and/or regulations with the objective of protecting significant natural and/or unique communities in perpetuity.
- 100.3.0.9 Secure mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.12 Develop policies that promote the preservation and protection of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN.
- 100.3.0.13 Develop policies that will promote protecting and restoring riparian areas.
- 100.3.0.14 Develop policies and/or regulations that increase the protective buffers of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) to biologically appropriate distances to benefit SGCN that rely upon these habitats and improve the function of the [associated] aquatic systems.
- 100.3.0.18 Develop policies for conserved lands that prohibit planting and supports the control of non-native vegetation and invasive, native vegetation.
- 100.3.0.23 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.26 Adopt regulations requiring the combined sewer overflow alternative analyses required by regulation address potential impacts to wildlife in watercourses or receiving water bodies.
- 100.3.0.31 Create or expand tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMPs.
- 100.3.0.32 Coordinate regulations across agencies to maximize availability of and enrollment in existing Forestry Stewardship Programs (e.g., "Woodland Stewards", Farm Bill, partners, etc.) to maintain and/or improve forest habitat.
- 100.3.0.38 Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.

Superb Jewelwing

- 100.3.0.39 Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.3.0.40 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.3.0.41 Explore all State regulatory requirements for mitigation, restoration, habitat management, etc. to ensure they prohibit the use of specified invasive or other problematic plant species.
- 100.3.0.43 Identify and address (amend) regulatory impediments to beneficial habitat management.
- 100.3.0.44 Incorporate requirements for technical support and funding for mitigation or restoration efforts so as to be consistent with existing regulations.
- 100.3.0.45 Increase the controlled burn season to focus on restoring vegetative communities.
- 100.3.0.46 Investigate and/or develop inter-agency Memorandum of Agreements to share common data stored or managed in program-specific databases.
- 100.3.0.48 Propose new State law or regulation mandating that a State-level "development impact fee" be assessed on all new development approved by municipalities (via the Municipal Land Use Law processes), and dedicate such monies to the development and implementation of regional Habitat Conservation Plans (or existing plans/programs serving the same regional function).
- 100.3.0.50 Retain endangered, threatened and special concern wildlife and habitat protection measures in the Water Quality Management Program Rules.
- 100.3.0.52 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded energy sitings and facilities.
- 100.3.0.53 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded rights-of-way corridors associated with energy transport/transmission.
- 100.3.0.60 Develop regulations that when implemented will protect significant natural and/or unique communities in perpetuity.
- 100.3.0.64 Develop regulations that when implemented will protect and restore riparian areas.
- 100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.
- 100.3.0.73 Develop regulations that would exempt the conversion of lawns to native vegetation (beneficial to wildlife) from local lawn ordinances.

100.3.2 State Land Acquisition Programs

- 100.3.2.1 Increase opportunities for habitat restoration by making any necessary policy changes to state, federal and local land acquisition programs (e.g., Green Acres, Blue Acres, etc.) to allow for acquisition within abandoned or failing bay shore communities, including mechanisms to relocate displaced people and infrastructure.

100. State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

Appendix J: Threats and Conservation Actions for the Focal Species of Greatest Conservation Need

Superb Jewelwing

- 100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).
- 100.4.0.2 Create a policy that requires the NJ DEP to incorporate scientific information regarding climate change and sea level rise (e.g., predictions, habitat management/acquisition efforts to enhance resilience to inundation) on their websites and to work with other government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.
- 100.4.0.3 Develop policies for mandatory buffer strips on preserved farmlands and state-owned agricultural lands.
- 100.4.0.8 Develop a white paper addressing the impacts that existing, new or expanded rights-of-way have upon wildlife, wildlife habitats and habitat connectivity.
- 100.4.0.10 Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.
- 100.4.0.11 Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.4.0.12 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.4.0.13 Develop policies for different circumstances (e.g., roadsides and medians, riparian, aquatic and terrestrial habitats) that outline appropriate habitat/vegetation management strategies and schedules to minimize risks to and benefit wildlife.
- 100.4.0.16 Develop policies to implement habitat management strategies that will increase the structural diversity surrounding areas used for energy, mining, and transportation and service corridors which include but are not limited to the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-
- 100.4.0.17 Develop policies to implement habitat management strategies, including prescribed burns, that will increase the structural diversity on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies to control and reduce the impacts of invasive, non-native species in order to increase structural habitat diversity.
- 100.4.0.18 Develop policies to minimize the extent of infrastructure associated with energy and service corridors or areas (e.g., wind and solar farms, pipelines, utility lines) and that require the implementation of habitat management strategies that will increase the structural diversity in the area including (e.g., the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-asides).
- 100.4.0.19 Develop regulations that will minimize the creation of new barriers, remove or replace current barriers with appropriately-sized systems to accommodate wildlife dispersal, and to minimize road widening and traffic volume increases within critical wildlife habitat areas.

Superb Jewelwing

- 100.4.0.20 Develop state regulations that require energy developers and utility service companies to implement habitat management strategies that will increase the structural diversity of the habitat, minimize habitat fragmentation and commercial infrastructure, and minimize the loss, alteration and/or degradation of the habitat and adjacent lands when working on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies.
- 100.4.0.21 Ensure that Section 303(d) of the Clean Water Act and applicable State statutory/regulatory requirements for surface water pollutant budgets are being met by monitoring and enforcing regulatory Total Maximum Daily Load (TMDL) targets established within regional Water Quality Management Plans.
- 100.4.0.22 Work with NJ DEP's Division of Land Use Regulation to ensure protection of listed species and their habitats during stream cleaning events.
- 100.4.0.24 Develop policies to provide financial support for the New Jersey Invasive Species Strike Team.
- 100.4.0.25 Develop policies that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

A. Introduction

Conservation partners provided a wide-ranging list of needed conservation actions during three Action Development Workshops in 2015. Some of these actions were broad in nature, applying to multiple species of conservation need (SGCN) and their habitats, while others were highly specific. The Division of Fish and Wildlife (DFW) grouped actions when they addressed a particular threat, a suite of related threats, or an overarching conservation need. These groups of actions lent themselves to the creation of "projects". Additional details on the development of these projects are provided in Chapter 3.

This report contains 31 projects that provide guidance for conservation organized around broad issues, threats, and needs; a 32nd project is under development. This report is not intended to represent a comprehensive or exhaustive catalog of conservation projects and is not prioritized in any way. Rather, the report provides examples of how threats and actions can be used by conservation partners to formulate specific species- or threat-oriented conservation initiatives or to pursue actions related to the projects presented here. The DFW intends to expand and refine the projects report in the future and seek conservation partner input on prioritization of the projects.

B. Project Format and Information

Each project consists of one or more jobs intended to focus conservation efforts on tasks that would collectively help accomplish the project. While jobs may indirectly benefit many wildlife species, the report identifies only the Focal SGCN that are specifically addressed. Each job contains the following information:

- Objectives and purpose;
- Expected benefits to wildlife and their habitats;
- Underlying threats; and
- Conservation actions recommended to ameliorate threats.

This Plan explicitly focuses on the development and implementation of actions to conserve New Jersey's wildlife species of conservation need (SGCN) and the habitats on which they depend. However, New Jersey also supports an extraordinarily diverse flora, described in Chapter 3, Section VI, including natural communities that provide significant habitat for wildlife SGCN and associated rare plants.

The actions, projects, and monitoring programs presented in this plan for wildlife also provide an opportunity to contribute to the conservation of rare plants and natural communities. At the same time, without proper precautions, actions directed at enhancing wildlife, especially "on-the-ground" actions that modify habitats, may pose risks to rare native flora. As such, it is important that land and wildlife managers consider plant communities when implementing conservation actions and monitoring programs for wildlife. Additional guidance for integrating rare plants and natural communities into wildlife planning and action implementation is presented in Attachment IV.

Project 1. State Wildlife Action Plan Integration and Implementation

Job 1.01. Coordinate the State Plan with the State Wildlife Action Plan

Objective: For the State Planning Commissioner to update NJ's State Plan with guidance from NJ's State Wildlife Action Plan (SWAP) such as SGCN information and prioritization of habitats and land parcels, resulting in SWAP implementation through State permit decisions.

Purpose: Minimize fragmentation and loss of critical wildlife habitats and corridors resulting from development and infrastructure.

Benefits: New development and infrastructure is planned and implemented to maintain ecologically important habitats with minimal fragmentation, and viable wildlife populations are supported with fewer human conflicts.

Focal wildlife species benefitting from this job

Birds

American Oystercatcher	American Woodcock	Black Rail
Black Skimmer	Blue-winged Warbler	Bobolink
Cerulean Warbler	Common Tern	Eastern Meadowlark
Forster's Tern	Golden-winged Warbler	Grasshopper Sparrow
Kentucky Warbler	Least Tern	Little Blue Heron
Northern Bobwhite	Northern Harrier	Peregrine Falcon
Pied-billed Grebe	Piping Plover	Prothonotary Warbler
Red Knot	Red-headed Woodpecker	Ruddy Turnstone
Scarlet Tanager	Snowy Egret	Tricolored Heron
Vesper Sparrow	Wood Thrush	

Fish

Alewife	Atlantic Sturgeon	Banded Sunfish
Blackbanded Sunfish	Blueback Herring	Bridle Shiner
Brook Trout	Comely Shiner	Ironcolor Shiner
Mud Sunfish	Shortnose Sturgeon	Swamp Darter

Macroinvertebrates

A Notodontid Moth (H. varia)	American Bumble Bee	Arogos Skipper
Ashton Cuckoo Bumble Bee	Brook Floater	Buchholz's Dart Moth

Appendix K: Projects to Conserve New Jersey's Wildlife Populations of Concern

Project 1. State Wildlife Action Plan Integration and Implementation

Buchholz's Gray	Carter's Noctuid Moth	Daecke's Pyralid Moth
Dotted Skipper	Dwarf Wedgemussel	Eastern Lampmussel
Frosted Elfin	Georgia Satyr	Green Floater
Hoary Elfin	Leonard's Skipper	Little White Tiger Beetle
Maritime Sunflower Borer Moth	New England Bluet	New Jersey Pine Barrens Tiger Beetle
Northeastern Beach Tiger Beetle	Northern Metalmark	Papaipema harrisii
Pine Barrens Bluet	Pink Sallow	Robust Baskettail
Rusty Patched Bumble Bee	Sand Myrtle Looper/Pink	Scarlet Bluet
Septima's Clubtail	Southeastern Beach Tiger Beetle	Southern Plains Bumble Bee
Superb Jewelwing	Triangle Floater	Variable Cuckoo Bumble Bee
Yellow Bumble Bee	Yellow Lampmussel	Yellow-banded Bumble Bee

Mammals

Allegheny Woodrat	Indiana Bat	Little Brown Bat
North Atlantic Right Whale	Northern Myotis	

Reptiles & Amphibians

Atlantic Green Turtle	Atlantic Leatherback	Atlantic Loggerhead
Atlantic Ridley	Bog Turtle	Carpenter Frog
Corn Snake	Eastern Box Turtle	Eastern Hognose Snake
Eastern Redbelly Turtle	Eastern Spadefoot	Eastern Tiger Salamander
Longtail Salamander	New Jersey Chorus Frog	Northern Black Racer
Northern Diamondback Terrapin	Northern Pine Snake	Northern Red Salamander
Northern Scarlet Snake	Pine Barrens Treefrog	Timber Rattlesnake
Wood Turtle		

Threats and Action Drivers associated with this conservation need

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale)

1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.1.1.2 Loss, alteration and/or degradation of habitat.

Project 1. State Wildlife Action Plan Integration and Implementation

1.1.1.3 Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.

1.1.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale)

1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.2.1.2 Loss, alteration and/or degradation of habitat.

1.2.1.3 Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.

1.2.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.

1.2.1.5 Impervious surfaces can lead to a decrease in water recharge.

1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale)

1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.3.1.2 Loss, alteration and/or degradation of habitat.

1.3.1.3 Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.1.2 Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.

12.1.2 Lack of up-to-date existing information

12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

12.1.3 Need to answer research question

Project 1. State Wildlife Action Plan Integration and Implementation

12.1.3.1 There are significant knowledge gaps regarding distribution, dispersal, diseases, population trends, etc. of SGCN.

12.1.3.4 Lack of information regarding the potential short- and long-term impacts of wind turbines and other tall coastal structures on migratory populations.

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms

12.3.0.7 Activities that threaten SGCN, their food sources, and/or habitats are often regulated separately and without consideration for the cumulative and synergistic effects over time or over a larger spatial scale. Therefore, regulations can fail to protect SGCN populations over time.

14 Education/ Outreach Needs

14.2 Outreach needs

14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions

14.2.1.4 Need to develop greater understanding of and support for efforts implemented to maintain disturbance-free habitats that allow coastal wildlife populations to thrive alongside human residential and recreational uses.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

3.0.0.5 Gather baseline data on resident and migratory SGCN (in particular migratory species for which New Jersey habitats are significant), terrestrial, freshwater and marine species, regarding the location and condition of their critical and supporting habitats (e.g., foraging, roosting, nesting/breeding, stopover, migration paths, etc.), and population demography (e.g., productivity, survival, dispersal). Compile this information into a database that includes descriptions of the conditions of the habitats and species, and a GIS component of the locations of these important habitats. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.

Project 1. State Wildlife Action Plan Integration and Implementation

- 3.0.0.24 Identify (through aerial and topographic maps), and confirm through field surveys, potential vernal pools using standard protocols. Provide confirmed vernal pool locations (and when possible, a description of the pools condition) and species' presence data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.25 Identify pathways of migratory SGCN in the Atlantic Coastal and Marine Regions (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and use the data to help evaluate the potential short- and long-term impacts of wind turbines, radio towers, utility guy lines, and other tall coastal structures on migratory populations.

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

- 3.3.1.1 Conduct habitat assessments of significant natural and/or unique communities to identify threats to native terrestrial and aquatic habitats through systematic monitoring, review of available data, enlistment of habitat management and/or species experts, etc. Incorporate findings into a database that includes descriptions/qualifiers of the habitats, identifies and values/qualifies the threats, and includes a GIS component of the locations of the assessed areas. Share this information with landowners/managers (e.g., federal, state and local government agencies or non-government organization).
- 3.3.1.2 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) resident and migratory SGCN habitats. Investigate their suitability for the various life history requirements of the species that dependent upon them to determine the ability for maintaining applicable SGCN populations in perpetuity.
- 3.3.1.3 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) remaining high and low marsh habitats with natural buffers and stable water levels that provide suitable habitat for SGCN and marsh habitats that would benefit from restoration. Conduct research to assess their condition for nesting, migrating and wintering birds.
- 3.3.1.4 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and investigate the suitability of corridors that connect large, contiguous tracts of similar habitats to increase their effective size (i.e., forest with forest, grassland with grassland, wetlands with wetlands, etc.) for dependent SGCN.
- 3.3.1.10 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and document fish SGCN habitats by plotting their distributions in GIS and submitting the data to the State for integration into the DEP's Biotics database.

8 Outreach

8.3 WSFR program/subprogram outreach

Project 1. State Wildlife Action Plan Integration and Implementation

8.3.0 WSFR program/subprogram outreach strategies

8.3.0.20 Develop an educational outreach program for landowners, particularly those in the coastal and bay areas, boaters, and the general public with information about the negative impacts on marine wildlife and habitats, and steps they can implement to reduce these impacts.

8.3.0.22 Post signage in sensitive coastal habitats (e.g., bird and Diamondback Terrapin nesting areas) to educate the boating community on responsible use of these areas.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

9.1.0.33 Review the species, threats, action successes, and habitats, and work with partners to revise the 2017 State Wildlife Action Plan for the 2025 resubmittal.

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

100.4.0.25 Develop policies that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

Job 1.02. Integrate the State Wildlife Action Plan Across State Departments and Divisions

Project 1. State Wildlife Action Plan Integration and Implementation

Objective: Integrate SWAP guidance and recommendations into regulatory, acquisition, and management decisions throughout all State Departments and Divisions.

Purpose: Provide biologically appropriate protection to species currently unprotected by land use patterns and decisions.

Benefits: Reduce the direct loss of habitat and improve habitat conditions.

Focal wildlife species benefitting from this job

Birds

American Oystercatcher	American Woodcock	Black Rail
Black Skimmer	Blue-winged Warbler	Bobolink
Cerulean Warbler	Common Tern	Eastern Meadowlark
Forster's Tern	Golden-winged Warbler	Grasshopper Sparrow
Kentucky Warbler	Least Tern	Little Blue Heron
Northern Bobwhite	Northern Harrier	Peregrine Falcon
Pied-billed Grebe	Piping Plover	Prothonotary Warbler
Red Knot	Red-headed Woodpecker	Ruddy Turnstone
Scarlet Tanager	Snowy Egret	Tricolored Heron
Vesper Sparrow	Wood Thrush	

Fish

Alewife	Atlantic Sturgeon	Banded Sunfish
Blackbanded Sunfish	Blueback Herring	Bridle Shiner
Brook Trout	Comely Shiner	Ironcolor Shiner
Mud Sunfish	Shortnose Sturgeon	Swamp Darter

Macroinvertebrates

A Notodontid Moth (H. varia)	American Bumble Bee	Arogos Skipper
Ashton Cuckoo Bumble Bee	Brook Floater	Buchholz's Dart Moth
Buchholz's Gray	Carter's Noctuid Moth	Daecke's Pyralid Moth
Dotted Skipper	Dwarf Wedgemussel	Eastern Lampmussel
Frosted Elfin	Georgia Satyr	Green Floater
Hoary Elfin	Leonard's Skipper	Little White Tiger Beetle
Maritime Sunflower Borer Moth	New England Bluet	New Jersey Pine Barrens Tiger Beetle

Appendix K: Projects to Conserve New Jersey's Wildlife Populations of Concern

Project 1. State Wildlife Action Plan Integration and Implementation

Northeastern Beach Tiger Beetle	Northern Metalmark	Papaipema harrisii
Pine Barrens Bluet	Pink Sallow	Robust Baskettail
Rusty Patched Bumble Bee	Sand Myrtle Looper/Pink	Scarlet Bluet
Septima's Clubtail	Southeastern Beach Tiger Beetle	Southern Plains Bumble Bee
Superb Jewelwing	Triangle Floater	Variable Cuckoo Bumble Bee
Yellow Bumble Bee	Yellow Lampmussel	Yellow-banded Bumble Bee

Mammals

Allegheny Woodrat	Indiana Bat	Little Brown Bat
North Atlantic Right Whale	Northern Myotis	

Reptiles & Amphibians

Atlantic Green Turtle	Atlantic Leatherback	Atlantic Loggerhead
Atlantic Ridley	Bog Turtle	Carpenter Frog
Corn Snake	Eastern Box Turtle	Eastern Hognose Snake
Eastern Redbelly Turtle	Eastern Spadefoot	Eastern Tiger Salamander
Longtail Salamander	New Jersey Chorus Frog	Northern Black Racer
Northern Diamondback Terrapin	Northern Pine Snake	Northern Red Salamander
Northern Scarlet Snake	Pine Barrens Treefrog	Timber Rattlesnake
Wood Turtle		

Threats and Action Drivers associated with this conservation need

1 Residential and Commercial Development

1.1 Housing and Urban Areas

- 1.1.1** Land conversion from natural habitat to urban and other residential areas (large and small scale)
 - 1.1.1.1** Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
 - 1.1.1.2** Loss, alteration and/or degradation of habitat.
 - 1.1.1.3** Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.
 - 1.1.1.4** Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.

1.2 Commercial and Industrial Areas

- 1.2.1** Land conversion from natural habitat to commercial or industrial areas (large and small scale)

Project 1. State Wildlife Action Plan Integration and Implementation

- 1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
- 1.2.1.2 Loss, alteration and/or degradation of habitat.
- 1.2.1.3 Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.
- 1.2.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.

1.3 Tourism and Recreational Areas

- 1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale)
 - 1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
 - 1.3.1.2 Loss, alteration and/or degradation of habitat.
 - 1.3.1.3 Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.

15 Administrative Needs

15.2 Organizational/program planning needs

- 15.2.3 Need for multi-state, regional and landscape scale planning
 - 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

9 Planning

- 9.1 Land use planning
 - 9.1.0 Land use planning strategies
 - 9.1.0.29 Provide GIS or related data, maps, resource inventories, as well as related training, pertaining to the SWAP and it's recommended conservation actions for use or consideration by State, County or municipal planning agencies.
- 9.3 Species and habitat management planning
 - 9.3.1 Species management planning
 - 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

11 Technical Assistance

11.2 Technical assistance

Project 1. State Wildlife Action Plan Integration and Implementation

11.2.1 With individuals and groups involved in resource management decision making

11.2.1.2 Provide professional training and technical assistance tools (e.g., mapping, guidance documents, justification, etc.) to agencies/divisions/programs within and outside of the NJ DEP regarding the SWAP, and the conservation actions recommended therein to help facilitate SWAP implementation.

100 Law and Policy

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).

Project 2. Update Landscape Project

Job 2.01. Regularly update the Landscape Project data and methodology

- Objective:** To provide better planning tools by updating the Landscape Project mapping and methodology more frequently, based on the most recent land-use/land-cover data, habitat associations and species occurrence data.
- Purpose:** To provide data that are easily accessible and can be pro-actively integrated with planning, protection and land management programs in order to guide strategic wildlife habitat conservation, minimize conflict and protect imperiled species.
- Benefits:** Landscape Project mapping that reflects the most recent data on the state of the landscape and species occurrence information will enable land use planning and management decisions to be informed by the most accurate and current data possible leading to better planning and more effective conservation of habitat.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

Project 2. Update Landscape Project

- 12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.
 - 12.1.1.2 Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.
- 12.1.2 Lack of up-to-date existing information
 - 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

Conservation actions that address Threats and Action Drivers

3 Data Collection and Analysis

- 3.0 General fish and wildlife research, survey or monitoring
 - 3.0.0 Research, survey or monitoring - general fish and wildlife needs
 - 3.0.0.1 Conduct long-term monitoring of resident and migratory SGCN populations using standardized survey protocols to determine the variables that may impact their long-term persistence in the State (e.g., population viability, distribution, dispersal, home range and habitat use, travel corridors, food availability, vulnerability to pollutants and disease, etc.). Compile this information to determine the likely causes of population declines and to understand metapopulation dynamics. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
 - 3.0.0.2 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) where data gaps exist regarding SGCN distribution, and their critical and supportive habitats. Conduct surveys using standardized survey protocols to acquire baseline data, and provide the data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.
 - 3.0.0.5 Gather baseline data on resident and migratory SGCN (in particular migratory species for which New Jersey habitats are significant), terrestrial, freshwater and marine species, regarding the location and condition of their critical and supporting habitats (e.g., foraging, roosting, nesting/breeding, stopover, migration paths, etc.), and population demography (e.g., productivity, survival, dispersal). Compile this information into a database that includes descriptions of the conditions of the habitats and species, and a GIS component of the locations of these important habitats. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.

Project 2. Update Landscape Project

- 3.0.0.6 Conduct long-term studies on resident and migratory SGCN to determine if there are changes to the populations' demography (productivity, survival, dispersal) and/or to their critical and/or supporting habitats (i.e., diminishing in value, acreage or connectivity, etc.), in particular changes that would not maintain SGCN at viable levels for species populations. Update data and GIS maps; provide updated information to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.24 Identify (through aerial and topographic maps), and confirm through field surveys, potential vernal pools using standard protocols. Provide confirmed vernal pool locations (and when possible, a description of the pools condition) and species' presence data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.1 Division of Fish and Wildlife should maintain a robust, up-to-date database and mapping of species occurrences.
- 3.2.0.18 Conduct baseline surveys/inventories to better understand the distribution of fish and invertebrate (including freshwater mussels) populations.

3.2.1 Abundance determination

- 3.2.1.1 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) population abundance and trends for SGCN using standardized survey protocols. Provide data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

- 3.3.1.10 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and document fish SGCN habitats by plotting their distributions in GIS and submitting the data to the State for integration into the DEP's Biotics database.

3.3.2 Monitoring

- 3.3.2.3 Continue to update wildlife and habitat databases and revise models of critical SGCN habitats using the most current data available and where lacking, develop new SGCN and/or habitat models as data on species habitat requirements and applicable GIS data layers become available.

Project 3. Region-based Habitat Conservation Plans: Statewide

Job 3.01. It All Adds Up: Local Actions + Regional Awareness = Regional Habitat Solutions!

Objective: Encourage municipalities to direct development in a manner that protects natural landscapes and connectivity.

Purpose: Integrate additional natural resource protection standards into local ordinances, relying upon available State mapping resources.

Benefits: Region-wide protection for wildlife SGCN, particularly upland species that are less often addressed by State regulations, using State mapping resources to provide for the accurate, consistent and uniform identification of resources or solutions.

Objective: Encourage municipalities to assess a "Habitat Conservation Fee" of all developments involving vegetation removal; the revenue from which would fund local and regional conservation efforts associated with the subject development or applied towards other local and regional conservation efforts.

Purpose: Establish a revenue source from parties benefitting from the removal or disturbance of wildlife habitats that would be dedicated to mitigating for said impacts via local or regional habitat conservation efforts.

Benefits: Region-wide protection for wildlife SGCN, particularly upland species that are less often addressed by State regulations, using State mapping resources to provide for the accurate, consistent and uniform identification of resources or solutions.

Threats and Action Drivers associated with this conservation need

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale)

- 1.1.1.1** Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
- 1.1.1.2** Loss, alteration and/or degradation of habitat.
- 1.1.1.3** Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.
- 1.1.1.4** Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.
- 1.1.1.5** Impervious surfaces can lead to a decrease in water recharge.
- 1.1.1.6** Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
- 1.1.1.7** Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale)

- 1.2.1.1** Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
- 1.2.1.2** Loss, alteration and/or degradation of habitat.
- 1.2.1.3** Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.
- 1.2.1.4** Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.
- 1.2.1.5** Impervious surfaces can lead to a decrease in water recharge.
- 1.2.1.6** Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
- 1.2.1.7** Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale)

- 1.3.1.1** Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
- 1.3.1.2** Loss, alteration and/or degradation of habitat.
- 1.3.1.3** Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.

Project 3. Region-based Habitat Conservation Plans: Statewide

- 1.3.1.4 Impervious surfaces can lead to a decrease in water recharge.
- 1.3.1.5 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
- 1.3.1.6 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

3 Energy Production and Mining

3.1 Oil and Gas Facilities and Pipelines

3.1.1 Distribution processes of petroleum and other liquid hydrocarbons

- 3.1.1.1 Fragments terrestrial and aquatic habitats.
- 3.1.1.2 Loss, alteration and/or degradation of habitat.
- 3.1.1.3 Increased risk of oil spills.

3.1.2 Natural gas distribution processes

- 3.1.2.1 Fragments terrestrial and aquatic habitats.
- 3.1.2.2 Loss, alteration and/or degradation of habitat.

3.2 Mining and Quarrying

3.2.2 Surface Mining - Rock Quarry (and sand quarries)

- 3.2.2.1 Fragments terrestrial and aquatic habitats.
- 3.2.2.2 Loss, alteration and/or degradation of habitat.

3.3 Renewable Energy

3.3.1 Wind Power

- 3.3.1.2 Fragments terrestrial habitats.
- 3.3.1.3 Loss, alteration and/or degradation of habitat.
- 3.3.1.4 Increased commercial infrastructure.

3.3.2 Solar Power

- 3.3.2.1 Fragments terrestrial habitats.
- 3.3.2.2 Loss, alteration and/or degradation of habitat.
- 3.3.2.3 Increased commercial infrastructure.

3.4 Conventional Power Plants

3.4.0 Conventional Power Plants

- 3.4.0.2 Loss, alteration and/or degradation of habitat due to new or the expansion of current facilities.

4 Transportation and Service Corridors

4.1 Roads and Railroads

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale)

- 4.1.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species and inhibiting dispersal of non-volant animals, reducing gene flow.
- 4.1.1.2 Loss, alteration and/or degradation of habitat associated with road and railroad construction and maintenance, and degradation of adjacent habitats.
- 4.1.1.3 Re-establishment of abandoned railroad lines may displace wildlife, in particular, less mobile species using the area to fulfill critical life history requirements.
- 4.1.1.5 Re-establishment of abandoned railroad lines may decrease turtles' abilities to disperse due to their difficulty traversing the railroad ties and tracks, leading to decreased genetic exchange.

4.2 Utility and Service Lines

4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads

- 4.2.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species, inhibiting dispersal of non-volant animals, reducing gene flow, and creating barriers to fish when service line-associated roads cross streams (e.g., bridges, culverts, fords, etc).
- 4.2.1.2 Loss, alteration and/or degradation of habitat associated with rights-of-way construction and maintenance, and degradation of adjacent habitats.

7 Natural Systems Modifications

7.2 Dams and Water Management/Use

7.2.2 Abstraction of Surface Water (commercial use)

- 7.2.2.2 Changing water levels due to water body drawdowns (legal and illegal) may lower dissolved oxygen levels, increase water temperatures, expose wildlife to predation, and increase exposure to winter temperatures, altering wildlife behavior and survival.
- 7.2.2.4 Water intake systems associated with industrial use and power plants threaten aquatic organisms due to injury or mortality from impingement and/or entrainment.

7.2.5 Abstraction of Ground Water (domestic use)

- 7.2.5.1 Heavy withdrawal of ground water for domestic use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.6 Abstraction of Ground Water (commercial use)

- 7.2.6.1 Heavy withdrawal of ground water for industrial and commercial use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

Project 3. Region-based Habitat Conservation Plans: Statewide

7.2.12 Culverts

- 7.2.12.1 Improper design, placement, installation and maintenance of culverts and other stream crossing structures can impede or prevent the movements of terrestrial organisms and can restrict or limit stream flow, impeding the movement of aquatic organisms along riparian corridors.

7.2.13 Stream Burial

- 7.2.13.1 Eliminates riparian habitats.
- 7.2.13.2 Eliminates in-stream habitat and water resources for wildlife.
- 7.2.13.3 Alters the hydrology and quality of downstream aquatic and riparian habitats.

7.3 Other Ecosystem Modifications

7.3.1 Shoreline Stabilization

- 7.3.1.2 Efforts to stabilize stream corridors, particularly near roads and infrastructure, in which vegetated and dynamic shorelines are replaced with unvegetated and rigid structures such as rip-rap, gabion, concrete raceways and bulkheads interfere with fish spawning, nursery and foraging areas.

7.3.5 Poor habitat management

- 7.3.5.2 Shifting from natural vegetation to lawns can cause increased temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.
- 7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.
- 7.3.5.18 Lack of funding or competitive market prices to maintain native grasslands for grassland-dependent species causes conversion of fallow or hay fields to other crops or shrublands.

9 **Pollution**

9.1 Domestic and Urban Waste Water

9.1.1 Sewage

- 9.1.1.1 Degradation of aquatic and marine water quality and habitats by changing turbidity, flow and water chemistry.
- 9.1.1.2 Leads to increased eutrophication and algae blooms that result in oxygen depletion.
- 9.1.1.3 Contaminants in sewage treatment effluents and Combined Sewer Overflows can cause developmental and behavioral abnormalities and reproductive failure in wildlife.

9.1.2 Run-off

Project 3. Region-based Habitat Conservation Plans: Statewide

- 9.1.2.1 Chemical fertilizers and nutrient run-off changes the pH in streams and ponds and causes eutrophication in inland waters and estuaries, which can make habitat unsuitable for specialist species and increase the risk of invasive and generalist species.
- 9.1.2.2 Contaminants degrade aquatic and marine water quality and can bioaccumulate in benthic organisms, threatening wildlife by causing developmental and behavioral abnormalities and reproductive failure.
- 9.1.2.3 Contaminants from road runoff (oil, sediment, salt, etc.) impact native vegetation and the species that rely upon them, degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.

9.6 Excess Energy

9.6.1 Light Pollution

- 9.6.1.1 Artificial lighting can reduce suitability of adjacent habitat for species sensitive to artificial lights by disorienting wildlife, reducing foraging suitability or success, or increasing visibility to predators, resulting in reduced diversity and/or productivity of species in adjacent habitat.

9.6.2 Thermal Pollution

- 9.6.2.2 Water temperature changes to aquatic systems can deter or preclude use by SGCN (e.g., alter habitat suitability for wildlife species, reduce prey base) or present stressors that are harmful if not fatal to wildlife.

9.6.3 Noise Pollution

- 9.6.3.1 Acute and chronic noise pollution in and adjacent to terrestrial and aquatic (marine and freshwater) environments could disrupt normal behaviors of wildlife such as migration, communication, feeding, eluding predators, resting and breeding, etc.

15 **Administrative Needs**

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

1 **Coordination and Administration**

1.2 Incentives

1.2.1 Incentives

Project 3. Region-based Habitat Conservation Plans: Statewide

- 1.2.1.1 Enhance critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates through incentive programs with adjacent private landowners to increase the effective size of the habitat.
- 1.2.1.2 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to increase the effective size of SGCN habitats by protecting/restoring adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats.
- 1.2.1.4 Secure and promote the protection, restoration, and/or development of old-growth forest stands with large trees, in particular those within large, contiguous forest tracts through incentive programs.
- 1.2.1.5 Secure and promote the protection/restoration of critical SGCN forested habitat and minimize forest edge to benefit interior forest and disturbance-sensitive SGCN through incentive programs.
- 1.2.1.6 Secure and promote the protection/restoration of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers through incentive programs.
- 1.2.1.7 Secure and promote the protection/restoration of fish SGCN habitats by protecting lands adjacent to fish SGCN habitats and/or aquatic systems feeding into such habitats through incentive programs.
- 1.2.1.8 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to municipalities, land developers, and other land managers to retain and/or enhance native vegetation adjacent to aquatic habitats, and along riparian areas and wildlife movement corridors.
- 1.2.1.9 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing Forestry Stewardship Programs.
- 1.2.1.10 Coordinate across government agencies and non-government organizations to maximize the availability of and enrollment in existing landowner incentive programs (e.g., "farm bill," partners, etc.) to maintain and/or improve habitat.

Project 3. Region-based Habitat Conservation Plans: Statewide

- 1.2.1.11 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 1.2.1.12 Create incentives (non-monetary and/or monetary) for land developers to redevelop abandoned areas (e.g., shopping centers, office complexes) to minimize the loss of natural habitats and reduce the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 1.2.1.13 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to land developers to minimize the impacts of new residential and commercial developments on SGCN and their habitats.
- 1.2.1.18 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and land managers to control and reduce the impacts of invasive, native and non-native species in order to increase structural habitat diversity.
- 1.2.1.20 Coordinate across government agencies and non-government organizations to create or expand upon tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMP's.
- 1.2.1.21 Create and/or support market-based programs that subsidize or create branding for products derived sustainably from managed wildlife habitats.
- 1.2.1.22 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to horse/livestock farm owners and managers to increase structural habitat diversity in and around the farms by managing vegetation for a variety of species, in particular, farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 1.2.1.23 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to provide cost shares and/or plan approvals for management based on management approaches and prescriptions.

Project 3. Region-based Habitat Conservation Plans: Statewide

- 1.2.1.24 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners, with habitat of suitable patch size to support breeding grassland-dependent species, to alter the timing of vegetation management to benefit grassland and pollinator species.
- 1.2.1.26 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing landowner incentive programs.
- 1.2.1.28 Create incentives to implement dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.

2 Direct Management of Natural Resources

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

- 2.10.0.5 Implement habitat restoration and/or enhancement activities that include the creation of vegetative buffers between sensitive habitats (e.g., aquatic systems) and human-inhabited areas (e.g., residences, parks, etc.) and that is conducted during appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.10.0.9 Restore and/or enhance riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation, alteration and/or changes in hydrology and subsequent disturbances to and behavioral changes of wildlife (e.g., restoring biologically appropriate buffers, revegetation or restoration efforts, etc.).
- 2.10.0.22 Restore and/or enhance terrestrial and aquatic habitats to promote the regeneration of native vegetation and enhance structural diversity to benefit SGCN (e.g., vegetative buffers of aquatic systems, allow coarse, woody debris to remain in terrestrial, aquatic and riparian habitats to provide shelter, riparian stabilization and necessary microclimates, plant native trees, shrubs and grasses, etc.).

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

- 9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and the SGCN inhabiting them.

Project 3. Region-based Habitat Conservation Plans: Statewide

- 9.1.0.2 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.1.0.3 Develop a plan that directs the creation of impervious surfaces away from and to minimize impacts on aquatic systems and critical terrestrial habitats. The plan should also include strategies to increase the resiliency of aquatic and critical terrestrial habitats to threats and stressors that would impact the reproduction and survival of wildlife.
- 9.1.0.5 Develop a plan that directs the creation or expansion of energy or utility rights-of-way in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.6 Develop a plan that directs the creation or expansion of roads and railroads or the re-establishment of abandoned railroads within and adjacent to critical forested habitats in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.8 Develop a plan that focuses on strategies for oil pipelines to avoid sensitive habitats that would be highly impacted by oil spills.
- 9.1.0.9 Develop a plan that focuses on strategies to minimize the creation of renewable energy farms (e.g., solar, wind) and related infrastructures within and their impacts on forested habitats and the wildlife community.
- 9.1.0.10 Develop a plan that focuses on strategies to minimize the impacts of mining on critical forested habitats.
- 9.1.0.11 Develop a plan that focuses on strategies to minimize the impacts of power plants on critical forested habitats and the wildlife community.
- 9.1.0.14 Develop a plan to minimize development that would result in groundwater withdrawal in critical forested areas.
- 9.1.0.15 Develop a plan to minimize fragmentation of terrestrial and aquatic habitats by roads.
- 9.1.0.16 Develop a plan to minimize new lawns and preserve natural vegetation within and adjacent to critical forest areas.
- 9.1.0.19 Develop a plan to minimize the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 9.1.0.22 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 9.1.0.23 Develop a plan to mitigate the effects of transportation barriers by using CHANJ products.
- 9.1.0.27 Develop a plan to use wildlife-appropriate culverts in critical forested areas.
- 9.1.0.28 Develop and coordinate state, regional and local plans for suitable lot layout and landscaping to minimize human-wildlife conflicts that also incorporates habitat connectivity and preservation of natural areas.

Project 3. Region-based Habitat Conservation Plans: Statewide

9.1.0.29 Provide GIS or related data, maps, resource inventories, as well as related training, pertaining to the SWAP and its recommended conservation actions for use or consideration by State, County or municipal planning agencies.

9.1.0.30 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and other related threats associated with development.

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

100.3.0.48 Propose new State law or regulation mandating that a State-level "development impact fee" be assessed on all new development approved by municipalities (via the Municipal Land Use Law processes), and dedicate such monies to the development and implementation of regional Habitat Conservation Plans (or existing plans/programs serving the same regional function).

Project 4. Climate Change Impacts to New Jersey Wildlife and Residents

Job 4.01. Rising Waters...It's a Thing!

Objective: Increase public awareness, in particular of coastal-dwelling residents, regarding the realities of sea-level rise. This should include how it will impact citizens and the decisions they, along with society/government agencies, need to make to address coastal changes. Provide alternate solutions such as hard versus soft stabilization techniques that can benefit wildlife and residential retreat (through the Blue Acres Program) to allow for natural processes to occur.

Purpose: Alter strategies regarding coastal/shoreline management to implement measures that will minimize its impact and still allow for natural processes (e.g., inlets shifting, barrier islands and marsh islands shifting) to occur that will benefit coastal wildlife species.

Benefits: There may be more capacity for natural processes to occur that benefit species as people accept the realities of sea-level rise (namely, the difficulty and cost of stabilizing shorelines to keep pace with rising waters). The public may see a benefit in expending less effort and funds on tasks with diminishing returns.

Focal wildlife species benefitting from this job

Birds

American Oystercatcher	Black Rail	Black Skimmer
Common Tern	Forster's Tern	Least Tern
Little Blue Heron	Pied-billed Grebe	Piping Plover
Red Knot	Ruddy Turnstone	Snowy Egret
Tricolored Heron		

Fish

Alewife	Atlantic Sturgeon	Blueback Herring
Shortnose Sturgeon		

Macroinvertebrates

Little White Tiger Beetle	Northeastern Beach Tiger Beetle	Southeastern Beach Tiger Beetle
---------------------------	---------------------------------	---------------------------------

Mammals

North Atlantic Right Whale

Reptiles & Amphibians

Atlantic Green Turtle	Atlantic Leatherback	Atlantic Loggerhead
Atlantic Ridley	Northern Diamondback Terrapin	

Threats and Action Drivers associated with this conservation need

7 Natural Systems Modifications

7.3 Other Ecosystem Modifications

7.3.1 Shoreline Stabilization

- 7.3.1.1 Efforts to stabilize barrier islands and shorelines, including jetties, groins, bulkheads, interfere with the natural geological processes needed to create and maintain high quality habitat for beach strand species.

11 Climate Change and Severe Weather

11.4 Storms and Flooding

11.4.1 Storms and flooding

- 11.4.1.7 Potentially damage coastal habitats, including beach and marsh habitats used by spawning horseshoe crabs, nesting diamondback terrapins, and resting and foraging birds.

11.5 Sea-level Rise

11.5.0 Sea-level Rise

- 11.5.0.4 Increased erosion of beach, mudflat and marsh habitats critical for a number of coastal species to fulfill life history requirements.
- 11.5.0.6 Alters salinity conditions in back bays and tidal creeks, thereby impacting food availability, composition and abundance for wildlife.
- 11.5.0.7 Sea level rise exacerbates marsh loss caused by prior human manipulations (e.g., impoundments, grid-ditching) that reduced the elevation of the marsh.

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats

- 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

4 **Education**

4.1 Educator/Instructor training

4.1.0 Public education

4.1.0.1 Provide educational resources and training programs to private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.

4.1.1 Aquatic resource education

4.1.1.1 Provide educational resources and training programs to teachers in aquatic resource education that includes information regarding climate change and sea-level rise for incorporation into the class curriculum and/or as the focus of school field trips.

4.1.1.2 Provide educational resources and training programs to teachers in aquatic resource education that includes information regarding how coastal stabilization negatively impacts wildlife by preventing natural processes for incorporation into the class curriculum and/or as the focus of school field trips.

8 **Outreach**

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

8.3.0.21 Develop an educational outreach program for the general public, in particular those within and adjacent to coastal and riparian areas on the realities of sea-level rise to help citizens living in these areas understand how this will affect them, how coastal stabilization negatively impacts wildlife by preventing natural processes, and how their decisions impact species.

9 **Planning**

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

Job 4.02. Modeling the Impacts of Climate Change to Identify Threatened Wildlife Habitats

Objective: Identify coastal habitats most vulnerable to sea level rise, severe storms, and flooding.

Purpose: Obtain information that can guide habitat management strategies and land acquisition priorities that enable beach and dune species to increase resiliency to the impacts of climate change and severe weather.

Benefits: Develop a greater understanding of threats from global climate change to species and habitat.

Focal wildlife species benefitting from this job

Birds

American Oystercatcher	Black Skimmer	Common Tern
Least Tern	Northern Harrier	Piping Plover
Red Knot	Ruddy Turnstone	

Fish

Alewife	Atlantic Sturgeon	Banded Sunfish
Blackbanded Sunfish	Blueback Herring	Bridle Shiner
Comely Shiner	Ironcolor Shiner	Mud Sunfish
Shortnose Sturgeon	Swamp Darter	

Macroinvertebrates

Brook Floater	Dwarf Wedgemussel	Eastern Lampmussel
Green Floater	Little White Tiger Beetle	New England Bluet
Northeastern Beach Tiger Beetle	Pine Barrens Bluet	Robust Baskettail
Scarlet Bluet	Septima's Clubtail	Southeastern Beach Tiger Beetle
Superb Jewelwing	Triangle Floater	Yellow Lampmussel

Threats and Action Drivers associated with this conservation need

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

- 12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.2 Lack of up-to-date existing information

- 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

15 Administrative Needs

15.2 Organizational/program planning needs

- 15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

3 Data Collection and Analysis

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

- 3.3.1.16 Gather "best information" for spatial modeling and update/create a current model/depiction of anticipated habitat shifts from sea-level rise, flooding, etc.
- 3.3.1.20 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) where invasive, non-indigenous plants and animals are either already established or are becoming established. Create a system for reporting and qualifying new locations of invasive species and for prioritizing areas for control measures according to the potential level of impact on the ecosystem and SGCN and the likelihood of success. Researchers and contractors encountering invasive plant species while performing plant and/or forest inventories on state or other conserved lands and/or private lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.3.1.28 Identify key habitats for the potential allowance of natural coastal processes without interfering through shoreline stabilization, etc. and evaluate the risks and benefits if coastal migration was permitted to occur naturally. Create a GIS map of the identified areas; provide the assessment and mapping to local towns and other appropriate governing agencies.
- 3.3.2 Monitoring
- 3.3.2.20 Once a system is developed for reporting and qualifying new locations of invasive species, develop, implement and monitor/evaluate invasive species removal strategies at identified locations. Priority should be given to those areas critical to SGCN and/or contain unique and/or rare plant communities supporting SGCN and/or other fish/wildlife species.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

Job 4.03. Reducing the Impacts of Climate Change on Wildlife, their Habitat and New Jersey's Residents through the Blue Acres Land Acquisition Program

Objective: Allow indigenous fauna and flora to establish in coastal habitats by relocating people and structures, and/or dismantling or abandoning infrastructure from floodprone areas of the state, where appropriate. Such action will also minimize future repetitive insurance claims by landowners as a result of storm-caused destruction to their property and eliminate repeated and costly attempts to rebuild in the same area.

Purpose: Restore the natural landscape and biodiversity of the coast and to minimize, if not eliminate, future repeated financial losses and claims by coastal landowners and businesses residing in the identified flood area by purchasing these properties (from willing sellers only) through the state's Blue Acres land acquisition program.

Benefits: Provides financial incentive and/or compensation for those landowners whose properties and infrastructure have become too vulnerable to sea-level rise and the threat of severe storms while providing an opportunity for wildlife species to occupy previously unavailable habitat.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

7 Natural Systems Modifications

7.3 Other Ecosystem Modifications

7.3.1 Shoreline Stabilization

7.3.1.1 Efforts to stabilize barrier islands and shorelines, including jetties, groins, bulkheads, interfere with the natural geological processes needed to create and maintain high quality habitat for beach strand species.

11 Climate Change and Severe Weather

11.4 Storms and Flooding

11.4.1 Storms and flooding

Project 4. Climate Change Impacts to New Jersey Wildlife and Residents

- 11.4.1.1 Extreme storms and flooding events threaten aquatic and marine wildlife through habitat degradation and alteration, including alterations to off-shore or back-bay benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic and marine wildlife.
- 11.4.1.4 Flood events alter river or stream morphology, benthic conditions and habitat availability for wildlife, cause bank erosion, and deposit sediments in floodplain wetlands altering wildlife habitat.
- 11.4.1.6 Increased storms and flooding reduce nesting success, especially for ground-nesting birds.
- 11.4.1.7 Potentially damage coastal habitats, including beach and marsh habitats used by spawning horseshoe crabs, nesting diamondback terrapins, and resting and foraging birds.

11.4.2 Increased rainfall

- 11.4.2.3 More frequent rain events can alter terrestrial and wetland vegetation communities as well as wetland hydrology, shifting wildlife community use.

11.5 Sea-level Rise

11.5.0 Sea-level Rise

- 11.5.0.4 Increased erosion of beach, mudflat and marsh habitats critical for a number of coastal species to fulfill life history requirements.
- 11.5.0.6 Alters salinity conditions in back bays and tidal creeks, thereby impacting food availability, composition and abundance for wildlife.
- 11.5.0.7 Sea level rise exacerbates marsh loss caused by prior human manipulations (e.g., impoundments, grid-ditching) that reduced the elevation of the marsh.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

6 Land and Water Rights Acquisition and Protection

6.1 Land acquisition

6.1.1 Fee title

- 6.1.1.1 Use state, federal, and local land acquisition programs (e.g., Green Acres, Blue Acres, etc.) to acquire abandoned or failing bay shore communities and to relocate displaced people and infrastructure.

9 **Planning**

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

100 **Law and Policy**

100.3 State Regulations

100.3.2 State Land Acquisition Programs

- 100.3.2.1 Increase opportunities for habitat restoration by making any necessary policy changes to state, federal and local land acquisition programs (e.g., Green Acres, Blue Acres, etc.) to allow for acquisition within abandoned or failing bay shore communities, including mechanisms to relocate displaced people and infrastructure.

Job 4.04. Increase the Climate and Ecological Consciousness within New Jersey's Residents

Objective: Grow the constituency of NJ residents who have an elevated ecological and climate consciousness through the use of social media campaigns and widespread access to resources for training and education.

Purpose: Create an ecologically-knowledgeable and responsive residential population and engage them in wildlife conservation as it relates to climate change.

Benefits: An increased population of citizens armed with an understanding of climate change and the impacts it has on wildlife. This may lead to a reduction of threats on SGCN through the political activism of an informed citizenry.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats

- 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

4 Education

4.1 Educator/Instructor training

4.1.1 Aquatic resource education

- 4.1.1.1 Provide educational resources and training programs to teachers in aquatic resource education that includes information regarding climate change and sea-level rise for incorporation into the class curriculum and/or as the focus of school field trips.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.3 Develop an outreach team of personnel from government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

8.3.0.21 Develop an educational outreach program for the general public, in particular those within and adjacent to coastal and riparian areas on the realities of sea-level rise to help citizens living in these areas understand how this will affect them, how coastal stabilization negatively impacts wildlife by preventing natural processes, and how their decisions impact species.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

100 Law and Policy

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

100.4.0.2 Create a policy that requires the NJ DEP to incorporate scientific information regarding climate change and sea level rise (e.g., predictions, habitat management/acquisition efforts to enhance resilience to inundation) on their websites and to work with other government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.

Project 5. Barriers to Conservation Efforts

Job 5.01. Remove Barriers on Habitat Management through Data Sharing

Objective: Coordinate habitat management and enhancement efforts and planning within State Agencies by sharing plant and wildlife species distribution and habitat data.

Purpose: Provide a more comprehensive understanding of the State's important habitats for SGCN for planning and implementation of habitat management efforts.

Benefits: Increased collaboration and awareness of concerns among individually-charged resource protection or management agencies, resulting in a more holistic approach to habitat management and enhancement.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

12 Resource Management Needs

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform

- 12.4.0.1** A species-by-species management focus as opposed to ecological systems and biodiversity generally has greater opportunity for unintended consequences for other species and may be less efficient in developing appropriate management actions.

Conservation actions that address Threats and Action Drivers

Project 5. Barriers to Conservation Efforts

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

8.1.0.6 Engage government agencies, conservation partners and other stakeholders in discussions focused on sharing information regarding coastal and marine critical wildlife habitats, developing comprehensive mapping to assist in reducing impacts of energy production activities, and establishing a long-term monitoring program to update the data. Ensure this information is available to appropriate personnel for planning or response measures.

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

100.3.0.46 Investigate and/or develop inter-agency Memorandum of Agreements to share common data stored or managed in program-specific databases.

Job 5.02. Remove Regulatory Barriers on Habitat Enhancement Projects

Objective: Where appropriate, remove regulatory barriers for voluntarily implementing habitat creation and enhancement projects by updating the NJ DEP's permit process (e.g., allow projects to be completed under "Permit by Rule" rather than General permit or Individual Permits with associated administrative requirements, reduce or eliminate fees, etc.).

Purpose: Promote and support habitat enhancement efforts rather than deter those willing to do the work.

Benefits: Reduced administrative burden for both applicant(s) and regulatory program staff (spend less time on permit application paperwork/less time reviewing beneficial projects with de minimis impacts) that could promote increased voluntary project participation and make such projects more affordable for landowners.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

12 Resource Management Needs

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms

12.3.0.10 Land use regulatory processes pertaining to habitat creation, enhancement or restoration projects can be costly and/or burdensome, precluding or discouraging the development or implementation of conservation projects.

Conservation actions that address Threats and Action Drivers

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

100.3.0.43 Identify and address (amend) regulatory impediments to beneficial habitat management.

Project 6. Coastal and Shoreline Stabilization

Job 6.01. Responsive Shoreline Stabilization

Objective: Identify important areas where soft stabilization techniques should replace the use of hard structures to prevent or reduce negative impacts on threatened resources and ecosystems.

Purpose: Increase the use of soft stabilization techniques to enhance nesting habitat and remove hard structures to reduce the risk of impingement.

Benefits: Improved and/or enhanced use of habitats shaped by soft stabilization by diamondback terrapin and other near-shore coastal species.

Objective: Allow natural processes to take place in conserved coastal areas. Perform habitat management in areas where natural processes may be stymied by stabilization efforts.

Purpose: Restore and/or maintain the natural landscape and biodiversity of the coast.

Benefits: Increased opportunities for wildlife that depends upon natural processes to shape their environment.

Threats and Action Drivers associated with this conservation need

7 Natural Systems Modifications

7.3 Other Ecosystem Modifications

7.3.1 Shoreline Stabilization

7.3.1.3 Efforts to stabilize barrier islands and shorelines, including jetties, groins, and bulkheads, degrade foraging areas for migrating whales and sea turtles.

11 Climate Change and Severe Weather

11.1 Habitat Shifting or Alteration

11.1.0 Macro- and Micro-Climate Alterations

Project 6. Coastal and Shoreline Stabilization

- 11.1.0.1 Alters native terrestrial and aquatic habitats at the macro- and micro-climate levels that can affect suitability for wildlife, in particular specialist species.

11.4 Storms and Flooding

11.4.1 Storms and flooding

- 11.4.1.1 Extreme storms and flooding events threaten aquatic and marine wildlife through habitat degradation and alteration, including alterations to off-shore or back-bay benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic and marine wildlife.
- 11.4.1.2 Potentially damage coastal habitats, including beach- and marsh-nesting bird habitats and interdunal wetlands, and can increase marsh erosion.
- 11.4.1.3 Increase risk of saltwater intrusion to freshwater habitats altering the water chemistry and potentially altering aquatic wildlife community.
- 11.4.1.4 Flood events alter river or stream morphology, benthic conditions and habitat availability for wildlife, cause bank erosion, and deposit sediments in floodplain wetlands altering wildlife habitat.
- 11.4.1.5 Storm damage can alter forest structure via blow-downs or micro-bursts, and can destroy bird nesting in the locales where the storms occur.
- 11.4.1.6 Increased storms and flooding reduce nesting success, especially for ground-nesting birds.

11.4.2 Increased rainfall

- 11.4.2.1 Extreme rain events threaten aquatic wildlife through habitat degradation and alteration, including alterations to benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic wildlife.
- 11.4.2.2 Extreme rain events can damage wildlife nesting and resting habitats, including impacts to avian eggs and chick and small mammal survivorship.
- 11.4.2.3 More frequent rain events can alter terrestrial and wetland vegetation communities as well as wetland hydrology, shifting wildlife community use.

11.5 Sea-level Rise

11.5.0 Sea-level Rise

- 11.5.0.1 Contributes to the conversion of high salt marsh to low salt marsh, threatening species that depend on high marsh habitat and those dependent on the marsh-upland ecotone.
- 11.5.0.2 Increased risk of saltwater intrusion into freshwater systems impacting associated wildlife and native vegetation.

Project 6. Coastal and Shoreline Stabilization

- 11.5.0.3 Alters salinity conditions; increased salinity will alter and degrade aquatic ecosystems, threatening anadromous species by shifting normal breeding areas upstream into potentially unsuitable areas, and causing mortality to salt-intolerant mussels and other species by inundating areas of the lower Delaware River and tributaries.
- 11.5.0.4 Increased erosion of beach, mudflat and marsh habitats critical for a number of coastal species to fulfill life history requirements.
- 11.5.0.5 Sea-level rise will result in the conversion of some upland habitats to tidal marshes impacting the species that rely upon those upland areas.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

- 12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.2 Lack of up-to-date existing information

- 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.3 Secure and promote the protection/restoration of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through incentive programs.

2 Direct Management of Natural Resources

2.9 Living shorelines

Project 6. Coastal and Shoreline Stabilization

2.9.1 Beach renourishment

- 2.9.1.8 Minimize habitat loss of critical coastal beach habitats that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas through beach renourishment.
- 2.9.1.16 Prevent or ameliorate near-term impacts of climate change throughout the State but in particular within the coastal and Delaware Bay areas by implementing habitat management strategies that will establish/improve habitat resilience, such as beach renourishment, that benefits wildlife inhabiting these areas.

2.9.3 Sand dune restoration

- 2.9.3.1 Prevent or ameliorate near-term impacts of climate change throughout the State but in particular within the coastal and Delaware Bay areas by implementing habitat management strategies that will establish/improve habitat resilience, such as sand dune restoration, that benefits wildlife inhabiting these areas.
- 2.9.3.6 Minimize habitat loss of critical coastal dune habitats that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas through sand dune restoration.

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

- 2.10.0.1 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 2.10.0.10 Minimize the loss of important habitats (e.g., coastal scrub-shrub and grassy habitats, high and low marsh habitats, etc.) that provide nesting, migrating, and wintering areas for SGCN birds and other coastal and marsh-dependent species through habitat restoration efforts.

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.6 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 2.11.0.9 Minimize habitat loss of critical coastal habitats that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas through vegetation management.

2.12 Water management

Project 6. Coastal and Shoreline Stabilization

2.12.2 Diversion/headgate

2.12.2.1 Prevent or ameliorate near-term impacts of climate change throughout the State but in particular within the coastal and Delaware Bay areas by implementing habitat management strategies that will establish/improve habitat resilience, such as using diversions, that benefits wildlife inhabiting these areas.

2.12.3 Drainage

2.12.3.2 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) such as removing drainage ditches to restore natural stream flows and wetlands, that benefit wildlife inhabiting these areas.

2.12.3.7 Minimize habitat loss of critical coastal habitats that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas by removing drainage ditches.

2.12.6 Tide gate

2.12.6.1 Prevent or ameliorate near-term impacts of climate change throughout the State but in particular within the coastal and Delaware Bay areas by implementing habitat management strategies that will establish/improve habitat resilience, such as tide gates, that benefits wildlife inhabiting these areas.

2.12.7 Waterfowl impoundment maintenance

2.12.7.4 Prevent or ameliorate near-term impacts of climate change throughout the State but in particular within the coastal and Delaware Bay areas by implementing habitat management strategies that will establish/improve habitat resilience, such as impoundment management, that benefits wildlife inhabiting these areas.

2.12.7.9 Minimize habitat loss of critical coastal habitats in Delaware Bay that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas through impoundment management.

2.12.8 Watering facilities

2.12.8.1 Install water control structures to reduce the impact of excessive salt water flooding to particularly vulnerable high marsh habitats.

2.12.8.2 Manage water levels in impoundments to improve coastal marsh habitat availability to wildlife and improve resiliency of the marshes to sea level rise.

3 Data Collection and Analysis

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

3.3.1.16 Gather "best information" for spatial modeling and update/create a current model/depiction of anticipated habitat shifts from sea-level rise, flooding, etc.

Project 6. Coastal and Shoreline Stabilization

3.3.1.20 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) where invasive, non-indigenous plants and animals are either already established or are becoming established. Create a system for reporting and qualifying new locations of invasive species and for prioritizing areas for control measures according to the potential level of impact on the ecosystem and SGCN and the likelihood of success. Researchers and contractors encountering invasive plant species while performing plant and/or forest inventories on state or other conserved lands and/or private lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.

3.3.1.28 Identify key habitats for the potential allowance of natural coastal processes without interfering through shoreline stabilization, etc. and evaluate the risks and benefits if coastal migration was permitted to occur naturally. Create a GIS map of the identified areas; provide the assessment and mapping to local towns and other appropriate governing agencies.

3.3.2 Monitoring

3.3.2.20 Once a system is developed for reporting and qualifying new locations of invasive species, develop, implement and monitor/evaluate invasive species removal strategies at identified locations. Priority should be given to those areas critical to SGCN and/or contain unique and/or rare plant communities supporting SGCN and/or other fish/wildlife species.

3.3.2.22 Conduct short- and long-term monitoring of the current natural processes affecting sediment transport along the coast. Share findings with organizations/agencies attempting to design beach nourishment projects in a manner that will be beneficial to wildlife.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

6.0.0.5 Secure and protect critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

6.3 Conservation area designation

6.3.0 Conservation area designation strategies

6.3.0.5 Promote the protection of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through conservation area designations.

8 Outreach

8.1 Partner/stakeholder engagement

Project 6. Coastal and Shoreline Stabilization

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.6** Engage government agencies, conservation partners and other stakeholders in discussions focused on sharing information regarding coastal and marine critical wildlife habitats, developing comprehensive mapping to assist in reducing impacts of energy production activities, and establishing a long-term monitoring program to update the data. Ensure this information is available to appropriate personnel for planning or response measures.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21** Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

100 Law and Policy

100.1 Legislation

100.1.4 County and Local

- 100.1.4.8** Secure critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through local ordinances.

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.2** Improve policies/regulations aimed at protecting and preserving critical coastal and marsh habitats and securing mitigation for losses that create an environmental benefit.
- 100.3.0.7** Amend current policies and/or regulations to increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.
- 100.3.0.23** Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.59** Develop regulations that when implemented will increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.

Job 6.02. Enlightened Coastal Stabilization: Identify Focal Areas

Project 6. Coastal and Shoreline Stabilization

Objective: Identify the best extant habitats that have not yet been impacted or only minimally impacted by stabilization. Use these as a guide to prioritize the reduction of impacts to adjacent developed habitats and/or the associated hard structure stabilization projects.

Purpose: Minimize the impacts of stabilization projects on coastal SGCN and their habitats by identifying focal areas critical to their survival and success.

Benefits: Reduce the threat of unintended negative impacts from stabilization projects on critical habitats and identifies areas where guidance can be provided to towns and landowners regarding how soft and hard stabilization efforts might impact adjacent sensitive habitat.

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

Project 6. Coastal and Shoreline Stabilization

- 3.3.1.16 Gather "best information" for spatial modeling and update/create a current model/depiction of anticipated habitat shifts from sea-level rise, flooding, etc.
- 3.3.1.20 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) where invasive, non-indigenous plants and animals are either already established or are becoming established. Create a system for reporting and qualifying new locations of invasive species and for prioritizing areas for control measures according to the potential level of impact on the ecosystem and SGCN and the likelihood of success. Researchers and contractors encountering invasive plant species while performing plant and/or forest inventories on state or other conserved lands and/or private lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.3.1.28 Identify key habitats for the potential allowance of natural coastal processes without interfering through shoreline stabilization, etc. and evaluate the risks and benefits if coastal migration was permitted to occur naturally. Create a GIS map of the identified areas; provide the assessment and mapping to local towns and other appropriate governing agencies.
- 3.3.1.29 Identify coastal wildlife habitats unimpacted by development and/or at greatest risk of habitat loss to help guide enlightened coastal stabilization efforts (i.e., use of soft stabilization) to reduce the impacts on wildlife and their habitats.

8 **Outreach**

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.20 Organize a small focal group of government and non-government agencies/organizations responsible for decisions regarding beach/dune management to share and coordinate their goals so that comprehensive planning can attempt to meet all needs.

Job 6.03. Enlightened Coastal Stabilization: Sediment Transport Strategy

Objective: Design beach nourishment projects whose implementation takes into account the redistribution of sand, which can either feed or starve conservation areas for migratory and nesting shorebirds. Focus on areas identified through Job 6.2 by monitoring and assessing the current natural processes affecting sediment.

Purpose: Enhance and maintain critical habitat for nesting and migrant shorebirds by understanding and incorporating impacts of local currents and the long-shore transport of sediment from beach nourishments.

Benefits: Benefits include habitat improvements and sustaining natural resources critical for developing and maintaining habitat by harnessing the potential of projects that are unrelated to wildlife conservation as a primary goal.

Focal wildlife species benefitting from this job

Northern Diamondback Terrapin

Threats and Action Drivers associated with this conservation need

7 Natural Systems Modifications

7.3 Other Ecosystem Modifications

7.3.1 Shoreline Stabilization

- 7.3.1.1 Efforts to stabilize barrier islands and shorelines, including jetties, groins, bulkheads, interfere with the natural geological processes needed to create and maintain high quality habitat for beach strand species.

11 Climate Change and Severe Weather

11.5 Sea-level Rise

11.5.0 Sea-level Rise

- 11.5.0.4 Increased erosion of beach, mudflat and marsh habitats critical for a number of coastal species to fulfill life history requirements.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.2 Lack of up-to-date existing information

- 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms

- 12.3.0.7 Activities that threaten SGCN, their food sources, and/or habitats are often regulated separately and without consideration for the cumulative and synergistic effects over time or over a larger spatial scale. Therefore, regulations can fail to protect SGCN populations over time.

12.4 Internal Policy & Procedures Reform

Project 6. Coastal and Shoreline Stabilization

12.4.0 State Policy and Procedure Reform

- 12.4.0.6 Techniques for ecological management or restoration of shorelines are not fully developed or evaluated for effectiveness for target and non-target SGCN in coastal areas.

14 Education/ Outreach Needs

14.1 Education needs

- 14.1.1 Need for improved knowledge of fish and wildlife and their habitats

- 14.1.1.2 Lack of general knowledge of SGCN life histories and vulnerabilities as they relate to land management practices.

Conservation actions that address Threats and Action Drivers

3 Data Collection and Analysis

- 3.3 Research, survey or monitoring - habitat

3.3.2 Monitoring

- 3.3.2.22 Conduct short- and long-term monitoring of the current natural processes affecting sediment transport along the coast. Share findings with organizations/agencies attempting to design beach nourishment projects in a manner that will be beneficial to wildlife.

8 Outreach

- 8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.20 Organize a small focal group of government and non-government agencies/organizations responsible for decisions regarding beach/dune management to share and coordinate their goals so that comprehensive planning can attempt to meet all needs.

9 Planning

- 9.3 Species and habitat management planning

9.3.3 Habitat management planning

- 9.3.3.13 Develop a management plan that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas and prevents or ameliorates near-term impacts of climate change throughout the State, but in particular within the coastal and Delaware Bay areas.

100 Law and Policy

- 100.4 State Agency Policy Integration

- 100.4.0 Policy initiatives for species and habitat protection

Project 6. Coastal and Shoreline Stabilization

100.4.0.25 Develop policies that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

Job 6.04. Enlightened Coastal Stabilization: The Benefits of Soft Structures over Hard Structures

Objective: Educate coastal municipalities and residents to promote an understanding of the benefits of soft structures over hard structures through teaching materials to be used in conservation centers and classrooms, and by creating and installing information signs at targeted beach areas.

Purpose: Minimize impacts on wildlife and their nesting habitats by encouraging the use of soft stabilization structures over hard structures.

Benefits: Investment in structures that can help ameliorate the impacts of climate change and sea level rise while allowing flexibility to adjust to constantly changing environmental conditions and reducing impacts to wildlife.

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats

14.1.1.2 Lack of general knowledge of SGCN life histories and vulnerabilities as they relate to land management practices.

Conservation actions that address Threats and Action Drivers

8 Outreach

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

8.3.0.23 Develop an educational outreach program for coastal municipalities and residents to promote an understanding of the benefits of soft structures over hard structures for shoreline stabilization.

11 Technical Assistance

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

11.2.0.27 Provide educational resources and presentations to coastal municipalities and residents to promote the understanding of the benefits of soft structures over hard structures for shoreline stabilization.

Project 7. Unify Coastal Landowners on Beach and Dune Management and Shoreline Stabilization Practices

Job 7.01. We're all in this together!

Objective: Develop model guidelines for managing beach and dune communities through cooperative efforts led by professionals. These can be created by engaging in a dialogue with beach-owning entities (public and private landowners) and organizing a focal group of a small number of decision-makers from the appropriate land-holdings to provide input.

Purpose: Enhance the creation and long-term persistence of habitats required for coastal species and minimize risks to successful nesting, such as human disturbance and predation.

Benefits: A consistent and effective approach with specific and focused prescriptions applied across the coastal landscape will protect and enhance wildlife associated with this system.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

6 Human Intrusions and Disturbance

6.3 Work and Other Activities

6.3.3 Other "work" unrelated to research

6.3.3.2 Intensive dune and beach management (including overuse of dune fencing, sand mining, mechanical beach raking, storm clean up), reduces foraging habitat for beach nesting and migratory shorebirds, and poses risks of injury and mortality to unfledged chicks.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

- 12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

14 Education/ Outreach Needs

14.1 Education needs

- 14.1.1 Need for improved knowledge of fish and wildlife and their habitats

- 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.

15 Administrative Needs

15.2 Organizational/program planning needs

- 15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.3 Secure and promote the protection/restoration of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through incentive programs.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.20 Organize a small focal group of government and non-government agencies/organizations responsible for decisions regarding beach/dune management to share and coordinate their goals so that comprehensive planning can attempt to meet all needs.
 - 8.1.0.41 Engage beach-owning entities (e.g., government, non-government and non-profit organizations, and landowners) in a constructive dialogue to develop guidelines for management of beach/dune communities and to ensure that each group is educated and aware of the needs of the other groups.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

9.3.3 Habitat management planning

9.3.3.3 Integrate best management practices (BMPs) regarding dune and beach management into beach nesting bird management agreements with government agencies (and private landowners where necessary).

9.3.3.25 Develop a habitat management plan focused on areas important to near-shore, coastal species (e.g., herring, sturgeon, terrapin, nesting birds) that prioritizes these areas to direct resources to minimize the impacts of sea-level rise, flooding and storms (including extreme rain events) such as increased erosion of beach, mudflat and marsh habitats, and the increased risk of saltwater intrusion into freshwater habitats. Gather "best information" for spatial modeling of anticipated habitat shifts from sea-level rise, flooding, etc.

11 **Technical Assistance**

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

11.2.0.20 Provide educational resources and technical support to public and private landowners and land managers to promote the protection and/or enhancement of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN.

100 **Law and Policy**

100.1 Legislation

100.1.4 County and Local

100.1.4.8 Secure critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through local ordinances.

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

100.3.0.7 Amend current policies and/or regulations to increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.

Project 7. Unify Coastal Landowners on Beach and Dune Management and Shoreline Stabilization Practices

100.3.0.59 Develop regulations that when implemented will increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.

Project 8. Coastal Marsh Migration

Job 8.01. Where can they go?

Objective: Identify areas that allow for coastal marsh migration to counteract the impacts of sea level rise.

Purpose: Create resiliency for coastal marsh habitats in the face of sea level rise.

Benefits: Providing a path for marsh migration will ensure their continued presence as an important and viable landscape feature of the coastal zone.

Threats and Action Drivers associated with this conservation need

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

- 12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.
- 12.1.1.4 Lack of information on the morphometrics and trends of coastal salt marshes and salt marsh islands.

12.1.2 Lack of up-to-date existing information

Project 8. Coastal Marsh Migration

- 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

3 Data Collection and Analysis

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

- 3.3.1.1 Conduct habitat assessments of significant natural and/or unique communities to Identify threats to native terrestrial and aquatic habitats through systematic monitoring, review of available data, enlistment of habitat management and/or species experts, etc. Incorporate findings into a database that includes descriptions/qualifiers of the habitats, identifies and values/qualifies the threats, and includes a GIS component of the locations of the assessed areas. Share this information with landowners/managers (e.g., federal, state and local government agencies or non-government organization).
- 3.3.1.3 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) remaining high and low marsh habitats with natural buffers and stable water levels that provide suitable habitat for SGCN and marsh habitats that would benefit from restoration. Conduct research to assess their condition for nesting, migrating and wintering birds.
- 3.3.1.23 Identify areas (through surveys/studies, predictive modeling, review of available data, enlistment of habitat management and/or species experts, etc.) where the State can allow coastal marsh migration due to sea level rise, and target these areas for land acquisition and/or land management to accommodate this transition. Targeted areas should include underdeveloped areas adjacent to unprotected coastal marshes.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

Job 8.02. Preparing for Wildlife Shifts

Objective: Acquire, protect and/or manage upland and transitional habitats adjacent to coastal marshes to accommodate marsh migration as a result of sea level rise.

Purpose: Create resiliency of coastal marsh habitats in the face of sea level rise.

Benefits: Salt marshes will persist if given space to naturally migrate, allowing them to continue to provide the myriad of benefits they offer to wildlife and society (nesting and foraging habitat, carbon sequestration and storage, flood protection, etc.).

Focal wildlife species benefitting from this job

Atlantic Green Turtle	Atlantic Leatherback	Atlantic Loggerhead
Atlantic Ridley	Northern Diamondback Terrapin	

Threats and Action Drivers associated with this conservation need

2 Agriculture and Aquaculture

2.1 Annual and Perennial Crops (non-timber)

2.1.1 Shifting Agriculture

- 2.1.1.4 Salt hay farming on Delaware Bay marshes, and the subsequent conversion of those farms to fully tidal marshes, results in compressed sediments that are less resilient to coastal forces of erosion and sea level rise.

7 Natural Systems Modifications

7.3 Other Ecosystem Modifications

7.3.5 Poor habitat management

Project 8. Coastal Marsh Migration

- 7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.
- 7.3.5.16 Lack of proactive management to preserve or maintain viable and functioning marshes for SGCN wildlife.

11 Climate Change and Severe Weather

11.5 Sea-level Rise

11.5.0 Sea-level Rise

- 11.5.0.1 Contributes to the conversion of high salt marsh to low salt marsh, threatening species that depend on high marsh habitat and those dependent on the marsh-upland ecotone.
- 11.5.0.2 Increased risk of saltwater intrusion into freshwater systems impacting associated wildlife and native vegetation.
- 11.5.0.3 Alters salinity conditions; increased salinity will alter and degrade aquatic ecosystems, threatening anadromous species by shifting normal breeding areas upstream into potentially unsuitable areas, and causing mortality to salt-intolerant mussels and other species by inundating areas of the lower Delaware River and tributaries.
- 11.5.0.4 Increased erosion of beach, mudflat and marsh habitats critical for a number of coastal species to fulfill life history requirements.
- 11.5.0.7 Sea level rise exacerbates marsh loss caused by prior human manipulations (e.g., impoundments, grid-ditching) that reduced the elevation of the marsh.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.44 Manage phragmites adjacent to coastal marshes of interest, in particular those that are within underdeveloped areas and are unprotected, through herbicide application and water management to improve resiliency of the marshes to sea level rise.

3 Data Collection and Analysis

Project 8. Coastal Marsh Migration

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

3.3.1.3 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) remaining high and low marsh habitats with natural buffers and stable water levels that provide suitable habitat for SGCN and marsh habitats that would benefit from restoration. Conduct research to assess their condition for nesting, migrating and wintering birds.

3.3.1.23 Identify areas (through surveys/studies, predictive modeling, review of available data, enlistment of habitat management and/or species experts, etc.) where the State can allow coastal marsh migration due to sea level rise, and target these areas for land acquisition and/or land management to accommodate this transition. Targeted areas should include underdeveloped areas adjacent to unprotected coastal marshes.

3.5 Techniques development

3.5.3 Habitat restoration methods

3.5.3.4 Modify best management practices of Open Marsh Water Management based on evaluation of the effectiveness and potential impacts of marsh management techniques on wildlife species, in particular high marsh nesting birds and waterfowl.

3.5.3.17 Investigate and improve marsh management techniques to benefit critical wildlife species, in particular high marsh nesting birds and waterfowl.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

6.0.0.5 Secure and protect critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

6.3 Conservation area designation

6.3.0 Conservation area designation strategies

6.3.0.5 Promote the protection of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through conservation area designations.

6.4 Private lands agreements

6.4.0 Private land agreement strategies

6.4.0.1 Enter into private lands agreements to expand control burns on private lands, in particular those adjacent to conserved lands to improve SGCN habitats.

9 **Planning**

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

9.3.3 Habitat management planning

9.3.3.25 Develop a habitat management plan focused on areas important to near-shore, coastal species (e.g., herring, sturgeon, terrapin, nesting birds) that prioritizes these areas to direct resources to minimize the impacts of sea-level rise, flooding and storms (including extreme rain events) such as increased erosion of beach, mudflat and marsh habitats, and the increased risk of saltwater intrusion into freshwater habitats. Gather "best information" for spatial modeling of anticipated habitat shifts from sea-level rise, flooding, etc.

Project 9. Marsh Habitats in Trouble

Job 9.01. Today's Marsh Islands in Tomorrow's Higher Seas

Objective: Comprehensively survey all current marsh islands and, along with available historical data, plan for conservation management approaches that may include marsh restoration using thin-layer application, or leaving to become submerged, shallow water habitat.

Purpose: Gather necessary information for planning efforts to manage impacts on marsh island-associated SGCN and their habitats.

Benefits: Habitat improvement and maintenance for coastal marsh wildlife, with secondary benefits to wildlife-related recreation.

Focal wildlife species benefitting from this job

Birds

American Oystercatcher	Black Rail	Black Skimmer
Common Tern	Forster's Tern	Least Tern
Little Blue Heron	Northern Harrier	Peregrine Falcon

Threats and Action Drivers associated with this conservation need

11 Climate Change and Severe Weather

11.5 Sea-level Rise

11.5.0 Sea-level Rise

11.5.0.1 Contributes to the conversion of high salt marsh to low salt marsh, threatening species that depend on high marsh habitat and those dependent on the marsh-upland ecotone.

11.5.0.4 Increased erosion of beach, mudflat and marsh habitats critical for a number of coastal species to fulfill life history requirements.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

Project 9. Marsh Habitats in Trouble

12.1.1.4 Lack of information on the morphometrics and trends of coastal salt marshes and salt marsh islands.

12.1.1.5 Lack of information regarding the SGCN populations that use managed salt marshes and the best techniques for making improvements for marsh-dependent SGCN wildlife.

12.1.2 Lack of up-to-date existing information

12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

3 Data Collection and Analysis

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

3.3.1.21 Conduct comprehensive baseline surveys of all marsh islands; surveys to include, but are not limited to, documented elevations, and assessments of the habitat's current condition and vulnerability of dependent SGCN species in relation to the increased inundation rate.

3.3.2 Monitoring

3.3.2.19 Once baseline data on the marsh islands' and associated SGCN species' vulnerability to inundation is completed, continue to conduct long-term monitoring the islands to determine sustainability for wildlife dependent on these areas.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

9.3.3 Habitat management planning

Project 9. Marsh Habitats in Trouble

- 9.3.3.31 Using data from baseline inventory and monitoring of all current marsh islands and their vulnerability to inundation as a result of sea level rise, create a plan to delineate each island's ideal fit for habitat management (e.g., restoration, hasting, dredging). Planning will factor in criteria to designate which islands should be maintained or restored, and which will be passively allowed to submerge.

Job 9.02. High Marsh Island Creation and Management

Objective: Provide suitable marsh island habitat (i.e., above normal tidal flooding and not connected to the mainland where upland ground predators are a threat) for nesting and loafing marsh species dependent on high marsh areas.

Purpose: Combat coastal flooding and the long term loss of high marsh habitat as a result of sea level rise.

Benefits: Improved nesting occupancy and success by high marsh birds due to maintained habitat, lower flood vulnerability and lower predation.

Focal wildlife species benefitting from this job

Birds

Black Rail

Northern Harrier

Reptiles & Amphibians

Northern Diamondback Terrapin

Threats and Action Drivers associated with this conservation need

2 Agriculture and Aquaculture

2.1 Annual and Perennial Crops (non-timber)

2.1.1 Shifting Agriculture

2.1.1.2 Conversion, and subsequent loss, of high salt marsh to low salt marsh threatens high-marsh dependent species and those dependent on the marsh-upland ecotone.

2.1.2 Small-holder Farming

2.1.2.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.3 Agro-industry

2.1.3.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

7 Natural Systems Modifications

7.3 Other Ecosystem Modifications

7.3.5 Poor habitat management

Project 9. Marsh Habitats in Trouble

- 7.3.5.16 Lack of proactive management to preserve or maintain viable and functioning marshes for SGCN wildlife.

11 Climate Change and Severe Weather

11.4 Storms and Flooding

11.4.1 Storms and flooding

- 11.4.1.7 Potentially damage coastal habitats, including beach and marsh habitats used by spawning horseshoe crabs, nesting diamondback terrapins, and resting and foraging birds.

11.5 Sea-level Rise

11.5.0 Sea-level Rise

- 11.5.0.1 Contributes to the conversion of high salt marsh to low salt marsh, threatening species that depend on high marsh habitat and those dependent on the marsh-upland ecotone.
- 11.5.0.2 Increased risk of saltwater intrusion into freshwater systems impacting associated wildlife and native vegetation.
- 11.5.0.3 Alters salinity conditions; increased salinity will alter and degrade aquatic ecosystems, threatening anadromous species by shifting normal breeding areas upstream into potentially unsuitable areas, and causing mortality to salt-intolerant mussels and other species by inundating areas of the lower Delaware River and tributaries.
- 11.5.0.4 Increased erosion of beach, mudflat and marsh habitats critical for a number of coastal species to fulfill life history requirements.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.4 Need to develop new technique

- 12.1.4.3 Lack of techniques for high marsh preservation that includes impoundments and elevated islands.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform

- 12.4.0.6 Techniques for ecological management or restoration of shorelines are not fully developed or evaluated for effectiveness for target and non-target SGCN in coastal areas.

15 Administrative Needs

15.2 Organizational/program planning needs

- 15.2.3 Need for multi-state, regional and landscape scale planning

Project 9. Marsh Habitats in Trouble

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.1 Create new habitat or natural processes

2.1.1 Habitat conversion

- 2.1.1.1 Create high marsh habitat through impoundments and diking of low marsh areas that are less susceptible to breaching by storms and sea-level rise.

2.9 Living shorelines

2.9.2 Erosion control structures

- 2.9.2.1 Install breakwaters in the form of living shorelines to reduce the impact of wave erosion while preserving the natural character of the site.

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

- 2.10.0.1 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.9 Minimize habitat loss of critical coastal habitats that provide nesting, migrating, and wintering areas for birds and other coastal species by maintaining or enhancing these areas through vegetation management.
- 2.11.0.16 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 2.11.0.22 Minimize habitat loss of high and low marsh habitats that provide nesting, migrating and wintering areas for SGCM birds and other marsh-dependent SGCM by maintaining or enhancing these areas through habitat management and/or revegetation or restoration efforts.

2.12 Water management

Project 9. Marsh Habitats in Trouble

2.12.7 Waterfowl impoundment maintenance

2.12.7.11 Restore existing salt hay farm areas by repairing breaches in impoundments to create habitat for high marsh nesting species and waterfowl.

2.12.8 Watering facilities

2.12.8.1 Install water control structures to reduce the impact of excessive salt water flooding to particularly vulnerable high marsh habitats.

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

3.0.0.16 Develop a baseline status (through studies and assessments, review of available data, enlistment of species experts, etc.) of marsh- and beach-dependent SGCN (and their habitats) whose populations may be impaired due to habitat degradation as a result of salt hay farm/dike abandonment.

3.0.0.17 Conduct long-term monitoring of marsh- and beach-dependent SGCN (and their habitats) to evaluate the effectiveness of the management strategies implemented to repair degraded marshes and beaches damaged by salt hay farm/dike abandonment within all bay shore areas.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

6.0.0.5 Secure and protect critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

6.3 Conservation area designation

6.3.0 Conservation area designation strategies

6.3.0.5 Promote the protection of critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through conservation area designations.

6.4 Private lands agreements

6.4.0 Private land agreement strategies

6.4.0.1 Enter into private lands agreements to expand control burns on private lands, in particular those adjacent to conserved lands to improve SGCN habitats.

9 Planning

9.3 Species and habitat management planning

Project 9. Marsh Habitats in Trouble

9.3.1 Species management planning

9.3.1.17 Evaluate the potential benefits to high marsh species (such as Black Rail and Northern Harrier) by restoring salt hay farms along Delaware Bay.

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

9.3.3 Habitat management planning

9.3.3.33 Evaluate the potential benefits to increasing high marsh habitat by restoring salt hay farms along Delaware Bay.

Job 9.03. Marsh Platform and Edge Protection

Objective: Immediately initiate a stabilization and restoration program that stabilizes the salt marsh platform and edge, and to provides sediment enrichment to a sediment-starved system.

Purpose: Address the loss of salt marsh due to erosion as a result of sea level rise.

Benefits: Protect and improve declining salt marsh habitats.

Focal wildlife species benefitting from this job

Birds

American Oystercatcher	Black Rail	Black Skimmer
Common Tern	Forster's Tern	Least Tern
Little Blue Heron	Northern Harrier	Red Knot
Ruddy Turnstone	Snowy Egret	Tricolored Heron

Fish

Alewife	Blueback Herring
---------	------------------

Reptiles & Amphibians

Northern Diamondback Terrapin

Threats and Action Drivers associated with this conservation need

11 Climate Change and Severe Weather

11.5 Sea-level Rise

11.5.0 Sea-level Rise

11.5.0.1 Contributes to the conversion of high salt marsh to low salt marsh, threatening species that depend on high marsh habitat and those dependent on the marsh-upland ecotone.

Project 9. Marsh Habitats in Trouble

- 11.5.0.4 Increased erosion of beach, mudflat and marsh habitats critical for a number of coastal species to fulfill life history requirements.

12 Resource Management Needs

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform

- 12.4.0.6 Techniques for ecological management or restoration of shorelines are not fully developed or evaluated for effectiveness for target and non-target SGCM in coastal areas.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.1 Create new habitat or natural processes

2.1.1 Habitat conversion

- 2.1.1.2 Utilize dredged materials to create marsh islands to provide nesting habitat for birds and marine turtles.

2.9 Living shorelines

2.9.2 Erosion control structures

- 2.9.2.1 Install breakwaters in the form of living shorelines to reduce the impact of wave erosion while preserving the natural character of the site.

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.46 Implement sediment augmentation techniques on tidal salt marshes to offset marsh subsidence and effects of sea level rise, and to stabilize tidal marsh ecosystem.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

Project 9. Marsh Habitats in Trouble

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

Job 9.04. Restoration of Grid-ditched Marshes

Objective: Increase acreage and function of high marsh habitat in suitable locations by restoring marshes that were historically grid-ditched to change drainage.

Purpose: Counter the effects of historic ditching that changed marsh drainage patterns, and restore high marsh and low marsh function.

Benefits: Increased nesting and foraging habitat for marsh birds; improved nesting success in a natural and functional marsh system.

Focal wildlife species benefitting from this job

Birds

Black Rail

Northern Harrier

Reptiles & Amphibians

Northern Diamondback Terrapin

Threats and Action Drivers associated with this conservation need

7 Natural Systems Modifications

7.3 Other Ecosystem Modifications

7.3.5 Poor habitat management

- 7.3.5.10 Ditching, draining and filling of marshes and wetlands eliminates habitat and degrades the remaining surrounding areas for wildlife.

11 Climate Change and Severe Weather

11.5 Sea-level Rise

11.5.0 Sea-level Rise

- 11.5.0.4 Increased erosion of beach, mudflat and marsh habitats critical for a number of coastal species to fulfill life history requirements.

- 11.5.0.7 Sea level rise exacerbates marsh loss caused by prior human manipulations (e.g., impoundments, grid-ditching) that reduced the elevation of the marsh.

12 Resource Management Needs

12.1 Resource information collection needs

- 12.1.1 Lack of initial baseline inventory

Project 9. Marsh Habitats in Trouble

12.1.1.5 Lack of information regarding the SGCN populations that use managed salt marshes and the best techniques for making improvements for marsh-dependent SGCN wildlife.

12.1.2 Lack of up-to-date existing information

12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

2.11.0.46 Implement sediment augmentation techniques on tidal salt marshes to offset marsh subsidence and effects of sea level rise, and to stabilize tidal marsh ecosystem.

3 Data Collection and Analysis

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

3.3.1.3 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) remaining high and low marsh habitats with natural buffers and stable water levels that provide suitable habitat for SGCN and marsh habitats that would benefit from restoration. Conduct research to assess their condition for nesting, migrating and wintering birds.

3.3.2 Monitoring

3.3.2.6 Investigate the effectiveness and potential impacts of marsh management techniques by studying the effects of Open Marsh Water Management on wildlife species, in particular high marsh nesting birds and waterfowl. Evaluate best management practices as appropriate.

Job 9.05. The Open Marsh Water Management Tweak

Objective: Refine/revise the current Open Marsh Water Management to develop a marsh restoration plan that meets both mosquito concerns (i.e., the elimination of excessive levels of mosquito breeding) and marsh restoration needs (i.e., restoring proper salt marsh functions) using more recent management data.

Purpose: Provide suitable salt marsh habitat for wildlife while benefitting NJ residents and visitors.

Benefits: Improved salt marsh function reduces or eliminates the need for chemical control of mosquitoes, and builds trust with mosquito control agencies and the conservation community.

Focal wildlife species benefitting from this job

Northern Diamondback Terrapin

Threats and Action Drivers associated with this conservation need

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

12.1.1.5 Lack of information regarding the SGCN populations that use managed salt marshes and the best techniques for making improvements for marsh-dependent SGCN wildlife.

12.1.2 Lack of up-to-date existing information

12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

12.1.4 Need to develop new technique

12.1.4.4 Lack of consideration of habitat management opportunities in the course of salt marsh management for mosquito control.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

3.0.0.16 Develop a baseline status (through studies and assessments, review of available data, enlistment of species experts, etc.) of marsh- and beach-dependent SGCN (and their habitats) whose populations may be impaired due to habitat degradation as a result of salt hay farm/dike abandonment.

3.0.0.17 Conduct long-term monitoring of marsh- and beach-dependent SGCN (and their habitats) to evaluate the effectiveness of the management strategies implemented to repair degraded marshes and beaches damaged by salt hay farm/dike abandonment within all bay shore areas.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

3.2.0.20 Evaluate the effectiveness of BMPs for mosquito control methods that may produce benefits for coastal marsh dependent SGCN wildlife, including but not limited to high-marsh nesting birds and migrating shorebirds and landbirds.

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

3.3.1.3 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) remaining high and low marsh habitats with natural buffers and stable water levels that provide suitable habitat for SGCN and marsh habitats that would benefit from restoration. Conduct research to assess their condition for nesting, migrating and wintering birds.

3.5 Techniques development

3.5.3 Habitat restoration methods

3.5.3.4 Modify best management practices of Open Marsh Water Management based on evaluation of the effectiveness and potential impacts of marsh management techniques on wildlife species, in particular high marsh nesting birds and waterfowl.

3.5.3.17 Investigate and improve marsh management techniques to benefit critical wildlife species, in particular high marsh nesting birds and waterfowl.

3.5.3.18 Develop recommendations to improve methods on land use practices such as ditching, impounding, dredging, open marsh water management, burning, and marsh restoration based on potential impacts on marsh-dependent SGCN.

3.5.4 Fish and wildlife research, survey and management techniques

3.5.4.3 Investigate alternative saltmarsh mosquito control methods that may produce benefits for coastal marsh dependent SGCN wildlife, including but not limited to high-marsh nesting birds and migrating shorebirds and landbirds.

Project 9. Marsh Habitats in Trouble

9 **Planning**

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

Job 9.06. Impoundment Restoration Management

Objective: To improve habitat availability for focal bird species and their resiliency to the impacts of sea level rise by managing water levels in impoundments.

Purpose: To reduce the risk of habitat loss for shorebirds, wading birds, and other waterbirds as a result of and/or during storms and sea level rise.

Benefits: Habitat improvement, increased habitat predictability and availability.

Focal wildlife species benefitting from this job

American Oystercatcher	Black Rail	Black Skimmer
Common Tern	Forster's Tern	Least Tern
Little Blue Heron	Northern Harrier	Red Knot
Ruddy Turnstone	Snowy Egret	Tricolored Heron

Threats and Action Drivers associated with this conservation need

11 Climate Change and Severe Weather

11.5 Sea-level Rise

11.5.0 Sea-level Rise

11.5.0.1 Contributes to the conversion of high salt marsh to low salt marsh, threatening species that depend on high marsh habitat and those dependent on the marsh-upland ecotone.

11.5.0.4 Increased erosion of beach, mudflat and marsh habitats critical for a number of coastal species to fulfill life history requirements.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.12 Water management

2.12.8 Watering facilities

2.12.8.2 Manage water levels in impoundments to improve coastal marsh habitat availability to wildlife and improve resiliency of the marshes to sea level rise.

Project 10. Best Management Practices (BMPs) to Benefit SGCN and their Habitats

Job 10.01. Focal Species and Species Guilds

Objective: Increase the statewide use of BMPs for focal SGCN by developing and providing easy reference guidance materials for landowners and existing and potential land managers, in particular forest managers.

Purpose: Improve SGCN habitats statewide, in particular for forest-associated species.

Benefits: Creation and enhancement of habitats for SGCN focal species can increase survivorship and fecundity of these species and help stabilize or reverse population declines.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats

- 14.1.1.3 Lack of understanding of the need to manage both natural and anthropogenic (e.g., yards, lawns, hayfields, etc.) habitats to minimize impacts or increase benefits to SGCN and their habitats.**

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.13 Wildlife damage management

2.13.0 Nuisance fish and wildlife damage

- 2.13.0.1 Investigate the impacts of mosquito control methods on predator SGCN (bats, insectivorous birds). Develop, implement and evaluate the effectiveness of mosquito control-BMPs designed to avoid depletion or contamination of SGCN's insect prey base and drinking sources with pyrethroids, organophosphates, or other chemicals.
- 2.13.0.2 Develop, implement and evaluate the effectiveness of BMPs for mosquito control methods that may produce benefits for coastal marsh dependent SGCN wildlife, including but not limited to high-marsh nesting birds and migrating shorebirds and landbirds.

3 Data Collection and Analysis

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.24 Develop, implement and evaluate the effectiveness of BMPs for lighting of/on tall structures that minimize harm to and/or disorient wildlife, in particular but not limited to migratory birds, bats and invertebrates. Implement BMPs into state, county and local permitting processes.

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.8 Develop best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

3.5.4 Fish and wildlife research, survey and management techniques

- 3.5.4.10 Develop BMPs for lighting of/on tall structures that minimize harm to and/or disorientation of wildlife, in particular but not limited to migratory birds, bats and invertebrates.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

9.3.3 Habitat management planning

9.3.3.6 Develop a management plan for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

Job 10.02. Forest Health

Objective: Improve forest sustainability and resilience to invasive and abundant pests by developing BMPs that promote managing for age structure and composition, and making this information available to public and private landowners for implementation.

Purpose: Manage more lands for healthy forests to benefit forest species and improve their chances to persist.

Benefits: Healthy forest that can transition with changing conditions and insects.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

5 Biological Resource Use

5.3 Logging and Wood Harvesting

5.3.1 Intentional Use (subsistence/small scale)

- 5.3.1.1 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may fragment their terrestrial habitats.
- 5.3.1.2 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may cause the loss, alteration and/or degradation of wildlife habitat.
- 5.3.1.3 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase soil erosion, impacting SGCN habitats.
- 5.3.1.4 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase the risk of invasive species establishment, impacting SGCN habitats.
- 5.3.1.5 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may decrease structural diversity and biomass leading to reduced biodiversity and ecological integrity.
- 5.3.1.6 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices in Atlantic White Cedar stands may destroy a unique wildlife wetland habitat that is difficult, and takes time, to restore.

Project 10. Best Management Practices (BMPs) to Benefit SGCN and their Habitats

5.3.2 Intentional Use (large scale)

- 5.3.2.1 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may fragment their terrestrial habitats.
- 5.3.2.2 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may cause the loss, alteration and/or degradation of wildlife habitat.
- 5.3.2.3 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase soil erosion, impacting SGCN habitats.
- 5.3.2.4 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase the risk of invasive species establishment, impacting SGCN habitats.
- 5.3.2.5 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may decrease structural diversity and biomass leading to reduced biodiversity and ecological integrity.
- 5.3.2.6 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices in Atlantic White Cedar stands may destroy a unique wildlife wetland habitat that is difficult, and takes time, to restore.

5.3.3 Unintentional effects (subsistence/small scale)

- 5.3.3.1 Direct mortality of wildlife, direct loss of suitable habitats (roost, foraging, shelter, etc.), and can disrupt sensitive species, decreasing the likelihood of success and/or reproduction.
- 5.3.3.2 Poorly planned/implemented tree harvesting adjacent to waterways and vernal pools can lead to increased water temperatures, soil erosion and sedimentation, and reduces the potential for woody debris within the aquatic system, leading to negative impacts on wildlife.

5.3.4 Unintentional effects (large scale)

- 5.3.4.1 Direct mortality of wildlife, direct loss of suitable habitats (roost, foraging, shelter, etc.), and can disrupt sensitive species, decreasing the likelihood of success and/or reproduction.
- 5.3.4.2 Extensive infrastructure and larger equipment requirements present a potential risk of direct injury/mortality to wildlife.
- 5.3.4.3 Poorly planned/implemented tree harvesting adjacent to waterways and vernal pools can lead to increased water temperatures, soil erosion and sedimentation, and reduces the potential for woody debris within the aquatic system, leading to negative impacts on wildlife.
- 5.3.4.4 Infrastructure and/or equipment use may result in subtle changes to drainage patterns, adversely affecting vernal pool and wetland hydrology.

- 5.3.4.5 Lack of appropriate, sustainable forest management can lead to a decrease in forest habitat diversity, degraded habitat for many forest species, the loss of habitat for early-successional species, and/or the loss of unique habitats for species that need canopy breaks and multi-aged tree composition to fulfill various life history requirements.

7 Natural Systems Modifications

7.3 Other Ecosystem Modifications

7.3.5 Poor habitat management

- 7.3.5.5 Habitat management that alters or removes vegetation without implementing long-term management increases the risk of invasive and exotic plants establishing themselves, outcompeting native vegetation.
 - 7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.43 Manage forests to increase variation in age structure and composition using BMPs that promote and maintain functioning ecological forest-based systems and biological diversity.

3 Data Collection and Analysis

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.8 Develop best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

9 **Planning**

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

9.3.3 Habitat management planning

9.3.3.6 Develop a management plan for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

Job 10.03. Scrub-shrub and Young Forest Habitat Management

Objective: Develop and/or revise species-specific best management practices (BMPs) to create site-appropriate BMPs (i.e., for use in specific areas such as rights-of-way, agricultural lands, forested lands, etc.) for scrub-shrub and young forest habitats and make them available to public and private land managers for implementation.

Purpose: Manage more lands using site-appropriate scrub-shrub and young forest BMPs to benefit these species and improve their chances to persist.

Benefits: Creation and enhancement of scrub-shrub and young forest habitats can increase survivorship and fecundity of SGCN and help stabilize or reverse population declines.

Threats and Action Drivers associated with this conservation need

2 Agriculture and Aquaculture

2.1 Annual and Perennial Crops (non-timber)

2.1.1 Shifting Agriculture

2.1.1.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.2 Small-holder Farming

2.1.2.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.2.2 Fragments terrestrial and aquatic habitats.

2.1.2.3 Agricultural practices (e.g., mechanized, row-crop agriculture) can render lands unsuitable for most wildlife due to soil degradation and erosion and can cause direct mortality to wildlife when harvesting takes places.

Project 10. Best Management Practices (BMPs) to Benefit SGCN and their Habitats

2.1.3 Agro-industry

- 2.1.3.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.
- 2.1.3.2 Fragments terrestrial and aquatic habitats.
- 2.1.3.3 Agricultural practices (e.g., mechanized, row-crop agriculture) can render lands unsuitable for most wildlife due to soil degradation and erosion and can cause direct mortality to wildlife when harvesting takes places.

2.2 Wood and Pulp Plantations

2.2.1 Small Holder

- 2.2.1.3 Improper design or restoration of skid roads may result in ponded areas that serve as habitat sinks for amphibians.

2.2.2 Agro-industry Plantations

- 2.2.2.3 Improper design or restoration of skid roads may result in ponded areas that serve as habitat sinks for amphibians.

4 Transportation and Service Corridors

4.2 Utility and Service Lines

4.2.2 Management of rights-of-way or communication tower facilities and/or their associated access roads

- 4.2.2.1 Improper or poorly scheduled vegetation management can cause direct mortality to and may reduce productivity of wildlife.

7 Natural Systems Modifications

7.3 Other Ecosystem Modifications

7.3.5 Poor habitat management

- 7.3.5.1 Improper or poorly scheduled maintenance of man-made corridors (e.g., roadsides and medians) can cause direct mortality to and may reduce productivity of wildlife.
- 7.3.5.4 Vegetation clearing or inappropriate alteration adjacent to aquatic habitats threatens aquatic species by degrading habitat and water quality (altering temperature and dissolved oxygen, increasing siltation and dessication, etc.).
- 7.3.5.5 Habitat management that alters or removes vegetation without implementing long-term management increases the risk of invasive and exotic plants establishing themselves, outcompeting native vegetation.
- 7.3.5.6 Habitat management, including that which occurs on public and private lands, that does not consider timing and species' behaviors can result in the direct mortality and/or alteration or loss of habitat.
- 7.3.5.12 Lack of diversity in age structure and composition of vegetation due to lack of natural disturbances and/or vegetation management.

- 7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

- 2.10.0.5 Implement habitat restoration and/or enhancement activities that include the creation of vegetative buffers between sensitive habitats (e.g., aquatic systems) and human-inhabited areas (e.g., residences, parks, etc.) and that is conducted during appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.13 Implement best management practices (BMPs), protective strategies, and guidelines for vegetation management to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.11.0.20 Create and/or maintain scrub-shrub habitats through management efforts with little to no impact on forested, wetland and grassland habitats to maintain populations of shrub-dependent SGCN.
- 2.11.0.24 Conduct vegetation management adjacent to aquatic habitats following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.25 Conduct vegetation management along access roads following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.

Project 10. Best Management Practices (BMPs) to Benefit SGCN and their Habitats

- 2.11.0.27 Conduct vegetation management for target shrub- or young forest-dependent SGCN following BMPs to minimize the risk of the establishment of invasive and non-native plants.
- 2.11.0.28 Conduct vegetation management in agricultural areas following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.29 Conduct vegetation management on transportation and service corridors (i.e., rights-of-way) following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.

3 Data Collection and Analysis

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.7 Develop/improve forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

9.3.3 Habitat management planning

- 9.3.3.6 Develop a management plan for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

11 Technical Assistance

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

- 11.2.0.1 Provide technical support to private and public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 11.2.0.10 Provide technical support to private landowners, consultants, and land managers to create customized management plans based on location and SGCN.

Job 10.04. Cooperative Partnerships with Corporations and Transportation Authorities to Implement Appropriate Habitat Management Strategies

Objective: Encourage and support corporations and transportation authorities to conduct habitat creation and enhancement, and integrate appropriate timing of BMPs in upland habitats by developing outreach programs/materials and providing technical assistance.

Purpose: Minimize impacts on SGCN by managing lands using SGCN-focused habitat management strategies and implementing appropriate BMPs for all activities.

Benefits: Creation and enhancement of habitats for SGCN can increase survivorship and fecundity of these species and help stabilize or reverse population declines.

Focal wildlife species benefitting from this job

Birds

American Woodcock	Blue-winged Warbler	Bobolink
Cerulean Warbler	Eastern Meadowlark	Golden-winged Warbler
Grasshopper Sparrow	Kentucky Warbler	Little Blue Heron
Northern Bobwhite	Northern Harrier	Peregrine Falcon
Prothonotary Warbler	Red Knot	Red-headed Woodpecker
Ruddy Turnstone	Scarlet Tanager	Snowy Egret
Tricolored Heron	Vesper Sparrow	Wood Thrush

Fish

Banded Sunfish	Blackbanded Sunfish	Bridle Shiner
Brook Trout	Comely Shiner	Ironcolor Shiner
Mud Sunfish	Swamp Darter	

Macroinvertebrates

A Notodontid Moth (H. varia)	American Bumble Bee	Arogos Skipper
Ashton Cuckoo Bumble Bee	Brook Floater	Buchholz's Dart Moth
Buchholz's Gray	Carter's Noctuid Moth	Daecke's Pyralid Moth
Dotted Skipper	Dwarf Wedgemussel	Eastern Lampmussel
Frosted Elfin	Georgia Satyr	Green Floater

Pine Barrens Treefrog	Timber Rattlesnake	Wood Turtle

Threats and Action Drivers associated with this conservation need

3 Energy Production and Mining

3.1 Oil and Gas Facilities and Pipelines

3.1.1 Distribution processes of petroleum and other liquid hydrocarbons

3.1.1.1 Fragments terrestrial and aquatic habitats.

3.1.1.2 Loss, alteration and/or degradation of habitat.

3.1.2 Natural gas distribution processes

3.1.2.1 Fragments terrestrial and aquatic habitats.

3.1.2.2 Loss, alteration and/or degradation of habitat.

3.2 Mining and Quarrying

3.2.2 Surface Mining - Rock Quarry (and sand quarries)

3.2.2.1 Fragments terrestrial and aquatic habitats.

3.2.2.2 Loss, alteration and/or degradation of habitat.

3.3 Renewable Energy

Project 10. Best Management Practices (BMPs) to Benefit SGCN and their Habitats

3.3.1 Wind Power

3.3.1.2 Fragments terrestrial habitats.

3.3.1.3 Loss, alteration and/or degradation of habitat.

3.3.1.4 Increased commercial infrastructure.

3.3.2 Solar Power

3.3.2.1 Fragments terrestrial habitats.

3.3.2.2 Loss, alteration and/or degradation of habitat.

3.3.2.3 Increased commercial infrastructure.

3.4 Conventional Power Plants

3.4.0 Conventional Power Plants

3.4.0.2 Loss, alteration and/or degradation of habitat due to new or the expansion of current facilities.

3.4.0.3 Alteration of the temperature, pH and/or hydrology of aquatic ecosystems change plant communities and can harm wildlife and/or impact their behavior and survivorship.

4 **Transportation and Service Corridors**

4.1 Roads and Railroads

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale)

4.1.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species and inhibiting dispersal of non-volant animals, reducing gene flow.

4.1.1.2 Loss, alteration and/or degradation of habitat associated with road and railroad construction and maintenance, and degradation of adjacent habitats.

4.2 Utility and Service Lines

4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads

4.2.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species, inhibiting dispersal of non-volant animals, reducing gene flow, and creating barriers to fish when service line-associated roads cross streams (e.g., bridges, culverts, fords, etc).

4.2.1.2 Loss, alteration and/or degradation of habitat associated with rights-of-way construction and maintenance, and degradation of adjacent habitats.

4.2.2 Management of rights-of-way or communication tower facilities and/or their associated access roads

4.2.2.1 Improper or poorly scheduled vegetation management can cause direct mortality to and may reduce productivity of wildlife.

4.4 Flight Paths

Project 10. Best Management Practices (BMPs) to Benefit SGCN and their Habitats

4.4.1 Airplane flight paths

4.4.1.1 Increased noise disturbance to wildlife, disrupting their normal behaviors.

4.4.1.2 Increased risk of collision between airplanes and birds, bats and insects.

15 **Administrative Needs**

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

8 **Outreach**

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

8.1.0.45 Form cooperative partnerships with airports and airline companies to facilitate habitat creation away from airports and outside of flight patterns, and to identify seasonal wildlife strike risks to determine if seasonal shifts in flight patterns will minimize this risk.

8.1.0.47 Form cooperative partnerships with energy companies to facilitate habitat creation and enhancement away from and outside of project areas, the restoration of appropriate habitats within project areas (e.g., rights-of-way could benefit butterflies and some bird species), and to identify seasonal timing of activities that would minimize impacts to wildlife.

8.1.0.48 Form cooperative partnerships with transportation and shipment agencies and companies to facilitate habitat creation and enhancement away from and outside of project areas and to identify seasonal timing of activities that would minimize impacts to wildlife.

9 **Planning**

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

11 **Technical Assistance**

11.2 Technical assistance

Project 10. Best Management Practices (BMPs) to Benefit SGCN and their Habitats

11.2.0 Assorted technical assistance strategies

11.2.0.1 Provide technical support to private and public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.

11.2.0.6 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on habitat creation, enhancement and restoration within and adjacent to project areas, as well as away from and outside of project areas (depending on the target species), by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. Wind farms should address both terrestrial bound and low-flying species. Examples of habitat management include, but are not limited to, integrating short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow setasides.

11.2.0.8 Provide educational resources, training programs, and on-the-ground guidance to public and private landowners and land managers on habitat creation and enhancement strategies that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.

11.2.1 With individuals and groups involved in resource management decision making

11.2.1.4 Provide educational resources, training programs, and on-the-ground guidance to dredging companies and resource managers on habitat creation and enhancement away from and outside of shipping lanes, and to identify seasonal timing of activities that would minimize impacts to wildlife and their habitats.

Job 10.05. Management of a Former Solar Farm Footprint

Objective: Implement habitat management BMPs on surfaces previously associated with solar farms that had been created within forested areas to provide: (A) Potential breeding habitats for forest-associated/-dependent wildlife species, in particular reptiles and amphibians, and (B) Foraging habitat (e.g., invertebrate host plants, pollinator plants, natural material debris piles).

Purpose: Enhance forest edges necessary for forest-associated and -dependent species with open-canopy needs.

Benefits: Enhancement of forest edge habitats can reduce fragmentation of forests, increase survivorship and fecundity of SGCN, and help stabilize or reverse population declines.

Threats and Action Drivers associated with this conservation need

3 Energy Production and Mining

3.3 Renewable Energy

3.3.2 Solar Power

3.3.2.1 Fragments terrestrial habitats.

3.3.2.2 Loss, alteration and/or degradation of habitat.

3.3.2.3 Increased commercial infrastructure.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.11 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

9.3.3 Habitat management planning

- 9.3.3.6 Develop a management plan for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 9.3.3.35 Incorporate habitat connectivity, preservation of natural areas, and the implementation of BMPs into state and local land-use policy environmental review process and energy development plans to minimize habitat fragmentation and related threats associated with solar farms and altered habitats.

100 Law and Policy

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

100.4.0.20 Develop state regulations that require energy developers and utility service companies to implement habitat management strategies that will increase the structural diversity of the habitat, minimize habitat fragmentation and commercial infrastructure, and minimize the loss, alteration and/or degradation of the habitat and adjacent lands when working on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies.

Project 11. Habitat Management to Improve Ecological Diversity

Job 11.01. Managing Microhabitats for Focal Species

Objective: Incorporate structural habitat diversity and appropriate management strategies and timing to benefit the widest range of species on parcels or within habitat patches. For example, provide areas of short and tall growing grasses for ground-nesting birds, native wildflowers/host plants and brush piles for invertebrates, water sources/wetlands for amphibians, stream buffers for wood turtles, scrub-shrub component, nesting areas, and no-mow setasides, etc.

Purpose: Improve wildlife diversity by creating a structurally diverse habitat.

Benefits: Improve nesting success for ground-nesting birds and the presence/persistence of host and food source plants for invertebrates. Such management will provide a synergistic and efficient use of available land and resources that will benefit a wide suite of focal species on available lands. Enhancement of habitats for SGCN focal species can increase survivorship and fecundity of these species and many others, and help stabilize or reverse population declines.

Threats and Action Drivers associated with this conservation need

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale)

- 1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
- 1.1.1.2 Loss, alteration and/or degradation of habitat.
- 1.1.1.3 Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.
- 1.1.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.
- 1.1.1.5 Impervious surfaces can lead to a decrease in water recharge.
- 1.1.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
- 1.1.1.7 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale)

- 1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

Project 11. Habitat Management to Improve Ecological Diversity

- 1.2.1.2 Loss, alteration and/or degradation of habitat.
- 1.2.1.3 Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.
- 1.2.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.
- 1.2.1.5 Impervious surfaces can lead to a decrease in water recharge.
- 1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
- 1.2.1.7 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.3 Tourism and Recreational Areas

- 1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale)
 - 1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
 - 1.3.1.2 Loss, alteration and/or degradation of habitat.
 - 1.3.1.3 Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.
 - 1.3.1.4 Impervious surfaces can lead to a decrease in water recharge.
 - 1.3.1.5 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
 - 1.3.1.6 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

2 **Agriculture and Aquaculture**

2.1 Annual and Perennial Crops (non-timber)

- 2.1.1 Shifting Agriculture
 - 2.1.1.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.
- 2.1.2 Small-holder Farming
 - 2.1.2.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.
 - 2.1.2.2 Fragments terrestrial and aquatic habitats.
 - 2.1.2.3 Agricultural practices (e.g., mechanized, row-crop agriculture) can render lands unsuitable for most wildlife due to soil degradation and erosion and can cause direct mortality to wildlife when harvesting takes places.
- 2.1.3 Agro-industry

Project 11. Habitat Management to Improve Ecological Diversity

- 2.1.3.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.
- 2.1.3.2 Fragments terrestrial and aquatic habitats.
- 2.1.3.3 Agricultural practices (e.g., mechanized, row-crop agriculture) can render lands unsuitable for most wildlife due to soil degradation and erosion and can cause direct mortality to wildlife when harvesting takes places.

2.2 Wood and Pulp Plantations

2.2.1 Small Holder

- 2.2.1.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.
- 2.2.1.3 Improper design or restoration of skid roads may result in ponded areas that serve as habitat sinks for amphibians.

2.2.2 Agro-industry Plantations

- 2.2.2.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.
- 2.2.2.3 Improper design or restoration of skid roads may result in ponded areas that serve as habitat sinks for amphibians.

2.3 Livestock Farming and Ranching

2.3.2 Small-holder Grazing

- 2.3.2.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.
- 2.3.2.2 Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.

2.3.3 Agro-industry Grazing

- 2.3.3.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.
- 2.3.3.2 Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.
- 2.3.3.3 Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.
- 2.3.3.4 Livestock allowed to wade into waterbodies trample and degrade aquatic habitats.

3 **Energy Production and Mining**

3.1 Oil and Gas Facilities and Pipelines

3.1.1 Distribution processes of petroleum and other liquid hydrocarbons

- 3.1.1.1 Fragments terrestrial and aquatic habitats.
- 3.1.1.2 Loss, alteration and/or degradation of habitat.

3.1.2 Natural gas distribution processes

Project 11. Habitat Management to Improve Ecological Diversity

3.1.2.1 Fragments terrestrial and aquatic habitats.

3.1.2.2 Loss, alteration and/or degradation of habitat.

3.2 Mining and Quarrying

3.2.2 Surface Mining - Rock Quarry (and sand quarries)

3.2.2.1 Fragments terrestrial and aquatic habitats.

3.2.2.2 Loss, alteration and/or degradation of habitat.

3.3 Renewable Energy

3.3.1 Wind Power

3.3.1.2 Fragments terrestrial habitats.

3.3.1.3 Loss, alteration and/or degradation of habitat.

3.3.1.4 Increased commercial infrastructure.

3.3.2 Solar Power

3.3.2.1 Fragments terrestrial habitats.

3.3.2.2 Loss, alteration and/or degradation of habitat.

3.3.2.3 Increased commercial infrastructure.

4 Transportation and Service Corridors

4.1 Roads and Railroads

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale)

4.1.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species and inhibiting dispersal of non-volant animals, reducing gene flow.

4.1.1.2 Loss, alteration and/or degradation of habitat associated with road and railroad construction and maintenance, and degradation of adjacent habitats.

4.1.1.3 Re-establishment of abandoned railroad lines may displace wildlife, in particular, less mobile species using the area to fulfill critical life history requirements.

4.1.1.5 Re-establishment of abandoned railroad lines may decrease turtles' abilities to disperse due to their difficulty traversing the railroad ties and tracks, leading to decreased genetic exchange.

4.2 Utility and Service Lines

4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads

4.2.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species, inhibiting dispersal of non-volant animals, reducing gene flow, and creating barriers to fish when service line-associated roads cross streams (e.g., bridges, culverts, fords, etc).

Project 11. Habitat Management to Improve Ecological Diversity

4.2.1.2 Loss, alteration and/or degradation of habitat associated with rights-of-way construction and maintenance, and degradation of adjacent habitats.

4.2.2 Management of rights-of-way or communication tower facilities and/or their associated access roads

4.2.2.1 Improper or poorly scheduled vegetation management can cause direct mortality to and may reduce productivity of wildlife.

7 Natural Systems Modifications

7.1 Fire and Fire Suppression

7.1.1 Increase in Fire Frequency/Intensity

7.1.1.4 Lack of diversity in age structure and composition of vegetation due to expansive, frequent fires.

7.1.2 Suppression of Fire Frequency/Intensity

7.1.2.2 Lack of diversity in age structure and composition of vegetation due to the suppression of fire.

7.3 Other Ecosystem Modifications

7.3.2 Inappropriate timing of mowing

7.3.2.1 Increased risk of direct mortality and/or reduced productivity of wildlife, as well as reduced use by migrating species.

7.3.3 Removal of coarse woody debris (streams, forests, scrub-shrub habitats)

7.3.3.1 Decreases the available detritus that normally accumulates behind and within stream obstructions, minimizing or eliminating food sources and shelters for fishes, invertebrates and amphibians.

7.3.3.2 Decreases habitat and/or corridor suitability due to limited or absent shelter and foraging habitat.

7.3.3.4 Decreases available basking, shelter, and foraging habitats.

7.3.4 Lack of natural disturbance patterns or ecosystem functions due to species loss

7.3.4.5 The lack of forest disturbance minimizes the diversity of herbaceous vegetation and other shrubs and trees that need a lot of sunlight to grow.

7.3.5 Poor habitat management

7.3.5.1 Improper or poorly scheduled maintenance of man-made corridors (e.g., roadsides and medians) can cause direct mortality to and may reduce productivity of wildlife.

7.3.5.2 Shifting from natural vegetation to lawns can cause increased temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

7.3.5.3 Vegetation clearing removes terrestrial and riparian corridors for animal movement, shelter, and resting areas.

Project 11. Habitat Management to Improve Ecological Diversity

- 7.3.5.4 Vegetation clearing or inappropriate alteration adjacent to aquatic habitats threatens aquatic species by degrading habitat and water quality (altering temperature and dissolved oxygen, increasing siltation and dessication, etc.).
- 7.3.5.5 Habitat management that alters or removes vegetation without implementing long-term management increases the risk of invasive and exotic plants establishing themselves, outcompeting native vegetation.
- 7.3.5.6 Habitat management, including that which occurs on public and private lands, that does not consider timing and species' behaviors can result in the direct mortality and/or alteration or loss of habitat.
- 7.3.5.7 Improperly planned habitat management and/or mitigation efforts along roadsides and within the medians can attract wildlife and increase the risk of vehicle strikes.
- 7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.
- 7.3.5.17 Decreased diversity in height and species of herbaceous vegetation resulting in reduced cover and food for nesting and foraging wildlife.
- 7.3.5.18 Lack of funding or competitive market prices to maintain native grasslands for grassland-dependent species causes conversion of fallow or hay fields to other crops or shrublands.

8 Invasive and Other Problematic Species, Genes and Diseases

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.1 Unspecified Species

- 8.1.1.1 Displace or outcompete native species for resources.
- 8.1.1.2 Alters, degrades and/or reduces the structural diversity of the natural composition of the landscape, including aquatic systems.
- 8.1.1.4 Invasive, non-native animals increase the risk of predation on native animals and/or herbivory on native vegetation.
- 8.1.1.5 Invasive, non-native animals and plants increase the risk of introduction and transference of diseases.
- 8.1.1.6 Invasive, non-native plants may create physical barriers for some species.

8.1.3 Invasive non-native aquatic plants

- 8.1.3.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.1.5 Invasive non-native terrestrial/wetland plants

- 8.1.5.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

Project 11. Habitat Management to Improve Ecological Diversity

8.2 Problematic Native Species/Diseases

8.2.1 Unspecified Species

- 8.2.1.3** Invasive, native species can out-compete non-invasive species for resources (food, light, shelter), leading to the demise of some species populations.

12 Resource Management Needs

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform

- 12.4.0.7** Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1** State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.11** Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

Project 11. Habitat Management to Improve Ecological Diversity

- 1.2.1.18 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and land managers to control and reduce the impacts of invasive, native and non-native species in order to increase structural habitat diversity.
- 1.2.1.22 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to horse/livestock farm owners and managers to increase structural habitat diversity in and around the farms by managing vegetation for a variety of species, in particular, farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 1.2.1.28 Create incentives to implement dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.

2 Direct Management of Natural Resources

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

- 2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.
- 2.8.0.6 Implement long-term management of invasive and/or non-native plants to help maintain functioning ecological systems and biological diversity, and to enhance travel corridors. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

- 2.10.0.5 Implement habitat restoration and/or enhancement activities that include the creation of vegetative buffers between sensitive habitats (e.g., aquatic systems) and human-inhabited areas (e.g., residences, parks, etc.) and that is conducted during appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

Project 11. Habitat Management to Improve Ecological Diversity

- 2.10.0.22 Restore and/or enhance terrestrial and aquatic habitats to promote the regeneration of native vegetation and enhance structural diversity to benefit SGCN (e.g., vegetative buffers of aquatic systems, allow coarse, woody debris to remain in terrestrial, aquatic and riparian habitats to provide shelter, riparian stabilization and necessary microclimates, plant native trees, shrubs and grasses, etc.).

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.
- 2.11.0.3 Create suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats through vegetation management.
- 2.11.0.13 Implement best management practices (BMPs), protective strategies, and guidelines for vegetation management to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.11.0.32 Increase structural habitat diversity around and when feasible, within agricultural landscapes by managing vegetation for a variety of species, in particular, those farms that have removed scrub-shrub habitat and/or fragmented forests, and by implementing ecologically best practices (e.g., no-till farming, maintaining hedgerows, buffer set-asides, etc.).
- 2.11.0.33 Increase structural habitat diversity by implementing long-term vegetation management to minimize the potential for the establishment of invasive and/or non-native plants that may outcompete native vegetation.
- 2.11.0.34 Increase structural habitat diversity by managing residential, commercial and recreational areas' landscapes for a variety of species. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.35 Increase structural habitat diversity by managing vegetation adjacent to aquatic habitats in a manner that provides a buffer from runoff and erosion and a microclimate to stabilize seasonal temperatures to benefit a variety of aquatic and semi-aquatic species.
- 2.11.0.36 Increase structural habitat diversity by managing vegetation for a variety of species and considering their life history requirements (e.g., travel corridors, shelter, resting and breeding areas) to minimize the risk of harm.
- 2.11.0.37 Increase structural habitat diversity by minimizing the removal of coarse, woody debris in terrestrial, aquatic and riparian habitats which benefits wildlife.

Project 11. Habitat Management to Improve Ecological Diversity

- 2.11.0.38 Increase structural habitat diversity in and around horse/livestock farms by managing vegetation for a variety of species, in particular, in and around farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 2.11.0.39 Increase structural habitat diversity in and around solar farms by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow setasides.
- 2.11.0.40 Increase structural habitat diversity surrounding areas used for energy, mining, and transportation and service corridors by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow setasides, and avoid managing habitat during the breeding seasons for ground-nesting birds, reptiles, amphibians and small mammals.
- 2.11.0.42 Increase structural habitat diversity within wind farms for terrestrial bound and low-flying species and around wind farms for other wildlife by managing vegetation for a variety of species and that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.

3 Data Collection and Analysis

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.2 Develop management strategies to improve the availability of prey/food resources for SGCN whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources. Monitor and investigate the management strategies over time to determine success and/or the need to revise methods.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.24 Engage government agencies, conservation partners and other stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 8.1.0.25 Provide technical support to public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.

Project 11. Habitat Management to Improve Ecological Diversity

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

8.3.0.27 Develop educational outreach programs for public and private landowners and land managers regarding the importance of structural habitat diversity, methods to increase diversity, and/or incentive programs available to increase habitat diversity.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

9.1.0.2 Develop town plans that avoid impacts to SGCN species and their habitats.

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

9.3.3 Habitat management planning

9.3.3.6 Develop a management plan for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

11 Technical Assistance

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

11.2.0.1 Provide technical support to private and public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.

11.2.0.2 Provide technical support to public and private landowners and land managers for controlling invasive, native and non-native plant species in order to increase structural habitat diversity.

11.2.0.8 Provide educational resources, training programs, and on-the-ground guidance to public and private landowners and land managers on habitat creation and enhancement strategies that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.

11.2.0.10 Provide technical support to private landowners, consultants, and land managers to create customized management plans based on location and SGCN.

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

100.3.0.73 Develop regulations that would exempt the conversion of lawns to native vegetation (beneficial to wildlife) from local lawn ordinances.

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).

100.4.0.9 Develop and implement policies to minimize the removal of coarse, woody debris in terrestrial, aquatic and riparian habitats in order to benefit wildlife.

100.4.0.13 Develop policies for different circumstances (e.g., roadsides and medians, riparian, aquatic and terrestrial habitats) that outline appropriate habitat/vegetation management strategies and schedules to minimize risks to and benefit wildlife.

100.4.0.16 Develop policies to implement habitat management strategies that will increase the structural diversity surrounding areas used for energy, mining, and transportation and service corridors which include but are not limited to the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-asides.

100.4.0.17 Develop policies to implement habitat management strategies, including prescribed burns, that will increase the structural diversity on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies to control and reduce the impacts of invasive, non-native species in order to increase structural habitat diversity.

100.4.0.18 Develop policies to minimize the extent of infrastructure associated with energy and service corridors or areas (e.g., wind and solar farms, pipelines, utility lines) and that require the implementation of habitat management strategies that will increase the structural diversity in the area including (e.g., the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-asides).

Job 11.02. Scrub-shrub Habitat Management

Project 11. Habitat Management to Improve Ecological Diversity

Objective: Increase state-wide acreage in young forest in 5-10 years by managing for scrub-shrub and young forest habitats within and adjacent to existing forests to achieve up to 15% young forest in appropriate, targeted forest lands.

Purpose: Improve wildlife diversity and enhance habitat for golden-winged warblers and other SGCN dependent upon scrub-shrub or young forest habitat to combat the impacts from a lack of natural disturbances and invasive species on these particular habitats and species.

Benefits: Increase habitat availability and diversity for game and nongame species, and provide an opportunity for improved public relations among corporations and municipalities.

Threats and Action Drivers associated with this conservation need

7 Natural Systems Modifications

7.3 Other Ecosystem Modifications

7.3.4 Lack of natural disturbance patterns or ecosystem functions due to species loss

7.3.4.5 The lack of forest disturbance minimizes the diversity of herbaceous vegetation and other shrubs and trees that need a lot of sunlight to grow.

7.3.5 Poor habitat management

7.3.5.12 Lack of diversity in age structure and composition of vegetation due to lack of natural disturbances and/or vegetation management.

7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.

8 Invasive and Other Problematic Species, Genes and Diseases

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.1 Unspecified Species

8.1.1.1 Displace or outcompete native species for resources.

8.1.1.2 Alters, degrades and/or reduces the structural diversity of the natural composition of the landscape, including aquatic systems.

8.1.1.4 Invasive, non-native animals increase the risk of predation on native animals and/or herbivory on native vegetation.

8.1.1.6 Invasive, non-native plants may create physical barriers for some species.

8.1.5 Invasive non-native terrestrial/wetland plants

8.1.5.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

12 Resource Management Needs

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform

12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.28 Create incentives to implement dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.

2 Direct Management of Natural Resources

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

- 2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.
- 2.11.0.2 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas for target SGCN and/or species groups; management should complement rare species needs in a targeted area.
- 2.11.0.20 Create and/or maintain scrub-shrub habitats through management efforts with little to no impact on forested, wetland and grassland habitats to maintain populations of shrub-dependent SGCN.
- 2.11.0.45 Regularly and/or rotationally create young forest habitat in targeted areas to maintain and regenerate a mosaic of upland forest habitats that will benefit shrub- and young forest-dependent species.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21** Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

100 Law and Policy

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.1** Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).

Job 11.03. Scrub-shrub and Young Forest Habitat Management - Outreach and Education

Objective: Provide public and private landowners, land managers and stakeholders with information regarding the importance of and encourage the management for scrub-shrub and young forest habitats over the next 5-10 years.

Purpose: To increase public support for and implementation of management actions that target the creation and/or enhancement of scrub-shrub and young forest habitat.

Benefits: Creation and enhancement of scrub-shrub and young forest habitat for SGCN can increase survivorship and fecundity of these species and help stabilize or reverse population declines.

Threats and Action Drivers associated with this conservation need

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats

14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

8 Outreach

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

8.3.0.5 Develop and provide (or otherwise make publicly available) educational programs and/or materials that provide homeowners information on how to design dwellings and other structures in a manner that is wildlife friendly (e.g., using bird-safe glass on windows).

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

Project 11. Habitat Management to Improve Ecological Diversity

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

11 Technical Assistance

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

- 11.2.0.11 Provide educational resources, training programs, and on-the-ground guidance to private and public landowners and land managers on the benefits of and for creating young forest and early succession habitat for SGCN.

Job 11.04. Grassland Habitat Management

Objective: Secure and manage habitat parcels of suitable patch size as grasslands, NJ's most diminishing habitat and most at risk of development, using native herbaceous plantings to support breeding grassland-dependent species in perpetuity.

Purpose: Provide permanent, suitable grassland habitat for grassland-dependent species.

Benefits: Increase the number of individuals of target species and overall biodiversity (plant and animal) while providing natural resource protection (soil, water, air) and recreational benefits to New Jersey's citizens.

Objective: Provide educational materials to public and private landowners and land managers including but not limited to corporations, universities, schools, municipalities, local nurseries, etc., on the importance of grassland habitat and provide technical assistance to assist them in creating, enhancing and properly managing (including timing of activities) grasslands in a manner that will benefit wildlife.

Purpose: Enhance grassland habitats and reduce the implementation of inappropriate management activities (e.g., planting non-native species, inappropriate timing of activities, etc.) to benefit grassland species, particularly birds and invertebrates.

Benefits: Improve public knowledge regarding the creation and/or enhancement of suitable wildlife habitat and best management practices on private and public properties such as appropriate timing of activities to minimize harm to wildlife, proper soil erosion control measures, additional wildlife-focused safety measures when using pesticides and herbicides, and the benefits of increasing suitable wildlife habitat, proper soil erosion control and pesticide use, and appropriate , increase habitat, species response, soil erosion, and pesticide use to increase wildlife habitat and minimize harm to animals during management efforts.

Threats and Action Drivers associated with this conservation need

2 Agriculture and Aquaculture

2.1 Annual and Perennial Crops (non-timber)

2.1.1 Shifting Agriculture

2.1.1.5 Lack of competitive market prices to maintain native grasslands causes conversion to other crops that have more monetary value but less value as wildlife habitat.

2.1.2 Small-holder Farming

2.1.2.5 Lack of competitive market prices to maintain native grasslands causes conversion to other crops that have more monetary value but less value as wildlife habitat.

2.1.3 Agro-industry

2.1.3.6 Lack of competitive market prices to maintain native grasslands causes conversion to other crops that have more monetary value but less value as wildlife habitat.

7 Natural Systems Modifications

7.3 Other Ecosystem Modifications

7.3.5 Poor habitat management

7.3.5.6 Habitat management, including that which occurs on public and private lands, that does not consider timing and species' behaviors can result in the direct mortality and/or alteration or loss of habitat.

7.3.5.12 Lack of diversity in age structure and composition of vegetation due to lack of natural disturbances and/or vegetation management.

7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.

Project 11. Habitat Management to Improve Ecological Diversity

- 7.3.5.18 Lack of funding or competitive market prices to maintain native grasslands for grassland-dependent species causes conversion of fallow or hay fields to other crops or shrublands.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

- 12.1.1.2 Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform

- 12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats

- 14.1.1.3 Lack of understanding of the need to manage both natural and anthropogenic (e.g., yards, lawns, hayfields, etc.) habitats to minimize impacts or increase benefits to SGCN and their habitats.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.24 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners, with habitat of suitable patch size to support breeding grassland-dependent species, to alter the timing of vegetation management to benefit grassland and pollinator species.

Project 11. Habitat Management to Improve Ecological Diversity

- 1.2.1.28 Create incentives to implement dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.

2 Direct Management of Natural Resources

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.

3 Data Collection and Analysis

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.29 Explore the use of alternative vegetation (i.e., commodity crops) to address agriculture concerns.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.15 Engage government agencies, conservation partners and other stakeholders in discussions encouraging and supporting the creation of laws and policies requiring vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.28 Develop educational outreach programs for public and private landowners and land managers regarding the importance of managing grasslands for grassland-dependent species, methods of management, and/or incentive programs available.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

9.3.3 Habitat management planning

- 9.3.3.26 Develop a management plan for parcels of suitable size to be managed for native herbaceous plant species that support breeding grassland dependent species.

11 Technical Assistance

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

11.2.0.1 Provide technical support to private and public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.

11.2.0.12 Provide educational resources and technical support to public landowners and land managers for managing grasslands for grassland-dependent species.

100 Law and Policy

100.1 Legislation

100.1.2 National Level

100.1.2.1 Create legislation to establish markets for warm-season grasses to increase the permanency of this crop on the landscape.

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

100.3.0.24 Create legislation to establish markets for warm-season grasses to increase the permanency of this crop on the landscape.

100.3.0.40 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).

100.4.0.3 Develop policies for mandatory buffer strips on preserved farmlands and state-owned agricultural lands.

100.4.0.12 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.

100.4.0.14 Develop policies to facilitate agreements between eligible entities to manage appropriate conserved lands for grassland-dependent species, and to have access to/obtain restoration funds.

Job 11.05. Landscape Level Forest Management Planning

Project 11. Habitat Management to Improve Ecological Diversity

Objective: Identify regional deficiencies in forest habitats (i.e., limiting habitat factors on the landscape such as a lack of structural diversity, distribution of forest types and age classes, lack of critical SGCN breeding habitats, etc.) for focal SGCN using existing tools such as forest inventory analysis, landscape project, etc.

Purpose: Improve forest habitat management decisions and efforts to benefit focal SGCN.

Benefits: Final products will contribute to forest management and planning to increase the diversity of habitats within New Jersey's forests and provide opportunities for collaboration between various entities, land managers, and landowners to focus forest management efforts.

Focal wildlife species benefitting from this job

Birds

American Woodcock	Blue-winged Warbler	Cerulean Warbler
Golden-winged Warbler	Kentucky Warbler	Northern Bobwhite
Peregrine Falcon	Prothonotary Warbler	Red-headed Woodpecker
Scarlet Tanager	Wood Thrush	

Fish

Alewife	Banded Sunfish	Blackbanded Sunfish
Blueback Herring	Bridle Shiner	Brook Trout
Comely Shiner	Ironcolor Shiner	Mud Sunfish
Swamp Darter		

Macroinvertebrates

American Bumble Bee	Arogos Skipper	Ashton Cuckoo Bumble Bee
Brook Floater	Dotted Skipper	Dwarf Wedgemussel
Eastern Lampmussel	Frosted Elfin	Georgia Satyr
Green Floater	Hoary Elfin	Leonard's Skipper
Little White Tiger Beetle	Maritime Sunflower Borer Moth	New England Bluet
New Jersey Pine Barrens Tiger Beetle	Northern Metalmark	Papaipema harrisii
Pine Barrens Bluet	Robust Baskettail	Rusty Patched Bumble Bee
Scarlet Bluet	Septima's Clubtail	Southeastern Beach Tiger Beetle
Southern Plains Bumble Bee	Superb Jewelwing	Triangle Floater
Variable Cuckoo Bumble Bee	Yellow Bumble Bee	Yellow Lampmussel
Yellow-banded Bumble Bee		

Mammals

Timber Rattlesnake

Wood Turtle

Threats and Action Drivers associated with this conservation need

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.2 Lack of up-to-date existing information

12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform

12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

3 Data Collection and Analysis

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

- 3.3.1.4** Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and investigate the suitability of corridors that connect large, contiguous tracts of similar habitats to increase their effective size (i.e., forest with forest, grassland with grassland, wetlands with wetlands, etc.) for dependent SGCN.
- 3.3.1.7** Map and prioritize existing and potential areas for early succession forest management. Share the results with state, county and municipal planners.
- 3.3.1.8** Assess the availability and suitability of forest habitats for SGCN species (particularly reptiles and amphibians, birds, pollinators, and tiger beetles) in southern forests since Superstorm Sandy.
- 3.3.1.9** Inventory forests throughout northern New Jersey to develop a baseline characterization of the structure and composition of habitats and identify deficient forest habitat types.
- 3.3.1.12** Conduct an initial assessment of and document the availability and suitability of intact, preserved forest blocks containing vernal pools within the possible range of Eastern Tiger Salamander, which appear under-represented on a landscape scale. Incorporate findings into a database that includes descriptions and qualifiers of the habitats, and a GIS component of the locations of such areas. Share this information with appropriate organizations and/or agencies working to implement habitat restoration and enhancement strategies to provide opportunities for this salamander to disperse and expand its current range.
- 3.3.1.17** Identify and map undeveloped roads and trails in all conserved forests, and create a database of locations. Integrate information regarding potentially sensitive areas.
- 3.3.1.20** Identify areas (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) where invasive, non-indigenous plants and animals are either already established or are becoming established. Create a system for reporting and qualifying new locations of invasive species and for prioritizing areas for control measures according to the potential level of impact on the ecosystem and SGCN and the likelihood of success. Researchers and contractors encountering invasive plant species while performing plant and/or forest inventories on state or other conserved lands and/or private lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.

3.3.2 Monitoring

Project 11. Habitat Management to Improve Ecological Diversity

- 3.3.2.1 Evaluate the effectiveness of forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.
- 3.3.2.9 Investigate the effectiveness of various silviculture techniques for enhancing forests for forest-dependent SGCN.
- 3.3.2.17 Conduct long-term habitat monitoring to determine the continued availability and suitability of intact, preserved forest blocks containing vernal pools within the possible range of Eastern Tiger Salamander. Update the database (to be developed during baseline assessments) regarding the forests' and vernal pools' conditions. Share this information with appropriate organizations and/or agencies working to implement habitat restoration and enhancement strategies to provide opportunities for this salamander to disperse and expand its current range.
- 3.3.2.24 Conduct regular inventories of forests throughout northern New Jersey to characterize the changing structure and composition of habitats and monitor forest conditions.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

100 Law and Policy

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).

Job 11.06. Forest Management in Southern New Jersey

Objective: Develop and implement a Forest Stewardship Plan for 1.2 million acres of Southern New Jersey forests by 2026, with management underway on 250,000 acres.

Project 11. Habitat Management to Improve Ecological Diversity

Purpose: Manage more lands for healthy forests to increase diversity of forest-dwelling wildlife species and improve their chances to persist.

Benefits: Creation and enhancement of forested habitats can increase survivorship and fecundity of SGCN and help stabilize or reverse population declines. Appropriate forest management will also improve habitat connectivity while reducing/minimizing fragmentation, can increase resiliency to the threat of pests, and can improve public safety from wild fires by creating appropriate buffers and minimizing forest litter (i.e., "fuel") proximate to residences and roads (Wildland Urban Interface).

Focal wildlife species benefitting from this job

Birds

American Woodcock	Blue-winged Warbler	Cerulean Warbler
Kentucky Warbler	Northern Bobwhite	Prothonotary Warbler
Red-headed Woodpecker	Scarlet Tanager	Wood Thrush

Fish

Alewife	Banded Sunfish	Blackbanded Sunfish

Northern Red Salamander	Northern Scarlet Snake	Pine Barrens Treefrog
Timber Rattlesnake	Wood Turtle	

Threats and Action Drivers associated with this conservation need

5 **Biological Resource Use**

5.3 Logging and Wood Harvesting

5.3.1 Intentional Use (subsistence/small scale)

5.3.1.4 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase the risk of invasive species establishment, impacting SGCN habitats.

5.3.1.5 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may decrease structural diversity and biomass leading to reduced biodiversity and ecological integrity.

5.3.1.6 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices in Atlantic White Cedar stands may destroy a unique wildlife wetland habitat that is difficult, and takes time, to restore.

5.3.2 Intentional Use (large scale)

5.3.2.4 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase the risk of invasive species establishment, impacting SGCN habitats.

5.3.2.5 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may decrease structural diversity and biomass leading to reduced biodiversity and ecological integrity.

5.3.2.6 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices in Atlantic White Cedar stands may destroy a unique wildlife wetland habitat that is difficult, and takes time, to restore.

7 **Natural Systems Modifications**

7.1 Fire and Fire Suppression

7.1.1 Increase in Fire Frequency/Intensity

7.1.1.1 Increase in frequency and intensity of wild fires as a result of droughts and heat waves drying out vegetation and litter.

7.1.1.4 Lack of diversity in age structure and composition of vegetation due to expansive, frequent fires.

Project 11. Habitat Management to Improve Ecological Diversity

7.1.2 Suppression of Fire Frequency/Intensity

7.1.2.1 Shift in vegetative communities as a result of suppression of natural fires.

7.1.2.2 Lack of diversity in age structure and composition of vegetation due to the suppression of fire.

7.3 Other Ecosystem Modifications

7.3.4 Lack of natural disturbance patterns or ecosystem functions due to species loss

7.3.4.4 Human interference in natural processes such as clean up (e.g., beach-filling, shoreline hardening, tree/log removal from forests) after storms, in particular those causing post-hurricane washover and/or barrier island westward movement, and tree felling limits the disturbance needed to maintain appropriate habitats for wildlife.

7.3.4.5 The lack of forest disturbance minimizes the diversity of herbaceous vegetation and other shrubs and trees that need a lot of sunlight to grow.

7.3.5 Poor habitat management

7.3.5.5 Habitat management that alters or removes vegetation without implementing long-term management increases the risk of invasive and exotic plants establishing themselves, outcompeting native vegetation.

7.3.5.6 Habitat management, including that which occurs on public and private lands, that does not consider timing and species' behaviors can result in the direct mortality and/or alteration or loss of habitat.

7.3.5.14 Intentional felling and removal of dead standing trees or snags eliminates resting, nesting or feeding habitat, and precludes the snags eventual contribution to coarse woody debris and forest floor structure and habitat.

7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.2 Lack of up-to-date existing information

12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform

12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats

- 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.3 Fire management

2.3.2 Fuel reduction

- 2.3.2.1 Prevent wildfires by reducing natural fuel (e.g., leaf litter).

2.3.3 Prescribed burning

- 2.3.3.3 Conduct prescribed burning to improve wildlife habitat.

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.
- 2.11.0.4 Implement vegetation management strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife, particularly SGCN.
- 2.11.0.18 Implement forest management/silvicultural strategies that promote the development of new old-growth forests and/or minimize the loss of old-growth forest stands with large trees and within large, contiguous tracts.
- 2.11.0.19 Implement forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN.
- 2.11.0.33 Increase structural habitat diversity by implementing long-term vegetation management to minimize the potential for the establishment of invasive and/or non-native plants that may outcompete native vegetation.

Project 11. Habitat Management to Improve Ecological Diversity

- 2.11.0.36 Increase structural habitat diversity by managing vegetation for a variety of species and considering their life history requirements (e.g., travel corridors, shelter, resting and breeding areas) to minimize the risk of harm.
- 2.11.0.37 Increase structural habitat diversity by minimizing the removal of coarse, woody debris in terrestrial, aquatic and riparian habitats which benefits wildlife.
- 2.11.0.41 Increase structural habitat diversity through the implementation of a variety of vegetation management practices such as prescribed burns (either increasing or decreasing their frequency depending on the site and objective), plantings, etc. that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife.
- 2.11.0.43 Manage forests to increase variation in age structure and composition using BMPs that promote and maintain functioning ecological forest-based systems and biological diversity.

3 Data Collection and Analysis

3.3 Research, survey or monitoring - habitat

3.3.2 Monitoring

- 3.3.2.1 Evaluate the effectiveness of forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN through research and monitoring.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.24 Engage government agencies, conservation partners and other stakeholders in constructive dialogue regarding the importance of providing and methods to provide technical support for carrying out restoration and management practices aimed at increasing structural habitat diversity.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

9.3.3 Habitat management planning

- 9.3.3.6 Develop a management plan for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

100 **Law and Policy**

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).

Job 11.07. Wetlands Restoration and Integrated Management

Objective: Implement a wetlands habitat restoration plan, particularly in wetlands impacted by development, agriculture, climate change, pollution, etc., with a focus on freshwater herbaceous and shrubland habitats for degraded wetlands that integrates the management of focal SGCN with rare plant conservation in the interest of biodiversity protection and ecosystem health.

Purpose: Maintain or improve biodiversity and ecosystem health within wetland habitats.

Benefits: Restoring wetland habitat creates higher quality, functioning systems that benefit SGCN (and associated rare plant species), and improves resiliency to stressors and ecological integrity, improving and/or securing long term viability for habitat and wildlife.

Focal wildlife species benefitting from this job

Birds

American Woodcock	Black Rail	Blue-winged Warbler
Bobolink	Cerulean Warbler	Eastern Meadowlark
Golden-winged Warbler	Grasshopper Sparrow	Kentucky Warbler
Little Blue Heron	Northern Harrier	Pied-billed Grebe
Prothonotary Warbler	Red Knot	Ruddy Turnstone
Scarlet Tanager	Snowy Egret	Tricolored Heron
Vesper Sparrow	Wood Thrush	

Fish

Banded Sunfish	Blackbanded Sunfish	Mud Sunfish
Swamp Darter		

Macroinvertebrates

Arogos Skipper	Brook Floater	Buchholz's Dart Moth
Buchholz's Gray	Carter's Noctuid Moth	Daecke's Pyralid Moth
Dwarf Wedgemussel	Eastern Lampmussel	Georgia Satyr
Green Floater	New England Bluet	Papaipema harrisii
Pine Barrens Bluet	Pink Sallow	Robust Baskettail
Sand Myrtle Looper/Pink	Septima's Clubtail	Superb Jewelwing
Triangle Floater	Yellow Lampmussel

New Jersey Chorus Frog	Northern Diamondback Terrapin	Northern Red Salamander
Pine Barrens Treefrog	Timber Rattlesnake	Wood Turtle

Threats and Action Drivers associated with this conservation need

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale)

1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.1.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale)

1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.2.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.

1.2.1.5 Impervious surfaces can lead to a decrease in water recharge.

1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

Project 11. Habitat Management to Improve Ecological Diversity

- 1.2.1.7 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

2 Agriculture and Aquaculture

2.1 Annual and Perennial Crops (non-timber)

2.1.1 Shifting Agriculture

- 2.1.1.4 Salt hay farming on Delaware Bay marshes, and the subsequent conversion of those farms to fully tidal marshes, results in compressed sediments that are less resilient to coastal forces of erosion and sea level rise.

2.4 Marine and Freshwater Aquaculture

2.4.1 Subsistence/Artisinal Aquaculture

- 2.4.1.1 May degrade freshwater and intertidal habitat due to farming techniques and damage from associated structures.
 - 2.4.1.3 Potential for increased nutrient and effluent loads.
 - 2.4.1.6 Potential for aquaculture structures to create impingement/entanglement hazard and/or preclude benthic habitat use by SGCN.

4 Transportation and Service Corridors

4.1 Roads and Railroads

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale)

- 4.1.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species and inhibiting dispersal of non-volant animals, reducing gene flow.
 - 4.1.1.2 Loss, alteration and/or degradation of habitat associated with road and railroad construction and maintenance, and degradation of adjacent habitats.

4.2 Utility and Service Lines

4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads

- 4.2.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species, inhibiting dispersal of non-volant animals, reducing gene flow, and creating barriers to fish when service line-associated roads cross streams (e.g., bridges, culverts, fords, etc).
 - 4.2.1.2 Loss, alteration and/or degradation of habitat associated with rights-of-way construction and maintenance, and degradation of adjacent habitats.
 - 4.2.1.4 Lines that cross or run parallel to streams result in a loss or reduction of vegetated riparian buffers and streamside shading, affecting water quality and in-stream habitat for aquatic biota.

6 Human Intrusions and Disturbance

Project 11. Habitat Management to Improve Ecological Diversity

6.1 Recreational Activities

6.1.1 Off-road vehicles (motorized and non-motorized)

- 6.1.1.1 Inappropriate use of off-road vehicles creates new roads/trails which fragments habitat.
- 6.1.1.2 Inappropriate use of off-road vehicles can degrade terrestrial and aquatic habitat and reduce the suitability of adjacent habitats for wildlife.
- 6.1.1.3 Increased risk of harassment that results in a change in wildlife behavior and/or direct mortality from vehicle strikes.
- 6.1.1.4 Increased noise pollution.
- 6.1.1.6 Off-road vehicles can be a mechanism of transference of wildlife diseases and invasive plant species if gear and apparel are not properly sanitized between sites.

6.1.5 Wildlife observation and photography

- 6.1.5.1 Improperly conducted recreational activities may disrupt normal wildlife behaviors which can result in reduced reproductive success or survival, abandonment of critical sites, etc.
- 6.1.5.2 Participants may introduce wildlife diseases and invasive plant species when gear and apparel is not properly sanitized between sites.

6.1.7 Other: Recreational activities (such as pyrotechnics or drones) that may disrupt normal wildlife activities, or recreation that results in transfer of pathogens deleterious to wildlife.

- 6.1.7.3 Drone use in areas with sensitive wildlife (e.g., nesting and foraging birds, migrating and foraging/feeding whales) can alter their behavior and can cause disturbance that impacts their reproductive and/or foraging success.

7 Natural Systems Modifications

7.2 Dams and Water Management/Use

7.2.1 Abstraction of Surface Water (domestic use)

- 7.2.1.1 Changing water levels due to water body drawdowns (legal and illegal) may lower dissolved oxygen levels, increase water temperatures, expose wildlife to predation, and increase exposure to winter temperatures, altering wildlife behavior and survival.

7.2.3 Abstraction of Surface Water (agricultural use)

- 7.2.3.3 Impounding water to create or expand bogs for cranberry farming leads to the loss of natural wetlands and the alteration of the natural hydrology in the area.

7.2.5 Abstraction of Ground Water (domestic use)

- 7.2.5.1 Heavy withdrawal of ground water for domestic use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.7 Abstraction of Ground Water (agricultural use)

Project 11. Habitat Management to Improve Ecological Diversity

- 7.2.7.1 Heavy withdrawal of ground water for agricultural use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.3 Other Ecosystem Modifications

7.3.5 Poor habitat management

- 7.3.5.4 Vegetation clearing or inappropriate alteration adjacent to aquatic habitats threatens aquatic species by degrading habitat and water quality (altering temperature and dissolved oxygen, increasing siltation and dessication, etc.).
- 7.3.5.5 Habitat management that alters or removes vegetation without implementing long-term management increases the risk of invasive and exotic plants establishing themselves, outcompeting native vegetation.
- 7.3.5.9 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, eliminates shallow water habitats, and disrupts/removes stream bottom habitat.
- 7.3.5.10 Ditching, draining and filling of marshes and wetlands eliminates habitat and degrades the remaining surrounding areas for wildlife.
- 7.3.5.12 Lack of diversity in age structure and composition of vegetation due to lack of natural disturbances and/or vegetation management.
- 7.3.5.13 Private landowners with rare species on their properties are not always cooperative in the protection and management of the species' habitats. Landowners may be held accountable for their actions when they cause harm to the species or destroy the habitat, but it is often too late for the species' population.
- 7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.
- 7.3.5.16 Lack of proactive management to preserve or maintain viable and functioning marshes for SGCN wildlife.

8 Invasive and Other Problematic Species, Genes and Diseases

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.1 Unspecified Species

- 8.1.1.1 Displace or outcompete native species for resources.
- 8.1.1.2 Alters, degrades and/or reduces the structural diversity of the natural composition of the landscape, including aquatic systems.
- 8.1.1.3 Invasive, non-native insects can damage native vegetation at a large scale, leading to die-offs, altering the ecological community.
- 8.1.1.4 Invasive, non-native animals increase the risk of predation on native animals and/or herbivory on native vegetation.
- 8.1.1.5 Invasive, non-native animals and plants increase the risk of introduction and transference of diseases.
- 8.1.1.6 Invasive, non-native plants may create physical barriers for some species.

Project 11. Habitat Management to Improve Ecological Diversity

8.1.2 Invasive non-native aquatic animals

8.1.2.1 Parasites introduced into the marine environment can alter the reproductive and feeding behavior of native wildlife, leading to their decline.

8.1.2.2 Displace or out-compete native species for resources (food, shelter), alter the composition of the native landscapes/aquatic systems, diminishing habitat suitability and reducing ecological integrity of natural communities, and may introduce disease into a population.

8.1.3 Invasive non-native aquatic plants

8.1.3.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.1.4 Invasive non-native terrestrial/wetland animals

8.1.4.1 Displace or out-compete native species for resources (food, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.1.4.2 Free-roaming and feral domestic animals such as cats and dogs causes direct mortality of wildlife and disturbance to wildlife breeding and resting areas.

8.1.5 Invasive non-native terrestrial/wetland plants

8.1.5.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.2 Problematic Native Species/Diseases

8.2.1 Unspecified Species

8.2.1.1 Overabundant native insects can damage native vegetation at a large scale, leading to die-offs, altering the ecological community.

8.2.1.2 Invasive pathogens and insects may increase in range and abundance as limiting factors (such as temperature) are altered as a result of climate change.

8.2.1.3 Invasive, native species can out-compete non-invasive species for resources (food, light, shelter), leading to the demise of some species populations.

8.2.1.4 Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.

8.2.2 Named Species

8.2.2.2 Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.

8.4.2 Named Species

Project 11. Habitat Management to Improve Ecological Diversity

8.4.2.1 Honey bee diseases such as Deformed Wing Virus(DWV) and Nosema ceranae have been found to be able to be transmitted to wild bumble bees.

8.4.2.2 Diseases of unknown origin, such as snake fungal disease and Ranavirus, can cause significant mortality among native animal populations.

8.6 Diseases of Unknown Cause

8.6.0 Unknown Diseases

8.6.0.1 Diseases yet to be identified by pathologists and virologists cause decreased fitness or mortality to native populations.

11 Climate Change and Severe Weather

11.1 Habitat Shifting or Alteration

11.1.0 Macro- and Micro-Climate Alterations

11.1.0.1 Alters native terrestrial and aquatic habitats at the macro- and micro-climate levels that can affect suitability for wildlife, in particular specialist species.

11.2 Droughts

11.2.1 Droughts

11.2.1.1 Contribute to hardened soils, decreasing water recharge during rains and increasing the likelihood of flash floods during storms.

11.2.1.2 Lead to lower groundwater levels and therefore, less available water for people and habitats.

11.2.1.3 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

11.2.1.6 Increased dessication risk for amphibians and altered wetland hydrology for critical habitats including breeding pools.

11.3 Temperature Extremes

11.3.1 Temperature extremes

11.3.1.1 Increasing temperatures may cause habitat loss and degradation by desiccating and/or raising the temperatures of small wetlands and streams leading to the loss of freshwater mussels and other aquatic species and species reliant upon these habitats.

11.3.1.2 Increased temperatures can negatively impact wetland, riverine, lacustrine and vernal pool-associated or -dependent wildlife by reducing flows, increasing water temperatures, lowering water levels and causing premature drying of vernal habitats.

11.4 Storms and Flooding

11.4.1 Storms and flooding

Project 11. Habitat Management to Improve Ecological Diversity

11.4.1.1 Extreme storms and flooding events threaten aquatic and marine wildlife through habitat degradation and alteration, including alterations to off-shore or back-bay benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic and marine wildlife.

11.4.1.2 Potentially damage coastal habitats, including beach- and marsh-nesting bird habitats and interdunal wetlands, and can increase marsh erosion.

11.4.1.3 Increase risk of saltwater intrusion to freshwater habitats altering the water chemistry and potentially altering aquatic wildlife community.

11.4.1.4 Flood events alter river or stream morphology, benthic conditions and habitat availability for wildlife, cause bank erosion, and deposit sediments in floodplain wetlands altering wildlife habitat.

11.4.1.5 Storm damage can alter forest structure via blow-downs or micro-bursts, and can destroy bird nesting in the locales where the storms occur.

11.4.2 Increased rainfall

11.4.2.1 Extreme rain events threaten aquatic wildlife through habitat degradation and alteration, including alterations to benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic wildlife.

11.4.2.2 Extreme rain events can damage wildlife nesting and resting habitats, including impacts to avian eggs and chick and small mammal survivorship.

11.4.2.3 More frequent rain events can alter terrestrial and wetland vegetation communities as well as wetland hydrology, shifting wildlife community use.

11.5 Sea-level Rise

11.5.0 Sea-level Rise

11.5.0.2 Increased risk of saltwater intrusion into freshwater systems impacting associated wildlife and native vegetation.

12 Resource Management Needs

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform

12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

- 2.8.0.1 Control invasive insect infestations by implementing BMP strategies through biological, chemical and/or mechanical means that will depress, or when appropriate, eradicate populations in a manner that avoids excessive harm to non-target species using BMPs to control infestations and limit their spread based on an inventory of invasive insect distribution and response to outbreaks.
- 2.8.0.2 Develop, implement, monitor and evaluate pest control/management strategies to reduce the impacts of over-abundant wildlife species (native and/or native, invasive species) on native vegetation and the degradation of habitats supporting SGCN. Over-abundant wildlife species include but are not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.
- 2.11.0.2 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas for target SGCN and/or species groups; management should complement rare species needs in a targeted area.
- 2.11.0.5 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats through vegetation management .
- 2.11.0.8 Maintain, enhance and/or restore biologically appropriate buffers for SGCN-inhabited/used freshwater wetlands through vegetation management.

Project 11. Habitat Management to Improve Ecological Diversity

- 2.11.0.21 Minimize the degradation, alteration and/or changes in hydrology of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) and subsequent disturbances to and behavioral changes of wildlife by maintaining or enhancing these areas and biologically appropriate buffers through habitat management and/or revegetation or restoration efforts.

2.13 Wildlife damage management

2.13.0 Nuisance fish and wildlife damage

- 2.13.0.7 Develop, implement, monitor and evaluate management strategies to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 2.13.0.8 Implement and assess management strategies to control and reduce the impacts of detrimental species and diseases that pose threats to native wildlife or communities.

3 Data Collection and Analysis

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.5 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.6 Develop/improve management strategies to repair marshes and associated beaches damaged by salt hay farm/dike abandonment for all bay shore areas currently degraded.
- 3.5.3.16 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.

3.5.4 Fish and wildlife research, survey and management techniques

3.5.4.21 Develop BMPs to address problematic species and diseases of unknown origin.

7 Law Enforcement

7.1 Law enforcement

7.1.4 Scale Unspecified

7.1.4.6 Recruit law enforcement to assist in the protection and enhancement of SGCN populations, in particular endangered species, through improved awareness of species through trainings, partnerships, and other methods. Information should include but is not limited to: 1) Issues concerning illegal collection of reptiles, 2) Persecution of rare snakes, 3) Illegal recreational activities on public lands (e.g., off-road vehicles) and their impact on wildlife, 4) Identification of sensitive areas, critical sites and/or "hot-spots" for collection.

7.1.4.7 Increase law enforcement presence to enforce regulations governing recreational activities (e.g., the use of personal watercraft and off road vehicles, caving, rock climbing, etc.) on conserved lands and within other sensitive habitats, and discourage activities that cause harm or disturbance to vegetation, wetlands, fish and wildlife.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

8.1.0.33 Engage government agencies, conservation partners and other land managers, communities, landowners, and commercial and industrial stakeholders in discussions regarding the importance of protecting and methods to protect priority wetlands beyond the levels afforded through regulation by maintaining and/or restoring optimal biological buffers around wetlands.

8.1.0.40 Encourage researchers, land managers, naturalists and enthusiasts to follow proper procedures for the coordination and/or permitting of research/management activities involving wildlife and sensitive habitats, and discourage activities that alter vegetation or wetlands, or cause harm or disturbance to wildlife.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

9.1.0.4 Develop a plan that directs the creation of new impoundments and/or the expansion of bogs for cranberry farming within or immediately adjacent to critical forested habitats in a manner that minimizes impacts on the natural hydrology of the watershed and subsequently, the natural wetlands in the area.

Project 11. Habitat Management to Improve Ecological Diversity

- 9.1.0.22 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 9.1.0.28 Develop and coordinate state, regional and local plans for suitable lot layout and landscaping to minimize human-wildlife conflicts that also incorporates habitat connectivity and preservation of natural areas.
- 9.1.0.30 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and other related threats associated with development.
- 9.1.0.31 Develop wetland restoration plans that consider the life history and needs of wildlife occupying targeted habitats.
- 9.1.0.32 Incorporate aquatic habitat connectivity and water quality/effluent standards into local and state aquaculture plans and BMPs.

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

9.3.3 Habitat management planning

- 9.3.3.6 Develop a management plan for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 9.3.3.13 Develop a management plan that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas and prevents or ameliorates near-term impacts of climate change throughout the State, but in particular within the coastal and Delaware Bay areas.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

- 11.1.1.3 Government organizations to thoroughly review wetland restoration plans, applying the most current science for wildlife, habitats and aquatic systems, to assess the impacts to resident and migratory wildlife occupying the targeted habitats.

Project 11. Habitat Management to Improve Ecological Diversity

11.1.1.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.

11.1.1.5 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.

11.1.2 Review of proposed policies and plans

11.1.2.2 Government organizations to thoroughly review wetland restoration plans, applying the most current science for wildlife, habitats and aquatic systems, to assess the impacts to resident and migratory wildlife occupying the targeted habitats.

11.1.2.3 Incorporate aquatic habitat connectivity and water quality/effluent standards into the environmental review process to help establish policies and plans that minimize the impact of aquaculture on fish and wildlife.

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

11.2.0.3 Develop state, regional and local BMPs that focus on minimizing habitat fragmentation and human-wildlife conflicts associated with development. Make information available to land developers and private and public landowners for implementation.

11.2.0.14 Provide educational resources and technical support to public and private landowners and land managers to promote the protection of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters), and to enhance or restore biologically appropriate buffers.

100 Law and Policy

100.1 Legislation

100.1.3 Sub-national Level

100.1.3.2 Develop policies for wetland restoration plans that consider life history requirements and needs of wildlife occupying targeted habitats.

100.1.4 County and Local

100.1.4.15 Incorporate habitat connectivity and the preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and related threats associated with development.

100.1.5 Scale Unspecified

100.1.5.2 Develop policies for wetland restoration plans that consider life history requirements and needs of wildlife occupying targeted habitats.

100.1.5.3 Incorporate aquatic habitat connectivity and water quality/effluent standards into state/local policy to minimize the impact of aquaculture on fish and wildlife.

Project 11. Habitat Management to Improve Ecological Diversity

100.1.5.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).

Job 11.08. Riparian Restoration

Objective: Increase the total area of vegetated riparian buffers statewide in an effort to reduce human impacts along stream corridors by recruiting public and private landowners to maintain and/or enhance riparian areas through educational materials, incentive programs and, where appropriate, regulations.

Purpose: Restore the natural physical, chemical and biological features of and minimize the impacts of human activities on aquatic habitats.

Benefits: Riparian restoration can decrease stream temperatures, reduce flashiness through a restored natural flow regime, reduce erosion through stabilized banks, filter pollutants, reduce sediments, and protect most species of fish, mussels, odonates, and salamanders.

Focal wildlife species benefitting from this job

Fish

Alewife	Atlantic Sturgeon	Banded Sunfish
Blackbanded Sunfish	Blueback Herring	Bridle Shiner
Brook Trout	Comely Shiner	Ironcolor Shiner
Mud Sunfish	Shortnose Sturgeon	Swamp Darter

Macroinvertebrates

Brook Floater	Dwarf Wedgemussel	Eastern Lampmussel
Green Floater	New England Bluet	Papaipema harrisii
Pine Barrens Bluet	Robust Baskettail	Scarlet Bluet
Septima's Clubtail	Superb Jewelwing	Triangle Floater
Yellow Lampmussel		

Mammals

Indiana Bat	Little Brown Bat	Northern Myotis
-------------	------------------	-----------------

Reptiles & Amphibians

Bog Turtle	Eastern Redbelly Turtle	Longtail Salamander
Northern Diamondback Terrapin	Northern Red Salamander	Timber Rattlesnake
Wood Turtle		

Threats and Action Drivers associated with this conservation need

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale)

1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.1.1.2 Loss, alteration and/or degradation of habitat.

1.1.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.1.1.7 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale)

1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.2.1.2 Loss, alteration and/or degradation of habitat.

1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.2.1.7 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale)

1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.3.1.2 Loss, alteration and/or degradation of habitat.

1.3.1.5 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.3.1.6 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

4 Transportation and Service Corridors

4.1 Roads and Railroads

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale)

4.1.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species and inhibiting dispersal of non-volant animals, reducing gene flow.

4.1.1.2 Loss, alteration and/or degradation of habitat associated with road and railroad construction and maintenance, and degradation of adjacent habitats.

4.2 Utility and Service Lines

4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads

4.2.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species, inhibiting dispersal of non-volant animals, reducing gene flow, and creating barriers to fish when service line-associated roads cross streams (e.g., bridges, culverts, fords, etc).

4.2.1.2 Loss, alteration and/or degradation of habitat associated with rights-of-way construction and maintenance, and degradation of adjacent habitats.

7 Natural Systems Modifications

7.3 Other Ecosystem Modifications

7.3.5 Poor habitat management

7.3.5.4 Vegetation clearing or inappropriate alteration adjacent to aquatic habitats threatens aquatic species by degrading habitat and water quality (altering temperature and dissolved oxygen, increasing siltation and dessication, etc.).

9 Pollution

9.1 Domestic and Urban Waste Water

9.1.2 Run-off

9.1.2.1 Chemical fertilizers and nutrient run-off changes the pH in streams and ponds and causes eutrophication in inland waters and estuaries, which can make habitat unsuitable for specialist species and increase the risk of invasive and generalist species.

9.1.2.2 Contaminants degrade aquatic and marine water quality and can bioaccumulate in benthic organisms, threatening wildlife by causing developmental and behavioral abnormalities and reproductive failure.

11 Climate Change and Severe Weather

11.2 Droughts

11.2.1 Droughts

Project 11. Habitat Management to Improve Ecological Diversity

11.2.1.1 Contribute to hardened soils, decreasing water recharge during rains and increasing the likelihood of flash floods during storms.

11.2.1.3 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

11.3 Temperature Extremes

11.3.1 Temperature extremes

11.3.1.1 Increasing temperatures may cause habitat loss and degradation by desiccating and/or raising the temperatures of small wetlands and streams leading to the loss of freshwater mussels and other aquatic species and species reliant upon these habitats.

11.3.1.2 Increased temperatures can negatively impact wetland, riverine, lacustrine and vernal pool-associated or -dependent wildlife by reducing flows, increasing water temperatures, lowering water levels and causing premature drying of vernal habitats.

11.4 Storms and Flooding

11.4.1 Storms and flooding

11.4.1.1 Extreme storms and flooding events threaten aquatic and marine wildlife through habitat degradation and alteration, including alterations to off-shore or back-bay benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic and marine wildlife.

11.4.1.4 Flood events alter river or stream morphology, benthic conditions and habitat availability for wildlife, cause bank erosion, and deposit sediments in floodplain wetlands altering wildlife habitat.

11.4.2 Increased rainfall

11.4.2.1 Extreme rain events threaten aquatic wildlife through habitat degradation and alteration, including alterations to benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic wildlife.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.6** Secure and promote the protection/restoration of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers through incentive programs.
- 1.2.1.8** Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to municipalities, land developers, and other land managers to retain and/or enhance native vegetation adjacent to aquatic habitats, and along riparian areas and wildlife movement corridors.
- 1.2.1.11** Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 1.2.1.12** Create incentives (non-monetary and/or monetary) for land developers to redevelop abandoned areas (e.g., shopping centers, office complexes) to minimize the loss of natural habitats and reduce the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 1.2.1.13** Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to land developers to minimize the impacts of new residential and commercial developments on SGCN and their habitats.

2 Direct Management of Natural Resources

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

- 2.10.0.1** Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.

Project 11. Habitat Management to Improve Ecological Diversity

- 2.10.0.9 Restore and/or enhance riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation, alteration and/or changes in hydrology and subsequent disturbances to and behavioral changes of wildlife (e.g., restoring biologically appropriate buffers, revegetation or restoration efforts, etc.).

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.16 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.

- 2.11.0.21 Minimize the degradation, alteration and/or changes in hydrology of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) and subsequent disturbances to and behavioral changes of wildlife by maintaining or enhancing these areas and biologically appropriate buffers through habitat management and/or revegetation or restoration efforts.

- 2.11.0.35 Increase structural habitat diversity by managing vegetation adjacent to aquatic habitats in a manner that provides a buffer from runoff and erosion and a microclimate to stabilize seasonal temperatures to benefit a variety of aquatic and semi-aquatic species.

7 Law Enforcement

7.1 Law enforcement

7.1.4 Scale Unspecified

- 7.1.4.16 Implement policies that protect and restore riparian areas.

8 Outreach

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.29 Develop educational outreach programs for local decision-makers, land developers, landowners and citizens about the importance of maintaining a vegetative buffer along riparian and aquatic habitats to intercept stormwater runoff and minimize soil erosion.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

Project 11. Habitat Management to Improve Ecological Diversity

- 9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and the SGCN inhabiting them.
- 9.1.0.2 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.1.0.3 Develop a plan that directs the creation of impervious surfaces away from and to minimize impacts on aquatic systems and critical terrestrial habitats. The plan should also include strategies to increase the resiliency of aquatic and critical terrestrial habitats to threats and stressors that would impact the reproduction and survival of wildlife.
- 9.1.0.5 Develop a plan that directs the creation or expansion of energy or utility rights-of-way in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.6 Develop a plan that directs the creation or expansion of roads and railroads or the re-establishment of abandoned railroads within and adjacent to critical forested habitats in a manner that minimizes the impacts on critical forested habitats and the wildlife community.
- 9.1.0.15 Develop a plan to minimize fragmentation of terrestrial and aquatic habitats by roads.
- 9.1.0.19 Develop a plan to minimize the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 9.1.0.22 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.
- 9.1.0.29 Provide GIS or related data, maps, resource inventories, as well as related training, pertaining to the SWAP and it's recommended conservation actions for use or consideration by State, County or municipal planning agencies.
- 9.1.0.30 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and other related threats associated with development.

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

11 Technical Assistance

11.2 Technical assistance

- 11.2.1 With individuals and groups involved in resource management decision making

Project 11. Habitat Management to Improve Ecological Diversity

- 11.2.1.2 Provide professional training and technical assistance tools (e.g., mapping, guidance documents, justification, etc.) to agencies/divisions/programs within and outside of the NJ DEP regarding the SWAP, and the conservation actions recommended therein to help facilitate SWAP implementation.

100 Law and Policy

100.1 Legislation

100.1.4 County and Local

- 100.1.4.4 Secure wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) and biologically appropriate buffers through local ordinances.

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.14 Develop policies and/or regulations that increase the protective buffers of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) to biologically appropriate distances to benefit SGCN that rely upon these habitats and improve the function of the [associated] aquatic systems.

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).

Job 11.09. Create Vernal Pools

Objective: Identify specific areas in conditionally secure, preserved, intact and/or under-represented habitats where vernal pool creation will benefit and expand opportunities for obligate vernal pool breeders and related herpetofauna, in particular where populations have suffered from habitat loss or fragmentation, climate change impacts, disease, etc.). Create one new breeding habitat per year for at least 10 consecutive years. Pools should be long cycle ephemeral pools situated within, ideally, at least 300 acres of intact forest or scrubshrub/young forest habitat, and, ideally, should have a minimum 300m vegetated dispersal habitat in all directions unless created for the purpose of "connectivity" of metapopulations.

Purpose: Assist the long-term persistence of vernal pool breeders.

Benefits: Encourage the dispersal of vernal pool obligate species and range adaption to offset the impacts of sea level rise and subsequent salt water intrusion into existing aquatic systems. Such actions will diversify forest habitat for SGCN and will enhance vernal pool species' resilience to the impacts of climate change, enable them to expand their ranges and promote genetic exchange, in particular those currently with limited range (e.g., Eastern Tiger Salamander), and consequently, improve their resistance to catastrophic population impacts as a result of local disease(s).

Focal wildlife species benefitting from this job

Reptiles & Amphibians

Carpenter Frog	Eastern Box Turtle	Eastern Spadefoot
Eastern Tiger Salamander	Longtail Salamander	New Jersey Chorus Frog
Pine Barrens Treefrog	Wood Turtle	

Threats and Action Drivers associated with this conservation need

5 Biological Resource Use

5.3 Logging and Wood Harvesting

5.3.3 Unintentional effects (subsistence/small scale)

5.3.3.2 Poorly planned/implemented tree harvesting adjacent to waterways and vernal pools can lead to increased water temperatures, soil erosion and sedimentation, and reduces the potential for woody debris within the aquatic system, leading to negative impacts on wildlife.

5.3.4 Unintentional effects (large scale)

5.3.4.3 Poorly planned/implemented tree harvesting adjacent to waterways and vernal pools can lead to increased water temperatures, soil erosion and sedimentation, and reduces the potential for woody debris within the aquatic system, leading to negative impacts on wildlife.

5.3.4.4 Infrastructure and/or equipment use may result in subtle changes to drainage patterns, adversely affecting vernal pool and wetland hydrology.

7 Natural Systems Modifications

7.2 Dams and Water Management/Use

7.2.5 Abstraction of Ground Water (domestic use)

7.2.5.1 Heavy withdrawal of ground water for domestic use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.6 Abstraction of Ground Water (commercial use)

7.2.6.1 Heavy withdrawal of ground water for industrial and commercial use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.7 Abstraction of Ground Water (agricultural use)

7.2.7.1 Heavy withdrawal of ground water for agricultural use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.3 Other Ecosystem Modifications

Project 11. Habitat Management to Improve Ecological Diversity

7.3.4 Lack of natural disturbance patterns or ecosystem functions due to species loss

7.3.4.4 Human interference in natural processes such as clean up (e.g., beach-filling, shoreline hardening, tree/log removal from forests) after storms, in particular those causing post-hurricane washover and/or barrier island westward movement, and tree felling limits the disturbance needed to maintain appropriate habitats for wildlife.

7.3.4.5 The lack of forest disturbance minimizes the diversity of herbaceous vegetation and other shrubs and trees that need a lot of sunlight to grow.

8 Invasive and Other Problematic Species, Genes and Diseases

8.2 Problematic Native Species/Diseases

8.2.1 Unspecified Species

8.2.1.1 Overabundant native insects can damage native vegetation at a large scale, leading to die-offs, altering the ecological community.

11 Climate Change and Severe Weather

11.1 Habitat Shifting or Alteration

11.1.0 Macro- and Micro-Climate Alterations

11.1.0.1 Alters native terrestrial and aquatic habitats at the macro- and micro-climate levels that can affect suitability for wildlife, in particular specialist species.

11.2 Droughts

11.2.1 Droughts

11.2.1.1 Contribute to hardened soils, decreasing water recharge during rains and increasing the likelihood of flash floods during storms.

11.2.1.3 Loss, alteration and/or degradation of terrestrial and aquatic habitats.

11.2.1.6 Increased dessication risk for amphibians and altered wetland hydrology for critical habitats including breeding pools.

11.3 Temperature Extremes

11.3.1 Temperature extremes

11.3.1.1 Increasing temperatures may cause habitat loss and degradation by desiccating and/or raising the temperatures of small wetlands and streams leading to the loss of freshwater mussels and other aquatic species and species reliant upon these habitats.

11.3.1.2 Increased temperatures can negatively impact wetland, riverine, lacustrine and vernal pool-associated or -dependent wildlife by reducing flows, increasing water temperatures, lowering water levels and causing premature drying of vernal habitats.

11.4 Storms and Flooding

Project 11. Habitat Management to Improve Ecological Diversity

11.4.1 Storms and flooding

11.4.1.1 Extreme storms and flooding events threaten aquatic and marine wildlife through habitat degradation and alteration, including alterations to off-shore or back-bay benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic and marine wildlife.

11.4.1.3 Increase risk of saltwater intrusion to freshwater habitats altering the water chemistry and potentially altering aquatic wildlife community.

11.4.2 Increased rainfall

11.4.2.1 Extreme rain events threaten aquatic wildlife through habitat degradation and alteration, including alterations to benthic conditions, damage to submerged aquatic vegetation (SAV), increased turbidity, altered water chemistry, and potentially displacement of aquatic wildlife.

11.4.2.3 More frequent rain events can alter terrestrial and wetland vegetation communities as well as wetland hydrology, shifting wildlife community use.

11.5 Sea-level Rise

11.5.0 Sea-level Rise

11.5.0.2 Increased risk of saltwater intrusion into freshwater systems impacting associated wildlife and native vegetation.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.1.2 Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.

12.1.2 Lack of up-to-date existing information

12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

12.1.3 Need to answer research question

12.1.3.1 There are significant knowledge gaps regarding distribution, dispersal, diseases, population trends, etc. of SGCN.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform

- 12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

- 2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

- 2.10.0.9 Restore and/or enhance riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation, alteration and/or changes in hydrology and subsequent disturbances to and behavioral changes of wildlife (e.g., restoring biologically appropriate buffers, revegetation or restoration efforts, etc.).
- 2.10.0.19 Provide woody debris within documented Tiger Salamander pools to benefit Tiger Salamanders and other associated vernal pool herpetofauna for shelter, egg-attachment and soil protection.
- 2.10.0.20 Expand breeding opportunities for obligate vernal pool breeders and related herpetofauna by creating vegetated buffers for dispersal from breeding pools in all directions, or as needed to establish the connectivity of metapopulations.

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

Project 11. Habitat Management to Improve Ecological Diversity

- 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.
- 2.11.0.2 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas for target SGCN and/or species groups; management should complement rare species needs in a targeted area.

3 Data Collection and Analysis

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

- 3.3.1.12 Conduct an initial assessment of and document the availability and suitability of intact, preserved forest blocks containing vernal pools within the possible range of Eastern Tiger Salamander, which appear under-represented on a landscape scale. Incorporate findings into a database that includes descriptions and qualifiers of the habitats, and a GIS component of the locations of such areas. Share this information with appropriate organizations and/or agencies working to implement habitat restoration and enhancement strategies to provide opportunities for this salamander to disperse and expand its current range.
- 3.3.1.13 Conduct wildlife surveys to confirm or reconfirm locations with suitable hydrologic conditions for tiger salamanders and associated vernal pool herpetofauna.

3.3.2 Monitoring

- 3.3.2.17 Conduct long-term habitat monitoring to determine the continued availability and suitability of intact, preserved forest blocks containing vernal pools within the possible range of Eastern Tiger Salamander. Update the database (to be developed during baseline assessments) regarding the forests' and vernal pools' conditions. Share this information with appropriate organizations and/or agencies working to implement habitat restoration and enhancement strategies to provide opportunities for this salamander to disperse and expand its current range.
- 3.3.2.18 Conduct long-term monitoring of and wildlife surveys at locations with suitable hydrologic conditions for Eastern Tiger Salamanders and associated vernal pool herpetofauna.

7 Law Enforcement

7.1 Law enforcement

7.1.4 Scale Unspecified

- 7.1.4.13 Implement policies that protect vernal pool habitats to benefit SGCN that rely upon them and promotes connectivity of SGCN populations.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

Project 11. Habitat Management to Improve Ecological Diversity

9.1.0.13 Develop a plan to minimize agriculture that would result in groundwater withdrawal in critical forested areas.

9.1.0.14 Develop a plan to minimize development that would result in groundwater withdrawal in critical forested areas.

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

9.3.3 Habitat management planning

9.3.3.27 Develop a management plan to expand breeding habitat and connectivity for tiger salamanders and other obligate vernal pool breeders.

100 Law and Policy

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).

Job 11.10. Woody Debris in Aquatic Habitats to Benefit Wildlife

Objective: Maintain natural and woody debris in aquatic habitats by creating legislation, a regulation or NJ DEP policy that prohibits stream cleaning without a proper on-site assessment regarding the likelihood of a flood hazard.

Purpose: Provide focal aquatic SGCN more suitable and varying habitat structure through the presence of coarse woody debris.

Benefits: Improve habitat diversity and complexity and available basking locations, and improve the substrate for macroinvertebrates. Woody debris creates bed scours and pools within streams and increases cover for prey species in all aquatic systems.

-------------------------	-------------

Threats and Action Drivers associated with this conservation need

5 Biological Resource Use

5.3 Logging and Wood Harvesting

5.3.3 Unintentional effects (subsistence/small scale)

5.3.3.2 Poorly planned/implemented tree harvesting adjacent to waterways and vernal pools can lead to increased water temperatures, soil erosion and sedimentation, and reduces the potential for woody debris within the aquatic system, leading to negative impacts on wildlife.

5.3.4 Unintentional effects (large scale)

5.3.4.3 Poorly planned/implemented tree harvesting adjacent to waterways and vernal pools can lead to increased water temperatures, soil erosion and sedimentation, and reduces the potential for woody debris within the aquatic system, leading to negative impacts on wildlife.

7 Natural Systems Modifications

7.2 Dams and Water Management/Use

7.2.1 Abstraction of Surface Water (domestic use)

7.2.1.3 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, and eliminates shallow water habitats.

7.2.2 Abstraction of Surface Water (commercial use)

7.2.2.1 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, eliminates shallow water habitats, and disrupts/removes stream bottom habitat.

7.2.3 Abstraction of Surface Water (agricultural use)

7.2.3.2 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, and eliminates shallow water habitats.

7.3 Other Ecosystem Modifications

Project 11. Habitat Management to Improve Ecological Diversity

7.3.3 Removal of coarse woody debris (streams, forests, scrub-shrub habitats)

7.3.3.1 Decreases the available detritus that normally accumulates behind and within stream obstructions, minimizing or eliminating food sources and shelters for fishes, invertebrates and amphibians.

7.3.3.2 Decreases habitat and/or corridor suitability due to limited or absent shelter and foraging habitat.

7.3.3.3 Removal of dead trees (snags), large felled logs (i.e., those > 12" dbh), and other downed woody material diminishes nesting, roosting, and sheltering options for wildlife, and increases the ease at which deer can browse regenerating vegetation.

7.3.3.4 Decreases available basking, shelter, and foraging habitats.

7.3.5 Poor habitat management

7.3.5.9 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, eliminates shallow water habitats, and disrupts/removes stream bottom habitat.

7.3.5.14 Intentional felling and removal of dead standing trees or snags eliminates resting, nesting or feeding habitat, and precludes the snags eventual contribution to coarse woody debris and forest floor structure and habitat.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

100 Law and Policy

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

Appendix K: Projects to Conserve New Jersey's Wildlife Populations of Concern

Project 11. Habitat Management to Improve Ecological Diversity

100.4.0.9 Develop and implement policies to minimize the removal of coarse, woody debris in terrestrial, aquatic and riparian habitats in order to benefit wildlife.

100.4.0.22 Work with NJ DEP's Division of Land Use Regulation to ensure protection of listed species and their habitats during stream cleaning events.

Project 12. Habitat Management through Prescribed Burns

Job 12.01. Southern New Jersey Forests - A Tool for Habitat Restoration

Objective: Enable and utilize fire (in combination with other forestry management practices) as a widespread tool for habitat restoration and public safety across 250,000 acres/year, and continue burning on an approximate 5-year cycle.

Purpose: Prevent wildfires from burning out of control while using controlled burns (in combination with other forestry management practices) to increase structural diversity and consequently, the diversity and persistence of forest-dwelling wildlife species.

Benefits: Improve structural diversity within the forest and, consequently, increase/improve suitable wildlife habitats to satisfy the life history requirements of SGCN and increase their survivorship and fecundity to help stabilize or reverse population declines. Additionally, such management can help to improve the forest's resiliency to the threat of pests and climatic changes, increase public safety (Wildland Urban Interface), and protect business investments.

Threats and Action Drivers associated with this conservation need

7 Natural Systems Modifications

7.1 Fire and Fire Suppression

7.1.2 Suppression of Fire Frequency/Intensity

7.1.2.1 Shift in vegetative communities as a result of suppression of natural fires.

12 Resource Management Needs

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform

12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

1.2.1.28 Create incentives to implement dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.

2 Direct Management of Natural Resources

2.3 Fire management

2.3.3 Prescribed burning

Project 12. Habitat Management through Prescribed Burns

- 2.3.3.1 Evaluate different management techniques of prescribed burns that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.
- 2.3.3.2 Conduct prescribed burning in Northern New Jersey forests to maintain and regenerate a mosaic of upland forest habitats.
- 2.3.3.3 Conduct prescribed burning to improve wildlife habitat.

2.11 Vegetation management

- 2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration
 - 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.
 - 2.11.0.23 Implement appropriate habitat management actions in areas where natural disturbances, such as wildfire, have been precluded.

3 Data Collection and Analysis

3.5 Techniques development

- 3.5.3 Habitat restoration methods
 - 3.5.3.3 Develop/improve management techniques that might be used to mimic the historic role of fire and other natural disturbances in shaping an ecosystem.

9 Planning

9.3 Species and habitat management planning

- 9.3.1 Species management planning
 - 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

100 Law and Policy

100.3 State Regulations

- 100.3.0 Regulatory initiatives for species and habitat protection
 - 100.3.0.70 Develop regulations that when implemented will facilitate the restoration of dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.

100.4 State Agency Policy Integration

- 100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).

Job 12.02. Statewide - A Tool to Restore Natural Disturbance Regimes

Objective: Develop and implement an educational initiative teaching citizens and land managers the benefits (and necessity) of using fire as a management tool in Northern Jersey deciduous forests and the Pinelands' forests to restore healthy ecological systems.

Purpose: Educate citizens and land managers of the benefits and necessity of implementing fire as a habitat management tool to maintain and/or restore ecological systems.

Benefits: Develop support for the use of fire as a management tool to maintain and regenerate mosaic upland forest types in Northern Jersey and the Pinelands with the primary focus on ecological systems rather than public safety.

Threats and Action Drivers associated with this conservation need

14 Education/ Outreach Needs

14.2 Outreach needs

14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions

14.2.1.1 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various forest management practices.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

8.1.0.26 Coordinate across federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to woodland landowners to adopt or endorse consistent best management practices concerning controlled burns to maintain and/or improve forested habitat for wildlife.

Project 12. Habitat Management through Prescribed Burns

- 8.1.0.44 Engage conservation partners, stakeholders, government agencies and other land stewards in constructive dialogues encouraging their inclusion of controlled burns in forest and other stewardship plans.

9 **Planning**

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

Job 12.03. Prescribed Burn Policy: Revise to include Ecological Enhancement of Private and Conserved Lands

Objective: Revise State policies to extend the prescribed burning season and enable the use of prescribed burns on private and conserved lands for the purpose of ecological diversity and habitat enhancement for wildlife, and to decrease fuel loads.

Purpose: Improve ecological diversity and habitat enhancement for wildlife, and prevent wildfires.

Benefits: Increase opportunities to use fire as a tool to promote ecological diversity, restore fire ecology within the Pinelands, and minimize the risk of wildfires.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

12 Resource Management Needs

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms

12.3.0.9 Prescribed burns implemented by the NJ Forest Fire Service are constrained by State air quality regulations to a timeframe where seasonal weather conditions are less than ideal for effective burning. As a result, the Forest Fire Service is limited in the number of overall prescribed burns it can implement to restore habitat for wildlife.

12.4.0 State Policy and Procedure Reform

12.4.0.5 Bureau of Forest Fire Management policy has traditionally implemented prescribed burns on State lands for the sole purpose of public safety (i.e., addressing hazard fuel reduction), missing opportunities to burn in a manner that would additionally manage habitat for ecological diversity.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform

12.4.0.5 Bureau of Forest Fire Management policy has traditionally implemented prescribed burns on State lands for the sole purpose of public safety (i.e., addressing hazard fuel reduction), missing opportunities to burn in a manner that would additionally manage habitat for ecological diversity.

Project 12. Habitat Management through Prescribed Burns

- 12.4.0.7 Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

100 Law and Policy

100.1 Legislation

100.1.4 County and Local

- 100.1.4.14 Adopt/pass local ordinances which require assessing and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.45 Increase the controlled burn season to focus on restoring vegetative communities.
- 100.3.0.70 Develop regulations that when implemented will facilitate the restoration of dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

Project 12. Habitat Management through Prescribed Burns

- 100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).
- 100.4.0.17 Develop policies to implement habitat management strategies, including prescribed burns, that will increase the structural diversity on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies to control and reduce the impacts of invasive, non-native species in order to increase structural habitat diversity.

Project 13. Land Management Coordination on Military Properties

Job 13.01. Improving Biodiversity on Military Lands

Objective: Improve the existing military planning mechanism (i.e., the Integrated Natural Resource Management Plan or INRMP) to include best practices for all SGCN (e.g., forest management, minimizing disturbances, appropriate timing of activities, etc.).

Purpose: Improve ecological diversity on military lands by improving management efforts for rare species and their habitats through the implementation of best practices provided through educational programs and materials, positive public relation incentives, and technical assistance to military facility staff regarding the importance of biodiversity and their responsibility for New Jersey's resources.

Benefits: Improve management efforts on military lands to benefit all SGCN by maintaining or restoring suitable habitats to satisfy SGCN's life history requirements and minimizing the risk of harm during management and/or daily activities.

Focal wildlife species benefitting from this job

Birds

American Oystercatcher	American Woodcock	Black Rail
Black Skimmer	Blue-winged Warbler	Bobolink
Cerulean Warbler	Common Tern	Eastern Meadowlark
Forster's Tern	Golden-winged Warbler	Grasshopper Sparrow
Kentucky Warbler	Least Tern	Little Blue Heron
Northern Bobwhite	Northern Harrier	Peregrine Falcon
Pied-billed Grebe	Piping Plover	Prothonotary Warbler
Red Knot	Red-headed Woodpecker	Ruddy Turnstone
Scarlet Tanager	Snowy Egret	Tricolored Heron
Vesper Sparrow	Wood Thrush	

Fish

Alewife	Atlantic Sturgeon	Banded Sunfish
Blackbanded Sunfish	Blueback Herring	Bridle Shiner
Brook Trout	Comely Shiner	Ironcolor Shiner
Mud Sunfish	Shortnose Sturgeon	Swamp Darter

Macroinvertebrates

A Notodontid Moth (H. varia)	American Bumble Bee	Arogos Skipper

Northern Pine Snake	Northern Red Salamander	Northern Scarlet Snake
Pine Barrens Treefrog	Timber Rattlesnake	Wood Turtle

Threats and Action Drivers associated with this conservation need

5 Biological Resource Use

5.1 Hunting and Collecting Terrestrial Animals

5.1.3 Persecution/Control

5.1.3.1 Wanton killing of perceived dangerous and/or undesirable animals.

5.1.3.2 Improper exclusion methods and/or timing can result in injury, death, or entrapment of bats in buildings.

5.3 Logging and Wood Harvesting

5.3.1 Intentional Use (subsistence/small scale)

- 5.3.1.1** Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may fragment their terrestrial habitats.
- 5.3.1.2** Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may cause the loss, alteration and/or degradation of wildlife habitat.
- 5.3.1.3** Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase soil erosion, impacting SGCN habitats.
- 5.3.1.4** Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase the risk of invasive species establishment, impacting SGCN habitats.
- 5.3.1.5** Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may decrease structural diversity and biomass leading to reduced biodiversity and ecological integrity.
- 5.3.1.6** Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices in Atlantic White Cedar stands may destroy a unique wildlife wetland habitat that is difficult, and takes time, to restore.

5.3.3 Unintentional effects (subsistence/small scale)

- 5.3.3.1** Direct mortality of wildlife, direct loss of suitable habitats (roost, foraging, shelter, etc.), and can disrupt sensitive species, decreasing the likelihood of success and/or reproduction.
- 5.3.3.2** Poorly planned/implemented tree harvesting adjacent to waterways and vernal pools can lead to increased water temperatures, soil erosion and sedimentation, and reduces the potential for woody debris within the aquatic system, leading to negative impacts on wildlife.

6 **Human Intrusions and Disturbance**

6.2 Military Exercises

6.2.1 Military exercises

- 6.2.1.1** Military testing and training exercises may inflict disturbance and potential physical harm to wildlife.

7 **Natural Systems Modifications**

7.3 Other Ecosystem Modifications

7.3.5 Poor habitat management

- 7.3.5.5 Habitat management that alters or removes vegetation without implementing long-term management increases the risk of invasive and exotic plants establishing themselves, outcompeting native vegetation.

9 Pollution

9.3 Agricultural and Forestry Effluents

9.3.5 Control of insect pests and plants leading to mortality of non-target species not associated with agriculture

- 9.3.5.1 Use of pesticides, insecticides, and/or herbicides can directly harm non-target species, such as amphibians and beneficial invertebrates through direct contact and/or by reducing and/or contaminating their food supply.
- 9.3.5.4 Improper use of current insecticides, such as those containing esfenvalerate, prallethrin, or piperonyl butoxide, or past use of pesticides containing chlordane still present in the soils, are toxic to various wildlife species, and can cause injury, mortality, or other effects that impair population viability.
- 9.3.5.5 Use of pesticides and herbicides can minimize the abundance of food sources for native wildlife populations.

9.5 Air-Bourne Pollutants

9.5.4 Other: Other air-bourne pollutants impacting habitat and/or animals.

- 9.5.4.1 Dust and/or airborne sedimentation from construction sites, agricultural operations or related earth disturbances can introduce mineral or organic sediments into adjacent wildlife habitats, degrading their quality and suitability for wildlife short-term and/or long-term.

9.6 Excess Energy

9.6.2 Thermal Pollution

- 9.6.2.2 Water temperature changes to aquatic systems can deter or preclude use by SGCN (e.g., alter habitat suitability for wildlife species, reduce prey base) or present stressors that are harmful if not fatal to wildlife.

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats

- 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.
- 14.1.1.2 Lack of general knowledge of SGCN life histories and vulnerabilities as they relate to land management practices.

14.2 Outreach needs

14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions

14.2.1.5 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various wetland management practices.

Conservation actions that address Threats and Action Drivers

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

1.2.1.14 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of herbicides and pesticides, and implementing more ecologically safe strategies when using such products.

1.2.1.28 Create incentives to implement dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.

2 Direct Management of Natural Resources

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

2.11.0.4 Implement vegetation management strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife, particularly SGCN.

2.11.0.7 Protect significant natural and/or unique communities by implementing best management practices through vegetation management.

2.11.0.13 Implement best management practices (BMPs), protective strategies, and guidelines for vegetation management to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

2.11.0.16 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.

2.11.0.17 Implement vegetation management strategies to improve the availability of prey/food resources for SGCN whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources.

Project 13. Land Management Coordination on Military Properties

- 2.11.0.18 Implement forest management/silvicultural strategies that promote the development of new old-growth forests and/or minimize the loss of old-growth forest stands with large trees and within large, contiguous tracts.
- 2.11.0.19 Implement forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN.
- 2.11.0.23 Implement appropriate habitat management actions in areas where natural disturbances, such as wildfire, have been precluded.
- 2.11.0.35 Increase structural habitat diversity by managing vegetation adjacent to aquatic habitats in a manner that provides a buffer from runoff and erosion and a microclimate to stabilize seasonal temperatures to benefit a variety of aquatic and semi-aquatic species.

3 Data Collection and Analysis

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.15 Modify management practices based on the effects of pesticides, herbicides and other biological controls on critical and supporting SGCN habitats.

3.5.4 Fish and wildlife research, survey and management techniques

- 3.5.4.2 Develop, implement, monitor and evaluate management strategies to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 3.5.4.14 Develop and implement agreements, and update existing agreements, with government agencies regarding the protection of critical SGCN habitats (e.g., significant breeding populations of beach nesting birds, colonial waterbird nesting areas, bat colonies, etc.).
- 3.5.4.22 Investigate the efficacy of implementing strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.13 Engage DOD in a constructive dialogue regarding strategies to minimize disturbances to all SGCN (i.e., beyond their federal requirements) from forest management and other practices on their lands.

Project 13. Land Management Coordination on Military Properties

8.1.0.43 Engage Nuisance Wildlife Control Operators (NWCs), conservation partners, and the public in conserving bat populations by advising proper exclusion methods from buildings, offering bat houses where roosting habitat is needed, and improving the public's understanding and acceptance of bats.

8.1.0.50 Engage Nuisance Wildlife Control Operators (NWCs), conservation partners, and the public in conserving snake populations by advising proper removal from buildings, exclusion methods from buildings, and improving the public's understanding and acceptance of snakes.

9 **Planning**

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.9 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.

9.3.1.16 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.

9.3.3 Habitat management planning

9.3.3.15 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.

9.3.3.32 DOD and appropriate state agencies work together to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities and to improve SGCN habitat and presence.

11 **Technical Assistance**

11.1 Environmental review

11.1.1 Review of proposed projects

11.1.1.7 Review proposed construction or other work projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

11.2.0.5 Provide educational resources, training programs, and expert guidance to private and public landowners and land managers on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

Project 13. Land Management Coordination on Military Properties

- 11.2.0.28 Provide educational resources, training programs, and on-the-ground guidance to Nuisance Wildlife Control Operators (NWCOS) and the public to ensure that proper bat exclusion methods are followed when addressing issues of bats in buildings.
 - 11.2.0.29 Provide educational resources, training programs, and on-the-ground guidance to Nuisance Wildlife Control Operators (NWCOS), conservation partners, and the public in conserving snake populations by advising proper removal from buildings, exclusion methods from buildings, and improving the public's understanding and acceptance of snakes.
 - 11.2.1 With individuals and groups involved in resource management decision making
 - 11.2.1.3 Provide educational resources, training programs, and on-the-ground guidance to DOD to improve DOD Integrated Natural Resource Management Plans (INRMP) to develop and implement forest management and other practices that minimize disturbances to SGCN (i.e., beyond their federal requirements).
 - 11.2.1.6 Provide educational resources, training programs, and on-the-ground guidance to resource agencies prior to project initiation to ensure wildlife and their habitats are protected to the highest degree possible during construction, and provisions are in place for post-construction habitat use.

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.49 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address the issue of disturbance to habitat or species as a result of human activities (e.g., construction, bridge maintenance, road work, etc.).

Project 14. Fostering Habitat in Urbanized/Suburbanized Areas

Job 14.01. Limit Fragmentation through Creation and Improvement of Urban/Suburban Wildlife Habitat

- Objective:** Provide transition habitat for birds, reptiles, amphibians, and pollinators by creating edge habitat along the periphery of development and encourage developers to include native grassland and woody vegetation as opposed to "landscaped" areas within stormwater basins.
- Purpose:** Reduce fragmentation of native habitats by maintaining/creating logical connectivity through appropriate habitat planning and management efforts.
- Benefits:** Increase and/or improve available wildlife habitat within developed areas to minimize the impacts of habitat fragmentation through native plant landscaping within basins and throughout developments. Create a buffer zone/ecotone between habitats to improve structural diversity and potentially increase foraging habitat for wildlife. Such management would enhance habitat for SGCN and other wildlife.

Threats and Action Drivers associated with this conservation need

7 Natural Systems Modifications

7.3 Other Ecosystem Modifications

7.3.5 Poor habitat management

7.3.5.2 Shifting from natural vegetation to lawns can cause increased temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

7.3.5.3 Vegetation clearing removes terrestrial and riparian corridors for animal movement, shelter, and resting areas.

7.3.5.4 Vegetation clearing or inappropriate alteration adjacent to aquatic habitats threatens aquatic species by degrading habitat and water quality (altering temperature and dissolved oxygen, increasing siltation and dessication, etc.).

7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats

14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.

14.1.1.2 Lack of general knowledge of SGCN life histories and vulnerabilities as they relate to land management practices.

Conservation actions that address Threats and Action Drivers

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.8** Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to municipalities, land developers, and other land managers to retain and/or enhance native vegetation adjacent to aquatic habitats, and along riparian areas and wildlife movement corridors.

8 Outreach

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.24** Develop educational outreach programs for local decision-makers, land developers, landowners and citizens about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.

11 Technical Assistance

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

- 11.2.0.1** Provide technical support to private and public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 11.2.0.9** Provide educational resources, training programs, and on-the-ground guidance to municipalities, land developers, and other land managers and private landowners about the importance of leaving vegetation in place, especially along riparian areas and wildlife movement corridors.
- 11.2.0.22** Provide educational resources, training programs, and expert guidance to public and private landowners and land managers about lawn alternatives and the importance of natural vegetation and "edge" habitats on developed properties.

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.73** Develop regulations that would exempt the conversion of lawns to native vegetation (beneficial to wildlife) from local lawn ordinances.

Project 15. Mapping Early Successional Habitats for Planning and Management

Job 15.01. Plan for Development and Agriculture

Objective: Map existing and potential areas (e.g., corporate lawns) for early succession forest habitats to assist long-term landscape-level planning, and habitat creation and management that will address the threats of development and agriculture on early successional species and habitats.

Purpose: Increase and improve early succession forest habitat availability to benefit early successional species.

Benefits: Direct efforts to create and manage early successional habitat for wildlife dependent upon them to help increase survivorship.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.2 Lack of up-to-date existing information

12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats

14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.

Conservation actions that address Threats and Action Drivers

3 Data Collection and Analysis

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

3.3.1.2 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) resident and migratory SGCN habitats. Investigate their suitability for the various life history requirements of the species that dependent upon them to determine the ability for maintaining applicable SGCN populations in perpetuity.

3.3.1.4 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and investigate the suitability of corridors that connect large, contiguous tracts of similar habitats to increase their effective size (i.e., forest with forest, grassland with grassland, wetlands with wetlands, etc.) for dependent SGCN.

3.3.1.5 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) where habitat restoration and/or enhancement would benefit wildlife SGCN.

3.3.1.7 Map and prioritize existing and potential areas for early succession forest management. Share the results with state, county and municipal planners.

3.3.2 Monitoring

Project 15. Mapping Early Successional Habitats for Planning and Management

- 3.3.2.2 Conduct long-term monitoring of resident and migratory SGCN habitats using standardized survey protocols to determine changes in habitat quality/suitability and threats (e.g., habitat loss and degradation, increased edge habitat, water quality) and other variables that may impact their long-term persistence in the State and to provide information needed for determining causes of population declines and understanding metapopulation dynamics.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.17 Engage municipalities in constructive dialogue to identify and minimize destruction of areas prioritized for early succession forest management.

Project 16. Farming for Bobwhite Quail

Job 16.01. Farming for Bobwhite Quail

Objective: Work with farming operations and woodland landowners to decrease clean farming (edge-to-edge) field practices and create ecotones to provide gradual shifts in habitat structure from farm field or grassland to forest.

Purpose: Improve habitat for early successional species, in particular, Northern Bobwhite Quail.

Benefits: Increase Northern Bobwhite Quail habitat, survivorship and fecundity in farmed fields, which will help stabilize or reverse population declines of Northern Bobwhite Quail and other SGCN.

Focal wildlife species benefitting from this job

--------------------	-------------

Threats and Action Drivers associated with this conservation need

2 Agriculture and Aquaculture

2.1 Annual and Perennial Crops (non-timber)

2.1.3 Agro-industry

Project 16. Farming for Bobwhite Quail

- 2.1.3.5 Loss of ecotones by implementing clean farming (edge-to-edge) practices degrades habitat for early successional wildlife.

7 Natural Systems Modifications

7.1 Fire and Fire Suppression

7.1.2 Suppression of Fire Frequency/Intensity

- 7.1.2.1 Shift in vegetative communities as a result of suppression of natural fires.

- 7.1.2.2 Lack of diversity in age structure and composition of vegetation due to the suppression of fire.

7.3 Other Ecosystem Modifications

7.3.4 Lack of natural disturbance patterns or ecosystem functions due to species loss

- 7.3.4.5 The lack of forest disturbance minimizes the diversity of herbaceous vegetation and other shrubs and trees that need a lot of sunlight to grow.

7.3.5 Poor habitat management

- 7.3.5.12 Lack of diversity in age structure and composition of vegetation due to lack of natural disturbances and/or vegetation management.

Conservation actions that address Threats and Action Drivers

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.28 Create incentives to implement dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.

- 1.2.1.28 Create incentives to implement dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.

2 Direct Management of Natural Resources

2.3 Fire management

2.3.3 Prescribed burning

- 2.3.3.3 Conduct prescribed burning to improve wildlife habitat.

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.23 Implement appropriate habitat management actions in areas where natural disturbances, such as wildfire, have been precluded.

11 Technical Assistance

Project 16. Farming for Bobwhite Quail

11.2 Technical assistance

11.2.2 With private landowners

- 11.2.2.1 Provide technical support to farming operations and woodland landowners on ways to decrease clean farming (edge-to-edge) practices and create ecotones to benefit bobwhite and other species dependent on early successional habitat.

Project 17. Habitat Connectivity

Job 17.01. Planning with "Connecting Habitat Across New Jersey (CHANJ)" and Mitigation for Road Impacts

Objective: Use CHANJ products to identify and mitigate the impacts of roads on terrestrial-bound wildlife.

Purpose: Strategic mitigation of the effects of fragmentation and vehicle strikes on terrestrial bound species.

Benefits: Provide safe opportunities for terrestrial-bound to disperse and/or expand their range and increase the persistence and viability of terrestrial-bound species that need to disperse to habitats on the opposing side of the road to fulfill life history requirements.

Focal wildlife species benefitting from this job

Pine Barrens Treefrog	Timber Rattlesnake	Wood Turtle

Threats and Action Drivers associated with this conservation need

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale)

1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

4 Transportation and Service Corridors

4.1 Roads and Railroads

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale)

4.1.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species and inhibiting dispersal of non-volant animals, reducing gene flow.

4.1.1.2 Loss, alteration and/or degradation of habitat associated with road and railroad construction and maintenance, and degradation of adjacent habitats.

Project 17. Habitat Connectivity

4.1.1.3 Re-establishment of abandoned railroad lines may displace wildlife, in particular, less mobile species using the area to fulfill critical life history requirements.

4.1.1.5 Re-establishment of abandoned railroad lines may decrease turtles' abilities to disperse due to their difficulty traversing the railroad ties and tracks, leading to decreased genetic exchange.

4.1.2 Movement of cars and other vehicles on roads and railroads (large and small scale)

4.1.2.1 Increased vehicle traffic increases the risk of wildlife mortality from strikes.

4.2 Utility and Service Lines

4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads

4.2.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species, inhibiting dispersal of non-volant animals, reducing gene flow, and creating barriers to fish when service line-associated roads cross streams (e.g., br

4.2.1.2 Loss, alteration and/or degradation of habitat associated with rights-of-way construction and maintenance, and degradation of adjacent habitats.

7 Natural Systems Modifications

7.2 Dams and Water Management/Use

7.2.12 Culverts

7.2.12.1 Improper design, placement, installation and maintenance of culverts and other stream crossing structures can impede or prevent the movements of terrestrial organisms and can restrict or limit stream flow, impeding the movement of aquatic organisms along

7.3 Other Ecosystem Modifications

7.3.5 Poor habitat management

7.3.5.4 Vegetation clearing or inappropriate alteration adjacent to aquatic habitats threatens aquatic species by degrading habitat and water quality (altering temperature and dissolved oxygen, increasing siltation and dessication, etc.).

7.3.5.7 Improperly planned habitat management and/or mitigation efforts along roadsides and within the medians can attract wildlife and increase the risk of vehicle strikes.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.2 Lack of up-to-date existing information

Project 17. Habitat Connectivity

- 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.
- 12.1.2.2 Lack of wildlife monitoring at sites with structures that pose high risk of mortality to SGCN wildlife.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.2 Dam and barrier removal

2.2.1 Culvert work

- 2.2.1.1 Replace existing barriers to wildlife movement with and/or install appropriately-sized systems to accommodate wildlife dispersal.

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

- 2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.
- 2.8.0.5 Implement biologically safe and appropriate control/management strategies, and where appropriate, eradication strategies to reduce the impacts and/or limit the distribution of invasive and/or non-native plant species within or near aquatic systems using methods that will provide the most protection to the aquatic and riparian ecological system, and minimize disturbance to the soil and wildlife. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.

2.10 Planting/seeding

Project 17. Habitat Connectivity

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

2.10.0.4 Restore and/or enhance suitable travel corridors connecting conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats.

2.10.0.6 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats.

2.10.0.22 Restore and/or enhance terrestrial and aquatic habitats to promote the regeneration of native vegetation and enhance structural diversity to benefit SGCN (e.g., vegetative buffers of aquatic systems, allow coarse, woody debris to remain in terrestrial, aquatic and riparian habitats to provide shelter, riparian stabilization and necessary microclimates, plant native trees, shrubs and grasses, etc.).

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

2.11.0.3 Create suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats through vegetation management.

3 Data Collection and Analysis

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

3.2.0.1 Division of Fish and Wildlife should maintain a robust, up-to-date database and mapping of species occurrences.

3.2.0.6 Develop, implement and conduct studies to evaluate the effectiveness of methods implemented to reduce road mortality of wildlife (e.g. wildlife underpasses, road closures).

3.2.3 Baseline inventory

3.2.3.7 Identify roads or portions of roads, paved or unimproved (through site surveys, land use/land cover assessments and analyses, review of available data, enlistment of species experts, etc.) with high incidences of road mortality and/or presence of snakes, turtles, medium-sized and large mammals. Conduct assessments of the roads and incorporate information into a database that includes descriptions (e.g., qualifiers to help prioritize the roads' risk to wildlife) and a GIS component of the locations of such areas. Share this information with appropriate organizations and/or agencies working to implement measures (e.g., wildlife passages, road closures) to minimize the risk to these species.

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

3.3.1.4 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and investigate the suitability of corridors that connect large, contiguous tracts of similar habitats to increase their effective size

Project 17. Habitat Connectivity

3.3.1.6 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) that could, through revegetation and/or enhancement efforts, become suitable travel corridors connecting and increasing the effect

3.3.2 Monitoring

3.3.2.2 Conduct long-term monitoring of resident and migratory SGCN habitats using standardized survey protocols to determine changes in habitat quality/suitability and threats (e.g., habitat loss and degradation, increased edge habitat, water quality) and other variables that may impact their long-term persistence in the State and to provide information needed for determining causes of population declines and understanding metapopulation dynamics.

3.5 Techniques development

3.5.4 Fish and wildlife research, survey and management techniques

3.5.4.9 Conduct studies to evaluate the impacts of roads on SGCN and develop, implement and conduct studies to evaluate the effectiveness of methods to reduce road mortality of wildlife (e.g. wildlife underpasses, road closures).

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and SGCN inhabiting them.

9.1.0.15 Develop a plan to minimize fragmentation of terrestrial and aquatic habitats by roads.

9.1.0.18 Develop a plan to minimize the effects of road widening and traffic volume increases within critical wildlife habitat areas using CHANJ products.

9.1.0.22 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.

9.1.0.23 Develop a plan to mitigate the effects of transportation barriers by using CHANJ products.

9.1.0.27 Develop a plan to use wildlife-appropriate culverts in critical forested areas.

9.1.0.30 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize habitat fragmentation and other related threats associated with development.

9.3 Species and habitat management planning

9.3.1 Species management planning

Project 17. Habitat Connectivity

- 9.3.1.13 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
 - 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.
 - 9.3.3 Habitat management planning
 - 9.3.3.10 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
 - 9.3.3.22 Create management plans to minimize and/or prevent wildlife road mortality that will incorporate wildlife passages in conjunction with barrier fencing and, where possible, seasonal closures. Aquatic-associated passages must avoid disturbance to the natura

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

- 11.1.1.9 Review strategies for creating or enhancing connectivity (e.g., installing appropriately-sized wildlife passages) between wetlands to allow wildlife to disperse naturally and safely.

11.1.2 Review of proposed policies and plans

- 11.1.2.4 Review strategies for creating or enhancing connectivity (e.g., installing appropriately-sized wildlife passages) between wetlands to allow wildlife to disperse naturally and safely.

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.19 Develop regulations that will minimize the creation of new barriers, remove or replace current barriers with appropriately-sized systems to accommodate wildlife dispersal, and to minimize road widening and traffic volume increases within critical wildlife habitat areas.

Job 17.02. Wildlife Wetland Corridors - Linking Corridors through Acquisition

Objective: Identify optimal wetland corridors for wildlife through GIS modeling at the state, state's landscape regions, and county levels to target priority areas for protection and management.

Purpose: Provide data and guidance to governing agencies, non-profit organizations, and land managers regarding the location and importance of wetlands/wetland corridors critical to and enabling wildlife to disperse for foraging and/or reproduction and improve resiliency to threats (e.g., changes in hydrology, climatic changes, severe weather, development and fragmentation).

Benefits: Help conservation partners identify specific areas for protection and/or management.

Objective: Connect wetlands by acquiring suitable lands to be managed/retained as wildlife corridors through fee title or easement purchase to allow for species' safe dispersal for genetic diversity, to fulfill life history requirements, expand their ranges, and to assist species' resiliency to habitat loss as a result of development, infrastructure, or climate change by providing the opportunity to safely shift their range.

Purpose: Combat the impacts of development, infrastructure, and climate change on wetland-dependent species.

Benefits: Help conservation partners identify specific areas for protection and/or management.

Objective: Connect wetlands by managing lands as wildlife corridors to allow for species' safe dispersal for genetic diversity, to fulfill life history requirements, expand their ranges, and to assist species' resiliency to habitat loss as a result of development, infrastructure, or climate change by providing the opportunity to safely shift their range.

Purpose: Combat the impacts of development, infrastructure, and climate change on wetland-dependent species.

Benefits: Provide opportunities for wetland-dependent and -associate species to expand their range, improve genetic exchange, increase survivorship and fecundity, and to minimize harm associated with threats (e.g., development and infrastructure, changes in hydrology, climatic conditions, etc.).

Focal wildlife species benefitting from this job

Timber Rattlesnake	Wood Turtle	

Threats and Action Drivers associated with this conservation need

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale)

- 1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
- 1.1.1.2 Loss, alteration and/or degradation of habitat.
- 1.1.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.
- 1.1.1.5 Impervious surfaces can lead to a decrease in water recharge.
- 1.1.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
- 1.1.1.7 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale)

- 1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
- 1.2.1.2 Loss, alteration and/or degradation of habitat.
- 1.2.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.
- 1.2.1.5 Impervious surfaces can lead to a decrease in water recharge.
- 1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
- 1.2.1.7 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale)

Project 17. Habitat Connectivity

- 1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
- 1.3.1.2 Loss, alteration and/or degradation of habitat.
- 1.3.1.4 Impervious surfaces can lead to a decrease in water recharge.
- 1.3.1.5 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
- 1.3.1.6 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

4 Transportation and Service Corridors

4.1 Roads and Railroads

- 4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale)
 - 4.1.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species and inhibiting dispersal of non-volant animals, reducing gene flow.
 - 4.1.1.3 Re-establishment of abandoned railroad lines may displace wildlife, in particular, less mobile species using the area to fulfill critical life history requirements.
 - 4.1.1.5 Re-establishment of abandoned railroad lines may decrease turtles' abilities to disperse due to their difficulty traversing the railroad ties and tracks, leading to decreased genetic exchange.
- 4.1.2 Movement of cars and other vehicles on roads and railroads (large and small scale)
 - 4.1.2.1 Increased vehicle traffic increases the risk of wildlife mortality from strikes.

4.2 Utility and Service Lines

- 4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads
 - 4.2.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species, inhibiting dispersal of non-volant animals, reducing gene flow, and creating barriers to fish when service line-associated roads cross streams (e.g., bridges, culverts, fords, etc).
 - 4.2.1.2 Loss, alteration and/or degradation of habitat associated with rights-of-way construction and maintenance, and degradation of adjacent habitats.
- 4.2.2 Management of rights-of-way or communication tower facilities and/or their associated access roads
 - 4.2.2.1 Improper or poorly scheduled vegetation management can cause direct mortality to and may reduce productivity of wildlife.

11 Climate Change and Severe Weather

11.1 Habitat Shifting or Alteration

- 11.1.0 Macro- and Micro-Climate Alterations

Project 17. Habitat Connectivity

- 11.1.0.1 Alters native terrestrial and aquatic habitats at the macro- and micro-climate levels that can affect suitability for wildlife, in particular specialist species.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

- 12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.2 Lack of up-to-date existing information

- 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.11 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

2 Direct Management of Natural Resources

Project 17. Habitat Connectivity

2.2 Dam and barrier removal

2.2.1 Culvert work

- 2.2.1.1 Replace existing barriers to wildlife movement with and/or install appropriately-sized systems to accommodate wildlife dispersal.

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

- 2.10.0.4 Restore and/or enhance suitable travel corridors connecting conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats.

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.3 Create suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN by restoring unsuitable (or less optimal) habitats through vegetation management.
- 2.11.0.13 Implement best management practices (BMPs), protective strategies, and guidelines for vegetation management to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.11.0.26 Conduct vegetation management along roadsides and medians, avoiding peak activity periods for wildlife, that enhances wildlife dispersal naturally and safely across roads and similar barriers to/between terrestrial and/or aquatic habitats.

3 Data Collection and Analysis

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

- 3.3.1.4 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and investigate the suitability of corridors that connect large, contiguous tracts of similar habitats to increase their effective size (i.e., forest with forest, grassland with grassland, wetlands with wetlands, etc.) for dependent SGCN.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

- 6.0.0.1 Enhance and increase the effective size of critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates by securing adjacent habitats through an appropriate combination of fee title, non-fee title and landowner agreements.

Project 17. Habitat Connectivity

- 6.0.0.3 Secure and protect riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.5 Secure and protect critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.18 Engage NJDOT, NJ Transit Authority and other road management entities, wildlife conservation organizations/agencies (e.g., Division of Fish and Wildlife, New Jersey Conservation Foundation, Conserve Wildlife Foundation of NJ), and communities and citizens in discussions regarding the importance of and methods to enhance habitat connectivity, and work together to develop feasible strategies for ensuring that wildlife can disperse naturally and safely across roads and similar barriers to terrestrial and/or aquatic habitats.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

- 9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and the SGCN inhabiting them.
- 9.1.0.2 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.1.0.3 Develop a plan that directs the creation of impervious surfaces away from and to minimize impacts on aquatic systems and critical terrestrial habitats. The plan should also include strategies to increase the resiliency of aquatic and critical terrestrial habitats to threats and stressors that would impact the reproduction and survival of wildlife.
- 9.1.0.19 Develop a plan to minimize the extent of impervious surfaces as part of new construction to increase water recharge in those areas.
- 9.1.0.22 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.

9.3 Species and habitat management planning

Project 17. Habitat Connectivity

9.3.1 Species management planning

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

9.3.3 Habitat management planning

9.3.3.22 Create management plans to minimize and/or prevent wildlife road mortality that will incorporate wildlife passages in conjunction with barrier fencing and, where possible, seasonal closures. Aquatic-associated passages must avoid disturbance to the natural streambeds and riparian habitat, permit high volumes of water to flow freely, and provide adequate travel corridors for terrestrial wildlife, while maintaining stream flow for fish passage. Bridges that span rivers and streambeds and include floodplain habitat on either side of the span to provide travel corridors for terrestrial wildlife are preferred over culverts.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

11.1.1.2 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.

11.1.1.5 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.

11.1.1.9 Review strategies for creating or enhancing connectivity (e.g., installing appropriately-sized wildlife passages) between wetlands to allow wildlife to disperse naturally and safely.

11.1.2 Review of proposed policies and plans

11.1.2.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimize human-associated disturbances to those habitats and the SGCN inhabiting them.

11.1.2.4 Review strategies for creating or enhancing connectivity (e.g., installing appropriately-sized wildlife passages) between wetlands to allow wildlife to disperse naturally and safely.

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

Project 17. Habitat Connectivity

- 11.2.0.1 Provide technical support to private and public landowners and land managers for carrying out restoration and management practices aimed at increasing structural habitat diversity.
- 11.2.0.24 Provide educational resources, training programs, and expert guidance to public and private landowners and land managers on how to manage vegetated roadside areas (e.g., mowing, brush-hogging, etc.) on a schedule that avoids peak activity periods for wildlife and therefore, minimizes harm.

100 Law and Policy

100.1 Legislation

100.1.5 Scale Unspecified

- 100.1.5.4 Incorporate habitat connectivity and preservation of natural areas into state and local land-use policy and the environmental review process to minimize the impacts of transportation and service corridors on fish and wildlife and their habitats.

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.16 Develop policies to implement habitat management strategies that will increase the structural diversity surrounding areas used for energy, mining, and transportation and service corridors which include but are not limited to the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-asides.

Project 18. Invasive and Non-native Species Control

Job 18.01. Protect Natural Areas from Invasive Species

Objective: Identify and protect high quality habitats from non-native and/or invasive plant and wildlife species' invasions.

Purpose: Protect intact habitats with the highest biodiversity and heritage components in perpetuity.

Benefits: Conserve the best remaining examples of New Jersey's biodiversity and natural heritage.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

6 Human Intrusions and Disturbance

6.3 Work and Other Activities

6.3.1 Unauthorized research projects at significant habitats

6.3.1.4 Illegal transfer of freshwater fish from one waterbody/watershed to another can result in the spread of non-native, invasive and/or undesirable fish or mussel species and/or diseases.

6.3.1.5 Illegal transfer of freshwater mussels from one waterbody/watershed to another can result in the spread of non-native, invasive and/or undesirable mussel species and/or diseases.

6.3.2 Authorized research projects at significant habitats

6.3.2.5 Authorized transfer of freshwater fish from one waterbody/watershed to another can result in the spread of non-native, invasive and/or undesirable fish or mussel species and/or diseases.

6.3.2.6 Authorized transfer of freshwater mussels from one waterbody/watershed to another can result in the spread of non-native, invasive and/or undesirable mussel species and/or diseases.

8 Invasive and Other Problematic Species, Genes and Diseases

Project 18. Invasive and Non-native Species Control

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.1 Unspecified Species

- 8.1.1.1** Displace or outcompete native species for resources.
- 8.1.1.2** Alters, degrades and/or reduces the structural diversity of the natural composition of the landscape, including aquatic systems.
- 8.1.1.3** Invasive, non-native insects can damage native vegetation at a large scale, leading to die-offs, altering the ecological community.
- 8.1.1.4** Invasive, non-native animals increase the risk of predation on native animals and/or herbivory on native vegetation.
- 8.1.1.5** Invasive, non-native animals and plants increase the risk of introduction and transference of diseases.
- 8.1.1.6** Invasive, non-native plants may create physical barriers for some species.

8.1.2 Invasive non-native aquatic animals

- 8.1.2.2** Displace or out-compete native species for resources (food, shelter), alter the composition of the native landscapes/aquatic systems, diminishing habitat suitability and reducing ecological integrity of natural communities, and may introduce disease into a population.

8.1.3 Invasive non-native aquatic plants

- 8.1.3.1** Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.1.4 Invasive non-native terrestrial/wetland animals

- 8.1.4.1** Displace or out-compete native species for resources (food, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.1.5 Invasive non-native terrestrial/wetland plants

- 8.1.5.1** Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.2 Problematic Native Species/Diseases

8.2.1 Unspecified Species

- 8.2.1.3** Invasive, native species can out-compete non-invasive species for resources (food, light, shelter), leading to the demise of some species populations.

12 **Resource Management Needs**

Project 18. Invasive and Non-native Species Control

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.2 Lack of up-to-date existing information

12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

2.8.0.1 Control invasive insect infestations by implementing BMP strategies through biological, chemical and/or mechanical means that will depress, or when appropriate, eradicate populations in a manner that avoids excessive harm to non-target species using BMPs to control infestations and limit their spread based on an inventory of invasive insect distribution and response to outbreaks.

2.8.0.2 Develop, implement, monitor and evaluate pest control/management strategies to reduce the impacts of over-abundant wildlife species (native and/or native, invasive species) on native vegetation and the degradation of habitats supporting SGCN. Over-abundant wildlife species include but are not limited to mute swans, Canada geese, beaver and white-tailed deer.

2.8.0.3 Work with NJ Invasive Species Strike Team to identify areas with and eradicate aquatic invasive species such as the Asian Swamp Eel, Northern Snakehead, and the Chinese pond mussel. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.

Project 18. Invasive and Non-native Species Control

2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.

2.8.0.6 Implement long-term management of invasive and/or non-native plants to help maintain functioning ecological systems and biological diversity, and to enhance travel corridors. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.

2.14 Wildlife disease management

2.14.0 Wildlife disease strategy development and investigation

2.14.0.3 Protect SGCN from non-native pathogen introduction or incident through implementation of a "rapid response plan"; DFW to give priority attention to these species in planning and/or implementing a response.

3 **Data Collection and Analysis**

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

3.3.1.20 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) where invasive, non-indigenous plants and animals are either already established or are becoming established. Create a system for reporting and qualifying new locations of invasive species and for prioritizing areas for control measures according to the potential level of impact on the ecosystem and SGCN and the likelihood of success. Researchers and contractors encountering invasive plant species while performing plant and/or forest inventories on state or other conserved lands and/or private lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.

3.3.2 Monitoring

3.3.2.20 Once a system is developed for reporting and qualifying new locations of invasive species, develop, implement and monitor/evaluate invasive species removal strategies at identified locations. Priority should be given to those areas critical to SGCN and/or contain unique and/or rare plant communities supporting SGCN and/or other fish/wildlife species.

9 **Planning**

9.3 Species and habitat management planning

Project 18. Invasive and Non-native Species Control

9.3.1 Species management planning

- 9.3.1.21** Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

Job 18.02. Invasive Species Elimination and Reduction - Aquatic Wildlife

Objective: Identify areas where harmful, invasive aquatic wildlife threaten native wildlife and the community, and implement BMP strategies to control, and when appropriate, eliminate the invasive species.

Purpose: Restore aquatic habitats to healthy, functioning systems that benefit the native wildlife dependent upon them.

Benefits: Eliminate invasive species such as Chinese Pond mussels, snakeheads, and flathead catfish to benefit native wildlife populations.

Focal wildlife species benefitting from this job

Fish

Alewife	Atlantic Sturgeon	Banded Sunfish
Blackbanded Sunfish	Blueback Herring	Bridle Shiner
Brook Trout	Comely Shiner	Ironcolor Shiner
Mud Sunfish	Shortnose Sturgeon	Swamp Darter

Macroinvertebrates

Brook Floater	Dwarf Wedgemussel	Eastern Lampmussel
Green Floater	Triangle Floater	Yellow Lampmussel

Threats and Action Drivers associated with this conservation need

6 Human Intrusions and Disturbance

6.3 Work and Other Activities

6.3.1 Unauthorized research projects at significant habitats

- 6.3.1.4** Illegal transfer of freshwater fish from one waterbody/watershed to another can result in the spread of non-native, invasive and/or undesirable fish or mussel species and/or diseases.
- 6.3.1.5** Illegal transfer of freshwater mussels from one waterbody/watershed to another can result in the spread of non-native, invasive and/or undesirable mussel species and/or diseases.

6.3.2 Authorized research projects at significant habitats

Project 18. Invasive and Non-native Species Control

6.3.2.5 Authorized transfer of freshwater fish from one waterbody/watershed to another can result in the spread of non-native, invasive and/or undesirable fish or mussel species and/or diseases.

6.3.2.6 Authorized transfer of freshwater mussels from one waterbody/watershed to another can result in the spread of non-native, invasive and/or undesirable mussel species and/or diseases.

8 Invasive and Other Problematic Species, Genes and Diseases

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.2 Invasive non-native aquatic animals

8.1.2.2 Displace or out-compete native species for resources (food, shelter), alter the composition of the native landscapes/aquatic systems, diminishing habitat suitability and reducing ecological integrity of natural communities, and may introduce disease into a population.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.2 Lack of up-to-date existing information

12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

Project 18. Invasive and Non-native Species Control

- 2.8.0.3 Work with NJ Invasive Species Strike Team to identify areas with and eradicate aquatic invasive species such as the Asian Swamp Eel, Northern Snakehead, and the Chinese pond mussel. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

- 3.0.0.14 Identify areas with invasive, aquatic plants and animals and collect a detailed baseline assessment of the species' status and distribution. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort. Researchers and contractors performing Forest Stewardship Inventories and/or Plans on state lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.

- 3.0.0.15 Conduct long-term monitoring of areas identified as having invasive, aquatic plants and animals to track the species' status/progress over time with or without the implementation of management strategies. Areas without management strategies should be assessed and prioritized for management/control. Areas where management strategies are being implemented should include an assessment of the management effort and identify/recommend and implement necessary changes to improve its success. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.1 Division of Fish and Wildlife should maintain a robust, up-to-date database and mapping of species occurrences.
- 3.2.0.8 Implement and conduct long-term monitoring of control measures aimed at minimizing the impacts of problematic species and/or diseases to evaluate the effectiveness of such efforts and to identify and incorporate additional strategies as appropriate.
- 3.2.0.9 Maintain an inventory of invasive insect distribution and where they exist, conduct long-term monitoring of habitat conditions to assist in developing strategies to combat the impacts to SGCN habitats. Report potential infestations to NJ DEP.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

Project 18. Invasive and Non-native Species Control

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

Job 18.03. Implement Multiple Strategies to Reduce the Spread of Invasive and Non-native Plants

Objective: Reduce the introduction and spread of invasive and non-native plants through a variety of management strategies.

Purpose: Control the spread of invasive and non-native plants to improve ecosystem health and biodiversity.

Benefits: Protect SGCN and restore and maintain the native habitats on which they depend.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

6 Human Intrusions and Disturbance

6.3 Work and Other Activities

6.3.1 Unauthorized research projects at significant habitats

6.3.1.4 Illegal transfer of freshwater fish from one waterbody/watershed to another can result in the spread of non-native, invasive and/or undesirable fish or mussel species and/or diseases.

6.3.1.5 Illegal transfer of freshwater mussels from one waterbody/watershed to another can result in the spread of non-native, invasive and/or undesirable mussel species and/or diseases.

6.3.2 Authorized research projects at significant habitats

Project 18. Invasive and Non-native Species Control

- 6.3.2.5 Authorized transfer of freshwater fish from one waterbody/watershed to another can result in the spread of non-native, invasive and/or undesirable fish or mussel species and/or diseases.
- 6.3.2.6 Authorized transfer of freshwater mussels from one waterbody/watershed to another can result in the spread of non-native, invasive and/or undesirable mussel species and/or diseases.

8 Invasive and Other Problematic Species, Genes and Diseases

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.1 Unspecified Species

- 8.1.1.1 Displace or outcompete native species for resources.
- 8.1.1.2 Alters, degrades and/or reduces the structural diversity of the natural composition of the landscape, including aquatic systems.
- 8.1.1.5 Invasive, non-native animals and plants increase the risk of introduction and transference of diseases.
- 8.1.1.6 Invasive, non-native plants may create physical barriers for some species.

8.1.3 Invasive non-native aquatic plants

- 8.1.3.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

8.1.5 Invasive non-native terrestrial/wetland plants

- 8.1.5.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

Project 18. Invasive and Non-native Species Control

- 1.2.1.16 Create incentives (non-monetary and/or monetary) within State regulations (mitigations requirements or credit, BMP satisfaction, etc.) to promote the use of retailers who refrain from selling specified invasive or other problematic plant species.
- 1.2.1.17 Develop a public-relations oriented certification program for private retailers who refrain from selling specified invasive or other problematic plant species.

2 Direct Management of Natural Resources

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

- 2.8.0.3 Work with NJ Invasive Species Strike Team to identify areas with and eradicate aquatic invasive species such as the Asian Swamp Eel, Northern Snakehead, and the Chinese pond mussel. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.
- 2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.
- 2.8.0.6 Implement long-term management of invasive and/or non-native plants to help maintain functioning ecological systems and biological diversity, and to enhance travel corridors. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.

8 Outreach

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.25 Develop educational outreach programs for landowners, nurseries and the general public regarding the negative impacts of invasive and non-native plants on our natural communities.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

Project 18. Invasive and Non-native Species Control

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

100 Law and Policy

100.1 Legislation

100.1.5 Scale Unspecified

- 100.1.5.5 Develop legislation to provide financial support for the New Jersey Invasive Species Strike Team.

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.41 Explore all State regulatory requirements for mitigation, restoration, habitat management, etc. to ensure they prohibit the use of specified invasive or other problematic plant species.

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.24 Develop policies to provide financial support for the New Jersey Invasive Species Strike Team.

Job 18.04. Forest Restoration through Invasive Plant Species Control

Objective: Restore breeding and migratory forest habitat for birds and invertebrates through invasive plant species suppression.

Purpose: Improve habitat conditions for breeding and migratory SGCN, particularly for birds and invertebrates.

Benefits: Improve and restore habitat, habitat connectivity, and water quality, while improving the aesthetics of the forest and reducing the presence of pests.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

8 Invasive and Other Problematic Species, Genes and Diseases

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.1 Unspecified Species

8.1.1.1 Displace or outcompete native species for resources.

8.1.1.2 Alters, degrades and/or reduces the structural diversity of the natural composition of the landscape, including aquatic systems.

8.1.1.6 Invasive, non-native plants may create physical barriers for some species.

8.1.5 Invasive non-native terrestrial/wetland plants

8.1.5.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.

2.10 Planting/seeding

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

2.10.0.21 Restore and/or enhance understory habitats that suppress invasive species and provide critical resources and enhance sheltering, foraging, and nesting cover for animals and invertebrates.

2.10.0.22 Restore and/or enhance terrestrial and aquatic habitats to promote the regeneration of native vegetation and enhance structural diversity to benefit SGCN (e.g., vegetative buffers of aquatic systems, allow coarse, woody debris to remain in terrestrial, aquatic and riparian habitats to provide shelter, riparian stabilization and necessary microclimates, plant native trees, shrubs and grasses, etc.).

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

2.11.0.19 Implement forest management/silviculture strategies that enhance and maintain critical core forests as appropriate for targeted species (e.g., for many SGCN forest birds, "core" forest would include the forest area >90 meters from the forest edge), in perpetuity, to benefit interior forest and disturbance-sensitive SGCN.

2.11.0.43 Manage forests to increase variation in age structure and composition using BMPs that promote and maintain functioning ecological forest-based systems and biological diversity.

2.11.0.45 Regularly and/or rotationally create young forest habitat in targeted areas to maintain and regenerate a mosaic of upland forest habitats that will benefit shrub- and young forest-dependent species.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

Project 18. Invasive and Non-native Species Control

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

Job 18.05. Control of Phragmites to Increase Marsh Bird Nesting Habitat

Objective: Increase the availability of suitable nesting habitat for marsh bird SGCN by reducing, if not eliminating, the presence of Phragmites monocultures.

Purpose: Increase suitable habitat available for successful nesting of marsh birds.

Benefits: Increase areas available for successful nesting of marsh birds.

Focal wildlife species benefitting from this job

Birds

American Oystercatcher	Black Rail	Black Skimmer
Common Tern	Forster's Tern	Least Tern
Little Blue Heron	Northern Harrier	Piping Plover
Snowy Egret	Tricolored Heron	

Threats and Action Drivers associated with this conservation need

7 Natural Systems Modifications

7.3 Other Ecosystem Modifications

7.3.5 Poor habitat management

- 7.3.5.16 Lack of proactive management to preserve or maintain viable and functioning marshes for SGCN wildlife.

8 Invasive and Other Problematic Species, Genes and Diseases

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.5 Invasive non-native terrestrial/wetland plants

- 8.1.5.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

Project 18. Invasive and Non-native Species Control

12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.2 Lack of up-to-date existing information

12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

2.11.0.30 Identify and prioritize areas where various management tools (such as increasing salinity through the management of water levels or chemical applications) may be effective in reducing phragmites within and restoring marsh habitat.

2.11.0.44 Manage phragmites adjacent to coastal marshes of interest, in particular those that are within underdeveloped areas and are unprotected, through herbicide application and water management to improve resiliency of the marshes to sea level rise.

3 Data Collection and Analysis

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

3.3.1.22 Identify, assess and prioritize marsh habitats for restoration where various management tools (such as increasing salinity through the management of water levels or chemical applications) may be effective in reducing the presence of phragmites.

3.3.2 Monitoring

3.3.2.21 Develop, implement and evaluate the effectiveness of management strategies use to restore marsh habitat (e.g., phragmites reduction).

9 Planning

Project 18. Invasive and Non-native Species Control

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

Job 18.06. Control Invasive, Non-native Plant Species within Wetlands and Wetland Buffers

Objective: Improve the quality of wetland habitats by suppressing and/or eradicating invasive, non-native plant species threatening wetland habitats and wetland-dependent wildlife through long-term, active management and monitoring. Prioritize treatment areas by selecting important SGCN inhabited wetlands with known invasive plant infestations.

Purpose: Restore wetland habitats to healthy, functioning systems that benefit the wildlife dependent upon them.

Benefits: Improve the quality of the wetland habitat for wildlife SGCN.

Focal wildlife species benefitting from this job

Longtail Salamander	New Jersey Chorus Frog	Northern Red Salamander
Pine Barrens Treefrog	Timber Rattlesnake	Wood Turtle

Threats and Action Drivers associated with this conservation need

8 Invasive and Other Problematic Species, Genes and Diseases

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.1 Unspecified Species

8.1.1.1 Displace or outcompete native species for resources.

8.1.1.2 Alters, degrades and/or reduces the structural diversity of the natural composition of the landscape, including aquatic systems.

Project 18. Invasive and Non-native Species Control

8.1.1.4 Invasive, non-native animals increase the risk of predation on native animals and/or herbivory on native vegetation.

8.1.1.6 Invasive, non-native plants may create physical barriers for some species.

8.2 Problematic Native Species/Diseases

8.2.1 Unspecified Species

8.2.1.3 Invasive, native species can out-compete non-invasive species for resources (food, light, shelter), leading to the demise of some species populations.

8.2.2 Named Species

8.2.2.2 Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.2 Lack of up-to-date existing information

12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

Project 18. Invasive and Non-native Species Control

- 2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.

3 Data Collection and Analysis

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

- 3.3.1.20 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of habitat management and/or species experts, etc.) where invasive, non-indigenous plants and animals are either already established or are becoming established. Create a system for reporting and qualifying new locations of invasive species and for prioritizing areas for control measures according to the potential level of impact on the ecosystem and SGCN and the likelihood of success. Researchers and contractors encountering invasive plant species while performing plant and/or forest inventories on state or other conserved lands and/or private lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.

3.3.2 Monitoring

- 3.3.2.20 Once a system is developed for reporting and qualifying new locations of invasive species, develop, implement and monitor/evaluate invasive species removal strategies at identified locations. Priority should be given to those areas critical to SGCN and/or contain unique and/or rare plant communities supporting SGCN and/or other fish/wildlife species.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

Project 19. Invasive and Native Species Control

Job 19.01. Deer Management: A Tool for Habitat Restoration

Objective: Increase the available access for hunting within high deer density areas to reduce herds and their impacts on the regeneration and competitive ability of native tree and shrub species.

Purpose: Minimize the impacts of deer browse on native forests and restoration projects, such as forest regeneration and Atlantic White Cedar restoration.

Benefits: Increase the regeneration of native tree and shrub species, thereby maintaining the availability of natural habitats and improve their resiliency to climatic changes.

Focal wildlife species benefitting from this job

Birds

American Woodcock	Blue-winged Warbler	Cerulean Warbler
Golden-winged Warbler	Kentucky Warbler	Northern Bobwhite
Northern Harrier	Prothonotary Warbler	Red-headed Woodpecker
Scarlet Tanager	Wood Thrush	

Macroinvertebrates

Northern Scarlet Snake	Pine Barrens Treefrog	Timber Rattlesnake
Wood Turtle		

Threats and Action Drivers associated with this conservation need

8 Invasive and Other Problematic Species, Genes and Diseases

8.2 Problematic Native Species/Diseases

8.2.2 Named Species

- 8.2.2.2** Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.13 Wildlife damage management

2.13.0 Nuisance fish and wildlife damage

- 2.13.0.7** Develop, implement, monitor and evaluate management strategies to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.

Job 19.02. Long-term Monitoring Program for Submerged Aquatic Vegetation Distribution

Objective: Establish a long-term monitoring program for submerged aquatic vegetation through the incorporation of a budgetary line item designated to consistently fund monitoring stations throughout Barnegat Bay, Little Egg Harbor Bay, and Great Bay.

Purpose: Provide the necessary framework and funds to gather consistent, useful data over time to determine trends in changes to the vegetative species, distribution, density, etc.

Benefits: Obtain essential monitoring data that can be used to more appropriately direct other research and conservation efforts (e.g., decreases in essential fish habitat, spawning grounds, overall fish population declines, etc.).

Focal wildlife species benefitting from this job

Project 19. Invasive and Native Species Control

Birds

American Oystercatcher	Black Skimmer	Least Tern
Piping Plover	Red Knot	Ruddy Turnstone

Alewife	Atlantic Sturgeon	Blueback Herring
Shortnose Sturgeon		

Mammals

North Atlantic Right Whale

Reptiles & Amphibians

Atlantic Green Turtle	Atlantic Leatherback	Atlantic Loggerhead
Atlantic Ridley	Northern Diamondback Terrapin	

Threats and Action Drivers associated with this conservation need

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

- 12.1.1.1** Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.
- 12.1.1.3** Inadequate or outdated submerged aquatic vegetation mapping inhibits effective regulatory protection, despite having appropriate rules in place.

12.1.2 Lack of up-to-date existing information

- 12.1.2.1** Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1** State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

Project 19. Invasive and Native Species Control

3 Data Collection and Analysis

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

3.3.1.30 Using available data, model a comprehensive Marine Submerged Aquatic Vegetation Mapping project (similar to the Statewide freshwater wetlands mapping project) of sufficient quality and integrity that it could support the NJ DEP's coastal regulatory programs. Continue to conduct surveys to gather additional data to test and improve the model.

3.3.2 Monitoring

3.3.2.23 Conduct long-term monitoring of marine submerged aquatic vegetation and update the Marine Submerged Aquatic Vegetation Mapping [to be developed under baseline activities] to provide the NJ DEP's coastal regulatory programs with the most current data.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

8.1.0.5 Engage government agencies, conservation partners and other stakeholders in discussions focused on establishing a long-term monitoring program for submerged aquatic vegetation distribution throughout Barnegat, Little Egg Harbor and Great Bay.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

100 Law and Policy

100.1 Legislation

100.1.3 Sub-national Level

100.1.3.4 Initiate legislative action to establish an annual budgetary line item designating funds to support programs and monitoring stations throughout Barnegat, Little Egg Harbor and Great Bay focused on long-term monitoring of submerged aquatic vegetation, both native and exotic species.

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

Project 19. Invasive and Native Species Control

- 100.4.0.5 Create a policy that requires an initial and subsequent updates of a comprehensive marine submerged aquatic vegetation mapping for use by NJ DEP's coastal regulatory program.

Job 19.03. Eelgrass Protection through Boat Propeller Damage Prevention

Objective: Prevent damage to Eelgrass (submerged aquatic vegetation) beds by educating boaters on the impacts of boat scarring and blowouts.

Purpose: Preserve submerged aquatic habitat.

Benefits: Maintain fish spawning habitat and provide shelter from predators, improve shoreline stabilization, reduce nutrient loading and sediment movement, thereby reducing risks to wildlife.

Focal wildlife species benefitting from this job

Birds

American Oystercatcher	Black Rail	Black Skimmer
Common Tern	Forster's Tern	Least Tern
Little Blue Heron	Piping Plover	Red Knot
Ruddy Turnstone	Snowy Egret	Tricolored Heron

Shortnose Sturgeon		

Mammals

North Atlantic Right Whale

Reptiles & Amphibians

Atlantic Green Turtle	Atlantic Leatherback	Atlantic Loggerhead
Atlantic Ridley	Northern Diamondback Terrapin	

Threats and Action Drivers associated with this conservation need

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats

- 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.

14.2 Outreach needs

Project 19. Invasive and Native Species Control

14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions

14.2.1.2 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various aquatic and riparian management practices.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

8.1.0.7 Engage government agencies, conservation partners and other stakeholders to collaboratively develop and implement an extensive educational/outreach program targeting coastal boating and recreation communities about eelgrass/widgeongrass, their impacts on marine environments, and the value, fragility and location of submerged aquatic vegetation beds and habitats.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

8.3.0.18 Develop an Eelgrass/Widgeon Grass education and mapping program to educate coastal boating and recreation communities about the value, fragility and location of submerged aquatic vegetation beds and habitats.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

Project 20. Incentives to Encourage Wildlife Conservation Efforts

Job 20.01. Incentives for Private Lands Management

Objective: Encourage and provide support for land owners to implement SGCN-focused habitat management by creating incentives for guidance and technical assistance for customized management plans for targeted SGCN, and cost-sharing for on-the-ground management.

Purpose: Increase the acreage of lands where SGCN-focused habitat management efforts are implemented, in particular, habitat corridors, wetlands and vernal pools.

Benefits: Recruit landowners as conservation partners and enable them to be part of a larger program with a stake in long term land and habitat conservation; increase SGCN-suitable habitat acreage on private lands; increase SGCN populations.

Focal wildlife species benefitting from this job

Birds

American Woodcock	Black Rail	Blue-winged Warbler
Bobolink	Cerulean Warbler	Eastern Meadowlark
Golden-winged Warbler	Grasshopper Sparrow	Kentucky Warbler
Northern Bobwhite	Prothonotary Warbler	Red-headed Woodpecker

Timber Rattlesnake	Wood Turtle	

Threats and Action Drivers associated with this conservation need

7 Natural Systems Modifications

7.3 Other Ecosystem Modifications

7.3.5 Poor habitat management

- 7.3.5.1** Improper or poorly scheduled maintenance of man-made corridors (e.g., roadsides and medians) can cause direct mortality to and may reduce productivity of wildlife.
- 7.3.5.2** Shifting from natural vegetation to lawns can cause increased temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.
- 7.3.5.3** Vegetation clearing removes terrestrial and riparian corridors for animal movement, shelter, and resting areas.
- 7.3.5.4** Vegetation clearing or inappropriate alteration adjacent to aquatic habitats threatens aquatic species by degrading habitat and water quality (altering temperature and dissolved oxygen, increasing siltation and dessication, etc.).
- 7.3.5.5** Habitat management that alters or removes vegetation without implementing long-term management increases the risk of invasive and exotic plants establishing themselves, outcompeting native vegetation.
- 7.3.5.6** Habitat management, including that which occurs on public and private lands, that does not consider timing and species' behaviors can result in the direct mortality and/or alteration or loss of habitat.

Conservation actions that address Threats and Action Drivers

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

Project 20. Incentives to Encourage Wildlife Conservation Efforts

- 1.2.1.2 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to increase the effective size of SGCN habitats by protecting/restoring adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats.
- 1.2.1.9 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing Forestry Stewardship Programs.
- 1.2.1.21 Create and/or support market-based programs that subsidize or create branding for products derived sustainably from managed wildlife habitats.
- 1.2.1.23 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to private and public landowners and land managers to provide cost shares and/or plan approvals for management based on management approaches and prescriptions.
- 1.2.1.28 Create incentives to implement dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.26 Coordinate across federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to woodland landowners to adopt or endorse consistent best management practices concerning controlled burns to maintain and/or improve forested habitat for wildlife.
- 8.1.0.38 Engage partners, stakeholders and land managers in constructive dialogue promoting forest stewardship for SGCN that use core forests and forested corridors.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.26 Develop educational outreach programs for private and public landowners and land managers regarding the importance of and how to manage core forests and forested corridors in a way that will be beneficial for SGCN, particularly endangered, threatened and special concern species.

11 Technical Assistance

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

- 11.2.0.10 Provide technical support to private landowners, consultants, and land managers to create customized management plans based on location and SGCN.

100 **Law and Policy**

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.32 Coordinate regulations across agencies to maximize availability of and enrollment in existing Forestry Stewardship Programs (e.g., "Woodland Stewards", Farm Bill, partners, etc.) to maintain and/or improve forest habitat.

Job 20.02. Backyard Habitat Incentive

Objective: Provide training and resources to schools and private/public landowners to create native habitats for SGCN (e.g., green ribbon schools, green schools, influence municipal ordinances) and presentations, seminars, and conferences to residents and government agencies to influence policy change with creation and passage of a habitat bill, and encourage local and backyard habitat improvements.

Purpose: Reduce SGCN habitat loss and fragmentation and encourage policies that provide incentives to those implementing such positive management and restoration efforts.

Benefits: Improve habitat with native vegetation for local ecosystem benefits, including backyards and small-areas where suitable habitat is limiting; engage citizens in habitat conservation.

Threats and Action Drivers associated with this conservation need

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats

Project 20. Incentives to Encourage Wildlife Conservation Efforts

- 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.
- 14.1.1.2 Lack of general knowledge of SGCN life histories and vulnerabilities as they relate to land management practices.
- 14.1.1.3 Lack of understanding of the need to manage both natural and anthropogenic (e.g., yards, lawns, hayfields, etc.) habitats to minimize impacts or increase benefits to SGCN and their habitats.

Conservation actions that address Threats and Action Drivers

4 **Education**

4.1 Educator/Instructor training

4.1.0 Public education

- 4.1.0.1 Provide educational resources and training programs to private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.

8 **Outreach**

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.4 Engage government agencies, conservation partners and other stakeholders in constructive dialogues encouraging them to influence policy change and the creation of incentives through a habitat bill and/or municipal ordinances for backyard habitat.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.30 Develop educational outreach programs for private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.

100 **Law and Policy**

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.73 Develop regulations that would exempt the conversion of lawns to native vegetation (beneficial to wildlife) from local lawn ordinances.

Job 20.03. Incentives for Corporations and Transportation Authorities

Project 20. Incentives to Encourage Wildlife Conservation Efforts

Objective: Provide non-monetary incentives (e.g., fast-tracked permits, public relations recognition, mitigation credits, etc.) to pipeline and utility companies, transportation services (roads and railroads), and renewable energy companies for integrating conservation measures in their project plans to 1) reduce direct and indirect wildlife mortality, 2) minimize habitat fragmentation, 3) create new habitat where appropriate, and 4) implement such efforts within a reasonable time period.

Purpose: Minimize direct and indirect impacts from energy and transportation development on terrestrial-bound wildlife and invertebrates, as well as their habitats (forests, young forest/scrub-shrub, wetlands, and grasslands).

Benefits: Improve habitat condition and reduce future fragmentation of habitats while improving wildlife travel corridors, leading to reductions in wildlife mortality and improved and population size.

Threats and Action Drivers associated with this conservation need

12 Resource Management Needs

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform

- 12.4.0.1 A species-by-species management focus as opposed to ecological systems and biodiversity generally has greater opportunity for unintended consequences for other species and may be less efficient in developing appropriate management actions.

14 Education/ Outreach Needs

14.1 Education needs

- 14.1.1 Need for improved knowledge of fish and wildlife and their habitats

- 14.1.1.3 Lack of understanding of the need to manage both natural and anthropogenic (e.g., yards, lawns, hayfields, etc.) habitats to minimize impacts or increase benefits to SGCN and their habitats.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.11 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

100.3.0.73 Develop regulations that would exempt the conversion of lawns to native vegetation (beneficial to wildlife) from local lawn ordinances.

Job 20.04. Incentives for Developers to Integrate SGCN Habitats into Planning

Objective: Provide the means to encourage or enhance incorporation of SGCN needs into development planning to protect pockets of habitats, increase restoration of habitats affected by new development, and retain or enhance wildlife corridors for safe passage.

Purpose: Provide food, habitat, and habitat connections for SGCN in newly developed areas.

Benefits: Reduce habitat loss, maintain connectivity of habitats, and improve protection for riparian corridors.

Threats and Action Drivers associated with this conservation need

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale)

1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.1.1.2 Loss, alteration and/or degradation of habitat.

1.1.1.3 Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.

1.1.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.

1.2 Commercial and Industrial Areas

Project 20. Incentives to Encourage Wildlife Conservation Efforts

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale)

1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.2.1.2 Loss, alteration and/or degradation of habitat.

1.2.1.3 Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.

1.2.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.

1.2.1.5 Impervious surfaces can lead to a decrease in water recharge.

1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale)

1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.3.1.2 Loss, alteration and/or degradation of habitat.

1.3.1.3 Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats

14.1.1.3 Lack of understanding of the need to manage both natural and anthropogenic (e.g., yards, lawns, hayfields, etc.) habitats to minimize impacts or increase benefits to SGCN and their habitats.

Conservation actions that address Threats and Action Drivers

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

Project 20. Incentives to Encourage Wildlife Conservation Efforts

- 1.2.1.11 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to public and private landowners and managers, including but not limited to government and non-government agencies/organizations, energy, mining, and transportation and utility service companies/agencies, to minimize commercial infrastructure and impervious surfaces, and to improve wildlife habitats, limit fragmentation, reduce elements which would exacerbate mortality, and/or implement activities/restoration that would create new or improved corridor habitat and/or increase connectivity, and to increase structural habitat diversity through the implementation of a variety of vegetation management practices that also considers appropriate timing for such activities to avoid sensitive periods (e.g., nesting, denning, roosting), and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 1.2.1.13 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to land developers to minimize the impacts of new residential and commercial developments on SGCN and their habitats.

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.73 Develop regulations that would exempt the conversion of lawns to native vegetation (beneficial to wildlife) from local lawn ordinances.

Job 20.05. Incentives for Working Land Habitat

Objective: Encourage and provide support for owners of "working lands" (commercial farms and forests) to enroll in land management programs by funding existing incentive programs, developing new market-based incentive programs, and funding other existing programs that are currently under-funded or not funded (e.g., Landowner Incentive Program).

Purpose: Increase the acreage of land where SGCN-focused habitat management is implemented in grasslands and forests, thereby reducing mortality and increasing populations.

Benefits: Funded incentive programs increase adoption and implementation of habitat projects on private land; financial incentives resulting from market-based programs provide a mechanism for proactive habitat management beyond the typical 3 year cycle of incentive programs.

Pine Barrens Treefrog	Timber Rattlesnake	Wood Turtle

Threats and Action Drivers associated with this conservation need

2 **Agriculture and Aquaculture**

2.1 Annual and Perennial Crops (non-timber)

2.1.1 Shifting Agriculture

2.1.1.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.1.2 Conversion, and subsequent loss, of high salt marsh to low salt marsh threatens high-marsh dependent species and those dependent on the marsh-upland ecotone.

2.1.2 Small-holder Farming

2.1.2.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.2.2 Fragments terrestrial and aquatic habitats.

2.1.2.3 Agricultural practices (e.g., mechanized, row-crop agriculture) can render lands unsuitable for most wildlife due to soil degradation and erosion and can cause direct mortality to wildlife when harvesting takes places.

2.1.3 Agro-industry

2.1.3.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.3.2 Fragments terrestrial and aquatic habitats.

2.1.3.3 Agricultural practices (e.g., mechanized, row-crop agriculture) can render lands unsuitable for most wildlife due to soil degradation and erosion and can cause direct mortality to wildlife when harvesting takes places.

2.2 Wood and Pulp Plantations

2.2.1 Small Holder

2.2.1.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.

2.2.2 Agro-industry Plantations

2.2.2.1 Conversion of native forests to plantations decreases the habitat quality for forest-dependent species.

2.3 Livestock Farming and Ranching

2.3.2 Small-holder Grazing

Project 20. Incentives to Encourage Wildlife Conservation Efforts

2.3.2.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.

2.3.2.2 Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.

2.3.3 Agro-industry Grazing

2.3.3.1 Inappropriately located, newly created horse/livestock farms may fragment forest habitats.

2.3.3.2 Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.

2.3.3.3 Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

2.3.3.4 Livestock allowed to wade into waterbodies trample and degrade aquatic habitats.

2.4 Marine and Freshwater Aquaculture

2.4.1 Subsistence/Artisinal Aquaculture

2.4.1.1 May degrade freshwater and intertidal habitat due to farming techniques and damage from associated structures.

2.4.1.3 Potential for increased nutrient and effluent loads.

2.4.2 Industrial Aquaculture

2.4.2.1 May degrade freshwater and intertidal habitat due to farming techniques and damage from associated structures.

2.4.2.3 Potential for increased nutrient and effluent loads.

7 **Natural Systems Modifications**

7.3 Other Ecosystem Modifications

7.3.5 Poor habitat management

7.3.5.1 Improper or poorly scheduled maintenance of man-made corridors (e.g., roadsides and medians) can cause direct mortality to and may reduce productivity of wildlife.

7.3.5.2 Shifting from natural vegetation to lawns can cause increased temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

7.3.5.3 Vegetation clearing removes terrestrial and riparian corridors for animal movement, shelter, and resting areas.

7.3.5.4 Vegetation clearing or inappropriate alteration adjacent to aquatic habitats threatens aquatic species by degrading habitat and water quality (altering temperature and dissolved oxygen, increasing siltation and dessication, etc.).

7.3.5.5 Habitat management that alters or removes vegetation without implementing long-term management increases the risk of invasive and exotic plants establishing themselves, outcompeting native vegetation.

Project 20. Incentives to Encourage Wildlife Conservation Efforts

- 7.3.5.6 Habitat management, including that which occurs on public and private lands, that does not consider timing and species' behaviors can result in the direct mortality and/or alteration or loss of habitat.
- 7.3.5.7 Improperly planned habitat management and/or mitigation efforts along roadsides and within the medians can attract wildlife and increase the risk of vehicle strikes.
- 7.3.5.12 Lack of diversity in age structure and composition of vegetation due to lack of natural disturbances and/or vegetation management.
- 7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.

Conservation actions that address Threats and Action Drivers

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.10 Coordinate across government agencies and non-government organizations to maximize the availability of and enrollment in existing landowner incentive programs (e.g., "farm bill," partners, etc.) to maintain and/or improve habitat.
- 1.2.1.19 Create incentives for federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to farmers, woodland landowners, and private landowners to adopt and/or endorse consistent BMPs concerning controlled burns to maintain and/or improve wildlife habitat.
- 1.2.1.20 Coordinate across government agencies and non-government organizations to create or expand upon tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMP's.
- 1.2.1.21 Create and/or support market-based programs that subsidize or create branding for products derived sustainably from managed wildlife habitats.
- 1.2.1.26 Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing landowner incentive programs.
- 1.2.1.28 Create incentives to implement dynamic forest disturbance patterns, using tools such as fire, flooding, and silviculture, to support the full life cycle requirements of forest and early successional wildlife species.

Project 21. Tax Structure for Conservation

Job 21.01. This Job is currently under development.

Objective:

Purpose:

Benefits:

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

Conservation actions that address Threats and Action Drivers

Project 22. Habitat Protection

Job 22.01. Easements and Acquisition

Objective: Continue to preserve key Focal SGCN habitats from the threat of development and high intensity agriculture through land acquisition and easements, in particular for grasslands, meadows, and wetlands, which are under conditions of reduced funding of incentive programs.

Purpose: Ensure grassland birds and pollinators, and wetland dependent species retain key habitats.

Benefits: Improve resiliency of SGCN populations and increase gene flow.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale)

1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.1.1.2 Loss, alteration and/or degradation of habitat.

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale)

1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.2.1.2 Loss, alteration and/or degradation of habitat.

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale)

1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.3.1.2 Loss, alteration and/or degradation of habitat.

2 Agriculture and Aquaculture

2.1 Annual and Perennial Crops (non-timber)

2.1.1 Shifting Agriculture

2.1.1.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.2 Small-holder Farming

2.1.2.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

2.1.2.2 Fragments terrestrial and aquatic habitats.

2.1.2.3 Agricultural practices (e.g., mechanized, row-crop agriculture) can render lands unsuitable for most wildlife due to soil degradation and erosion and can cause direct mortality to wildlife when harvesting takes places.

2.1.3 Agro-industry

2.1.3.1 Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades habitat, especially for early-successional species.

Project 22. Habitat Protection

2.1.3.2 Fragments terrestrial and aquatic habitats.

2.1.3.3 Agricultural practices (e.g., mechanized, row-crop agriculture) can render lands unsuitable for most wildlife due to soil degradation and erosion and can cause direct mortality to wildlife when harvesting takes places.

2.3 Livestock Farming and Ranching

2.3.2 Small-holder Grazing

2.3.2.2 Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.

2.3.2.3 Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

2.3.2.4 Livestock allowed to wade into waterbodies trample and degrade aquatic habitats.

2.3.3 Agro-industry Grazing

2.3.3.2 Overgrazing of pasturelands and/or hay-fields degrade suitability for wildlife.

2.3.3.3 Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

2.3.3.4 Livestock allowed to wade into waterbodies trample and degrade aquatic habitats.

12 Resource Management Needs

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms

12.3.0.6 Certain geographic or habitat features, such as vernal pools and headwater wetlands or streams, may be too small, mischaracterized, or misidentified to benefit from regulatory protection.

Conservation actions that address Threats and Action Drivers

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

6.0.0.1 Enhance and increase the effective size of critical migratory stopover habitats for songbirds, raptors, shorebirds, bats and invertebrates by securing adjacent habitats through an appropriate combination of fee title, non-fee title and landowner agreements.

6.0.0.2 Enhance and increase the effective size of SGCN habitats by protecting adjacent habitats that contribute to the overall size of the "core" area and/or provide a natural buffer, enhancing the suitability of the core area for SGCN, and/or connect conserved SGCN habitats through an appropriate combination of fee title, non-fee title and landowner agreements.

Project 22. Habitat Protection

- 6.0.0.3 Secure and protect riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.0.0.4 Secure and protect fish SGCN habitats by protecting lands adjacent to fish SGCN habitats and/or aquatic systems feeding into such habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
- 6.3 Conservation area designation
 - 6.3.0 Conservation area designation strategies
 - 6.3.0.3 Increase the protection of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through conservation area designations

Job 22.02. Forest Stewardship Program

Objective: Provide a means of forest land preservation similar to current farmland preservation through legislation that also gives the rights to conduct tree harvests through State-approved forest management or forest stewardship plans.

Purpose: Long-term protection and management of forest habitats to benefit forest- and young forest-dwelling species.

Benefits: Enable more private landowners to conduct forest management on behalf of forest- and young forest-dependent SGCN.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

12 Resource Management Needs

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform

- 12.4.0.7** Land preservation contracts, easements, etc. that do not contain prescriptive language or flexibility allowing for habitat management can result in unsuitable habitat conditions and biodiversity declines for SGCN.

Conservation actions that address Threats and Action Drivers

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

- 1.2.1.9** Develop a new funding source, targeting natural resource damages monies, mitigation monies or other available sources, to fund new or existing Forestry Stewardship Programs.
- 1.2.1.19** Create incentives for federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to farmers, woodland landowners, and private landowners to adopt and/or endorse consistent BMPs concerning controlled burns to maintain and/or improve wildlife habitat.
- 1.2.1.21** Create and/or support market-based programs that subsidize or create branding for products derived sustainably from managed wildlife habitats.

8 Outreach

Project 22. Habitat Protection

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

8.1.0.26 Coordinate across federal, state and local agencies and approved consulting foresters that provide financial, logistical or planning assistance to woodland landowners to adopt or endorse consistent best management practices concerning controlled burns to maintain and/or improve forested habitat for wildlife.

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

100.3.0.32 Coordinate regulations across agencies to maximize availability of and enrollment in existing Forestry Stewardship Programs (e.g., "Woodland Stewards", Farm Bill, partners, etc.) to maintain and/or improve forest habitat.

Job 22.03. Protecting Priority Wetlands

Objective: Increase the regulatory protection of priority wetlands (e.g., fens, sinkhole ponds, vernal pools, etc.) beyond that already provided (i.e., require optimal biological buffers).

Purpose: Decrease the loss and/or degradation of wetland habitats as a result of land use activities such as development and agriculture that directly or indirectly alter the characteristic water quality conditions.

Benefits: Preserve wetlands through acquisition and subsequent management as needed, in addition to indirectly affording adjacent upland habitat preservation.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale)

1.1.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.1.1.2 Loss, alteration and/or degradation of habitat.

1.1.1.5 Impervious surfaces can lead to a decrease in water recharge.

1.1.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.1.1.7 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale)

1.2.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

1.2.1.2 Loss, alteration and/or degradation of habitat.

1.2.1.5 Impervious surfaces can lead to a decrease in water recharge.

1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.2.1.7 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale)

Project 22. Habitat Protection

- 1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
- 1.3.1.2 Loss, alteration and/or degradation of habitat.
- 1.3.1.4 Impervious surfaces can lead to a decrease in water recharge.
- 1.3.1.5 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
- 1.3.1.6 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

2 Agriculture and Aquaculture

2.1 Annual and Perennial Crops (non-timber)

2.1.1 Shifting Agriculture

- 2.1.1.2 Conversion, and subsequent loss, of high salt marsh to low salt marsh threatens high-marsh dependent species and those dependent on the marsh-upland ecotone.
- 2.1.1.3 Conversion of agricultural landscape that results in increased erosion, runoff, and chemical and thermal pollution decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

2.3 Livestock Farming and Ranching

2.3.3 Agro-industry Grazing

- 2.3.3.4 Livestock allowed to wade into waterbodies trample and degrade aquatic habitats.

2.4 Marine and Freshwater Aquaculture

2.4.1 Subsistence/Artisinal Aquaculture

- 2.4.1.1 May degrade freshwater and intertidal habitat due to farming techniques and damage from associated structures.
- 2.4.1.3 Potential for increased nutrient and effluent loads.

2.4.2 Industrial Aquaculture

- 2.4.2.1 May degrade freshwater and intertidal habitat due to farming techniques and damage from associated structures.
- 2.4.2.3 Potential for increased nutrient and effluent loads.

4 Transportation and Service Corridors

4.2 Utility and Service Lines

- 4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads

Project 22. Habitat Protection

- 4.2.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species, inhibiting dispersal of non-volant animals, reducing gene flow, and creating barriers to fish when service line-associated roads cross streams (e.g., bridges, culverts, fords, etc).
- 4.2.1.2 Loss, alteration and/or degradation of habitat associated with rights-of-way construction and maintenance, and degradation of adjacent habitats.

5 Biological Resource Use

5.3 Logging and Wood Harvesting

5.3.1 Intentional Use (subsistence/small scale)

- 5.3.1.2 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may cause the loss, alteration and/or degradation of wildlife habitat.
- 5.3.1.3 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase soil erosion, impacting SGCN habitats.

5.3.2 Intentional Use (large scale)

- 5.3.2.2 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN may cause the loss, alteration and/or degradation of wildlife habitat.
- 5.3.2.3 Forestry and/or logging practices that are poorly planned/implemented or planned without consideration for SGCN and unsustainable forestry practices may increase soil erosion, impacting SGCN habitats.

5.3.3 Unintentional effects (subsistence/small scale)

- 5.3.3.1 Direct mortality of wildlife, direct loss of suitable habitats (roost, foraging, shelter, etc.), and can disrupt sensitive species, decreasing the likelihood of success and/or reproduction.
- 5.3.3.2 Poorly planned/implemented tree harvesting adjacent to waterways and vernal pools can lead to increased water temperatures, soil erosion and sedimentation, and reduces the potential for woody debris within the aquatic system, leading to negative impacts on wildlife.

6 Human Intrusions and Disturbance

6.1 Recreational Activities

6.1.1 Off-road vehicles (motorized and non-motorized)

- 6.1.1.2 Inappropriate use of off-road vehicles can degrade terrestrial and aquatic habitat and reduce the suitability of adjacent habitats for wildlife.

7 Natural Systems Modifications

7.2 Dams and Water Management/Use

Project 22. Habitat Protection

7.2.5 Abstraction of Ground Water (domestic use)

7.2.5.1 Heavy withdrawal of ground water for domestic use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

7.2.7 Abstraction of Ground Water (agricultural use)

7.2.7.1 Heavy withdrawal of ground water for agricultural use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms

12.3.0.6 Certain geographic or habitat features, such as vernal pools and headwater wetlands or streams, may be too small, mischaracterized, or misidentified to benefit from regulatory protection.

Conservation actions that address Threats and Action Drivers

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

1.2.1.6 Secure and promote the protection/restoration of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers th

2 Direct Management of Natural Resources

2.1 Create new habitat or natural processes

2.10.0 Planting/seeding strategies for terrestrial or aquatic habitat creation or restoration

2.10.0.9 Restore and/or enhance riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation, alt

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

3.3.1.1 Conduct habitat assessments of significant natural and/or unique communities to Identify threats to native terrestrial and aquatic habitats through systematic monitoring, review of available data, enlistment of habitat management and/or species experts, etc. Incorporate findings into a database that includes descriptions/qualifiers of the habitats, identifies and values/qualifies the threats, and includes a GIS component of the locations of the assessed areas. Share this information with landowners/managers (e.g., federal, state and local government agencies or non-government organization).

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

6.0.0.3 Secure and protect riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through an appropriate combination of fee title, non-fee title and landowner agreements.

6.3 Conservation area designation

6.3.0 Conservation area designation strategies

6.3.0.3 Increase the protection of riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation

7 Law Enforcement

7.1 Law enforcement

7.1.4 Scale Unspecified

7.1.4.6 Recruit law enforcement to assist in the protection and enhancement of SGCN populations, in particular endangered species, through improved awareness of species through trainings, partnerships, and other methods. Information should include but is not limited to: 1) Issues concerning illegal collection of reptiles, 2) Persecution of rare snakes, 3) Illegal recreational activities on public lands (e.g., off-road vehicles) and their impact on wildlife, 4) Identification of sensitive areas, critical sites and/or "hot-spots" for collection.

7.1.4.7 Increase law enforcement presence to enforce regulations governing recreational activities (e.g., the use of personal watercraft and off road vehicles, caving, rock climbing, etc.) on conserved lands and within other sensitive habitats, and discourage activities that cause harm or disturbance to vegetation, wetlands, fish and wildlife.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.33 Engage government agencies, conservation partners and other land managers, communities, landowners, and commercial and industrial stakeholders in discussions regarding the importance of protecting and methods to protect priority wetlands beyond the levels afforded through regulation by maintaining and/or restoring optimal biological buffers around wetlands.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

- 9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and SGCN inhabiting them.

100 Law and Policy

100.1 Legislation

100.1.3 Sub-national Level

- 100.1.3.1 Develop laws and policies to increase protection and biological buffers of wetlands.

100.1.4 County and Local

- 100.1.4.7 Secure vernal pools and biologically appropriate buffers through local ordinances.

100.1.5 Scale Unspecified

- 100.1.5.1 Develop laws and policies to increase protection and biological buffers of wetlands.

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.10 Develop policies that promote protecting vernal pool habitats to benefit SGCN that rely upon them and promotes connectivity of SGCN populations.

- 100.3.0.61 Develop regulations that when implemented will protect vernal pool habitats to benefit SGCN that rely upon them and promotes connectivity of SGCN populations.

Job 22.04. Preserving Land to Protect Critical Habitats for Lake and Pond Aquatic Species

Project 22. Habitat Protection

Objective: Preserve lands around lake and pond habitats inhabited by Focal SGCN through land acquisition and regulatory protection and the implementation of biologically appropriate wetlands buffers.

Purpose: Provide the necessary and improved protection for pond and lake species to improve habitat availability and quality.

Benefits: Increase population numbers through the protection of habitat critical to foraging and improved water quality.

Focal wildlife species benefitting from this job

Fish

Banded Sunfish	Blackbanded Sunfish	Bridle Shiner
Ironcolor Shiner	Mud Sunfish	Swamp Darter

Macroinvertebrates

Eastern Lampmussel	New England Bluet	Pine Barrens Bluet
Robust Baskettail		

Reptiles & Amphibians

Eastern Redbelly Turtle

Threats and Action Drivers associated with this conservation need

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale)

- 1.1.1.1** Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
- 1.1.1.2** Loss, alteration and/or degradation of habitat.
- 1.1.1.4** Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.
- 1.1.1.5** Impervious surfaces can lead to a decrease in water recharge.
- 1.1.1.6** Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
- 1.1.1.7** Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale)

- 1.2.1.1** Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.

Project 22. Habitat Protection

- 1.2.1.2 Loss, alteration and/or degradation of habitat.
- 1.2.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.
- 1.2.1.5 Impervious surfaces can lead to a decrease in water recharge.
- 1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
- 1.2.1.7 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.3 Tourism and Recreational Areas

- 1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale)
 - 1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
 - 1.3.1.2 Loss, alteration and/or degradation of habitat.
 - 1.3.1.4 Impervious surfaces can lead to a decrease in water recharge.
 - 1.3.1.5 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
 - 1.3.1.6 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

Conservation actions that address Threats and Action Drivers

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

- 6.0.0.3 Secure and protect riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through an appropriate combination of fee title, non-fee title and landowner agreements.

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.14 Develop policies and/or regulations that increase the protective buffers of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) to biologically appropriate distances to benefit SGCM that rely upon these habitats and improve the function of the [associated] aquatic systems.

Job 22.05. Conserved Lands, ORV Access, and State Recreational Area Policy

Project 22. Research and Monitoring

Objective: Map and codify roads and trails within conserved land that are available for motor vehicle access or recreational use and uphold/enforce through regulatory and/or policy implementation.

Purpose: Reduce, if not eliminate, habitat degradation and wildlife disturbance and other negative impacts of ORV use within conserved lands, in particular highly sensitive areas.

Benefits: Protection of critical habitats for SGCN, including but not limited to ephemeral and emergent wetlands, upland basking sites, rookeries (reptile and avian species), and related avian species congregation or foraging sites, thereby improving fecundity and longevity of the wildlife that depend upon their integrity.

Focal wildlife species benefitting from this job

Birds

American Oystercatcher	American Woodcock	Black Rail
Black Skimmer	Blue-winged Warbler	Bobolink
Cerulean Warbler	Common Tern	Eastern Meadowlark
Forster's Tern	Golden-winged Warbler	Grasshopper Sparrow
Kentucky Warbler	Least Tern	Little Blue Heron
Northern Bobwhite	Pied-billed Grebe	Piping Plover
Prothonotary Warbler	Red Knot	Red-headed Woodpecker
Ruddy Turnstone	Scarlet Tanager	Snowy Egret
Tricolored Heron	Vesper Sparrow	Wood Thrush

Fish

Northern Pine Snake	Northern Red Salamander	Northern Scarlet Snake
Pine Barrens Treefrog	Timber Rattlesnake	Wood Turtle

Threats and Action Drivers associated with this conservation need

6 Human Intrusions and Disturbance

6.1 Recreational Activities

6.1.1 Off-road vehicles (motorized and non-motorized)

- 6.1.1.1 Inappropriate use of off-road vehicles creates new roads/trails which fragments habitat.
- 6.1.1.2 Inappropriate use of off-road vehicles can degrade terrestrial and aquatic habitat and reduce the suitability of adjacent habitats for wildlife.
- 6.1.1.3 Increased risk of harassment that results in a change in wildlife behavior and/or direct mortality from vehicle strikes.
- 6.1.1.4 Increased noise pollution.
- 6.1.1.5 Vehicle use on beaches can cause disturbance, harms breeding and foraging habitats, and can cause direct mortality of beach-nesting birds.
- 6.1.1.6 Off-road vehicles can be a mechanism of transference of wildlife diseases and invasive plant species if gear and apparel are not properly sanitized between sites.

Conservation actions that address Threats and Action Drivers

5 Facilities and Areas

5.15 Wildlife Management Areas

5.15.6 Roads

5.15.6.1 Clearly post areas/roads where vehicle access is permitted.

5.15.6.2 Clearly post areas/trails where vehicle access is not permitted.

7 Law Enforcement

7.1 Law enforcement

7.1.4 Scale Unspecified

7.1.4.6 Recruit law enforcement to assist in the protection and enhancement of SGCN populations, in particular endangered species, through improved awareness of species through trainings, partnerships, and other methods. Information should include but is not limited to: 1) Issues concerning illegal collection of reptiles, 2) Persecution of rare snakes, 3) Illegal recreational activities on public lands (e.g., off-road vehicles) and their impact on wildlife, 4) Identification of sensitive areas, critical sites and/or "hot-spots" for collection.

7.1.4.7 Increase law enforcement presence to enforce regulations governing recreational activities (e.g., the use of personal watercraft and off road vehicles, caving, rock climbing, etc.) on conserved lands and within other sensitive habitats, and discourage activities that cause harm or disturbance to vegetation, wetlands, fish and wildlife.

9 Planning

9.2 Organizational strategic and CMS planning

9.2.1 Organizational strategic and operational planning

9.2.1.1 Identify and codify legal ORV access areas on state lands.

9.3 Species and habitat management planning

9.3.3 Habitat management planning

9.3.3.29 Develop habitat management plans aimed at reducing or eliminating negative impacts of ORVs.

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

100.3.0.6 Develop policies that will promote expanding acreages and enhancing the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.

Project 22. Research and Monitoring

- 100.3.0.14 Develop policies and/or regulations that increase the protective buffers of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) to biologically appropriate distances to benefit SGCN that rely upon these habitats and improve the function of the [associated] aquatic systems.
- 100.3.0.21 Develop policies that minimize wildlife road mortality through: 1) Requiring the integration of wildlife passages into all new and repaired roads, in particular those areas that will connect SGCN habitats, 2) Requiring current fish/wildlife passages be improved and maintained in perpetuity, 3) Supporting seasonal road closures, in particular for unimproved roads, 4) Supporting projects that work to improve connectivity of SGCN habitats such as land conservation through acquisition or other means.
- 100.3.0.69 Develop regulations that when implemented will minimize wildlife road mortality.

Project 23. Land Use Planning

Job 23.01. Transportation, Service, and Pipeline Corridors: Inland

Objective: Minimize the impacts of new and/or the expansion of linear development (e.g., transportation, service, and pipeline corridors, etc.) by using wildlife habitat and corridor mapping products for planning and project review to better integrate proactive habitat connectivity efforts.

Purpose: Minimize direct and indirect impacts of energy and transportation corridors on terrestrial-bound wildlife and invertebrates.

Benefits: Maintain and/or minimize impacts on core and corridor habitat for and population persistence of SGCN terrestrial wildlife.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

3 **Energy Production and Mining**

3.1 Oil and Gas Facilities and Pipelines

3.1.1 Distribution processes of petroleum and other liquid hydrocarbons

3.1.1.1 Fragments terrestrial and aquatic habitats.

3.1.1.2 Loss, alteration and/or degradation of habitat.

3.1.2 Natural gas distribution processes

3.1.2.1 Fragments terrestrial and aquatic habitats.

3.1.2.2 Loss, alteration and/or degradation of habitat.

3.2 Mining and Quarrying

3.2.2 Surface Mining - Rock Quarry (and sand quarries)

3.2.2.1 Fragments terrestrial and aquatic habitats.

3.2.2.2 Loss, alteration and/or degradation of habitat.

3.3 Renewable Energy

3.3.1 Wind Power

3.3.1.2 Fragments terrestrial habitats.

3.3.1.3 Loss, alteration and/or degradation of habitat.

3.3.1.4 Increased commercial infrastructure.

3.3.2 Solar Power

3.3.2.1 Fragments terrestrial habitats.

3.3.2.2 Loss, alteration and/or degradation of habitat.

3.3.2.3 Increased commercial infrastructure.

4 **Transportation and Service Corridors**

4.1 Roads and Railroads

4.1.1 Land conversion from natural habitat to roads and railroads (large and small scale)

4.1.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species and inhibiting dispersal of non-volant animals, reducing gene flow.

4.2 Utility and Service Lines

4.2.1 Land conversion from natural habitat to utility and other service lines (large and small scale) or communication towers and associated access roads

Project 23. Land Use Planning

- 4.2.1.1 Fragments terrestrial and aquatic habitats making the landscape unsuitable for area-sensitive species, inhibiting dispersal of non-volant animals, reducing gene flow, and creating barriers to fish when service line-associated roads cross streams (e.g., bridges, culverts, fords, etc).

12 Resource Management Needs

12.1 Resource information collection needs

12.1.2 Lack of up-to-date existing information

- 12.1.2.2 Lack of wildlife monitoring at sites with structures that pose high risk of mortality to SGCN wildlife.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

3 Data Collection and Analysis

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.3 Baseline inventory

- 3.2.3.7 Identify roads or portions of roads, paved or unimproved (through site surveys, land use/land cover assessments and analyses, review of available data, enlistment of species experts, etc.) with high incidences of road mortality and/or presence of snakes, turtles, medium-sized and large mammals. Conduct assessments of the roads and incorporate information into a database that includes descriptions (e.g., qualifiers to help prioritize the roads' risk to wildlife) and a GIS component of the locations of such areas. Share this information with appropriate organizations and/or agencies working to implement measures (e.g., wildlife passages, road closures) to minimize the risk to these species.

3.5 Techniques development

3.5.4 Fish and wildlife research, survey and management techniques

- 3.5.4.9 Conduct studies to evaluate the impacts of roads on SGCN and develop, implement and conduct studies to evaluate the effectiveness of methods to reduce road mortality of wildlife (e.g. wildlife underpasses, road closures).

9 Planning

9.3 Species and habitat management planning

Project 23. Land Use Planning

9.3.1 Species management planning

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

- 11.1.1.10 Use CHANJ mapping in reviews of proposed energy, mining, transportation and utility service companies/agencies' projects to attempt to maintain habitat connectivity and reduce fragmentation, and identify potential impacts of the projects.

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

- 11.2.0.7 Provide educational resources, training programs, and on-the-ground guidance to energy, mining, transportation, and utility service agencies/companies and their project and resource managers on the importance of maintaining habitat connectivity, minimizing fragmentation, and the use of CHANJ products to help them target areas for such planning.

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.52 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded energy sitings and facilities.
- 100.3.0.53 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded rights-of-way corridors associated with energy transport/transmission.
- 100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.4 Create a policy that requires the use of wildlife habitat and corridor mapping products for both regulatory use when conducting project reviews and planning/siting new or expanded rights-of-way projects.
- 100.4.0.8 Develop a white paper addressing the impacts that existing, new or expanded rights-of-way have upon wildlife, wildlife habitats and habitat connectivity.

Job 23.02. Renewable Energy

- Objective:** Identify brownfields and developed areas where solar and wind energy facilities could be sited with minimal impacts to migratory wildlife and minimal habitat fragmentation.
- Purpose:** Minimize the impacts of solar and wind farms on migratory species (birds, bats, and invertebrates) and species vulnerable to fragmentation.
- Benefits:** Reduce mortality of wildlife caused by poorly-sited wind turbines and reduce habitat fragmentation and loss cause by the conversion of natural lands to energy generation uses, while encouraging renewable energy generation on old industrial sites and urban rooftops.

Focal wildlife species benefitting from this job

Birds

American Woodcock	Blue-winged Warbler	Bobolink
Cerulean Warbler	Eastern Meadowlark	Golden-winged Warbler
Grasshopper Sparrow	Kentucky Warbler	Northern Bobwhite
Peregrine Falcon	Prothonotary Warbler	Red-headed Woodpecker
Scarlet Tanager	Vesper Sparrow	Wood Thrush

Mammals

Indiana Bat	Little Brown Bat	Northern Myotis
-------------	------------------	-----------------

Reptiles & Amphibians

Corn Snake	Eastern Hognose Snake	Northern Black Racer
Northern Pine Snake	Northern Scarlet Snake	Timber Rattlesnake

Threats and Action Drivers associated with this conservation need

3 Energy Production and Mining

3.3 Renewable Energy

3.3.1 Wind Power

- 3.3.1.1 Turbines, blades, and structure foundations create a collision risk to volant species (birds, bats and invertebrates) and marine animals.
- 3.3.1.2 Fragments terrestrial habitats.
- 3.3.1.3 Loss, alteration and/or degradation of habitat.
- 3.3.1.4 Increased commercial infrastructure.

3.3.2 Solar Power

- 3.3.2.1 Fragments terrestrial habitats.

Project 23. Land Use Planning

3.3.2.2 Loss, alteration and/or degradation of habitat.

3.3.2.3 Increased commercial infrastructure.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

12.1.1.2 Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.

12.1.1.6 Lack of information regarding migratory pathways and response of wildlife to lights and noise associated with offshore wind turbines.

12.1.2 Lack of up-to-date existing information

12.1.2.2 Lack of wildlife monitoring at sites with structures that pose high risk of mortality to SGCN wildlife.

12.1.3 Need to answer research question

12.1.3.4 Lack of information regarding the potential short- and long-term impacts of wind turbines and other tall coastal structures on migratory populations.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

3.0.0.25 Identify pathways of migratory SGCN in the Atlantic Coastal and Marine Regions (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and use the data to help evaluate the potential short- and long-term impacts of wind turbines, radio towers, utility guy lines, and other tall coastal structures on migratory populations.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

Project 23. Land Use Planning

- 3.2.0.17 Conduct monitoring at constructed wind farms (within or outside of NJ) to assess the impacts on migratory species (birds, bats, insects) and determine if NJ's land use planning efforts and/or smart-growth plans need to be revised.

9 Planning

9.1 Land use planning

9.1.0 Land use planning strategies

- 9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and the SGCN inhabiting them.

- 9.1.0.2 Develop town plans that avoid impacts to SGCN species and their habitats.

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

- 11.1.1.12 Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed solar and/or wind farm projects to reduce habitat fragmentation and minimize impacts on wildlife.

Job 23.03. Habitat Management within the "Clear Zone" of Roads

Objective: Identify "clear zone" areas along roads and within road medians where it would be appropriate, and not likely to increase wildlife mortality, to manage habitat for wildlife and implement management of these areas (e.g., plant native herbaceous plant species to increase habitat suitability for insects and birds) as appropriate.

Purpose: Repurpose roadside habitat conditions in suitable areas to benefit wildlife where linear development has altered or degraded habitat.

Benefits: Increase in habitat availability and diversity in under-utilized area and improve habitat conditions.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

7 Natural Systems Modifications

7.3 Other Ecosystem Modifications

7.3.5 Poor habitat management

7.3.5.1 Improper or poorly scheduled maintenance of man-made corridors (e.g., roadsides and medians) can cause direct mortality to and may reduce productivity of wildlife.

7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.1.2 Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

2.11.0.26 Conduct vegetation management along roadsides and medians, avoiding peak activity periods for wildlife, that enhances wildlife dispersal naturally and safely across roads and similar barriers to/between terrestrial and/or aquatic habitats.

3 Data Collection and Analysis

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.1 Abundance determination

Project 23. Land Use Planning

- 3.2.1.2 Conduct wildlife surveys on resident and migratory SGCN regarding their population abundance and trends.

- 3.3 Research, survey or monitoring - habitat

- 3.3.1 Baseline inventory

- 3.3.1.5 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) where habitat restoration and/or enhancement would benefit wildlife SGCN.

- 3.3.1.6 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) that could, through revegetation and/or enhancement efforts, become suitable travel corridors connecting and increasing the effective size of conserved habitats for SGCN.

8 **Outreach**

- 8.1 Partner/stakeholder engagement

- 8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.18 Engage NJDOT, NJ Transit Authority and other road management entities, wildlife conservation organizations/agencies (e.g., Division of Fish and Wildlife, New Jersey Conservation Foundation, Conserve Wildlife Foundation of NJ), and communities and citizens in discussions regarding the importance of and methods to enhance habitat connectivity, and work together to develop feasible strategies for ensuring that wildlife can disperse naturally and safely across roads and similar barriers to terrestrial and/or aquatic habitats.

9 **Planning**

- 9.3 Species and habitat management planning

- 9.3.3 Habitat management planning

- 9.3.3.36 Integrate plans for properly located and timed habitat restoration and management along transportation, energy and service corridors to minimize risks to and benefit wildlife.

100 **Law and Policy**

- 100.3 State Regulations

- 100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.31 Create or expand tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMPs.

Job 23.04. Secondary Impact Analysis Ordinances

Project 23. Research and Monitoring

Objective: Work with the Association of New Jersey Environmental Commissions (ANJEC) to develop model municipal ordinances that require the full assessment of secondary impacts of development in particular development adjacent to natural/conserved lands, when revising local planning or zoning documents or when granting site plan/subdivision approvals. Examples of impacts include residential-edge burn obligations by NJ Forest Fire Service, increased ORV access and its effects, expanded mosquito control, increased deer populations resulting from hunting restrictions in developed areas, and lack of vegetated buffers to protect adjacent natural areas.

Purpose: Minimize or mitigate for impacts to forest species and forest ecology that would be expected to result from activities often associated with new development, including actions required for public safety (e.g., prescribed burns to reduce fuel, mosquito control, etc.).

Benefits: Maintain the quality of existing wildlife habitats adjacent to new development.

Focal wildlife species benefitting from this job

Birds

American Woodcock	Blue-winged Warbler	Cerulean Warbler
Golden-winged Warbler	Kentucky Warbler	Northern Bobwhite
Prothonotary Warbler	Red-headed Woodpecker	Scarlet Tanager
Wood Thrush		

Fish

Banded Sunfish	Blackbanded Sunfish	Bridle Shiner
Brook Trout	Comely Shiner	Ironcolor Shiner
Mud Sunfish	Swamp Darter	

Macroinvertebrates

A Notodontid Moth (H. varia)	American Bumble Bee	Arogos Skipper
Ashton Cuckoo Bumble Bee	Brook Floater	Buchholz's Dart Moth
Buchholz's Gray	Carter's Noctuid Moth	Daecke's Pyralid Moth
Dotted Skipper	Dwarf Wedgemussel	Eastern Lampmussel
Frosted Elfin	Georgia Satyr	Green Floater
Hoary Elfin	Leonard's Skipper	Maritime Sunflower Borer Moth
New England Bluet	New Jersey Pine Barrens Tiger Beetle	Northern Metalmark
Papaipema harrisii	Pine Barrens Bluet	Pink Sallow
Robust Baskettail	Rusty Patched Bumble Bee	Sand Myrtle Looper/Pink
Scarlet Bluet	Septima's Clubtail	Southern Plains Bumble Bee

Project 23. Research and Monitoring

Superb Jewelwing	Triangle Floater	Variable Cuckoo Bumble Bee
Yellow Bumble Bee	Yellow Lampmussel	Yellow-banded Bumble Bee

Mammals

Allegheny Woodrat	Indiana Bat	Little Brown Bat
Northern Myotis		

Reptiles & Amphibians

Bog Turtle	Carpenter Frog	Corn Snake
Eastern Box Turtle	Eastern Hognose Snake	Eastern Redbelly Turtle
Eastern Spadefoot	Eastern Tiger Salamander	Longtail Salamander
New Jersey Chorus Frog	Northern Black Racer	Northern Pine Snake
Northern Red Salamander	Northern Scarlet Snake	Pine Barrens Treefrog
Timber Rattlesnake	Wood Turtle	

Threats and Action Drivers associated with this conservation need

1 Residential and Commercial Development

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale)

- 1.1.1.1** Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
- 1.1.1.2** Loss, alteration and/or degradation of habitat.
- 1.1.1.3** Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.
- 1.1.1.4** Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.
- 1.1.1.5** Impervious surfaces can lead to a decrease in water recharge.
- 1.1.1.6** Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
- 1.1.1.7** Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale)

- 1.2.1.1** Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
- 1.2.1.2** Loss, alteration and/or degradation of habitat.

Project 23. Research and Monitoring

- 1.2.1.3 Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.
- 1.2.1.4 Increased risk of vehicle strikes/mortality to terrestrial-bound and some bird species.
- 1.2.1.5 Impervious surfaces can lead to a decrease in water recharge.
- 1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
- 1.2.1.7 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.3 Tourism and Recreational Areas

- 1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale)
 - 1.3.1.1 Fragments terrestrial and aquatic habitats making the area unsuitable for area-sensitive species and inhibit dispersal of animals, reducing gene flow.
 - 1.3.1.2 Loss, alteration and/or degradation of habitat.
 - 1.3.1.3 Lot layout, design and/or landscaping may create conditions that increase wildlife-human conflict.
 - 1.3.1.4 Impervious surfaces can lead to a decrease in water recharge.
 - 1.3.1.5 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.
 - 1.3.1.6 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

2 **Agriculture and Aquaculture**

2.1 Annual and Perennial Crops (non-timber)

- 2.1.2 Small-holder Farming
 - 2.1.2.2 Fragments terrestrial and aquatic habitats.
- 2.1.3 Agro-industry
 - 2.1.3.2 Fragments terrestrial and aquatic habitats.
 - 2.1.3.5 Loss of ecotones by implementing clean farming (edge-to-edge) practices degrades habitat for early successional wildlife.

12 **Resource Management Needs**

12.3 Regulatory Reform

- 12.3.0 State Regulatory Reforms

- 12.3.0.7 Activities that threaten SGCN, their food sources, and/or habitats are often regulated separately and without consideration for the cumulative and synergistic effects over time or over a larger spatial scale. Therefore, regulations can fail to protect SGCN populations over time.

Conservation actions that address Threats and Action Drivers

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.15 Engage government agencies, conservation partners and other stakeholders in discussions encouraging and supporting the creation of laws and policies requiring vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 8.1.0.16 Engage local governments in discussions regarding the importance of them adopting/passing ordinances which require assessing and addressing secondary impacts (i.e., ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.

11 Technical Assistance

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

- 11.2.0.25 Provide educational resources, training programs, and on-the-ground guidance to resource managers regarding the assessment of and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) related to residential and commercial development.

100 Law and Policy

100.1 Legislation

100.1.4 County and Local

- 100.1.4.14 Adopt/pass local ordinances which require assessing and addressing secondary impacts (i.e. ancillary prescribed burns, trespassers, ORV use, mosquitoes, deer, buffers) on biological resources when revising planning/zoning documents or granted site plan/subdivision approvals.

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

Project 24. Marine Protection

Job 24.01. Marine Spatial Planning

Objective: Develop a plan that prioritizes near-shore coastal species and habitats that may be negatively affected by sea level rise, flooding, and increased storm surges, and implement efforts to minimize impacts.

Purpose: Provide guidance on methods to minimize the impacts of sea level rise, flooding, and increased storms/surges on priority near-shore coastal habitats and wildlife.

Benefits: Ameliorate the impacts of sea-level rise, flooding, and storms, and preserve biological diversity through the preservation of diverse habitats that would otherwise be lost as a result of salt water inundation.

Focal wildlife species benefitting from this job

Birds

American Oystercatcher	Black Rail	Black Skimmer
Common Tern	Forster's Tern	Least Tern
Little Blue Heron	Northern Harrier	Piping Plover
Red Knot	Ruddy Turnstone	Snowy Egret
Tricolored Heron		

Fish

Alewife	Atlantic Sturgeon	Blueback Herring
Shortnose Sturgeon		

Mammals

North Atlantic Right Whale

Reptiles & Amphibians

Atlantic Green Turtle	Atlantic Leatherback	Atlantic Loggerhead
Atlantic Ridley	Northern Diamondback Terrapin	

Threats and Action Drivers associated with this conservation need

11 Climate Change and Severe Weather

11.4 Storms and Flooding

11.4.1 Storms and flooding

11.4.1.2 Potentially damage coastal habitats, including beach- and marsh-nesting bird habitats and interdunal wetlands, and can increase marsh erosion.

11.5 Sea-level Rise

Project 24. Marine Protection

11.5.0 Sea-level Rise

- 11.5.0.1 Contributes to the conversion of high salt marsh to low salt marsh, threatening species that depend on high marsh habitat and those dependent on the marsh-upland ecotone.
- 11.5.0.4 Increased erosion of beach, mudflat and marsh habitats critical for a number of coastal species to fulfill life history requirements.
- 11.5.0.5 Sea-level rise will result in the conversion of some upland habitats to tidal marshes impacting the species that rely upon those upland areas.
- 11.5.0.7 Sea level rise exacerbates marsh loss caused by prior human manipulations (e.g., impoundments, grid-ditching) that reduced the elevation of the marsh.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

- 12.1.1.4 Lack of information on the morphometrics and trends of coastal salt marshes and salt marsh islands.

12.1.2 Lack of up-to-date existing information

- 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.46 Implement sediment augmentation techniques on tidal salt marshes to offset marsh subsidence and effects of sea level rise, and to stabilize tidal marsh ecosystem.

3 Data Collection and Analysis

3.3 Research, survey or monitoring - habitat

Project 24. Marine Protection

3.3.1 Baseline inventory

3.3.1.16 Gather "best information" for spatial modeling and update/create a current model/depiction of anticipated habitat shifts from sea-level rise, flooding, etc.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

9.3.3 Habitat management planning

9.3.3.25 Develop a habitat management plan focused on areas important to near-shore, coastal species (e.g., herring, sturgeon, terrapin, nesting birds) that prioritizes these areas to direct resources to minimize the impacts of sea-level rise, flooding and storms (including extreme rain events) such as increased erosion of beach, mudflat and marsh habitats, and the increased risk of saltwater intrusion into freshwater habitats. Gather "best information" for spatial modeling of anticipated habitat shifts from sea-level rise, flooding, etc.

Job 24.02. Submarine and Pipeline Construction Requirements for Minimizing Impacts

Objective: Support the development, implementation, and enforcement of improved submarine and pipeline construction requirements, through State regulations or policy, that minimize harm to benthic and marine biota.

Purpose: Reduce the loss of benthic and marine biota as a result of construction activities associated with submarine cable and pipeline installation.

Benefits: Protection for benthic and marine biota from the activities associated with the installation submarine cable and pipeline.

Threats and Action Drivers associated with this conservation need

3 Energy Production and Mining

3.1 Oil and Gas Facilities and Pipelines

3.1.1 Distribution processes of petroleum and other liquid hydrocarbons

3.1.1.1 Fragments terrestrial and aquatic habitats.

3.1.1.2 Loss, alteration and/or degradation of habitat.

3.1.2 Natural gas distribution processes

3.1.2.1 Fragments terrestrial and aquatic habitats.

3.1.2.2 Loss, alteration and/or degradation of habitat.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

Project 24. Marine Protection

- 11.1.1.11 Use the best available science (species data, habitat present, site layout options, etc.) when conducting regulatory reviews of proposed offshore energy projects relating to drilling, extraction and distribution of petroleum and gas products to reduce habitat destruction and minimize impacts on wildlife.

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.49 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address the issue of disturbance to habitat or species as a result of human activities (e.g., construction, bridge maintenance, road work, etc.).

Job 24.03. Marine Species Education

Objective: Educate the public and individuals involved in commercial aquaculture and commercial fishing on actionable steps to reduce the impacts to marine resources (animals and habitats) caused by 1) marine debris (e.g., abandoned traps, coastal debris), 2) shellfish aquaculture (e.g., structures, equipment), and 3) fisheries and shellfisheries bycatch.

Purpose: Reduce impacts on marine wildlife and habitats from commercial aquaculture and commercial fishing activities.

Benefits: Reduce accidental harm to non-targeted marine species and provide opportunity for the aquaculture industry to consider non-targeted marine species when maintaining and/or harvesting their products.

Focal wildlife species benefitting from this job

Northern Diamondback Terrapin

Threats and Action Drivers associated with this conservation need

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats

- 14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.

14.2 Outreach needs

14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions

- 14.2.1.2 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various aquatic and riparian management practices.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

8 Outreach

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.20 Develop an educational outreach program for landowners, particularly those in the coastal and bay areas, boaters, and the general public with information about the negative impacts on marine wildlife and habitats, and steps they can implement to reduce these impacts.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

Project 24. Marine Protection

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

Project 25. Fisheries Management

Job 25.01. Ecosystem Management for Fisheries Management

Objective: Apply ecosystem-based strategies to freshwater and marine fisheries management.

Purpose: Enhance the sustainability of fishery resources in freshwater and marine environments.

Benefits: Management of fisheries resources through the application of ecosystem-based strategies can enhance the sustainability of the resource through the management of multiple related trophic levels and their associated environments.

Focal wildlife species benefitting from this job

Fish

Alewife	Atlantic Sturgeon	Banded Sunfish
Blackbanded Sunfish	Blueback Herring	Bridle Shiner
Brook Trout	Comely Shiner	Ironcolor Shiner
Mud Sunfish	Shortnose Sturgeon	Swamp Darter

Threats and Action Drivers associated with this conservation need

1 **Residential and Commercial Development**

1.1 Housing and Urban Areas

1.1.1 Land conversion from natural habitat to urban and other residential areas (large and small scale)

1.1.1.5 Impervious surfaces can lead to a decrease in water recharge.

1.1.1.7 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.2 Commercial and Industrial Areas

1.2.1 Land conversion from natural habitat to commercial or industrial areas (large and small scale)

1.2.1.6 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

1.2.1.7 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

1.3 Tourism and Recreational Areas

1.3.1 Land conversion from natural habitat to recreation or tourism areas (large and small scale)

1.3.1.5 Impervious surfaces can cause an increased risk of floods, flash floods and storm damage that degrade terrestrial and aquatic habitats.

Project 25. Fisheries Management

- 1.3.1.6 Impervious surfaces can cause an increase in temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

2 Agriculture and Aquaculture

2.1 Annual and Perennial Crops (non-timber)

2.1.1 Shifting Agriculture

- 2.1.1.3 Conversion of agricultural landscape that results in increased erosion, runoff, and chemical and thermal pollution decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

2.3 Livestock Farming and Ranching

2.3.2 Small-holder Grazing

- 2.3.2.3 Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

2.3.3 Agro-industry Grazing

- 2.3.3.3 Conversion of natural stream buffers into pastures decreases the landscape's ability to buffer aquatic systems from various forms of terrestrial degradation.

5 Biological Resource Use

5.4 Fishing and Harvesting of Aquatic Resources

5.4.3 Unintentional effects (subsistence/small scale)

- 5.4.3.7 Improperly sanitized equipment, relocation of fish, importation and release of non-native species, and the use of bait from a different location can spread invasive species and diseases from one waterbody to another.

5.4.4 Unintentional effects (large scale)

- 5.4.4.7 Improperly sanitized equipment, relocation of fish, importation and release of non-native species, and the use of bait from a different locations can spread invasive species and diseases from one waterbody to another.

6 Human Intrusions and Disturbance

6.1 Recreational Activities

6.1.2 Boating

- 6.1.2.5 Watercraft can be a mechanism of transference of wildlife diseases and invasive plant species if gear is not properly sanitized between sites.

6.3 Work and Other Activities

6.3.1 Unauthorized research projects at significant habitats

- 6.3.1.1 Participants may introduce wildlife diseases and invasive plant species when gear and apparel is not properly sanitized between sites.

Project 25. Fisheries Management

6.3.1.4 Illegal transfer of freshwater fish from one waterbody/watershed to another can result in the spread of non-native, invasive and/or undesirable fish or mussel species and/or diseases.

6.3.2 Authorized research projects at significant habitats

6.3.2.2 Participants may introduce wildlife diseases and invasive plant species when gear and apparel is not properly sanitized between sites.

6.3.2.5 Authorized transfer of freshwater fish from one waterbody/watershed to another can result in the spread of non-native, invasive and/or undesirable fish or mussel species and/or diseases.

7 Natural Systems Modifications

7.2 Dams and Water Management/Use

7.2.1 Abstraction of Surface Water (domestic use)

7.2.1.1 Changing water levels due to water body drawdowns (legal and illegal) may lower dissolved oxygen levels, increase water temperatures, expose wildlife to predation, and increase exposure to winter temperatures, altering wildlife behavior and survival.

7.2.1.2 Controlled water releases and/or improper water level management of water bodies may alter downstream dissolved oxygen levels, water temperatures, sediment deposition, and flow rates, altering wildlife behavior and survival.

7.2.1.3 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, and eliminates shallow water habitats.

7.2.1.4 Water intake systems associated with municipal water supply threaten aquatic organisms due to injury or mortality from impingement and/or entrainment.

7.2.1.5 Abstraction of surface water may deplete upland mesic habitats of water needed by plants and wildlife.

7.2.1.6 Impoundments may alter the water levels in high marshes and mudflats, impacting those foraging and nesting habitats.

7.2.2 Abstraction of Surface Water (commercial use)

7.2.2.1 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, eliminates shallow water habitats, and disrupts/removes stream bottom habitat.

7.2.2.2 Changing water levels due to water body drawdowns (legal and illegal) may lower dissolved oxygen levels, increase water temperatures, expose wildlife to predation, and increase exposure to winter temperatures, altering wildlife behavior and survival.

7.2.2.3 Controlled water releases and/or improper water level management of water bodies may alter downstream dissolved oxygen levels, water temperatures, sediment deposition, and flow rates, altering wildlife behavior and survival.

Project 25. Fisheries Management

- 7.2.2.4 Water intake systems associated with industrial use and power plants threaten aquatic organisms due to injury or mortality from impingement and/or entrainment.
 - 7.2.2.5 Abstraction of surface water may deplete upland mesic habitats of water needed by plants and wildlife.
 - 7.2.2.6 Impoundments may alter the water levels in high marshes and mudflats, impacting those foraging and nesting habitats.
 - 7.2.3 Abstraction of Surface Water (agricultural use)
 - 7.2.3.1 Controlled water releases and/or improper water level management of water bodies may alter downstream dissolved oxygen levels, water temperatures, sediment deposition, and flow rates, altering wildlife behavior and survival.
 - 7.2.3.2 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, and eliminates shallow water habitats.
 - 7.2.3.3 Impounding water to create or expand bogs for cranberry farming leads to the loss of natural wetlands and the alteration of the natural hydrology in the area.
 - 7.2.3.4 Water intake systems associated with agriculture threaten aquatic organisms due to injury or mortality from impingement and/or entrainment.
 - 7.2.3.5 Changing water levels due to water body drawdowns (legal and illegal) may lower dissolved oxygen levels, increase water temperatures, expose wildlife to predation, and increase exposure to winter temperatures, altering wildlife behavior and survival.
 - 7.2.3.6 Abstraction of surface water may deplete upland mesic habitats of water needed by plants and wildlife.
 - 7.2.3.7 Impoundments may alter the water levels in high marshes and mudflats, impacting those foraging and nesting habitats.
 - 7.2.5 Abstraction of Ground Water (domestic use)
 - 7.2.5.1 Heavy withdrawal of ground water for domestic use may lower water tables and alter the hydrology of freshwater wetlands and headwater streams, including tributaries, seepages and vernal pools.
 - 7.2.9 Small Dams
 - 7.2.9.1 Alter the physical, chemical and biological stream environment, causing changes in substrate composition, flow rates, dissolved oxygen, and water temperatures.
 - 7.2.9.2 Dams act as a barrier to fish movement, limiting the distribution of anadromous fish and fish that act as hosts for mussels.
 - 7.2.9.3 Dams act as a barrier to movement, limiting the ability of aquatic or semi-aquatic wildlife to move safely between habitats.
 - 7.2.10 Large Dams
 - 7.2.10.1 Alter the physical, chemical and biological stream environment, causing changes in substrate composition, flow rates, dissolved oxygen, and water temperatures.

Project 25. Fisheries Management

7.2.10.2 Dams act as a barrier to fish movement, limiting the distribution of anadromous fish and fish that act as hosts for mussels.

7.2.10.3 Dams act as a barrier to movement, limiting the ability of aquatic or semi-aquatic wildlife to move safely between habitats.

7.2.11 Dams (size unknown)

7.2.11.1 Alter the physical, chemical and biological stream environment, causing changes in substrate composition, flow rates, dissolved oxygen, and water temperatures.

7.2.11.2 Dams act as a barrier to fish movement, limiting the distribution of anadromous fish and fish that act as hosts for mussels.

7.2.11.3 Dams act as a barrier to movement, limiting the ability of aquatic or semi-aquatic wildlife to move safely between habitats.

7.2.12 Culverts

7.2.12.1 Improper design, placement, installation and maintenance of culverts and other stream crossing structures can impede or prevent the movements of terrestrial organisms and can restrict or limit stream flow, impeding the movement of aquatic organisms along riparian corridors.

7.2.13 Stream Burial

7.2.13.3 Alters the hydrology and quality of downstream aquatic and riparian habitats.

7.3 Other Ecosystem Modifications

7.3.3 Removal of coarse woody debris (streams, forests, scrub-shrub habitats)

7.3.3.1 Decreases the available detritus that normally accumulates behind and within stream obstructions, minimizing or eliminating food sources and shelters for fishes, invertebrates and amphibians.

7.3.3.2 Decreases habitat and/or corridor suitability due to limited or absent shelter and foraging habitat.

7.3.3.4 Decreases available basking, shelter, and foraging habitats.

7.3.5 Poor habitat management

7.3.5.2 Shifting from natural vegetation to lawns can cause increased temperatures of local aquatic systems making them unsuitable (or less suitable) for aquatic species' reproduction and survival.

7.3.5.4 Vegetation clearing or inappropriate alteration adjacent to aquatic habitats threatens aquatic species by degrading habitat and water quality (altering temperature and dissolved oxygen, increasing siltation and dessication, etc.).

7.3.5.8 Storm water outfall pipes can create habitats in small streams that are conducive to non-native predatory fish which can negatively impact native fish species.

7.3.5.9 Channelization alters water volume and flow rates, removes aquatic vegetation and coarse, woody debris, eliminates shallow water habitats, and disrupts/removes stream bottom habitat.

Project 25. Fisheries Management

7.3.5.10 Ditching, draining and filling of marshes and wetlands eliminates habitat and degrades the remaining surrounding areas for wildlife.

7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.

8 Invasive and Other Problematic Species, Genes and Diseases

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.2 Invasive non-native aquatic animals

8.1.2.1 Parasites introduced into the marine environment can alter the reproductive and feeding behavior of native wildlife, leading to their decline.

8.1.2.2 Displace or out-compete native species for resources (food, shelter), alter the composition of the native landscapes/aquatic systems, diminishing habitat suitability and reducing ecological integrity of natural communities, and may introduce disease into a population.

8.1.3 Invasive non-native aquatic plants

8.1.3.1 Displace or out-compete native species for resources (food, light, shelter), alter the composition of the native landscapes/aquatic systems, diminish habitat suitability and reduce ecological integrity of natural communities, and may introduce disease into a population.

9 Pollution

9.1 Domestic and Urban Waste Water

9.1.1 Sewage

9.1.1.1 Degradation of aquatic and marine water quality and habitats by changing turbidity, flow and water chemistry.

9.1.1.2 Leads to increased eutrophication and algae blooms that result in oxygen depletion.

9.1.1.3 Contaminants in sewage treatment effluents and Combined Sewer Overflows can cause developmental and behavioral abnormalities and reproductive failure in wildlife.

9.1.2 Run-off

9.1.2.1 Chemical fertilizers and nutrient run-off changes the pH in streams and ponds and causes eutrophication in inland waters and estuaries, which can make habitat unsuitable for specialist species and increase the risk of invasive and generalist species.

9.1.2.2 Contaminants degrade aquatic and marine water quality and can bioaccumulate in benthic organisms, threatening wildlife by causing developmental and behavioral abnormalities and reproductive failure.

9.1.2.3 Contaminants from road runoff (oil, sediment, salt, etc.) impact native vegetation and the species that rely upon them, degrade water quality in aquatic systems, and can injure or kill the aquatic and semi-aquatic species that rely upon them.

Project 25. Fisheries Management

9.3 Agricultural and Forestry Effluents

9.3.1 Nutrient Loads

- 9.3.1.1** Chemical fertilizers and nutrient run-off changes the pH in streams, ponds and wetlands and causes eutrophication in inland waters and estuaries, which can make habitat unsuitable for specialist species and increase the risk of invasive and generalist species.
- 9.3.1.2** Animal waste degrades terrestrial and aquatic habitats, especially streams, ponds and wetlands, resulting in eutrophication, which disrupts oxygen and nutrient balances, and causes injury and mortality to aquatic organisms.
- 9.3.1.3** Organic nutrient inputs from aquaculture may, depending upon type and location, adversely impact intertidal and subtidal habitats and water bodies where there is insufficient tidal flushing.
- 9.3.1.4** Conversion of low-intensity agriculture to intensive agriculture (e.g., tree nursery, row crop) degrades wetland and aquatic habitats with runoff, increasing sediment and nutrient loads and pH.
- 9.3.1.5** Conversion of native forests to plantations degrades wetland and aquatic habitats through increased runoff.

9.3.2 Soil Erosion and Sedimentation

- 9.3.2.1** Soil erosion, sedimentation and destruction of streambanks and riparian buffers degrade waters making them unsuitable for riparian-dependent wildlife.
- 9.3.2.3** Conversion of native forests to plantations degrades wetland and aquatic habitats through increased sedimentation.

9.3.5 Control of insect pests and plants leading to mortality of non-target species not associated with agriculture

- 9.3.5.1** Use of pesticides, insecticides, and/or herbicides can directly harm non-target species, such as amphibians and beneficial invertebrates through direct contact and/or by reducing and/or contaminating their food supply.
- 9.3.5.5** Use of pesticides and herbicides can minimize the abundance of food sources for native wildlife populations.

9.4 Garbage and Solid Waste

9.4.1 Direct hazards to wildlife

- 9.4.1.2** Garbage and solid waste destroys natural habitats and obstructs wildlife movements.

9.6 Excess Energy

9.6.2 Thermal Pollution

- 9.6.2.2** Water temperature changes to aquatic systems can deter or preclude use by SGCN (e.g., alter habitat suitability for wildlife species, reduce prey base) or present stressors that are harmful if not fatal to wildlife.

11 **Climate Change and Severe Weather**

Project 25. Fisheries Management

11.2 Droughts

11.2.1 Droughts

- 11.2.1.1 Contribute to hardened soils, decreasing water recharge during rains and increasing the likelihood of flash floods during storms.
- 11.2.1.2 Lead to lower groundwater levels and therefore, less available water for people and habitats.
- 11.2.1.3 Loss, alteration and/or degradation of terrestrial and aquatic habitats.
- 11.2.1.5 Leads to lower river levels that may impact the ability of anadromous species to reach spawning grounds.

11.3 Temperature Extremes

11.3.1 Temperature extremes

- 11.3.1.1 Increasing temperatures may cause habitat loss and degradation by desiccating and/or raising the temperatures of small wetlands and streams leading to the loss of freshwater mussels and other aquatic species and species reliant upon these habitats.
- 11.3.1.2 Increased temperatures can negatively impact wetland, riverine, lacustrine and vernal pool-associated or -dependent wildlife by reducing flows, increasing water temperatures, lowering water levels and causing premature drying of vernal habitats.
- 11.3.1.3 Temperature extremes of surface water and air degrades marine habitats and ecosystems, threatening marine wildlife. Such extremes also disrupt offshore currents and migratory patterns, species' ranges, and/or impact communities/food chains, all of which further impact the ecosystem.
- 11.3.1.4 Extremely low temperatures and/or extensive periods of unseasonably low temperatures during critical life history stages (e.g., hibernation, gestation/nesting) can alter animals' behaviors and decrease survivorship.

11.6 Phenology Shifting or Alteration

11.6.2 Phenology shifts related to predator-prey ecology

- 11.6.2.1 Alters inter-specific relationships (e.g., competition, parasitism, predation) of wildlife, ultimately leads to detrimental impacts on the ecological system.
- 11.6.2.2 Shifts timing of species migration, breeding and hibernation, and available food resources, causes redistribution of species, or mortality for species that are unable to relocate due to their already isolated habitat or limited mobility.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

Project 25. Fisheries Management

- 12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.
- 12.1.1.2 Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.
- 12.1.2 Lack of up-to-date existing information
 - 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms

- 12.3.0.2 Delays between State species status reviews and regulation amendments to incorporate the findings leads to extended periods when imperiled species do not receive the benefit of land use and other regulatory protections.
- 12.3.0.4 The NJ Administrative Code (N.J.A.C.) fails to protect native, freshwater fish species from collection and/or their use as bait.
- 12.3.0.5 NJDEP land use regulations provide no protection for spawning habitats of native, freshwater fish that are identified as candidates for State endangered, threatened, or special concern status.
- 12.3.0.7 Activities that threaten SGCN, their food sources, and/or habitats are often regulated separately and without consideration for the cumulative and synergistic effects over time or over a larger spatial scale. Therefore, regulations can fail to protect SGCN populations over time.
- 12.3.0.8 Lack of stable funding to support State marine fisheries research, monitoring, and management is a significant impediment to biologically-based management of fish and shellfish populations in New Jersey, which can result in overharvest and severe population declines.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform

- 12.4.0.1 A species-by-species management focus as opposed to ecological systems and biodiversity generally has greater opportunity for unintended consequences for other species and may be less efficient in developing appropriate management actions.
- 12.4.0.2 Policies and procedures for lands management that lack consideration of the impacts of activity timing can result in unintended impacts to wildlife during vulnerable periods.

14 Education/ Outreach Needs

14.1 Education needs

Project 25. Fisheries Management

14.1.1 Need for improved knowledge of fish and wildlife and their habitats

- 14.1.1.3 Lack of understanding of the need to manage both natural and anthropogenic (e.g., yards, lawns, hayfields, etc.) habitats to minimize impacts or increase benefits to SGCN and their habitats.

14.2 Outreach needs

14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions

- 14.2.1.2 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various aquatic and riparian management practices.

- 14.2.1.3 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various coastal management practices.

- 14.2.1.4 Need to develop greater understanding of and support for efforts implemented to maintain disturbance-free habitats that allow coastal wildlife populations to thrive alongside human residential and recreational uses.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.2 Dam and barrier removal

2.2.1 Culvert work

- 2.2.1.1 Replace existing barriers to wildlife movement with and/or install appropriately-sized systems to accommodate wildlife dispersal.

2.2.5 Obstruction removal

- 2.2.5.1 Enhance fish SGCN habitats by removing obstructions to fish passage to benefit those species.

2.8 Invasive species control

2.8.0 Invasive species control strategies and implementation

Project 25. Fisheries Management

- 2.8.0.2 Develop, implement, monitor and evaluate pest control/management strategies to reduce the impacts of over-abundant wildlife species (native and/or native, invasive species) on native vegetation and the degradation of habitats supporting SGCN. Over-abundant wildlife species include but are not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 2.8.0.3 Work with NJ Invasive Species Strike Team to identify areas with and eradicate aquatic invasive species such as the Asian Swamp Eel, Northern Snakehead, and the Chinese pond mussel. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.
- 2.8.0.4 Implement control/management strategies to reduce the impacts and/or limit the distribution of invasive, native and non-native species (wildlife and plants) that pose threats to native wildlife or communities. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical. Follow BMPs to maximize the effectiveness of the strategies while avoiding excessive harm to non-target species.
- 2.8.0.5 Implement biologically safe and appropriate control/management strategies, and where appropriate, eradication strategies to reduce the impacts and/or limit the distribution of invasive and/or non-native plant species within or near aquatic systems using methods that will provide the most protection to the aquatic and riparian ecological system, and minimize disturbance to the soil and wildlife. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.
- 2.8.0.6 Implement long-term management of invasive and/or non-native plants to help maintain functioning ecological systems and biological diversity, and to enhance travel corridors. Encourage the implementation of biological and mechanical removal/control. When chemical control is used, encourage low-volume, targeted application using NJDEP-approved chemicals in accordance with the specific instructions for that chemical.

2.11 Vegetation management

- 2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration
 - 2.11.0.1 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas to improve ecological diversity.
 - 2.11.0.2 Conduct vegetation management in native terrestrial and aquatic habitats to provide suitable and appropriately sized areas for target SGCN and/or species groups; management should complement rare species needs in a targeted area.

Project 25. Fisheries Management

- 2.11.0.4 Implement vegetation management strategies that consider appropriate timing to avoid sensitive periods (e.g., nesting, denning, roosting) and minimize harm to wildlife, particularly SGCN.
- 2.11.0.5 Expand the acreages and enhance the effective size of SGCN habitats by restoring adjacent, less optimal or unsuitable, habitats through vegetation management.
- 2.11.0.7 Protect significant natural and/or unique communities by implementing best management practices through vegetation management.
- 2.11.0.8 Maintain, enhance and/or restore biologically appropriate buffers for SGCN-inhabited/used freshwater wetlands through vegetation management.
- 2.11.0.13 Implement best management practices (BMPs), protective strategies, and guidelines for vegetation management to maintain and enhance healthy, SGCN-associated habitats while minimizing (if not avoiding) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 2.11.0.15 Implement vegetation management to benefit urban-associated SGCN.
- 2.11.0.18 Implement forest management/silvicultural strategies that promote the development of new old-growth forests and/or minimize the loss of old-growth forest stands with large trees and within large, contiguous tracts.
- 2.11.0.21 Minimize the degradation, alteration and/or changes in hydrology of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) and subsequent disturbances to and behavioral changes of wildlife by maintaining or enhancing these areas and biologically appropriate buffers through habitat management and/or revegetation or restoration efforts.
- 2.11.0.22 Minimize habitat loss of high and low marsh habitats that provide nesting, migrating and wintering areas for SGCN birds and other marsh-dependent SGCN by maintaining or enhancing these areas through habitat management and/or revegetation or restoration efforts.
- 2.11.0.24 Conduct vegetation management adjacent to aquatic habitats following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.27 Conduct vegetation management for target shrub- or young forest-dependent SGCN following BMPs to minimize the risk of the establishment of invasive and non-native plants.
- 2.11.0.28 Conduct vegetation management in agricultural areas following BMPs to enhance habitat for target shrub- or young forest-dependent SGCN while minimizing negative impacts to other SGCN.
- 2.11.0.33 Increase structural habitat diversity by implementing long-term vegetation management to minimize the potential for the establishment of invasive and/or non-native plants that may outcompete native vegetation.

Project 25. Fisheries Management

- 2.11.0.34 Increase structural habitat diversity by managing residential, commercial and recreational areas' landscapes for a variety of species. For example, integrate short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas and no-mow set-asides.
- 2.11.0.35 Increase structural habitat diversity by managing vegetation adjacent to aquatic habitats in a manner that provides a buffer from runoff and erosion and a microclimate to stabilize seasonal temperatures to benefit a variety of aquatic and semi-aquatic species.
- 2.11.0.36 Increase structural habitat diversity by managing vegetation for a variety of species and considering their life history requirements (e.g., travel corridors, shelter, resting and breeding areas) to minimize the risk of harm.
- 2.11.0.37 Increase structural habitat diversity by minimizing the removal of coarse, woody debris in terrestrial, aquatic and riparian habitats which benefits wildlife.
- 2.11.0.38 Increase structural habitat diversity in and around horse/livestock farms by managing vegetation for a variety of species, in particular, in and around farms that have fragmented forests, and by implementing ecologically best practices (e.g., do not permit overgrazing, do not allow livestock to wade in waterbodies).
- 2.11.0.44 Manage phragmites adjacent to coastal marshes of interest, in particular those that are within underdeveloped areas and are unprotected, through herbicide application and water management to improve resiliency of the marshes to sea level rise.

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

- 3.0.0.1 Conduct long-term monitoring of resident and migratory SGCN populations using standardized survey protocols to determine the variables that may impact their long-term persistence in the State (e.g., population viability, distribution, dispersal, home range and habitat use, travel corridors, food availability, vulnerability to pollutants and disease, etc.). Compile this information to determine the likely causes of population declines and to understand metapopulation dynamics. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.2 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) where data gaps exist regarding SGCN distribution, and their critical and supportive habitats. Conduct surveys using standardized survey protocols to acquire baseline data, and provide the data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.

Project 25. Fisheries Management

- 3.0.0.3 Gather baseline data on SGCN inhabiting permanently protected natural lands regarding their distribution and population (e.g., abundance, dispersal, demography including productivity and survival, etc.), and identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) critical and supporting habitats within those landscapes.
- 3.0.0.4 Conduct long-term studies on SGCN inhabiting permanently protected natural lands to develop population trend data and changes in demography, and to determine if critical and/or supporting habitats are limited or changing; i.e., diminishing in value, acreage or connectivity.
- 3.0.0.5 Gather baseline data on resident and migratory SGCN (in particular migratory species for which New Jersey habitats are significant), terrestrial, freshwater and marine species, regarding the location and condition of their critical and supporting habitats (e.g., foraging, roosting, nesting/breeding, stopover, migration paths, etc.), and population demography (e.g., productivity, survival, dispersal). Compile this information into a database that includes descriptions of the conditions of the habitats and species, and a GIS component of the locations of these important habitats. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.6 Conduct long-term studies on resident and migratory SGCN to determine if there are changes to the populations' demography (productivity, survival, dispersal) and/or to their critical and/or supporting habitats (i.e., diminishing in value, acreage or connectivity, etc.), in particular changes that would not maintain SGCN at viable levels for species populations. Update data and GIS maps; provide updated information to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.7 Collect baseline data to document species distributions, in particular SGCN, and current habitat for future analysis of possible distribution shifting as a result of habitat shifting or alteration associated with climate change impacts.
- 3.0.0.8 Conduct long-term studies and compare baseline metrics of documented species distributions and associated habitats to identify possible species and/or habitat shifting or alteration associated with climate change impacts.
- 3.0.0.11 Develop, implement and evaluate the effectiveness of town plans that avoid impacts to SGCN species and their habitats.
- 3.0.0.12 Compile available life history information on urban-associated SGCN (e.g., predators, levels of nest/young depredation, breeding longevity and reproductive effort over time, preferred nesting/reproductive requirements, fidelity to breeding and wintering sites, comprehensive assessment of migration routes and destinations) for future development of management strategies to benefit such species.
- 3.0.0.13 Investigate the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats. Evaluate and modify management practices as appropriate.

Project 25. Fisheries Management

- 3.0.0.14 Identify areas with invasive, aquatic plants and animals and collect a detailed baseline assessment of the species' status and distribution. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort. Researchers and contractors performing Forest Stewardship Inventories and/or Plans on state lands should report invasive plant species through the New Jersey Invasive Species Strike Team phone application.
- 3.0.0.15 Conduct long-term monitoring of areas identified as having invasive, aquatic plants and animals to track the species' status/progress over time with or without the implementation of management strategies. Areas without management strategies should be assessed and prioritized for management/control. Areas where management strategies are being implemented should include an assessment of the management effort and identify/recommend and implement necessary changes to improve its success. Solicit volunteers from organizations such as the New Jersey Invasive Species Strike Team to support this effort.
- 3.0.0.19 Identify the presence and status (e.g., functioning, structure, slated for removal, etc.) of existing dams and culverts within and/or that may impact SGCN and their habitats, and create a database that includes a GIS component identifying the locations of such structures and their status. Share this information with appropriate organizations and/or agencies evaluating the benefits and risks of such structures on SGCN and their habitats.
- 3.0.0.20 Once baseline data identifying and describing the status of existing dams and culverts have been gathered, conduct evaluations at a variety of sites to determine whether the benefits of culvert and dam creation or removal outweigh the risks to SGCN species and their habitats, and if other variables/conditions specific to individual sites/locations result in a different outcome. Identify and target appropriate dams and culverts for removal and/or reconstruction to minimize harm to SGCN species and their habitats.
- 3.0.0.21 Conduct long-term monitoring to determine the impacts of the fish and shellfish aquaculture industries on focal and non-focal SGCN and their habitats (i.e., NJ bays, estuaries, ocean areas). Assess the success of management actions implemented to minimize these impacts and make specific recommendations to the NJ DEP regarding how such management efforts may be improved to minimize harm to wildlife and their habitats.
- 3.0.0.22 Develop, implement and evaluate the success of a habitat improvement and restoration program to restore cold-water fish habitat, ecosystems and populations.
- 3.0.0.23 Identify (through wildlife and aquatic system surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and research water quality parameters for all [types of] aquatic systems for various SGCN populations.
- 3.0.0.26 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species including objectives and guidance pertaining to and the condition/status of critical and supporting habitats.

Project 25. Fisheries Management

- 3.0.0.27 Evaluate the effectiveness of strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals through research and monitoring. Develop and provide NJ DEP and other appropriate governing agencies/commissions a summary of findings and recommendations to improve such efforts.
- 3.0.0.28 Evaluate best management practices for using mined sand or dredged material to improve habitat for wildlife, particularly for spawning horseshoe crabs and migrating shorebirds.
- 3.0.0.29 Conduct long-term monitoring of sensitive marine species habitats and migration and/or spawning areas to determine their continued use or changes as a result of habitat shifts or alterations that may warrant further management actions.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.1 Division of Fish and Wildlife should maintain a robust, up-to-date database and mapping of species occurrences.
- 3.2.0.2 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
- 3.2.0.3 Survey for and monitor populations of freshwater aquatic focal SGCN to assess the populations' demography, trends, condition, distribution, etc.
- 3.2.0.4 Conduct long-term monitoring of the impacts of contaminants to vulnerable wildlife to determine the magnitude of exposure within populations and around the State, the impacts to those species, in particular SGCN, and investigate the feasibility of mitigating for such impacts. Maintain records on exposure of vulnerable wildlife to environmental toxins (such as flame retardants and endocrine disruptors), so that sources may be identified and controlled or eliminated.
- 3.2.0.5 Prevent or ameliorate near-term impacts of climate change throughout the State by developing, implementing and monitoring/evaluating habitat management strategies that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas, in particular within the coastal and Delaware Bay areas.
- 3.2.0.6 Develop, implement and conduct studies to evaluate the effectiveness of methods implemented to reduce road mortality of wildlife (e.g. wildlife underpasses, road closures).
- 3.2.0.7 Track (via a database that includes a GIS component) and research problematic species and diseases to determine their distribution, impacts on SGCN wildlife/wildlife communities, and develop potential control measures.

Project 25. Fisheries Management

- 3.2.0.8 Implement and conduct long-term monitoring of control measures aimed at minimizing the impacts of problematic species and/or diseases to evaluate the effectiveness of such efforts and to identify and incorporate additional strategies as appropriate.
- 3.2.0.10 Evaluate the effectiveness of sanitation/decontamination protocols in minimizing the transference of wildlife diseases and invasive plant species.
- 3.2.0.13 Continue the research and studies undertaken by the State's Shad and River Herring/Alewife Technical Working Group regarding an assessment to determine if the herring should be listed as a "stock in the fishery."
- 3.2.0.14 Identify spawning areas for species such as Atlantic and Shortnose sturgeon, Alewife, and Blueback Herring, and document shifts of these areas over time. Assess their reproductive success over time, including fecundity, early life stages and juvenile success, etc.
- 3.2.0.15 Identify and compile information regarding critical time periods in which freshwater SGCN fish are vulnerable (e.g., spawning periods) using literature searches, review of available data, enlistment of species experts, etc.).
- 3.2.0.16 Conduct long-term monitoring to evaluate the success of marine conservation zone designations on marine SGCN.
- 3.2.0.18 Conduct baseline surveys/inventories to better understand the distribution of fish and invertebrate (including freshwater mussels) populations.
- 3.2.0.21 Investigate the effects of mosquito control methods on freshwater aquatic and semi-aquatic SGCN including but not limited to, amphibian, fish, dragonfly, and damselfly populations.

3.2.7 Population assessment

- 3.2.7.1 Conduct species status assessments using the Delphi Technique and review of available data and literature on fish and wildlife (including marine animals) to maintain accurate legal status categorization of native wildlife.
- 3.2.7.2 Conduct studies to evaluate the effectiveness of proactive species recovery plans for all endangered and threatened species to meet and maintain recovery goals.

3.5 Techniques development

3.5.4 Fish and wildlife research, survey and management techniques

- 3.5.4.2 Develop, implement, monitor and evaluate management strategies to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 3.5.4.4 Investigate the effects of mosquito control methods on freshwater aquatic and semi-aquatic SGCN including but not limited to, amphibian, fish, dragonfly, and damselfly populations.

Project 25. Fisheries Management

- 3.5.4.5 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
- 3.5.4.6 Investigate the feasibility of mitigating for the impacts of contaminants to vulnerable wildlife, particularly SGCN. Maintain records on exposure of vulnerable wildlife to environmental toxins (such as flame retardants and endocrine disruptors), so that sources may be identified and controlled or eliminated.
- 3.5.4.8 Develop a habitat improvement and restoration program to restore cold-water fish ecosystems and populations.
- 3.5.4.11 Develop aquaculture practices in the Delaware Bay that are compatible with the recovery of SGCN.
- 3.5.4.13 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.
- 3.5.4.14 Develop and implement agreements, and update existing agreements, with government agencies regarding the protection of critical SGCN habitats (e.g., significant breeding populations of beach nesting birds, colonial waterbird nesting areas, bat colonies, etc.).
- 3.5.4.15 Investigate the success of management strategies used to protect and/or enhance SGCN populations and when appropriate, aid in identifying failures/resource problems and issues, and developing new strategies.
- 3.5.4.16 Use data regarding SGCN population numbers/trends and demography, on-going threats, habitat changes, etc. to determine if directed management efforts are needed to reach or maintain viable population levels and develop the necessary management strategies.
- 3.5.4.17 Investigate new, non-invasive techniques for SGCN population evaluation through literature review, expert opinion, trial studies (if low risk), etc.
- 3.5.4.18 Investigate the effectiveness of survey techniques through selected “ground truthing” and literature and peer review in order to increase efficacy of survey, minimize surveyor bias and error, and increase accuracy of trend data.
- 3.5.4.19 Develop reliable, standardized survey and monitoring protocols for SGCN species, for which none currently exist, and their habitats.

- 3.5.4.23 Reduce the impacts of entrainment, impingement and thermal discharge at power plants by working with conservation partners, academia, etc. to ensure that best available technologies are utilized wherever possible.

6 Land and Water Rights Acquisition and Protection

6.0 Acquisition and protection strategies

6.0.0 Combined acquisition and protection strategies

- 6.0.0.3 Secure and protect riparian and floodplain habitats, inland wetland habitats (marsh, vernal pool, fen, emergent shrubland, forest), and other aquatic habitats (including open waters) and/or biologically appropriate buffers to minimize degradation through an appropriate combination of fee title, non-fee title and landowner agreements.
 - 6.0.0.4 Secure and protect fish SGCN habitats by protecting lands adjacent to fish SGCN habitats and/or aquatic systems feeding into such habitats through an appropriate combination of fee title, non-fee title and landowner agreements.
 - 6.0.0.5 Secure and protect critical coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating and wintering areas for SGCN birds, fish and other coastal SGCN through an appropriate combination of fee title, non-fee title and landowner agreements.
 - 6.0.0.6 Secure and protect old-growth forest stands with large trees and/or stands that are approaching or being actively managed for old growth forests, in particular those within large, contiguous forest tracts, through an appropriate combination of fee title, non-fee title and landowner agreements.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.3 Develop an outreach team of personnel from government entities, conservation organizations and other stakeholders to work together to collaboratively use social media campaigns to grow a constituency of NJ residents who have an elevated ecological and climate consciousness.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.1 Utilize WSFR grant funds, in combination with alternate funding sources as needed, to implement a scientific data-driven, extensive educational/outreach program targeting sportsmen's organizations and fisheries, as well as public constituents, addressing the potential impacts of over-harvesting wildlife can have on the ecological system and to promote "sustainable harvest".

9 Planning

9.1 Land use planning

Project 25. Fisheries Management

9.1.0 Land use planning strategies

- 9.1.0.1 Develop smart-growth plans and critical habitat designations that consider SGCN life history requirements and habitat needs, connectivity and health of those habitats, and minimizes human-associated disturbances to those habitats and the SGCN inhabiting them.

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.1 Develop a management plan specific to River Herring/Alewife to ensure a sustainable population in perpetuity.
- 9.3.1.3 Develop a management plan to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals.
- 9.3.1.4 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.3.1.7 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
- 9.3.1.9 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
- 9.3.1.12 Develop a management plan to benefit urban-associated SGCN based on research.
- 9.3.1.13 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
- 9.3.1.14 Create species management plans that will promote the protection and where appropriate, the development of old-growth forest stands with large trees, in particular those within large, contiguous forest tracts.
- 9.3.1.19 Develop management strategies for freshwater SGCN fish and incorporate them into existing Freshwater Fisheries Management Plans.
- 9.3.1.20 Use compiled life history information on urban-associated SGCN regarding threats, breeding, fecundity, survival, habitat needs, wintering sites/roosts, migration routes and destinations, etc. to develop wildlife management strategies to benefit such species.
- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

9.3.3 Habitat management planning

Project 25. Fisheries Management

- 9.3.3.6 Develop a management plan for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 9.3.3.7 Develop a management plan to reduce the impacts of herbivory on native vegetation and the degradation of habitats supporting SGCN by invasive and/or native, over-abundant wildlife species including but not limited to mute swans, Canada geese, beaver and white-tailed deer.
- 9.3.3.10 Develop a management plan to ensure SGCN populations' persistence based on long-term monitoring of resident and migratory SGCN populations and their habitats.
- 9.3.3.11 Develop town plans that avoid impacts to SGCN species and their habitats.
- 9.3.3.13 Develop a management plan that will establish/improve habitat resilience (e.g., shorelines of the coast and Delaware Bay, forested habitats of the Pinelands and Skylands) that benefits wildlife inhabiting these areas and prevents or ameliorates near-term impacts of climate change throughout the State, but in particular within the coastal and Delaware Bay areas.
- 9.3.3.14 Develop a management plan using aquaculture practices in coastal areas that are compatible with the recovery of SGCN.
- 9.3.3.15 Develop a management plan incorporating the effects of pesticides, herbicides and other biological controls on SGCN and their critical and supporting habitats.
- 9.3.3.18 In cooperation with species and habitat experts, develop management plans for significant natural and/or unique communities, in particular those supporting SGCN, and provide the information to the landowners/managers (federal, state and local government agencies or non-government organization) for review and implementation.
- 9.3.3.19 Develop management plans for SGCN inhabiting permanently protected natural lands using available baseline and population trend data.
- 9.3.3.21 Develop a rapid response plan for various scenarios (e.g., insect infestations destroying native habitat, wildlife disease) to be implemented upon exotic pathogen introduction or incident.
- 9.3.3.22 Create management plans to minimize and/or prevent wildlife road mortality that will incorporate wildlife passages in conjunction with barrier fencing and, where possible, seasonal closures. Aquatic-associated passages must avoid disturbance to the natural streambeds and riparian habitat, permit high volumes of water to flow freely, and provide adequate travel corridors for terrestrial wildlife, while maintaining stream flow for fish passage. Bridges that span rivers and streambeds and include floodplain habitat on either side of the span to provide travel corridors for terrestrial wildlife are preferred over culverts.

Project 25. Fisheries Management

- 9.3.3.23 Create forest management plans that will promote the protection and/or development of old-growth forest stands with large trees, in particular those within large, contiguous forest tracts.
- 9.3.3.24 Develop a plan to improve the enforcement of policies and/or regulations that protect wetlands, riparian and floodplain areas, and aquatic habitats (including open waters).
- 9.3.3.25 Develop a habitat management plan focused on areas important to near-shore, coastal species (e.g., herring, sturgeon, terrapin, nesting birds) that prioritizes these areas to direct resources to minimize the impacts of sea-level rise, flooding and storms (including extreme rain events) such as increased erosion of beach, mudflat and marsh habitats, and the increased risk of saltwater intrusion into freshwater habitats. Gather "best information" for spatial modeling of anticipated habitat shifts from sea-level rise, flooding, etc.
- 9.3.3.35 Incorporate habitat connectivity, preservation of natural areas, and the implementation of BMPs into state and local land-use policy environmental review process and energy development plans to minimize habitat fragmentation and related threats associated with solar farms and altered habitats.
- 9.3.3.36 Integrate plans for properly located and timed habitat restoration and management along transportation, energy and service corridors to minimize risks to and benefit wildlife.
- 9.3.3.37 Develop management strategies for freshwater SGCN fish and incorporate them into existing Freshwater Fisheries Management Plans.
- 9.3.3.38 Use compiled life history information on urban-associated SGCN regarding threats, breeding, fecundity, survival, habitat needs, wintering sites/roosts, migration routes and destinations, etc. to develop habitat management strategies to benefit such species.

11 Technical Assistance

11.1 Environmental review

11.1.1 Review of proposed projects

- 11.1.1.8 Review proposed research projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.

100 Law and Policy

100.1 Legislation

100.1.4 County and Local

- 100.1.4.4 Secure wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) and biologically appropriate buffers through local ordinances.
- 100.1.4.5 Secure SGCN-inhabited/used freshwater wetlands and biologically appropriate buffers through local ordinances.

Project 25. Fisheries Management

- 100.1.4.6 Secure fish SGCN habitats by protecting lands adjacent to fish SGCN habitats and/or aquatic systems feeding into such habitats through local ordinances.

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.1 Develop (and/or improve) policies and/or regulations that will promote the reduction of run-off and point and non-point source pollution into NJ's aquatic systems (streams, rivers, lakes/ponds, bays, ocean, wetlands, etc.).
- 100.3.0.4 Promote policies and regulations that support marine conservation zone designations in suitable areas identified through research and literature.
- 100.3.0.5 Develop policies that will promote improved and secure habitat connections between conserved SGCN habitats.
- 100.3.0.6 Develop policies that will promote expanding acreages and enhancing the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 100.3.0.7 Amend current policies and/or regulations to increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.
- 100.3.0.8 Develop policies and/or regulations with the objective of protecting significant natural and/or unique communities in perpetuity.
- 100.3.0.9 Secure mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.11 Develop policies that will ensure the protection and/or development of old-growth forest stands with large trees, in particular those within large, contiguous forest tracts.
- 100.3.0.13 Develop policies that will promote protecting and restoring riparian areas.
- 100.3.0.14 Develop policies and/or regulations that increase the protective buffers of wetlands, riparian and floodplain areas, and aquatic habitats (including open waters) to biologically appropriate distances to benefit SGCN that rely upon these habitats and improve the function of the [associated] aquatic systems.
- 100.3.0.18 Develop policies for conserved lands that prohibit planting and supports the control of non-native vegetation and invasive, native vegetation.
- 100.3.0.21 Develop policies that minimize wildlife road mortality through: 1) Requiring the integration of wildlife passages into all new and repaired roads, in particular those areas that will connect SGCN habitats, 2) Requiring current fish/wildlife passages be improved and maintained in perpetuity, 3) Supporting seasonal road closures, in particular for unimproved roads, 4) Supporting projects that work to improve connectivity of SGCN habitats such as land conservation through acquisition or other means.

Project 25. Fisheries Management

- 100.3.0.23 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.25 Amend the harvest quota or "bag limits" within the freshwater fish code relative to SGCN or sensitive game species' as needed.
- 100.3.0.26 Adopt regulations requiring the combined sewer overflow alternative analyses required by regulation address potential impacts to wildlife in watercourses or receiving water bodies.
- 100.3.0.31 Create or expand tax-based incentive programs available to private, agricultural, commercial, industrial or governmental landowners and land managers to include or provide for incentives for the maintenance and/or improvement to existing habitat via the endorsement of wildlife-related BMPs.
- 100.3.0.32 Coordinate regulations across agencies to maximize availability of and enrollment in existing Forestry Stewardship Programs (e.g., "Woodland Stewards", Farm Bill, partners, etc.) to maintain and/or improve forest habitat.
- 100.3.0.33 Adopt additional timing restrictions, and any necessary permit conditions, into the Administrative Code for NJ DEP-permitted projects to minimize impacts on freshwater SGCN fish, in particular, within habitats during their vulnerable periods as identified through a thorough review of available information.
- 100.3.0.35 Incorporate Freshwater Fish Status Assessment (Delphi Technique) results pertaining to endangered and threatened species into regulations.
- 100.3.0.37 Develop a law and/or policy that requires NJ DEP to continue to address and correct the allowable combined sewer overflow inputs of solid waste into the marine environment to minimize harm to wildlife and their habitats.
- 100.3.0.38 Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.
- 100.3.0.39 Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.
- 100.3.0.40 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.
- 100.3.0.41 Explore all State regulatory requirements for mitigation, restoration, habitat management, etc. to ensure they prohibit the use of specified invasive or other problematic plant species.
- 100.3.0.42 Fully adopt the former Storm water Management Rules' 300ft buffer requirements into the Flood Hazard Area Control Act Rules.

Project 25. Fisheries Management

- 100.3.0.46 Investigate and/or develop inter-agency Memorandum of Agreements to share common data stored or managed in program-specific databases.
- 100.3.0.47 Investigate regulatory options available to direct the location of aquaculture activities in Aquaculture Development Zone 4 (Delaware Bay area) in a manner which minimizes the loss of wildlife habitats and adverse impacts to the environment.
- 100.3.0.48 Propose new State law or regulation mandating that a State-level "development impact fee" be assessed on all new development approved by municipalities (via the Municipal Land Use Law processes), and dedicate such monies to the development and implementation of regional Habitat Conservation Plans (or existing plans/programs serving the same regional function).
- 100.3.0.49 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address the issue of disturbance to habitat or species as a result of human activities (e.g., construction, bridge maintenance, road work, etc.).
- 100.3.0.50 Retain endangered, threatened and special concern wildlife and habitat protection measures in the Water Quality Management Program Rules.
- 100.3.0.53 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded rights-of-way corridors associated with energy transport/transmission.
- 100.3.0.54 Revise existing and/or incorporate new State land use regulations that specifically address the impacts of new or expanded surface mining areas.
- 100.3.0.55 Develop regulations to address potentially adverse effects of aquaculture on SGCN species and their habitats.
- 100.3.0.57 Develop regulations that when implemented will improve and secure habitat connections between conserved SGCN habitats.
- 100.3.0.58 Develop regulations that when implemented will promote the expansion of acreages and enhancement of the effective size of SGCN habitats by providing biologically appropriate buffers of native habitat surrounding SGCN habitats.
- 100.3.0.59 Develop regulations that when implemented will increase the ability to protect and preserve coastal habitats (beach/dune, scrub-shrub, forest, wetland, marsh, and marine and estuarine habitats) that provide nesting, migrating, and wintering areas for SGCN birds, fish and other coastal and aquatic SGCN.
- 100.3.0.60 Develop regulations that when implemented will protect significant natural and/or unique communities in perpetuity.
- 100.3.0.62 Develop regulations that when implemented will protect existing old-growth forest stands with large trees and/or stands that are being actively managed for old growth forests, in particular those within large, contiguous forest tracts.
- 100.3.0.64 Develop regulations that when implemented will protect and restore riparian areas.

Project 25. Fisheries Management

100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

100.3.0.73 Develop regulations that would exempt the conversion of lawns to native vegetation (beneficial to wildlife) from local lawn ordinances.

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

100.4.0.1 Create any necessary policy changes (including those to incentive programs) to encourage the integration of SWAP actions associated with SGCN priority habitats as a deliberative factor in agencies' actions (e.g., environmental and land management review processes, land acquisition and management).

100.4.0.3 Develop policies for mandatory buffer strips on preserved farmlands and state-owned agricultural lands.

100.4.0.4 Create a policy that requires the use of wildlife habitat and corridor mapping products for both regulatory use when conducting project reviews and planning/siting new or expanded rights-of-way projects.

100.4.0.7 Develop a law and/or policy that requires NJ DEP to continue to address and correct the allowable combined sewer overflow inputs of solid waste into the marine environment to minimize harm to wildlife and their habitats.

100.4.0.9 Develop and implement policies to minimize the removal of coarse, woody debris in terrestrial, aquatic and riparian habitats in order to benefit wildlife.

100.4.0.10 Develop laws and/or policies to ensure appropriate and obligated financial compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the disturbance of subtidal shallows and/or impacts to habitat and water quality from pollution.

100.4.0.11 Develop laws and/or policies to ensure appropriate financial and obligated compensation to NJDEP's Office of Natural Resource Restoration (and similar groups) for the purpose of marine habitat enhancement and wildlife research, and mitigation efforts address the impacts of invasive, non-native aquatic plant species establishing themselves or thriving as a result of illegal actions.

100.4.0.12 Develop laws and/or policies to require vegetative buffers of native plants on preserved farmland and state lands with agricultural leases or agreements.

100.4.0.13 Develop policies for different circumstances (e.g., roadsides and medians, riparian, aquatic and terrestrial habitats) that outline appropriate habitat/vegetation management strategies and schedules to minimize risks to and benefit wildlife.

Project 25. Fisheries Management

- 100.4.0.16 Develop policies to implement habitat management strategies that will increase the structural diversity surrounding areas used for energy, mining, and transportation and service corridors which include but are not limited to the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-asides.
- 100.4.0.18 Develop policies to minimize the extent of infrastructure associated with energy and service corridors or areas (e.g., wind and solar farms, pipelines, utility lines) and that require the implementation of habitat management strategies that will increase the structural diversity in the area including (e.g., the presence of short and tall grasses, specific host plants, brush piles, water sources/wetlands, shrubby areas, nesting areas, and no-mow set-asides).
- 100.4.0.19 Develop regulations that will minimize the creation of new barriers, remove or replace current barriers with appropriately-sized systems to accommodate wildlife dispersal, and to minimize road widening and traffic volume increases within critical wildlife habitat areas.
- 100.4.0.20 Develop state regulations that require energy developers and utility service companies to implement habitat management strategies that will increase the structural diversity of the habitat, minimize habitat fragmentation and commercial infrastructure, and minimize the loss, alteration and/or degradation of the habitat and adjacent lands when working on preserved farmlands, state-owned agricultural lands, forests, parks and wildlife management areas, and any conserved lands purchased with the assistance of Green Acres and Federal Land & Water Conservation Fund monies.
- 100.4.0.21 Ensure that Section 303(d) of the Clean Water Act and applicable State statutory/regulatory requirements for surface water pollutant budgets are being met by monitoring and enforcing regulatory Total Maximum Daily Load (TMDL) targets established within regional Water Quality Management Plans.
- 100.4.0.22 Work with NJ DEP's Division of Land Use Regulation to ensure protection of listed species and their habitats during stream cleaning events.
- 100.4.0.23 Adopt additional timing restrictions, and any necessary permit conditions, into the Administrative Code for NJ DEP-permitted projects to minimize impacts on freshwater SGCN fish, in particular, within habitats during their vulnerable periods as identified through a thorough review of available information.
- 100.4.0.24 Develop policies to provide financial support for the New Jersey Invasive Species Strike Team.
- 100.4.0.25 Develop policies that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

Project 26. Pollutants Come in Many Forms

Job 26.01. Oil Spills within Sensitive Wildlife Habitat

Objective: Identify and develop electronic mapping of sensitive wildlife areas to share with appropriate response organizations and agencies to help prioritize the oil spill response efforts.

Purpose: Minimize harm to wildlife impacted by oil spills by improving the oil spill response time.

Benefits: Reduce threat risk to wildlife species from oil spills.

Focal wildlife species benefitting from this job

Birds

American Oystercatcher	Black Skimmer	Common Tern
Forster's Tern	Least Tern	Little Blue Heron
Piping Plover	Red Knot	Ruddy Turnstone
Snowy Egret	Tricolored Heron	

Fish

Alewife	Atlantic Sturgeon	Blueback Herring
Shortnose Sturgeon		

Macroinvertebrates

A Notodontid Moth (H. varia)	American Bumble Bee	Arogos Skipper
Ashton Cuckoo Bumble Bee	Brook Floater	Buchholz's Dart Moth
Buchholz's Gray	Carter's Noctuid Moth	Daecke's Pyralid Moth
Dotted Skipper	Dwarf Wedgemussel	Eastern Lampmussel
Frosted Elfin	Georgia Satyr	Green Floater
Hoary Elfin	Leonard's Skipper	Little White Tiger Beetle
Maritime Sunflower Borer Moth	New England Bluet	New Jersey Pine Barrens Tiger Beetle
Northeastern Beach Tiger Beetle	Northern Metalmark	Papaipema harrisii
Pine Barrens Bluet	Pink Sallow	Robust Baskettail
Rusty Patched Bumble Bee	Sand Myrtle Looper/Pink	Scarlet Bluet
Septima's Clubtail	Southeastern Beach Tiger Beetle	Southern Plains Bumble Bee
Superb Jewelwing	Triangle Floater	Variable Cuckoo Bumble Bee
Yellow Bumble Bee	Yellow Lampmussel	Yellow-banded Bumble Bee

Mammals

North Atlantic Right Whale

Reptiles & Amphibians

Atlantic Green Turtle

Atlantic Leatherback

Atlantic Loggerhead

Atlantic Ridley

Northern Diamondback Terrapin

Threats and Action Drivers associated with this conservation need

3 Energy Production and Mining

3.1 Oil and Gas Facilities and Pipelines

3.1.1 Distribution processes of petroleum and other liquid hydrocarbons

3.1.1.3 Increased risk of oil spills.

9 Pollution

9.2 Industrial and Military Effluents

9.2.1 Oil Spills

9.2.1.1 Oil spills render resting, breeding and foraging habitats temporarily unavailable to wildlife, altering normal wildlife behavior.

9.2.1.2 Oil spills have long term effects on habitats and damage ecological processes that can cause local wildlife population declines and impaired foraging or reproduction.

9.2.1.3 Oil spills cause external oiling of wildlife and ingestion of oil, both of which can injure or kill wildlife.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

3.0.0.2 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) where data gaps exist regarding SGCN distribution, and their critical and supportive habitats. Conduct surveys using standardized survey protocols to acquire baseline data, and provide the data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.

3.0.0.5 Gather baseline data on resident and migratory SGCN (in particular migratory species for which New Jersey habitats are significant), terrestrial, freshwater and marine species, regarding the location and condition of their critical and supporting habitats (e.g., foraging, roosting, nesting/breeding, stopover, migration paths, etc.), and population demography (e.g., productivity, survival, dispersal). Compile this information into a database that includes descriptions of the conditions of the habitats and species, and a GIS component of the locations of these important habitats. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.3 Baseline inventory

3.2.3.1 Identify the distribution of whales (particularly right whale) during seasonal migrations. Methods include but are not limited to: a) Conduct surveys in shipping lane vicinities and along the coast during whale migration to determine the seasonal distribution, b) Develop a predictive GIS model (based on available species occurrence information and habitat data) to predict right whale migration routes off the NJ coast, and c) Identify whale distribution and right whale migration routes through the participation in the East Coast's Sightings Advisory System for mariners.

3.2.3.2 Identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) suitable areas for marine conservation zone designation and promote policies and regulations that support the designation of such areas.

3.3 Research, survey or monitoring - habitat

3.3.2 Monitoring

3.3.2.23 Conduct long-term monitoring of marine submerged aquatic vegetation and update the Marine Submerged Aquatic Vegetation Mapping [to be developed under baseline activities] to provide the NJ DEP's coastal regulatory programs with the most current data.

3.5 Techniques development

3.5.3 Habitat restoration methods

Project 26. Pollutants Come in Many Forms

- 3.5.3.27 Conduct an assessment and develop a location list of available equipment for boom deployment during oil spills.

8 **Outreach**

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.2 Develop a team of personnel from government entities, conservation organizations and other stakeholders engaged in oil/gas spill response for marine and freshwater habitats to develop a feasible plan for oil spill response and/or to amend NJ's current oil spill response plan that clearly outlines each organizations responsibilities and an assessment and location list of available equipment for boom deployment during oil spills.
- 8.1.0.6 Engage government agencies, conservation partners and other stakeholders in discussions focused on sharing information regarding coastal and marine critical wildlife habitats, developing comprehensive mapping to assist in reducing impacts of energy production activities, and establishing a long-term monitoring program to update the data. Ensure this information is available to appropriate personnel for planning or response measures.
- 8.1.0.7 Engage government agencies, conservation partners and other stakeholders to collaboratively develop and implement an extensive educational/outreach program targeting coastal boating and recreation communities about eelgrass/widgeongrass, their impacts on marine environments, and the value, fragility and location of submerged aquatic vegetation beds and habitats.
- 8.1.0.31 Encourage government agencies, conservation partners and other stakeholders to work together to create GIS mapping for marine wildlife and habitat to assist in reducing impacts of energy production activities. Ensure this information is available to appropriate personnel for planning or response measures.

9 **Planning**

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.15 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.
- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

9.3.3 Habitat management planning

- 9.3.3.28 Develop a plan to minimize the impacts of oil spills on wildlife and their habitats.

Job 26.02. Herbicides, Pesticides, and Wildlife

Project 26. Pollutants Come in Many Forms

Objective: Create and provide tools, such as educational materials and incentives, to encourage the agricultural industry, forest managers, developers, and homeowners to implement more targeted use of herbicides and pesticides when such products are necessary and to employ buffer strips, settling basins, and other protections against runoff and over-spraying. Engage with pesticide and herbicide manufacturers to encourage refinement of their products and labels as warranted.

Purpose: Minimize the impacts of herbicides and pesticides on non-target flora and fauna.

Benefits: Reduce the risk of direct impacts to non-target wildlife as well as any secondary or cumulative effects caused by herbicides and pesticides in the environment and food chain.

Focal wildlife species benefitting from this job

Birds

American Oystercatcher	American Woodcock	Black Rail
Black Skimmer	Blue-winged Warbler	Bobolink
Cerulean Warbler	Common Tern	Eastern Meadowlark
Forster's Tern	Golden-winged Warbler	Grasshopper Sparrow
Kentucky Warbler	Least Tern	Little Blue Heron
Northern Bobwhite	Northern Harrier	Peregrine Falcon
Pied-billed Grebe	Piping Plover	Prothonotary Warbler
Red Knot	Red-headed Woodpecker	Ruddy Turnstone
Scarlet Tanager	Snowy Egret	Tricolored Heron
Vesper Sparrow	Wood Thrush	

Fish

Alewife	Atlantic Sturgeon	Banded Sunfish
Blackbanded Sunfish	Blueback Herring	Bridle Shiner
Brook Trout	Comely Shiner	Ironcolor Shiner
Mud Sunfish	Shortnose Sturgeon	Swamp Darter

Macroinvertebrates

A Notodontid Moth (H. varia)	American Bumble Bee	Arogos Skipper
Ashton Cuckoo Bumble Bee	Brook Floater	Buchholz's Dart Moth
Buchholz's Gray	Carter's Noctuid Moth	Daecke's Pyralid Moth
Dotted Skipper	Dwarf Wedgemussel	Eastern Lampmussel
Frosted Elfin	Georgia Satyr	Green Floater

Appendix K: Projects to Conserve New Jersey's Wildlife Populations of Concern

Project 26. Pollutants Come in Many Forms

Hoary Elfin	Leonard's Skipper	Little White Tiger Beetle
Maritime Sunflower Borer Moth	New England Bluet	New Jersey Pine Barrens Tiger Beetle
Northeastern Beach Tiger Beetle	Northern Metalmark	Papaipema harrisii
Pine Barrens Bluet	Pink Sallow	Robust Baskettail
Rusty Patched Bumble Bee	Sand Myrtle Looper/Pink	Scarlet Bluet
Septima's Clubtail	Southeastern Beach Tiger Beetle	Southern Plains Bumble Bee
Superb Jewelwing	Triangle Floater	Variable Cuckoo Bumble Bee
Yellow Bumble Bee	Yellow Lampmussel	Yellow-banded Bumble Bee

Mammals

Allegheny Woodrat	Indiana Bat	Little Brown Bat
North Atlantic Right Whale	Northern Myotis	

Reptiles & Amphibians

Atlantic Green Turtle	Atlantic Leatherback	Atlantic Loggerhead
Atlantic Ridley	Bog Turtle	Carpenter Frog
Corn Snake	Eastern Box Turtle	Eastern Hognose Snake
Eastern Redbelly Turtle	Eastern Spadefoot	Eastern Tiger Salamander
Longtail Salamander	New Jersey Chorus Frog	Northern Black Racer
Northern Diamondback Terrapin	Northern Pine Snake	Northern Red Salamander
Northern Scarlet Snake	Pine Barrens Treefrog	Timber Rattlesnake
Wood Turtle		

Threats and Action Drivers associated with this conservation need

9 Pollution

9.3 Agricultural and Forestry Effluents

9.3.3 Herbicides and Pesticides

- 9.3.3.1** Pesticides degrade terrestrial and aquatic habitats, especially streams, ponds and wetlands. Aquatic wildlife are particularly sensitive to these contaminants, which can cause developmental and behavioral abnormalities and reproductive failure. Some contaminants may bioaccumulate in predatory fish and birds and disrupt reproduction.
- 9.3.3.2** Use of rodenticides can cause secondary actions of injury and death to animals in the course of scavenging.

Project 26. Pollutants Come in Many Forms

9.3.3.3 Use of pesticides can directly harm non-target species through direct contact and/or by reducing and/or contaminating their food supply.

9.3.3.4 Use of herbicides can destroy beneficial food and nectar plants for insects.

Conservation actions that address Threats and Action Drivers

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

1.2.1.14 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of herbicides and pesticides, and implementing more ecologically safe strategies when using such products.

1.2.1.15 Create incentives (non-monetary and/or monetary) for and programs to deliver those incentives to NJ landowners and land managers (including farmers, foresters and developers) for reducing or eliminating the use of rodenticides, and implementing more ecologically safe strategies when using such products.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

8.1.0.37 Enlist landowners and NJ citizens in the protection of and survey efforts for SGCN, in particular rare species, by increasing enrollment in landowner incentives, forest stewardship, backyard habitat management and wildlife-related volunteer programs.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

8.3.0.10 Develop and provide (or otherwise make publicly available) educational programs and/or materials to educate landowners and NJ citizens on threats to fish and wildlife (including marine animals).

8.3.0.31 Develop an educational outreach program for landowners and citizens on the secondary impacts of rodenticides on predators and scavengers.

8.3.0.32 Develop an educational outreach program for landowners and citizens on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

11 Technical Assistance

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

Project 26. Pollutants Come in Many Forms

11.2.0.4 Provide educational resources, training programs, and expert guidance to private and public landowners and land managers on the secondary impacts of rodenticides on predators and scavengers.

11.2.0.5 Provide educational resources, training programs, and expert guidance to private and public landowners and land managers on the threats that herbicides and pesticides pose to aquatic systems and wildlife, and to promote safer usage of such products.

Job 26.03. Stormwater and Wastewater Management

Objective: Reduce point and nonpoint source pollution resulting from stormwater by supporting pending legislation focused on this issue.

Purpose: Protect marine and freshwater species from the impacts of stormwater-related run-off by reducing chemical stressors that cause physical and biological stress on sensitive SGCN.

Benefits: Cleaner waters that provide numerous benefits and ecosystem services to aquaculture, marine and freshwater fish species, and aquatic invertebrates such as freshwater mussels. Cleaner waters will also benefit tourism, public health, and safety.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

12 Resource Management Needs

12.3 Regulatory Reform

12.3.0 State Regulatory Reforms

- 12.3.0.1 Regulatory habitat protections within state land use regulations are spatially limited to specific geographic areas (e.g., Pinelands, Coastal Area) or geographic features (e.g., wetlands, streams) and so fail to protect critical habitats that exist outside of these regulated areas.

Conservation actions that address Threats and Action Drivers

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.26 Adopt regulations requiring the combined sewer overflow alternative analyses required by regulation address potential impacts to wildlife in watercourses or receiving water bodies.
- 100.3.0.42 Fully adopt the former Stormwater Management Rules' 300ft buffer requirements into the Flood Hazard Area Control Act Rules.
- 100.3.0.50 Retain endangered, threatened and special concern wildlife and habitat protection measures in the Water Quality Management Program Rules.

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.21 Ensure that Section 303(d) of the Clean Water Act and applicable State statutory/regulatory requirements for surface water pollutant budgets are being met by monitoring and enforcing regulatory Total Maximum Daily Load (TMDL) targets established within regional Water Quality Management Plans.

Job 26.04. Support the Pending "Plastic Bag Surcharge" Legislation in New Jersey

Objective: Decrease the amount of plastic shopping bags available to enter the marine environment through the support and passage of legislation to limit the amount of bags in circulation.

Purpose: Minimize harm to marine wildlife that may otherwise become entangled in and/or ingest the plastic bags.

Benefits: Minimize the opportunity for animals to consume or become entangled in plastic bags to help decrease injury/mortality of SGCN. Such action will improve habitat by decreasing garbage accumulation in the environment.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

9 Pollution

9.4 Garbage and Solid Waste

9.4.1 Direct hazards to wildlife

9.4.1.1 Wildlife may ingest garbage causing choking or impingement in the digestive system, or they may become physically entangled in it (e.g., plastic or abandoned fish nets); conditions that make them unable to feed or drink, cause them to suffocate or drown, or otherwise restrict the animal's movement making them more susceptible to predators, starvation or injury.

Conservation actions that address Threats and Action Drivers

1 Coordination and Administration

1.2 Incentives

1.2.1 Incentives

1.2.1.27 Create legislation to re-instate incentives for citizens bringing their own shopping bag(s) to grocery stores in an effort to decrease the amount of plastic shopping bags in circulation.

8 Outreach

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

8.3.0.33 Develop an educational outreach program for citizens regarding: 1) The impacts to wildlife as a result of plastic bags entering aquatic and marine systems, 2) The importance of decreasing the amount of plastic shopping bags in circulation, 3) The need for businesses to voluntarily charge for bags or reimburse people for using their own non-plastic bags, and 4) The need for their assistance through public pressure on legislators and government to pass legislation that limits the amount of plastic shopping bags in circulation.

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

100.3.0.36 Create legislation to limit the amount of plastic from shopping bags in circulation and re-instate incentives for citizens bringing their own shopping bag to grocery store.

100.3.0.37 Develop a law and/or policy that requires NJ DEP to continue to address and correct the allowable combined sewer overflow inputs of solid waste into the marine environment to minimize harm to wildlife and their habitats.

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

100.4.0.7 Develop a law and/or policy that requires NJ DEP to continue to address and correct the allowable combined sewer overflow inputs of solid waste into the marine environment to minimize harm to wildlife and their habitats.

Project 27. Research and Monitoring

Job 27.01. Long-term Wildlife Disease Research and Monitoring

Objective: Research and monitor wildlife diseases, distribution and expansion, life history cycles, exacerbating factors (e.g., climate change), and the resiliency of wildlife species.

Purpose: Enable wildlife managers and conservationists to develop and implement strategies to combat and/or minimize the spread and impacts of wildlife diseases.

Benefits: Increase understanding of wildlife diseases and their presence/distribution within the State.

Objective: Establish a long-term research and monitoring program for wildlife diseases through the incorporation of a budgetary line item designated to consistently fund such research.

Purpose: Enable wildlife managers and conservationist to gather consistent, useful data over the long-term to help better understand diseases and increase the chance of developing strategies to combat and/or minimize their spread and impact on wildlife.

Benefits: Increase understanding of wildlife diseases and their presence/distribution within the State at baseline levels.

Threats and Action Drivers associated with this conservation need

2 Agriculture and Aquaculture

2.4 Marine and Freshwater Aquaculture

2.4.2 Industrial Aquaculture

Project 27. Research and Monitoring

- 2.4.2.8 Potential for fish to escape and compete with, predate upon, or spread disease to fish species that serve as hosts for SGCN freshwater mussels.

6 Human Intrusions and Disturbance

6.3 Work and Other Activities

6.3.1 Unauthorized research projects at significant habitats

- 6.3.1.4 Illegal transfer of freshwater fish from one waterbody/watershed to another can result in the spread of non-native, invasive and/or undesirable fish or mussel species and/or diseases.
 - 6.3.1.5 Illegal transfer of freshwater mussels from one waterbody/watershed to another can result in the spread of non-native, invasive and/or undesirable mussel species and/or diseases.

6.3.2 Authorized research projects at significant habitats

- 6.3.2.5 Authorized transfer of freshwater fish from one waterbody/watershed to another can result in the spread of non-native, invasive and/or undesirable fish or mussel species and/or diseases.
 - 6.3.2.6 Authorized transfer of freshwater mussels from one waterbody/watershed to another can result in the spread of non-native, invasive and/or undesirable mussel species and/or diseases.

8 Invasive and Other Problematic Species, Genes and Diseases

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.6 Invasive non-native fungal/bacterial diseases

- 8.1.6.1 The introduction of non-native fungal and bacterial diseases threatens native populations and ecosystems.

8.2 Problematic Native Species/Diseases

8.4.1 Unspecified Species

- 8.4.1.1 Non-native or poorly understood diseases and parasites could potentially impact native animals.

8.2.2 Named Species

- 8.2.2.2 Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.

8.4.2 Named Species

- 8.4.2.2 Diseases of unknown origin, such as snake fungal disease and Ranavirus, can cause significant mortality among native animal populations.

8.5 Viral/Prion-induced Diseases

8.5.1 Unspecified Species (Disease)

Project 27. Research and Monitoring

- 8.5.1.1 There is a large knowledge gap regarding the existence of, or potential for, other diseases impacting native wildlife.

- 8.5.2 Named Species (Disease)

- 8.5.2.1 Diseases such as West Nile Virus, arenavirus, sudden oak death, Avian Influenza, and snake fungal disease cause morbidity or mortality to native populations.

- 8.5.2.2 Viral Hemorrhagic Septicemia (VHS) (recently introduced into the Great Lakes) has caused mortality in 30 common fish species across many families. Although many of the fish SGCN have not been tested, it is hypothesized that they may be vulnerable. If introduced into NJ, VHS is predicted to cause widespread fish kills.

- 8.6 Diseases of Unknown Cause

- 8.6.0 Unknown Diseases

- 8.6.0.1 Diseases yet to be identified by pathologists and virologists cause decreased fitness or mortality to native populations.

12 Resource Management Needs

- 12.1 Resource information collection needs

- 12.1.1 Lack of initial baseline inventory

- 12.1.1.2 Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.

- 12.1.2 Lack of up-to-date existing information

- 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

15 Administrative Needs

- 15.2 Organizational/program planning needs

- 15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

- 2.14 Wildlife disease management

- 2.14.0 Wildlife disease strategy development and investigation

- 2.14.0.1 Investigate diseases/pathogens impacting SGCN and/or their habitats.

Project 27. Research and Monitoring

- 2.14.0.2 Develop and implement strategies to combat the impacts of diseases/pathogens impacting SGCN and/or their habitats, track disease occurrences and monitor/research impacts to SGCN populations and their habitats.
- 2.14.0.4 Conduct long-term monitoring of diseases in vulnerable wildlife to determine the magnitude of exposure within populations and around the State, the impacts to those species, in particular SGCN, and investigate the feasibility of mitigating for such impacts.
- 2.14.0.5 Assess the impacts of diseases on the life cycles of wildlife.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

100 Law and Policy

100.1 Legislation

100.1.3 Sub-national Level

- 100.1.3.3 Initiate legislative action to establish an annual budgetary line item designating funds to support programs focused on long-term research and monitoring of wildlife diseases.

Job 27.02. Power Plant Thermal Discharge and the Entrainment and Impingement of Aquatic Species

Objective: Monitor entrainment, impingement, and thermal discharge at power plants to ensure the potential for adverse impact is minimized.

Purpose: Protect sturgeon, alewife and blueback herring, sea turtles, and other aquatic species, particularly SGCN, from injury and mortality associated with power plant operations.

Benefits: Stabilize and improve populations of important marine, estuarine, and freshwater aquatic species.

Focal wildlife species benefitting from this job

Fish

Alewife

Atlantic Sturgeon

Blueback Herring

Shortnose Sturgeon

Macroinvertebrates

Brook Floater

Dwarf Wedgemussel

Eastern Lampmussel

Project 27. Research and Monitoring

Green Floater	New England Bluet	Pine Barrens Bluet
Robust Baskettail	Scarlet Bluet	Septima's Clubtail
Superb Jewelwing	Triangle Floater	Yellow Lampmussel

Threats and Action Drivers associated with this conservation need

3 Energy Production and Mining

3.4 Conventional Power Plants

3.4.0 Conventional Power Plants

- 3.4.0.3 Alteration of the temperature, pH and/or hydrology of aquatic ecosystems change plant communities and can harm wildlife and/or impact their behavior and survivorship.

7 Natural Systems Modifications

7.2 Dams and Water Management/Use

7.2.2 Abstraction of Surface Water (commercial use)

- 7.2.2.4 Water intake systems associated with industrial use and power plants threaten aquatic organisms due to injury or mortality from impingement and/or entrainment.

9 Pollution

9.6 Excess Energy

9.6.2 Thermal Pollution

- 9.6.2.1 Water temperature changes due to industrial discharge of heated water may impact species composition in the receiving waterbody. Species such as sea turtles and migrating fish may be attracted to the thermal plume and become more vulnerable to mortality during emergency shutdowns during cooler months.
- 9.6.2.2 Water temperature changes to aquatic systems can deter or preclude use by SGCN (e.g., alter habitat suitability for wildlife species, reduce prey base) or present stressors that are harmful if not fatal to wildlife.
- 9.6.2.3 Water temperature changes due to industrial discharge of heated water in aquatic systems may be stressful/fatal to free floating freshwater mussel glochida.

Conservation actions that address Threats and Action Drivers

3 Data Collection and Analysis

3.3 Research, survey or monitoring - habitat

3.3.2 Monitoring

- 3.3.2.14 Research and evaluate the effectiveness of water quality management practices on water-dependent and semi-dependent SGCN, particularly those practices associated with permitting or mitigation actions.

Project 27. Research and Monitoring

3.5 Techniques development

3.5.3 Habitat restoration methods

3.5.3.23 Revise water quality management practices based on research on water-dependent and semi-dependent SGCN, particularly when associated with permitting or mitigation actions.

3.5.4 Fish and wildlife research, survey and management techniques

3.5.4.23 Reduce the impacts of entrainment, impingement and thermal discharge at power plants by working with conservation partners, academia, etc. to ensure that best available technologies are utilized wherever possible.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

8.1.0.32 Work with NJ DEP's Water Management, other state agencies and watershed organizations to determine if mitigation is warranted at applicable power plants.

8.1.0.49 Reduce the impacts of entrainment, impingement and thermal discharge at power plants by working with conservation partners, academia, etc. to ensure that best available technologies are utilized wherever possible.

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

100.3.0.9 Secure mitigation that creates an environmental benefit for losses of SGCN and their habitats.

100.3.0.23 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address mitigation that creates an environmental benefit for losses of SGCN and their habitats.

100.3.0.49 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address the issue of disturbance to habitat or species as a result of human activities (e.g., construction, bridge maintenance, road work, etc.).

Job 27.03. Assessing the Distribution and Habitat Needs of Freshwater SGCN

Objective: Generate an up-to-date distribution and habitat suitability map for freshwater Focal SGCN with data gathered from population surveys and habitat assessments.

Project 27. Research and Monitoring

Purpose: To obtain the necessary information to better protect and manage for rare fish, odonates, and freshwater mussels which currently have limited distribution data and poorly understood habitat requirements.

Benefits: Increase knowledge and data to inform management and regulatory protection of species and critical habitats.

Focal wildlife species benefitting from this job

Green Floater	New England Bluet	Pine Barrens Bluet
Robust Baskettail	Scarlet Bluet	Septima's Clubtail
Superb Jewelwing	Triangle Floater	Yellow Lampmussel

Threats and Action Drivers associated with this conservation need

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.2 Lack of up-to-date existing information

12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

12.1.3 Need to answer research question

12.1.3.1 There are significant knowledge gaps regarding distribution, dispersal, diseases, population trends, etc. of SGCN.

15 Administrative Needs

15.2 Organizational/program planning needs

Project 27. Research and Monitoring

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

- 3.0.0.5 Gather baseline data on resident and migratory SGCN (in particular migratory species for which New Jersey habitats are significant), terrestrial, freshwater and marine species, regarding the location and condition of their critical and supporting habitats (e.g., foraging, roosting, nesting/breeding, stopover, migration paths, etc.), and population demography (e.g., productivity, survival, dispersal). Compile this information into a database that includes descriptions of the conditions of the habitats and species, and a GIS component of the locations of these important habitats. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.3 Survey for and monitor populations of freshwater aquatic focal SGCN to assess the populations' demography, trends, condition, distribution, etc.
- 3.2.0.18 Conduct baseline surveys/inventories to better understand the distribution of fish and invertebrate (including freshwater mussels) populations.

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

- 3.3.1.26 Survey all historic locations and unsurveyed suitable habitats to identify populations of freshwater aquatic focal species.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

Job 27.04. Culverts and Wildlife Passage: Culvert Placement

Project 27. Research and Monitoring

Objective: Assess existing culverts to determine if it would be beneficial to SGCN to retrofit the structure to improve wildlife passage or to replace the existing structure. Identify and assess locations where a culvert installation would enhance wildlife passage.

Purpose: Minimize negative impacts of culvert presence and/or absence on aquatic and terrestrial SGCN.

Benefits: Maintain water flow, increase habitat connectivity, provide opportunity for resident and migratory fish to expand their ranges, thereby improving resiliency to climatic changes, and provide/incorporate dry passage for wildlife not willing to wade through water. Larger culverts reduce the likelihood of a blowout and replacement/removal of undersized culverts decreases erosion.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

Project 27. Research and Monitoring

12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.2 Lack of up-to-date existing information

12.1.2.2 Lack of wildlife monitoring at sites with structures that pose high risk of mortality to SGCN wildlife.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

3.0.0.19 Identify the presence and status (e.g., functioning, structure, slated for removal, etc.) of existing dams and culverts within and/or that may impact SGCN and their habitats, and create a database that includes a GIS component identifying the locations of such structures and their status. Share this information with appropriate organizations and/or agencies evaluating the benefits and risks of such structures on SGCN and their habitats.

3.0.0.20 Once baseline data identifying and describing the status of existing dams and culverts have been gathered, conduct evaluations at a variety of sites to determine whether the benefits of culvert and dam creation or removal outweigh the risks to SGCN species and their habitats, and if other variables/conditions specific to individual sites/locations result in a different outcome. Identify and target appropriate dams and culverts for removal and/or reconstruction to minimize harm to SGCN species and their habitats.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.3 Baseline inventory

Project 27. Research and Monitoring

- 3.2.3.7 Identify roads or portions of roads, paved or unimproved (through site surveys, land use/land cover assessments and analyses, review of available data, enlistment of species experts, etc.) with high incidences of road mortality and/or presence of snakes, turtles, medium-sized and large mammals. Conduct assessments of the roads and incorporate information into a database that includes descriptions (e.g., qualifiers to help prioritize the roads' risk to wildlife) and a GIS component of the locations of such areas. Share this information with appropriate organizations and/or agencies working to implement measures (e.g., wildlife passages, road closures) to minimize the risk to these species.

3.5 Techniques development

3.5.4 Fish and wildlife research, survey and management techniques

- 3.5.4.9 Conduct studies to evaluate the impacts of roads on SGCN and develop, implement and conduct studies to evaluate the effectiveness of methods to reduce road mortality of wildlife (e.g. wildlife underpasses, road closures).

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

Job 27.05. Dams and Aquatic Species' Passage: Dam Removal

Objective: Evaluate existing dams to determine whether removal would be beneficial or detrimental to Focal SGCN and their habitats through site assessments and surveys. Identify additional threats that may result from the dams' presence and/or are compounding the impact of the dam.

Purpose: Improve/restore riverine, stream and creek aquatic systems for SGCN.

Benefits: Improve habitat connectivity and expansion/restoration of gene flow for aquatic species such as anadromous and resident fish, freshwater mussels via fish hosts, and stream-associated Odonata.

Focal wildlife species benefitting from this job

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

Job 27.06. Address Focal Insect SGCN Data Gaps

Objective: Conduct research related to Focal insect SGCN to better determine their distribution, habitats, life history requirements, and threats to improve the understanding of their conservation and management needs.

Purpose: Address vital data gaps regarding many insect species to help inform management and conservation planning, decision making, and regulatory protection needs.

Benefits: Provide land managers and conservation organizations with comprehensive information related to the Focal insect SGCN to improve management and conservation strategies, and minimize harm to these species during management activities.

Focal wildlife species benefitting from this job

Macroinvertebrates

A Notodontid Moth (H. varia)	American Bumble Bee	Arogos Skipper
Ashton Cuckoo Bumble Bee	Buchholz's Dart Moth	Buchholz's Gray
Carter's Noctuid Moth	Daecke's Pyralid Moth	Dotted Skipper
Frosted Elfin	Georgia Satyr	Hoary Elfin
Leonard's Skipper	Little White Tiger Beetle	Maritime Sunflower Borer Moth
New England Bluet	New Jersey Pine Barrens Tiger Beetle	Northern Metalmark

Project 27. Research and Monitoring

Papaipema harrisii	Pine Barrens Bluet	Pink Sallow
Robust Baskettail	Rusty Patched Bumble Bee	Sand Myrtle Looper/Pink
Scarlet Bluet	Septima's Clubtail	Southeastern Beach Tiger Beetle
Southern Plains Bumble Bee	Superb Jewelwing	Variable Cuckoo Bumble Bee
Yellow Bumble Bee	Yellow-banded Bumble Bee	

Threats and Action Drivers associated with this conservation need

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.1.2 Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.

12.1.2 Lack of up-to-date existing information

12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

Conservation actions that address Threats and Action Drivers

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

3.0.0.1 Conduct long-term monitoring of resident and migratory SGCN populations using standardized survey protocols to determine the variables that may impact their long-term persistence in the State (e.g., population viability, distribution, dispersal, home range and habitat use, travel corridors, food availability, vulnerability to pollutants and disease, etc.). Compile this information to determine the likely causes of population declines and to understand metapopulation dynamics. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.

3.0.0.2 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) where data gaps exist regarding SGCN distribution, and their critical and supportive habitats. Conduct surveys using standardized survey protocols to acquire baseline data, and provide the data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.

Project 27. Research and Monitoring

- 3.0.0.3 Gather baseline data on SGCN inhabiting permanently protected natural lands regarding their distribution and population (e.g., abundance, dispersal, demography including productivity and survival, etc.), and identify (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) critical and supporting habitats within those landscapes.
- 3.0.0.5 Gather baseline data on resident and migratory SGCN (in particular migratory species for which New Jersey habitats are significant), terrestrial, freshwater and marine species, regarding the location and condition of their critical and supporting habitats (e.g., foraging, roosting, nesting/breeding, stopover, migration paths, etc.), and population demography (e.g., productivity, survival, dispersal). Compile this information into a database that includes descriptions of the conditions of the habitats and species, and a GIS component of the locations of these important habitats. Provide data to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.6 Conduct long-term studies on resident and migratory SGCN to determine if there are changes to the populations' demography (productivity, survival, dispersal) and/or to their critical and/or supporting habitats (i.e., diminishing in value, acreage or connectivity, etc.), in particular changes that would not maintain SGCN at viable levels for species populations. Update data and GIS maps; provide updated information to NJ DEP for integration into the Biotics database, Landscape Project and permitting review processes.
- 3.0.0.10 Conduct long-term studies to evaluate the effectiveness of management strategies implemented to enhance food/prey availability for SGCN [whose populations are thought to be limited due wholly or in part to a lack of (or contaminated) food resources] through studies that investigate the populations and health of the food resources as well as the target SGCN. Revise management strategies as needed and continue to monitor the effectiveness of the efforts.
- 3.0.0.12 Compile available life history information on urban-associated SGCN (e.g., predators, levels of nest/young depredation, breeding longevity and reproductive effort over time, preferred nesting/reproductive requirements, fidelity to breeding and wintering sites, comprehensive assessment of migration routes and destinations) for future development of management strategies to benefit such species.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.1 Abundance determination

- 3.2.1.1 Identify (through literature searches, review of available data, enlistment of habitat and/or species experts, etc.) population abundance and trends for SGCN using standardized survey protocols. Provide data to NJ DEP for integration into the Biotics database, Landscape Project Map and permitting review processes.

3.2.3 Baseline inventory

- 3.2.3.9 Investigate hazardous environmental issues that may impact grassland invertebrates.

3.2.5 Genetics

- 3.2.5.1 Investigate the feasibility and potential for success of conducting genetic rescue through translocation and/or reintroduction of animals into suitable habitat that was historically occupied to increase genetic diversity and reconnect isolated populations. Methods of investigation should include, but are not limited to, thorough literature reviews, expert opinions, identifying potential pitfalls (e.g., species' fidelity to their range or critical areas), and an examination of historic and current SGCN population distribution and suitable habitat availability.

Job 27.07. Wind Turbines and Wildlife

Objective: Investigate the effects of above-water, offshore wind turbine structures and their operation on wildlife such as pelagic birds, waterfowl, migratory songbirds, raptors, bats, and marine animals, including the specific causes of any observed impacts (e.g., high collision risk, attractiveness for perching, air pressure changes, submarine vibrations, etc.).

Purpose: Understand the impacts of wind turbines on migratory and resident birds, bats, and marine wildlife in order for managers to develop recommendations to minimize harm.

Benefits: Greater capacity to develop and defend strategies that safeguard wildlife from the impacts of wind turbines, such as seasonal operating restrictions, use of visual and/or acoustic wildlife deterrents, and the compatible placement and design of future projects.

Focal wildlife species benefitting from this job

Birds

American Oystercatcher	American Woodcock	Black Rail
Black Skimmer	Blue-winged Warbler	Bobolink
Cerulean Warbler	Common Tern	Eastern Meadowlark
Forster's Tern	Golden-winged Warbler	Grasshopper Sparrow
Kentucky Warbler	Least Tern	Little Blue Heron

Threats and Action Drivers associated with this conservation need

3 Energy Production and Mining

3.3 Renewable Energy

3.3.1 Wind Power

- 3.3.1.1** Turbines, blades, and structure foundations create a collision risk to volant species (birds, bats and invertebrates) and marine animals.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

- 12.1.1.6** Lack of information regarding migratory pathways and response of wildlife to lights and noise associated with offshore wind turbines.

12.1.2 Lack of up-to-date existing information

- 12.1.2.2** Lack of wildlife monitoring at sites with structures that pose high risk of mortality to SGCN wildlife.

12.1.3 Need to answer research question

- 12.1.3.4** Lack of information regarding the potential short- and long-term impacts of wind turbines and other tall coastal structures on migratory populations.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1** State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

3 **Data Collection and Analysis**

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

3.0.0.25 Identify pathways of migratory SGCN in the Atlantic Coastal and Marine Regions (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) and use the data to help evaluate the potential short- and long-term impacts of wind turbines, radio towers, utility guy lines, and other tall coastal structures on migratory populations.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

3.2.0.17 Conduct monitoring at constructed wind farms (within or outside of NJ) to assess the impacts on migratory species (birds, bats, insects) and determine if NJ's land use planning efforts and/or smart-growth plans need to be revised.

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

3.3.1.14 Compile information (obtained through literature reviews, communication with other States along the Atlantic coast, academia, etc.) regarding the impacts of above-water operation of wind turbines on migratory marine birds and bats. Provide data to appropriate governing agencies and/or State commissions for integration into permitting review processes.

3.3.1.15 Conduct a literature review to determine the potential impacts of underwater vibrational noise on marine mammals, sea turtles and fishes emanating from offshore wind turbines during routine operations.

9 **Planning**

9.3 Species and habitat management planning

9.3.1 Species management planning

9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

Job 27.08. Project Coordination with University Faculty and Students

Objective: Work with Universities to identify and develop projects to collaborate on with faculty and students.

Purpose: Broaden the ability to conduct conservation research and planning efforts.

Benefits: Increase ability to make informed decisions and meet conservation objectives.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

14 Education/ Outreach Needs

14.2 Outreach needs

14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions

14.2.1.1 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various forest management practices.

14.2.1.2 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various aquatic and riparian management practices.

14.2.1.3 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various coastal management practices.

14.2.1.4 Need to develop greater understanding of and support for efforts implemented to maintain disturbance-free habitats that allow coastal wildlife populations to thrive alongside human residential and recreational uses.

14.2.1.5 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various wetland management practices.

Conservation actions that address Threats and Action Drivers

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

8.1.0.19 Engage government agencies, conservation partners and other stakeholders to collaboratively develop a list of important projects, targeting SGCN and/or their habitat, as a guide for graduate student research. Distribute the list and contact information to all State colleges and universities.

Project 28. Harvests, By-catch and Impingement

Job 28.01. Remove Impingement Hazards, Reduce Mortality, and Restore Natural Habitat for Horseshoe Crabs

Objective: Using citizen science data, identify impingement hazards, specifically rip-rap, derelict structures, and natural hazards, and create a database and GIS layer to document the information.

Purpose: Identify impingement hazards along the Delaware Bay shoreline.

Benefits: Reduce horseshoe crab mortality and improve spawning habitat to increase egg abundance, and improve development and hatching success, thereby increasing egg/larval density for foraging migratory shorebirds and marine species.

Objective: Develop a plan to reduce horseshoe crab mortality from impingement hazards, fisheries by-catch, and lysate industry bleeding that includes, at a minimum, the following: a) a timeline, b) potential funding sources, c) the prioritization of impingement hazards for removal, d) improved bycatch reporting to be applied to horseshoe crab harvest management, and e) coordination with the lysate industry to reduce or eliminate horseshoe crab mortality.

Purpose: Provide guidance to reduce and account for sources of horseshoe crab mortality.

Benefits: Reduce horseshoe crab mortality and improve spawning habitat to increase egg abundance, and improve development and hatching success, thereby increasing egg/larval density for foraging migratory shorebirds and marine species.

Objective: Implement the plan to remove impingement hazards on Delaware Bay shoreline beaches and conduct long-term monitoring to assess the effectiveness of hazard removals.

Purpose: Reduce crab mortality by removing impingement hazards along the Delaware Bayshore spawning beaches.

Benefits: Reduce horseshoe crab mortality and improve spawning habitat to increase egg abundance, and improve development and hatching success, thereby increasing egg/larval density for foraging migratory shorebirds and marine species.

Focal wildlife species benefitting from this job

Red Knot

Ruddy Turnstone

Threats and Action Drivers associated with this conservation need

2 Agriculture and Aquaculture

2.4 Marine and Freshwater Aquaculture

2.4.1 Subsistence/Artisinal Aquaculture

Project 28. Harvests, By-catch and Impingement

2.4.1.6 Potential for aquaculture structures to create impingement/entanglement hazard and/or preclude benthic habitat use by SGCN.

2.4.2 Industrial Aquaculture

2.4.2.6 Potential for aquaculture structures to create impingement/entanglement hazard and/or preclude benthic habitat use by SGCN.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.2 Lack of up-to-date existing information

12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

12.1.3 Need to answer research question

12.1.3.3 Lack of studies specific to structural shellfish aquaculture (racks, bottom cages, bottom screens, etc.) and tending activities which may adversely impact horseshoe crabs, shorebirds and other benthic-dependent species.

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform

12.4.0.6 Techniques for ecological management or restoration of shorelines are not fully developed or evaluated for effectiveness for target and non-target SGCN in coastal areas.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

Project 28. Harvests, By-catch and Impingement

- 3.0.0.18 Develop, implement and evaluate the effectiveness (through research and long-term monitoring) of engineering standards that embrace both shore protection/resiliency and habitat creation for shorebirds, horseshoe crabs and other coastal species along the Atlantic and Delaware Bay coasts that minimize horseshoe crab impingement and damage to beach habitat from residential and commercial construction.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.19 Develop, implement and evaluate aquaculture practices in coastal areas that are compatible with the recovery of SGCNs and industry needs.
- 3.2.0.26 Develop, implement and evaluate efforts to remove horseshoe crab impingement hazards, and provide recommendations of potential improvements, if warranted.

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

- 3.3.1.25 Compile an inventory of all horseshoe crab impingement hazards and share with permitting agencies, and the fisheries organizations and industry.

3.3.2 Monitoring

- 3.3.2.2 Conduct long-term monitoring of resident and migratory SGCN habitats using standardized survey protocols to determine changes in habitat quality/suitability and threats (e.g., habitat loss and degradation, increased edge habitat, water quality) and other variables that may impact their long-term persistence in the State and to provide information needed for determining causes of population declines and understanding metapopulation dynamics.
- 3.3.2.16 Evaluate the effectiveness of best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.29 Encourage government agencies and conservation partners to engage science community in the study of interactions among aquaculture, SGCN, their habitats, and potential impacts on migratory shorebirds and horseshoe crabs.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

Project 28. Harvests, By-catch and Impingement

- 9.3.1.18 Using baseline and monitoring data, develop a plan and seek funding for the removal of horseshoe crab impingement hazards.
- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.
- 9.3.3 Habitat management planning
 - 9.3.3.14 Develop a management plan using aquaculture practices in coastal areas that are compatible with the recovery of SGCN.
 - 9.3.3.30 Using baseline and monitoring data, develop a plan and seek funding for the removal of horseshoe crab impingement hazards.

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.25 Develop policies that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

Job 28.02. Improve the Derelict Pot Reporting System (Crab, Lobster, and Fish)

Objective: Improve the harvest reporting system by creating a stipulation in the NJ Bureau of Marine Fisheries commercial licensing that requires crabbers and fishermen to report number and location of lost pots at the end of each harvest season.

Purpose: Minimize by-catch as a result of derelict crab pots (and other pots) by documenting their locations and developing removal strategies.

Benefits: Improve documentation efforts regarding the number, type, and location of fishing gear lost annually in the NJ pot fishery, and as such, reduce search time and cost associated with finding and retrieving/removing lost gear.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

12 Resource Management Needs

12.4 Internal Policy & Procedures Reform

12.4.0 State Policy and Procedure Reform

- 12.4.0.4 Lack of a mandatory reporting system for lost crab traps threatens diamondback terrapins and other marine species due to persistent trapping/attraction of organisms by ghost pots.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.23 Work with the NJ Division of Fish and Wildlife's Bureau of Marine Fisheries, local recreational and commercial fisheries associations, and fishers to develop a process that encourages fishermen to report the number and location of lost pots to the appropriate state agency/agencies at the end of the harvest season.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.30 Amend the NJ Bureau of Marine Fisheries commercial licensing and harvest reporting system to require fishermen to report the number and location of lost pots to the appropriate state agency/agencies at the end of the harvest season.

Job 28.03. Fisheries Gear Characterization and Interactions

- Objective:** Develop a matrix that lists every commercial and recreational fishery that operates in NJ state waters including data regarding fishing seasons, gear descriptions, and the locations and number of fishers.
- Purpose:** Obtain the necessary data regarding commercial and recreational fisheries to determine/characterize threats to SGCN (e.g., Diamondback Terrapins) and sensitive habitats.
- Benefits:** Provide critical information pertaining to fishery interactions over time and help drive fishery management measures that are designed and implemented to minimize bycatch of SGCN species (e.g. Diamondback Terrapin).

3 Data Collection and Analysis

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

- 3.3.1.27 Develop a matrix that lists every commercial and recreational fishery and aquaculture facility that operates in state waters and for each fishery listed, provide details regarding their fishing seasons, gear descriptions, locations and number of fishers. Add a GIS component to overlay species of concern and sensitive areas.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

Job 28.04. Expand Fisheries Reporting

Project 28. Harvests, By-catch and Impingement

Objective: Expand fisheries (including bycatch) reporting and increase observer presence on fishing boats to assist in data collection.

Purpose: Improve the characterization of reported fisheries catch, including bycatch (sea turtles, sturgeon, alewife/blueback).

Benefits: More accurate descriptions of catch composition and improved parameter.collection from fishery-dependent data-sources.

Objective: Educate those in the fishery industry and general public regarding the potential impacts of over-harvesting and the importance of accurate harvest (including bycatch) reporting.

Purpose: Improve the characterization of reported fisheries catch, including bycatch (sea turtles, sturgeon, alewife/blueback).

Benefits: Improved collaboration and support between science and fishing industry participants.

Objective: Coordinate SGCN protective measures with Atlantic States Marine Fisheries Commission.

Purpose: Improve the characterization of reported fisheries catch, including bycatch (sea turtles, sturgeon, alewife/blueback).

Benefits: Improved large-scale fishery-management plans and data-collection efforts.

Threats and Action Drivers associated with this conservation need

5 Biological Resource Use

5.4 Fishing and Harvesting of Aquatic Resources

5.4.1 Intentional Use (subsistence/small scale)

5.4.1.1 Legal but excessive harvest of SGCN and/or sensitive game species can threaten populations especially for species already suffering from multiple threats.

Project 28. Harvests, By-catch and Impingement

- 5.4.1.2 Overharvesting of one species may lead to detrimental impacts on another; e.g., the harvesting of horseshoe crabs reduces the food availability for migrating shorebirds dependent on crab eggs.
 - 5.4.1.3 Collection of fish for food, bait, or aquarium trade can lead to population exploitation.
 - 5.4.1.4 Illegal collection of aquatic and semi-aquatic wildlife can have detrimental impacts on populations.
 - 5.4.2 Intentional Use (large scale)
 - 5.4.2.1 Overharvesting of one species may lead to detrimental impacts on another; e.g., overharvest of menhaden affecting piscivorous birds.
 - 5.4.2.2 Collection of fish for food, bait, or aquarium trade can lead to population exploitation.
 - 5.4.2.3 Legal but excessive harvest of commercial SGCN species can threaten populations.
 - 5.4.3 Unintentional effects (subsistence/small scale)
 - 5.4.3.6 Fishing gear used by commercial fisheries results in bycatch or entanglement of non-targeted wildlife leading to injury and/or mortality.
 - 5.4.4 Unintentional effects (large scale)
 - 5.4.4.5 Fishing gear used by commercial fisheries results in bycatch or entanglement of non-targeted wildlife leading to injury and/or mortality.

12 Resource Management Needs

12.1 Resource information collection needs

- 12.1.1 Lack of initial baseline inventory
 - 12.1.1.2 Lack of information regarding the population dynamics and trends, habitat requirements and dispersal distances of the various age classes, and survivorship of SGCN throughout the State.
- 12.1.2 Lack of up-to-date existing information
 - 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

14 Education/ Outreach Needs

14.2 Outreach needs

- 14.2.1 Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions
 - 14.2.1.3 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various coastal management practices.

15 **Administrative Needs**

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

3 **Data Collection and Analysis**

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

- 3.3.1.27 Develop a matrix that lists every commercial and recreational fishery and aquaculture facility that operates in state waters and for each fishery listed, provide details regarding their fishing seasons, gear descriptions, locations and number of fishers. Add a GIS component to overlay species of concern and sensitive areas.

7 **Law Enforcement**

7.1 Law enforcement

7.1.4 Scale Unspecified

- 7.1.4.6 Recruit law enforcement to assist in the protection and enhancement of SGCN populations, in particular endangered species, through improved awareness of species through trainings, partnerships, and other methods. Information should include but is not limited to: 1) Issues concerning illegal collection of reptiles, 2) Persecution of rare snakes, 3) Illegal recreational activities on public lands (e.g., off-road vehicles) and their impact on wildlife, 4) Identification of sensitive areas, critical sites and/or "hot-spots" for collection.

8 **Outreach**

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.8 Engage government agencies, conservation partners and other stakeholders to collaboratively develop and implement an extensive educational/outreach program targeting sportsmen's organizations and fisheries addressing the potential effects of over-harvesting wildlife and promote "catch and release".
- 8.1.0.9 Review the marine fish code enforcement policies relative to SGCN or sensitive game species' populations and fecundity, and amend the harvest quota or "bag limits" as needed, and address enforcement of such quotas.

Project 28. Harvests, By-catch and Impingement

- 8.1.0.10 Engage government agencies, conservation partners and other stakeholders to collaboratively develop and implement an extensive educational/outreach program targeting sportsmen's organizations and fisheries, as well as public constituents, addressing the potential impacts of over-harvesting wildlife can have on the ecological system and to promote "sustainable harvest".
- 8.1.0.12 Engage government agencies, conservation partners and other stakeholders to collaboratively develop and implement an extensive educational/outreach program targeting sportsmen's organizations and fisheries, as well as public constituents, addressing the unintended effects fishing gear and tackle can have on wildlife.
- 8.1.0.27 NJ Division of Fish and Wildlife and their Game Council, and appropriate conservation partners and other stakeholders to review the freshwater fish code relative to SGCN or sensitive game species' populations and fecundity, and support amendments to the harvest quota or "bag limits" as needed.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.1 Utilize WSFR grant funds, in combination with alternate funding sources as needed, to implement a scientific data-driven, extensive educational/outreach program targeting sportsmen's organizations and fisheries, as well as public constituents, addressing the potential impacts of over-harvesting wildlife can have on the ecological system and to promote "sustainable harvest".
- 8.3.0.2 Utilize WSFR grant funds, in combination with alternate funding sources as needed, to implement an extensive educational/outreach program consisting of displays, fliers, list-serve mailings, facebook posts and speaking engagements with sportsmen's organizations and fisheries, as well as public constituents, addressing the unintended effects fishing gear and tackle can have on non-target species.
- 8.3.0.3 Utilize WSFR grant funds, in combination with alternate funding sources as needed, to implement catch and release outreach program(s).
- 8.3.0.15 Develop an educational outreach program using a variety of media to ensure maximizing the distribution of information, in particular targeting sportsmen's organizations and fisheries, regarding the unintended effects fishing gear and tackle can have on non-target species.
- 8.3.0.16 Develop an educational outreach program using a variety of media to ensure maximizing the distribution of information, in particular targeting sportsmen's organizations and fisheries, promoting "catch and release" and the impacts excessive harvests can have on wildlife populations.
- 8.3.0.17 Develop an educational outreach program using a variety of media to ensure maximizing the distribution of information, in particular targeting sportsmen's organizations and fisheries, promoting "sustainable harvest" using scientific data, and garner support from constituents through this outreach.

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21** Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.25** Amend the harvest quota or "bag limits" within the freshwater fish code relative to SGCN or sensitive game species' as needed.
- 100.3.0.27** Amend harvest, license and/or permit requirements to incorporate guidance regarding the use of gear and/or tackle and current best practices to minimize bycatch or entanglement of non-target species.
- 100.3.0.28** Amend harvest, license and/or permit requirements to require mandatory reporting by permittees/licensees of lost harvest gear, by-catch, and entanglement of non-target species.
- 100.3.0.51** Amend the harvest quota or "bag limits" within the marine fish code enforcement policies relative to SGCN or sensitive game species' as needed.

Project 29. Limiting Effects of Predators

Job 29.01. Reducing the Impacts of Predators on Beach Nesting Species

Objective: Decrease the impact of predator populations at and adjacent to critical areas for beach dependent wildlife by implementing predator management strategies, including including exclusionary tactics, aversive conditioning, and removal.

Purpose: Decreasing the predation pressure on beach dependent wildlife to result in an increase in adult survival, hatch success, and productivity.

Benefits: Increased reproductive success and survival of beach dependent wildlife.

Focal wildlife species benefitting from this job

Birds

American Oystercatcher

Black Skimmer

Common Tern

Least Tern

Piping Plover

Red Knot

Ruddy Turnstone

Reptiles & Amphibians

Northern Diamondback Terrapin

Threats and Action Drivers associated with this conservation need

8 Invasive and Other Problematic Species, Genes and Diseases

8.1 Invasive Non-native/ Alien Species/ Diseases

8.1.4 Invasive non-native terrestrial/wetland animals

8.1.4.2 Free-roaming and feral domestic animals such as cats and dogs causes direct mortality of wildlife and disturbance to wildlife breeding and resting areas.

8.2 Problematic Native Species/Diseases

8.2.2 Named Species

8.2.2.2 Human-subsidized native species can become overabundant, increasing predation on other native wildlife and/or altering the ecological community.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.13 Wildlife damage management

2.13.0 Nuisance fish and wildlife damage

Project 29. Limiting Effects of Predators

- 2.13.0.6 Develop, implement and evaluate the effectiveness of predator-control techniques aimed at improving SGCN populations and methods to minimize the impact of those species carrying parasites or diseases that may impact SGCN (e.g., raccoon roundworm kills Allegheny woodrat).

3 Data Collection and Analysis

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.22 Evaluate the effectiveness of predator-control techniques aimed at improving SGCN populations and methods to minimize the impact of those species carrying parasites or diseases that may impact SGCN (e.g., raccoon roundworm kills Allegheny woodrat).

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.21 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation human-subsidized and/or overabundant, native species cause to local nesting species, and provide expert guidance on how residents can help alleviate this threat.
 - 8.1.0.22 Work with government agencies and environmental educators to develop educational resources and training programs, educate the public on the devastation invasive species cause to native nesting species, and provide expert guidance on how residents can help alleviate this threat.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.6 Develop and provide (or otherwise make publicly available) educational programs and/or materials to enlist landowners, land managers and local communities to discourage the presence of managed cat colonies and trap, neuter and release programs in wildlife habitats.
 - 8.3.0.19 Develop an educational outreach program for the public on the devastating effects predators can have on native nesting wildlife.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.11 Develop a management plan using predator-control techniques aimed at improving SGCN populations and methods to minimize the impact of those species carrying parasites or diseases that may impact SGCN (e.g., raccoon roundworm kills Allegheny woodrat).

Project 30. Do Not Disturb the Birds

Job 30.01. Reduce Human Disturbance

Objective: Reduce, if not eliminate, disturbance related to human activities at shorebird nesting, foraging, and roosting areas.

Purpose: Provide high quality beach habitats to improve breeding shorebirds' productivity and foraging.

Benefits: Improved reproductive success for beach nesting bird species, and increased fitness and survival for all shorebirds.

Objective: Reduce, if not eliminate, disturbance related to human activities at colonial bird colonies and foraging locations.

Purpose: Provide high quality marsh and beach habitats to improve the breeding productivity of colonial waterbirds.

Benefits: Improve reproductive success for colonial waterbirds and create opportunities for new colonies or the re-establishment of inactive sites.

Focal wildlife species benefitting from this job

Birds

American Oystercatcher	Black Skimmer	Common Tern
Forster's Tern	Least Tern	Little Blue Heron
Red Knot	Ruddy Turnstone	Snowy Egret
Tricolored Heron		

Threats and Action Drivers associated with this conservation need

2 Agriculture and Aquaculture

2.4 Marine and Freshwater Aquaculture

2.4.1 Subsistence/Artisinal Aquaculture

2.4.1.5 Increased risk of persistent human disturbance from tending activities that hinder or preclude habitat use by SGCN.

2.4.2 Industrial Aquaculture

2.4.2.5 Increased risk of persistent human disturbance from tending activities that hinder or preclude habitat use by SGCN.

5 Biological Resource Use

5.2 Gathering Terrestrial Plants

5.2.2 Unintentional effects

5.2.2.1 Stepping on nests or young/hatchling animals.

6 Human Intrusions and Disturbance

6.1 Recreational Activities

6.1.1 Off-road vehicles (motorized and non-motorized)

6.1.1.5 Vehicle use on beaches can cause disturbance, harms breeding and foraging habitats, and can cause direct mortality of beach-nesting birds.

6.1.2 Boating

6.1.2.1 Alteration and/or degradation of aquatic habitat.

6.1.2.2 Increased disturbance to marine animals and ocean-, bay- and marsh-associated birds which can alter their behavior decreasing the likelihood of their success and/or reproduction.

6.1.3 Use of beaches

6.1.3.1 Increases disturbance to beach nesting birds that reduces nesting success, and reduces foraging and resting opportunities for a wide range of nesting and migrating shorebirds.

6.1.5 Wildlife observation and photography

6.1.5.1 Improperly conducted recreational activities may disrupt normal wildlife behaviors which can result in reduced reproductive success or survival, abandonment of critical sites, etc.

6.1.7 Other: Recreational activities (such as pyrotechnics or drones) that may disrupt normal wildlife activities, or recreation that results in transfer of pathogens deleterious to wildlife.

6.1.7.3 Drone use in areas with sensitive wildlife (e.g., nesting and foraging birds, migrating and foraging/feeding whales) can alter their behavior and can cause disturbance that impacts their reproductive and/or foraging success.

6.2 Military Exercises

6.2.1 Military exercises

6.2.1.1 Military testing and training exercises may inflict disturbance and potential physical harm to wildlife.

6.3 Work and Other Activities

6.3.1 Unauthorized research projects at significant habitats

6.3.1.3 Activities conducted without proper precautions may disturb and disrupt normal wildlife behaviors, which may impact reproductive success or survival, cause abandonment of critical sites, etc.

6.3.2 Authorized research projects at significant habitats

Project 30. Do Not Disturb the Birds

- 6.3.2.4 Activities conducted without proper precautions may disturb and disrupt normal wildlife behaviors, which may impact reproductive success or survival, cause abandonment of critical sites, etc.
 - 6.3.3 Other "work" unrelated to research
 - 6.3.3.2 Intensive dune and beach management (including overuse of dune fencing, sand mining, mechanical beach raking, storm clean up), reduces foraging habitat for beach nesting and migratory shorebirds, and poses risks of injury and mortality to unfledged chicks.
 - 6.3.3.3 Beach nourishment projects create suitable habitat for beach-nesting birds in areas of high human use, increasing the likelihood of disturbance to the birds, harm to the eggs, and injury and/or mortality to chicks.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

- 2.9 Living shorelines
 - 2.9.1 Beach renourishment
 - 2.9.1.9 Manage beaches to divert human activity away from staging areas for red knots and other migratory shorebirds during critical periods.
 - 2.9.3 Sand dune restoration
 - 2.9.3.7 Manage sand dunes to divert human activity away from staging areas for red knots and other migratory shorebirds during critical periods.

3 Data Collection and Analysis

- 3.0 General fish and wildlife research, survey or monitoring
 - 3.0.0 Research, survey or monitoring - general fish and wildlife needs
 - 3.0.0.27 Evaluate the effectiveness of strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals through research and monitoring. Develop and provide NJ DEP and other appropriate governing agencies/commissions a summary of findings and recommendations to improve such efforts.
- 3.5 Techniques development
 - 3.5.3 Habitat restoration methods
 - 3.5.3.14 Develop aquaculture practices in the coastal areas that are compatible with the recovery of SGCN.
 - 3.5.4 Fish and wildlife research, survey and management techniques

- 3.5.4.13 Develop/improve strategies to restrict human activity (e.g., recreational, maintenance work, etc.) from sensitive habitats/areas such as avian nesting sites, reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively), and bat hibernacula, and federal buffers for marine mammals. Methods may include, but are not limited to, managing the landscape to deter access, diverting recreational and other activities from sensitive areas during critical periods through permit processes or blocking access (trails, roads, etc.), posting (if appropriate), increasing law enforcement presence, conducting management activities at appropriate times to avoid disturbance and/or harm to wildlife (e.g., habitat management, beach raking, etc.), and decreasing noise and light pollution.

7 Law Enforcement

7.1 Law enforcement

7.1.2 National Level

- 7.1.2.1 Enforce regulations to protect nesting bird colonies from human disturbance.

7.1.3 Sub-national Level

- 7.1.3.1 Enforce slow wake zones and marine conservation area regulations to protect aquatic vegetation.
- 7.1.3.2 Increase the number of law enforcement officers tending to wildlife issues to a reasonable number to sufficiently cover the State and marine waters.

7.1.4 Scale Unspecified

- 7.1.4.2 Restrict human activity from staging areas for red knots and other migratory shorebirds through increasing law enforcement presence.
- 7.1.4.3 Increase law enforcement presence proximate to sensitive areas [e.g., avian nesting sites, in particular rookeries, and reptile and amphibian breeding areas (nesting or gestation/birthing and breeding pools, respectively)] to deter human activity and subsequent disturbance to SGCN.
- 7.1.4.6 Recruit law enforcement to assist in the protection and enhancement of SGCN populations, in particular endangered species, through improved awareness of species through trainings, partnerships, and other methods. Information should include but is not limited to: 1) Issues concerning illegal collection of reptiles, 2) Persecution of rare snakes, 3) Illegal recreational activities on public lands (e.g., off-road vehicles) and their impact on wildlife, 4) Identification of sensitive areas, critical sites and/or "hot-spots" for collection.
- 7.1.4.7 Increase law enforcement presence to enforce regulations governing recreational activities (e.g., the use of personal watercraft and off road vehicles, caving, rock climbing, etc.) on conserved lands and within other sensitive habitats, and discourage activities that cause harm or disturbance to vegetation, wetlands, fish and wildlife.

8 Outreach

Project 30. Do Not Disturb the Birds

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.7** Engage government agencies, conservation partners and other stakeholders to collaboratively develop and implement an extensive educational/outreach program targeting coastal boating and recreation communities about eelgrass/widgeongrass, their impacts on marine environments, and the value, fragility and location of submerged aquatic vegetation beds and habitats.
- 8.1.0.14** Engage DOD in a constructive dialogue regarding strategies to minimize or eliminate disturbances to all SGCN (i.e., beyond their federal requirements) during military activities.

8.2 Recruitment and retention activities

8.2.3 For wildlife watching

- 8.2.3.1** Develop and implement nature-focused tourism opportunities including wildlife viewing sites, interpretive signage highlighting unique ecosystems/habitats, and wildlife-related recreational opportunities that do not negatively impact SGCN or their habitats.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.20** Develop an educational outreach program for landowners, particularly those in the coastal and bay areas, boaters, and the general public with information about the negative impacts on marine wildlife and habitats, and steps they can implement to reduce these impacts.
- 8.3.0.22** Post signage in sensitive coastal habitats (e.g., bird and Diamondback Terrapin nesting areas) to educate the boating community on responsible use of these areas.

9 **Planning**

9.3 Species and habitat management planning

9.3.3 Habitat management planning

- 9.3.3.14** Develop a management plan using aquaculture practices in coastal areas that are compatible with the recovery of SGCN.

11 **Technical Assistance**

11.1 Environmental review

11.1.1 Review of proposed projects

- 11.1.1.6** Review all projects to be conducted in or adjacent to coastal wetlands and marshes, and provide recommendations on how to best avoid or reduce human disturbance at nesting colonies (for example, timing restrictions) and actions not permitted.

Project 30. Do Not Disturb the Birds

- 11.1.1.8 Review proposed research projects and permit applications, provide recommendations on how to best avoid disturbing sensitive species, and identify actions not permitted.

11.2 Technical assistance

11.2.0 Assorted technical assistance strategies

- 11.2.0.26 Make educational resources available to the public that encourage researchers to seek out guidance prior to finalizing proposals and submitting State permit applications to reduce potential impacts on sensitive species.

11.2.1 With individuals and groups involved in resource management decision making

- 11.2.1.5 Provide educational resources, training programs, and on-the-ground guidance to municipalities, state and federal agency resource managers on tasks such as writing and integrating Beach Management Plans into other management documents.

- 11.2.1.6 Provide educational resources, training programs, and on-the-ground guidance to resource agencies prior to project initiation to ensure wildlife and their habitats are protected to the highest degree possible during construction, and provisions are in place for post-construction habitat use.

Job 30.02. Manage and Reduce Human Disturbance in Focal Areas

Objective: Identify and develop strategies for focal areas where habitat management and reducing human disturbance will benefit coastal avian SGCN and their habitats.

Purpose: Provide guidance to land owners, managers, and governing agencies to improve and/or restore designated habitats in focal areas for the benefit of coastal avian SGCN.

Benefits: Maximize productivity of coastal avian focal SGCN to prevent further losses in some species and help reverse population declines in others.

Focal wildlife species benefitting from this job

American Oystercatcher	Black Rail	Black Skimmer
Common Tern	Forster's Tern	Least Tern
Little Blue Heron	Northern Harrier	Piping Plover
Red Knot	Ruddy Turnstone	Snowy Egret
Tricolored Heron		

Threats and Action Drivers associated with this conservation need

2 Agriculture and Aquaculture

2.4 Marine and Freshwater Aquaculture

2.4.1 Subsistence/Artisinal Aquaculture

2.4.1.5 Increased risk of persistent human disturbance from tending activities that hinder or preclude habitat use by SGCN.

2.4.2 Industrial Aquaculture

2.4.2.5 Increased risk of persistent human disturbance from tending activities that hinder or preclude habitat use by SGCN.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.1 Lack of initial baseline inventory

12.1.1.1 Lack of information regarding the distribution, connectivity and quality of SGCN habitats throughout the State, and where habitat enhancement/restoration will benefit SGCN and other wildlife.

12.1.2 Lack of up-to-date existing information

12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

Conservation actions that address Threats and Action Drivers

3 Data Collection and Analysis

3.3 Research, survey or monitoring - habitat

3.3.1 Baseline inventory

3.3.1.5 Identify areas (through surveys/studies, literature searches, review of available data, enlistment of species experts, etc.) where habitat restoration and/or enhancement would benefit wildlife SGCN.

3.3.2 Monitoring

3.3.2.16 Evaluate the effectiveness of best management practices (BMPs), protective strategies, and guidelines for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.14 Develop aquaculture practices in the coastal areas that are compatible with the recovery of SGCN.

9 Planning

9.3 Species and habitat management planning

9.3.3 Habitat management planning

- 9.3.3.3 Integrate best management practices (BMPs) regarding dune and beach management into beach nesting bird management agreements with government agencies (and private landowners where necessary).
- 9.3.3.4 Create habitat restoration plans to repair marshes and associated beaches damaged by salt hay farm/dike abandonment for all bay shore areas currently degraded.
- 9.3.3.14 Develop a management plan using aquaculture practices in coastal areas that are compatible with the recovery of SGCN.

Project 31. Aquaculture, Wildlife, and Habitat

Job 31.01. The Relationship between Coastal Species and Aquaculture

Objective: Study the interactions between migratory shorebirds, horseshoe crabs, aquaculture structures, and tending activities to understand the potential impacts of such interactions, and develop and implement a plan for SGCN protection while conducting sustainable aquaculture practices.

Purpose: Create and maintain conditions in the coastal and intertidal zones that support healthy populations of migratory shorebirds and horseshoe crabs, along with sustainable aquaculture.

Benefits: Identify metrics and thresholds useful for the management of aquaculture and its conservation impacts.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

2 Agriculture and Aquaculture

2.4 Marine and Freshwater Aquaculture

2.4.1 Subsistence/Artisinal Aquaculture

2.4.1.1 May degrade freshwater and intertidal habitat due to farming techniques and damage from associated structures.

2.4.1.3 Potential for increased nutrient and effluent loads.

2.4.1.5 Increased risk of persistent human disturbance from tending activities that hinder or preclude habitat use by SGCN.

2.4.1.6 Potential for aquaculture structures to create impingement/entanglement hazard and/or preclude benthic habitat use by SGCN.

2.4.2 Industrial Aquaculture

2.4.2.1 May degrade freshwater and intertidal habitat due to farming techniques and damage from associated structures.

2.4.2.3 Potential for increased nutrient and effluent loads.

2.4.2.5 Increased risk of persistent human disturbance from tending activities that hinder or preclude habitat use by SGCN.

- 2.4.2.6 Potential for aquaculture structures to create impingement/entanglement hazard and/or preclude benthic habitat use by SGCN.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.3 Need to answer research question

- 12.1.3.3 Lack of studies specific to structural shellfish aquaculture (racks, bottom cages, bottom screens, etc.) and tending activities which may adversely impact horseshoe crabs, shorebirds and other benthic-dependent species.

Conservation actions that address Threats and Action Drivers

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

- 3.0.0.21 Conduct long-term monitoring to determine the impacts of the fish and shellfish aquaculture industries on focal and non-focal SGCN and their habitats (i.e., NJ bays, estuaries, ocean areas). Assess the success of management actions implemented to minimize these impacts and make specific recommendations to the NJ DEP regarding how such management efforts may be improved to minimize harm to wildlife and their habitats.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.19 Develop, implement and evaluate aquaculture practices in coastal areas that are compatible with the recovery of SGCNs and industry needs.

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.14 Develop aquaculture practices in the coastal areas that are compatible with the recovery of SGCN.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.29 Encourage government agencies and conservation partners to engage science community in the study of interactions among aquaculture, SGCN, their habitats, and potential impacts on migratory shorebirds and horseshoe crabs.

9 Planning

9.3 Species and habitat management planning

9.3.3 Habitat management planning

- 100 Law and Policy**

100.4.0.25 Develop policies that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

Reptiles & Amphibians

Atlantic Green Turtle

Atlantic Leatherback

Atlantic Loggerhead

Atlantic Ridley

Northern Diamondback Terrapin

Threats and Action Drivers associated with this conservation need

2 Agriculture and Aquaculture

2.1 Annual and Perennial Crops (non-timber)

2.1.1 Shifting Agriculture

- 2.1.1.4 Salt hay farming on Delaware Bay marshes, and the subsequent conversion of those farms to fully tidal marshes, results in compressed sediments that are less resilient to coastal forces of erosion and sea level rise.

2.4 Marine and Freshwater Aquaculture

2.4.1 Subsistence/Artisinal Aquaculture

- 2.4.1.1 May degrade freshwater and intertidal habitat due to farming techniques and damage from associated structures.
- 2.4.1.3 Potential for increased nutrient and effluent loads.
- 2.4.1.5 Increased risk of persistent human disturbance from tending activities that hinder or preclude habitat use by SGCN.
- 2.4.1.6 Potential for aquaculture structures to create impingement/entanglement hazard and/or preclude benthic habitat use by SGCN.

2.4.2 Industrial Aquaculture

- 2.4.2.1 May degrade freshwater and intertidal habitat due to farming techniques and damage from associated structures.
- 2.4.2.3 Potential for increased nutrient and effluent loads.
- 2.4.2.5 Increased risk of persistent human disturbance from tending activities that hinder or preclude habitat use by SGCN.
- 2.4.2.6 Potential for aquaculture structures to create impingement/entanglement hazard and/or preclude benthic habitat use by SGCN.

7 Natural Systems Modifications

7.3 Other Ecosystem Modifications

7.3.5 Poor habitat management

- 7.3.5.15 Lack of funding, incentives, or technical guidance resources to proactively manage land to benefit SGCN wildlife.
- 7.3.5.16 Lack of proactive management to preserve or maintain viable and functioning marshes for SGCN wildlife.

12 Resource Management Needs

12.1 Resource information collection needs

12.1.2 Lack of up-to-date existing information

- 12.1.2.1 Lack of (routine, regular, ongoing) surveys/assessments that provide up-to-date information regarding population trends or health, and/or status of fish, wildlife and/or their habitats.

15 Administrative Needs

15.2 Organizational/program planning needs

15.2.3 Need for multi-state, regional and landscape scale planning

- 15.2.3.1 State governance and financial structures can sometimes inhibit conservation planning and implementation at the regional and landscape-scales that are often more effective at setting priorities and meeting species and habitat conservation goals and objectives.

Conservation actions that address Threats and Action Drivers

2 Direct Management of Natural Resources

2.11 Vegetation management

2.11.0 Vegetation management strategies for terrestrial or aquatic habitat creation or restoration

- 2.11.0.46 Implement sediment augmentation techniques on tidal salt marshes to offset marsh subsidence and effects of sea level rise, and to stabilize tidal marsh ecosystem.

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

- 3.0.0.21 Conduct long-term monitoring to determine the impacts of the fish and shellfish aquaculture industries on focal and non-focal SGCN and their habitats (i.e., NJ bays, estuaries, ocean areas). Assess the success of management actions implemented to minimize these impacts and make specific recommendations to the NJ DEP regarding how such management efforts may be improved to minimize harm to wildlife and their habitats.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.19 Develop, implement and evaluate aquaculture practices in coastal areas that are compatible with the recovery of SGCNs and industry needs.

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.14 Develop aquaculture practices in the coastal areas that are compatible with the recovery of SGCN.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

- 8.1.0.1 Coordinate research efforts among government agencies, non-government conservation partners and other stakeholders to investigate the impacts of aquaculture on migratory shorebirds, waterfowl, finfish, shellfish and other SGCN and their habitats, to determine relative effects of farming locations and aquaculture techniques, and to evaluate management actions to minimize such impacts.

9 Planning

9.3 Species and habitat management planning

9.3.1 Species management planning

- 9.3.1.21 Develop and implement conservation actions for issues, threats, and opportunities most effectively addressed at a regional-, multi-state-, and landscape-scales, with the input and involvement of multiple parties involved in the creation and implementation of the State Wildlife Action Plans.

9.3.3 Habitat management planning

- 9.3.3.14 Develop a management plan using aquaculture practices in coastal areas that are compatible with the recovery of SGCN.

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.47 Investigate regulatory options available to direct the location of aquaculture activities in Aquaculture Development Zone 4 (Delaware Bay area) in a manner which minimizes the loss of wildlife habitats and adverse impacts to the environment.
 - 100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

- 100.4.0.25 Develop policies that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

Job 31.03. Incentives for Oyster Aquaculture

Objective: Target areas where intertidal structural oyster aquaculture poses risks to focal species and other SGCN's and incentivize (e.g., conservation easements, support/grants) the transition from intertidal to subtidal oyster aquaculture.

Purpose: Reduce the extent of intertidal oyster aquaculture that may have impacts on SGCN.

Benefits: Reduce impacts to coastal SGCN (e.g., migrating shorebirds) by shifting from intertidal structural aquaculture to subtidal aquaculture to reduce disturbance in intertidal habitats. Subtidal structural aquaculture largely frees oyster growers from timing restrictions on tending activities.

Objective: Incentivize (e.g., conservation easements, support/grants) consolidation of structural oysterculture into Aquaculture Development Zone 4.

Purpose: Reduce negative impacts of intertidal or subtidal aquaculture operations by limiting its extent inside localized areas.

Benefits: Reduce impacts to coastal SGCN (e.g., migrating shorebirds, horseshoe crabs, other marine SGCN), reduce fragmentation of benthic habitats, and create efficiencies for growers, public health, and law enforcement functions by clustering development of structural aquaculture operations.

Objective: Incentivize (grants, support, loans, etc.) experimentation with intertidal and subtidal structures and configurations that are permeable to migration, spawning, benthic foraging and sheltering for SGCN species (horseshoe crab, other benthic-dependent SGCN) in Delaware Bay and Atlantic Coast bays.

Purpose: Reduce negative impacts of aquaculture on coastal SGCN and their habitats.

Benefits: Maximize area, and minimize fragmentation, of intertidal habitat for SGCN while creating efficiencies for growers, public health, and law enforcement functions related to the structural aquaculture industry.

Objective: Incentivize development of non-chemical mudworm and fouling control methods that reduce intertidal aquaculture tending time and activity, and thus reduce disturbance to coastal SGCN.

Purpose: Reduce potential negative impacts of aquaculture on coastal SGCN and their habitats in Delaware Bay and Atlantic Coast bays (Red Knot, Horseshoe Crab, intertidal/benthic-dependent SGCN).

Benefits: Reduce potential disturbances to coastal SGCN in shellfish aquaculture areas.

Focal wildlife species benefitting from this job

Red Knot

Ruddy Turnstone

Reptiles & Amphibians

Northern Diamondback Terrapin

Threats and Action Drivers associated with this conservation need

2 **Agriculture and Aquaculture**

2.4 Marine and Freshwater Aquaculture

2.4.1 Subsistence/Artisinal Aquaculture

2.4.1.1 May degrade freshwater and intertidal habitat due to farming techniques and damage from associated structures.

2.4.1.2 Increased risk of parasite introduction into marine environments.

2.4.1.3 Potential for increased nutrient and effluent loads.

2.4.1.4 Potential increased noise pollution.

2.4.2 Industrial Aquaculture

2.4.2.1 May degrade freshwater and intertidal habitat due to farming techniques and damage from associated structures.

2.4.2.2 Increased risk of parasite introduction into marine environments.

2.4.2.3 Potential for increased nutrient and effluent loads.

2.4.2.4 Potential increased noise pollution.

Conservation actions that address Threats and Action Drivers

1 **Coordination and Administration**

1.2 Incentives

1.2.1 Incentives

1.2.1.25 Create incentives (non-monetary and/or monetary) within State regulations to assist and programs to deliver those incentives to aquaculture growers to relocate, for example, from intertidal to subtidal lease areas through buyouts of leases or microloans, and/or promoting on-lease conservation measures used by aquaculture growers (such as the implementation of conservation easements, use of living shorelines, incorporation of BMPs for habitat protection, etc.) for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.

Job 31.04. Integrated Multi-Trophic Aquaculture

Objective: Develop and implement practices for citing and management of aquaculture operations (all types) that reduce the risks of nutrient concentration or eutrophication.

Project 31. Aquaculture, Wildlife, and Habitat

Purpose: Reduce overall nutrient inputs from aquaculture by citing appropriate aquaculture types in appropriate areas based on, but not limited to, nutrient loading, tidal range and tidal flushing capacity; (e.g., oysters in Delaware Bay). Consider appropriate scale (acres) of aquaculture operations relative to conditions within individual bays and cumulative inputs by region (e.g., tidal drainage). Citing of native fish aquaculture (excess nutrients, entanglement, other impacts) should be carefully considered before placement in state waters.

Benefits: Reduce risks of eutrophication; improve water quality and clarity, preserve important aquatic vegetation habitats, improve water quality for native bivalve aquaculture.

Threats and Action Drivers associated with this conservation need

2 Agriculture and Aquaculture

2.4 Marine and Freshwater Aquaculture

2.4.1 Subsistence/Artisinal Aquaculture

2.4.1.3 Potential for increased nutrient and effluent loads.

2.4.2 Industrial Aquaculture

2.4.2.3 Potential for increased nutrient and effluent loads.

Conservation actions that address Threats and Action Drivers

3 Data Collection and Analysis

3.0 General fish and wildlife research, survey or monitoring

3.0.0 Research, survey or monitoring - general fish and wildlife needs

Project 31. Aquaculture, Wildlife, and Habitat

- 3.0.0.21 Conduct long-term monitoring to determine the impacts of the fish and shellfish aquaculture industries on focal and non-focal SGCN and their habitats (i.e., NJ bays, estuaries, ocean areas). Assess the success of management actions implemented to minimize these impacts and make specific recommendations to the NJ DEP regarding how such management efforts may be improved to minimize harm to wildlife and their habitats.

3.2 Research, survey or monitoring - fish and wildlife populations

3.2.0 Data deficiency

- 3.2.0.19 Develop, implement and evaluate aquaculture practices in coastal areas that are compatible with the recovery of SGCNs and industry needs.

3.5 Techniques development

3.5.3 Habitat restoration methods

- 3.5.3.12 Develop management actions to minimize the documented adverse impacts and reduce risks of potential adverse impacts of aquaculture on migratory shorebirds and other SGCN, including waterfowl, finfish, and shellfish and their habitats.
- 3.5.3.14 Develop aquaculture practices in the coastal areas that are compatible with the recovery of SGCN.

9 Planning

9.3 Species and habitat management planning

9.3.3 Habitat management planning

- 9.3.3.6 Develop a management plan for maintaining and enhancing healthy, SGCN-associated terrestrial and aquatic habitats and associated riparian habitats, and to minimize (if not avoid) incidental take of resident and migratory fish and wildlife and/or disturbance to them (in particular during breeding periods) on public and private lands for maintaining populations in perpetuity.
- 9.3.3.14 Develop a management plan using aquaculture practices in coastal areas that are compatible with the recovery of SGCN.

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

- 100.3.0.23 Review existing CAFRA regulations and ensure that the Coastal Zone Management Rules (NJAC 7:7E) adequately address mitigation that creates an environmental benefit for losses of SGCN and their habitats.
- 100.3.0.47 Investigate regulatory options available to direct the location of aquaculture activities in Aquaculture Development Zone 4 (Delaware Bay area) in a manner which minimizes the loss of wildlife habitats and adverse impacts to the environment.

Project 31. Aquaculture, Wildlife, and Habitat

100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

100.4.0.25 Develop policies that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

Job 31.05. Zoning: Leave Room for Wildlife

Objective: Minimize impacts of native bivalve aquaculture practices (oysters, clams, mussels, etc.) and facilities on coastal species by zoning the aquaculture industry within clustered locations in each proposed embayment and thereby allowing for long-term study of SGCN impacts, development of best management practices or mitigation, while preserving a larger zone solely for habitat preservation and restoration.

Purpose: Reduce potential negative impacts of intertidal and subtidal bivalve aquaculture operations by clustering in discrete and limited areas.

Benefits: Maximize the area and minimize fragmentation of intertidal and subtidal coastal habitats used by SGCN (e.g., migratory shorebirds, horseshoe crabs, benthic-dependent SGCN) while creating efficiencies for bivalve growers, public health, and law enforcement functions by clustering structural aquaculture development.

2 Agriculture and Aquaculture

2.4 Marine and Freshwater Aquaculture

2.4.1 Subsistence/Artisinal Aquaculture

2.4.1.1 May degrade freshwater and intertidal habitat due to farming techniques and damage from associated structures.

2.4.1.3 Potential for increased nutrient and effluent loads.

2.4.2 Industrial Aquaculture

2.4.2.1 May degrade freshwater and intertidal habitat due to farming techniques and damage from associated structures.

2.4.2.3 Potential for increased nutrient and effluent loads.

Conservation actions that address Threats and Action Drivers

100 Law and Policy

100.3 State Regulations

100.3.0 Regulatory initiatives for species and habitat protection

100.3.0.47 Investigate regulatory options available to direct the location of aquaculture activities in Aquaculture Development Zone 4 (Delaware Bay area) in a manner which minimizes the loss of wildlife habitats and adverse impacts to the environment.

100.3.0.72 Develop regulations that require permit applicants and/or review agencies to assess the cumulative and synergistic effects of a proposed project (i.e., "secondary effects"), both over time and over a larger spatial scale than the site itself.

100.4 State Agency Policy Integration

100.4.0 Policy initiatives for species and habitat protection

100.4.0.4 Create a policy that requires the use of wildlife habitat and corridor mapping products for both regulatory use when conducting project reviews and planning/siting new or expanded rights-of-way projects.

Project 32. Education and Outreach

Job 32.01. Wildlife Observer Ethics

Objective: Reduce human disturbances to wildlife by encouraging wildlife observers and photographers to exercise appropriate and ethical behavior.

Purpose: Reduce human disturbance to wildlife.

Benefits: Eliminating human disturbances will result in improved reproductive and foraging success for wildlife and decreased destruction of/disturbance to important habitats within locations targeted by observers and photographers.

Focal wildlife species benefitting from this job

Birds

American Oystercatcher	Black Rail	Black Skimmer
Common Tern	Forster's Tern	Least Tern
Little Blue Heron	Northern Harrier	Peregrine Falcon
Pied-billed Grebe	Piping Plover	Red Knot
Ruddy Turnstone	Snowy Egret	Tricolored Heron

Reptiles & Amphibians

Corn Snake	Eastern Hognose Snake	Northern Black Racer
Northern Pine Snake	Northern Scarlet Snake	Timber Rattlesnake

Threats and Action Drivers associated with this conservation need

6 Human Intrusions and Disturbance

6.1 Recreational Activities

6.1.5 Wildlife observation and photography

6.1.5.1 Improperly conducted recreational activities may disrupt normal wildlife behaviors which can result in reduced reproductive success or survival, abandonment of critical sites, etc.

Conservation actions that address Threats and Action Drivers

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

Project 32. Education and Outreach

- 8.1.0.42 Engage citizens, wildlife observers and photographers through discussions and distributable information regarding the importance of and encouraging implementing responsible and ethical behavior when observing wildlife by developing an alliance of wildlife photographers and widely circulating recommendations on how to reduce impact.

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.13 Conduct an educational campaign to encourage observer ethics and respect for wildlife and natural habitat.

Job 32.02. Environmental Education in the Core Curriculum

Objective: Initiate legislative action to require schools (grades k-12) to provide environmental education regarding wildlife and their habitats and how students can be thoughtful stewards.

Purpose: Recruit and inspire future generations to become thoughtful stewards of wildlife and natural landscapes.

Benefits: Creation of school yard habitat, inspiring backyard habitat, and cultivating new generations of stewards and outdoor recreationists which in turn increases public support of natural resources and wildlife conservation.

Focal wildlife species benefitting from this job

Threats and Action Drivers associated with this conservation need

Project 32. Education and Outreach

14 Education/ Outreach Needs

14.1 Education needs

14.1.1 Need for improved knowledge of fish and wildlife and their habitats

14.1.1.1 Lack of understanding of the importance of various SGCN habitats, their connectivity to similar habitats, and how planning decisions impact their quality and the wildlife that depend upon them.

14.1.1.2 Lack of general knowledge of SGCN life histories and vulnerabilities as they relate to land management practices.

Conservation actions that address Threats and Action Drivers

4 Education

4.1 Educator/Instructor training

4.1.0 Public education

4.1.0.1 Provide educational resources and training programs to private and public landowners, as well as schools, regarding the benefits and creation of backyard habitats for wildlife.

4.1.1 Aquatic resource education

4.1.1.1 Provide educational resources and training programs to teachers in aquatic resource education that includes information regarding climate change and sea-level rise for incorporation into the class curriculum and/or as the focus of school field trips.

4.1.1.2 Provide educational resources and training programs to teachers in aquatic resource education that includes information regarding how coastal stabilization negatively impacts wildlife by preventing natural processes for incorporation into the class curriculum and/or as the focus of school field trips.

8 Outreach

8.1 Partner/stakeholder engagement

8.1.0 Partner/stakeholder engagement strategies

8.1.0.34 Work with the NJ Education Association and Department of Education to design curriculum and outdoor experimental learning opportunities, and provide training to teachers on implementation of these activities.

Job 32.03. Wildlife and Sportfish Restoration Outreach and Awareness

Objective: Promote awareness of this funding source among hunters, anglers, and the general public, for wildlife and habitat conservation through product labeling, websites, public service announcements, and signage (or other recognition) at places that have benefited.

Project 32. Education and Outreach

Purpose: Increase participation in outdoor recreation that ties people to the land and the work done to preserve it, and unite the conservation philosophies of hunter/angler and non-sportsmen communities.

Benefits: Improve public awareness of conservation that enhances wildlife, habitats, and functioning ecosystems, and provide informative signage and educational opportunities to the public.

Threats and Action Drivers associated with this conservation need

14 Education/ Outreach Needs

14.2 Outreach needs

- 14.2.1** Need to improve specific understanding of agency/organization goals, objectives and ongoing wildlife conservation actions
 - 14.2.1.1** Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various forest management practices.
 - 14.2.1.2** Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various aquatic and riparian management practices.
 - 14.2.1.3** Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various coastal management practices.

Project 32. Education and Outreach

- 14.2.1.4 Need to develop greater understanding of and support for efforts implemented to maintain disturbance-free habitats that allow coastal wildlife populations to thrive alongside human residential and recreational uses.
- 14.2.1.5 Need to develop greater understanding of and support for efforts implemented to enhance SGCN habitat and biodiversity through various wetland management practices.

Conservation actions that address Threats and Action Drivers

8 Outreach

8.3 WSFR program/subprogram outreach

8.3.0 WSFR program/subprogram outreach strategies

- 8.3.0.12 Promote awareness of WSFR (Wildlife and Sportfish Restoration) Outreach/Awareness grants, an important funding source for conservation among hunters and anglers as well as the general public.

Appendix M: USFWS TRACS Indicators to Measure Success of Conservation Actions

Wildlife TRACS Project Action Levels with Indicators 8/20/14

Project Level	Action Level 1	Action Level 2	Action Level 3	Level 2 and Level 3 Output Measures	Description/Examples/Notes
Project Categories	Category	Strategy	Activity	Units	
Administration and/or Conservation / Management and/or Recreation	Coordination and Administration	Coordination and Administration		Number	Coordination and administration necessary for effective agency operations and program/project management
			Agency administrative support	Number	Administration necessary for effective agency operations (e.g., acquisition of goods and services, human resources tasks)
			Program/project administrative support	Number	Administration necessary for effective program/project management (e.g., staff support and training, monitoring progress of grant proposal and reporting processes)
		Incentives	Incentives	Number	Development and delivery of economic incentives to private landowners to influence responsible stewardship of land/water and specific species
	Direct Management of Natural Resources				
		Create new habitat or natural processes		Acres	Creation of new habitat or natural processes for the benefit of fish and wildlife and recreational users
			Habitat conversion	Acres	Conversion of one type of habitat into another (e.g., creating bottomland forest from agricultural land, wetland creation) Note: Forest and wetland would be the appropriate broad habitat types to code for these two examples
			Public fishing lake construction	Acres	Construction of new public fishing lakes
			Waterfowl impoundment creation	Acres	Creation of shallow water impoundments for the primary benefit of waterfowl
		Dam and barrier removal		Structures	Removal of barriers to maintain aquatic species populations and restore ecological functions in streams (e.g., dam or dike removal, notching of dams)
			Culvert work	Structures	Replacement or repair of road culverts (e.g., installing larger culvert, eliminating perching)
			Dam notching	Structures	Removal of portions of dams for increased flow

NOTE: The asterisk (*) denotes required activity level data

Wildlife TRACS Project Action Levels with Indicators 8/20/14

Project Level	Action Level 1	Action Level 2	Action Level 3	Level 2 and Level 3 Output Measures	Description/Examples/Notes
			Dam removal	Structures	Removal of entire dams
			Road crossing removal	Structures	Removal of in-stream road crossings
			Obstruction removal	Structures	Removal of other obstructions (e.g., beaver dams)
		Fire management		Acres	Use of fire to benefit fish and wildlife and their habitats
			Firebreak	Acres	Creation or maintenance of a strip of cleared or plowed land used to stop the spread of a fire
			Fuel reduction	Acres	Application of treatments to reduce the risk of high-severity wildfires and to manage changes in the ecological functions of forests (e.g., mechanical thinning)
			Prescribed burning	Acres	Application of fire in a knowledgeable manner to forest fuels on a specific land under selected weather conditions to accomplish predetermined, well-defined management objectives (e.g., burning an established native grass community to reduce or eliminate invading brush or exotic species)
		Fish and wildlife habitat structures		Structures	Installation of structures to benefit fish and wildlife and their habitats
			Artificial reef development	Structures	Development of artificial reefs in freshwater or marine environments for aquatic species spawning, foraging and refugia
			Hibernacula	Structures	Creation or improvement of overwintering sites
			Nesting habitat improvements	Structures	Installation of nesting structures (e.g., wood duck boxes, osprey platforms)
			Wildlife escape structures	Structures	Installation of structures that allow wildlife to escape from man-made devices placed in the environment (e.g., ramps that allow sage grouse to escape from livestock watering troughs)
				Acres	Improvements to agricultural practices to benefit fish and wildlife and their habitats
			Alley cropping/silvopasture	Acres	Methods of planting in which perennial, preferably leguminous trees or shrubs, are grown simultaneously with an arable crop

NOTE: The asterisk (*) denotes required activity level data

Wildlife TRACS Project Action Levels with Indicators 8/20/14

Project Level	Action Level 1	Action Level 2	Action Level 3	Level 2 and Level 3 Output Measures	Description/Examples/Notes
		Grazing/farm management	Farming residue management	Acres	Use of vegetative crop material left on a field after harvesting, pruning or processing to benefit wildlife and soil quality
			Forage use management	Acres	Management of timing and duration of grazing to maintain adequate cover for range health and nesting success (e.g., establishment of rotational grazing system to improve grassland nesting bird habitat)
			Livestock heavy use area establishment	Acres	Provision of stable, non-eroding surfaces for areas intensively used by livestock to protect and improve water quality
			Livestock stream crossing	Acres	Installation of structures that allow livestock to cross a stream in a safe and environmentally sound manner (e.g., fords, culverts, bridges)
			Nutrient or runoff management system	Acres	Application of techniques to minimize nutrient runoff from agricultural operations
			Riparian fence installation	Acres	Installation of fences along riparian areas to keep out livestock
			Waste storage/treatment	Acres	Management of on-farm generated wastes in an environmentally responsible manner (e.g., liquid retention and storage ponds, anerobic waste treatment lagoons)
		Hazard or infrastructure removal		Acres	Removal of hazards or infrastructure to benefit fish and wildlife and their habitats
			Building removal	Acres	Removal of buildings to improve habitat for wildlife
			Degraded land reconstruction	Acres	Reconstruction of degraded land to benefit wildlife (e.g., abandoned mine area recovery, deleveling)
			Derelict gear (net/pot) removal	Acres	Removal of derelict fishing gear from waters to prevent continued capture of aquatic species (e.g., fishing nets, fish/crab pots)
			Pavement removal	Acres	Removal of pavement to improve habitat for wildlife (e.g., roads, airplane runways)
			Pier/dock removal	Acres	Removal of piers or docks to improve aquatic habitats

NOTE: The asterisk (*) denotes required activity level data

Wildlife TRACS Project Action Levels with Indicators 8/20/14

Project Level	Action Level 1	Action Level 2	Action Level 3	Level 2 and Level 3 Output Measures	Description/Examples/Notes
			Shoreline armoring removal	Acres	Removal of shoreline armoring to improve aquatic habitats (e.g., jetties, riprap)
			Solid waste removal	Acres	Removal of solid waste to improve habitat for wildlife (e.g., derelict vehicles, rubbish)
		Instream modification		Miles	Stream improvements to benefit fish and wildlife and their habitats
			Channel reconfiguration	Miles	Restoration of natural stream channel (e.g., returning meanders and sustainable profiles to straightened streams, sandbar improvement)
			Channel structure placement	Miles	Placement of structures within streams to restore natural characteristics (e.g., cross vanes, boulders)
			Nutrient improvement	Miles	Application of nutrients to improve water quality of fish and wildlife (e.g., liming of streams, carcass placement)
			Spawning by-pass channels	Miles	Construction of side channel fish spawning and rearing habitat
			Spawning gravel placement	Miles	Addition of gravel to streams to improve spawning areas
			Streambank stabilization	Miles	Stabilization of streambanks (e.g., bank armoring, bank bioengineering)
		Invasive species control		Acres	Control of invasive animal and plant species to maintain native species populations and restore ecological functions
			Animal - biological	Acres	Control of invasive animal species by biological means (e.g., introducing predators to control invasive animal species)
			Animal - chemical	Acres	Control of invasive animal species by chemical means (e.g., piscicide treatment of sea lamprey in inland waters)
			Animal - mechanical	Acres	Control of invasive animal species by mechanical means (e.g., constructing a barrier in a stream to prevent entry of invasive fish species)
			Plant - biological	Acres	Control of invasive plant species by biological means (e.g., using beetles to control purple loosestrife)

NOTE: The asterisk (*) denotes required activity level data

Wildlife TRACS Project Action Levels with Indicators 8/20/14

Project Level	Action Level 1	Action Level 2	Action Level 3	Level 2 and Level 3 Output Measures	Description/Examples/Notes
			Plant - chemical	Acres	Control of invasive plant species by chemical means (e.g., herbicide treatment of invasive plant species)
			Plant- mechanical	Acres	Control of invasive plant species by mechanical means (e.g., hand pulling of invasive plant species)
		Living shorelines		Acres	Physical manipulation in shoreline areas to maintain fish and wildlife habitats and/or restore ecological functions
			Beach renourishment	Acres	Placement of sand onto beaches and employing other techniques for their renourishment
			Erosion control structures	Acres	Installation of hard structures (e.g., seawall bulkhead) or living structures (e.g., greenwall systems) to control erosion
			Sand dune restoration	Acres	Application of techniques to restore sand dunes (e.g., fencing off sea-grass areas)
				Acres	Planting or seeding to maintain fish and wildlife habitats and/or restore ecological functions
		Planting/seeding	Coral	Acres	Application of techniques to reestablish coral reefs
			Field border/hedgerow	Acres	Maintenance or establishment of edge between two vegetation types
			Food plots	Acres	Planting crops specifically as food for wildlife
			Herbaceous vegetation	Acres	Planting/seeding of grasslands
			Mulching	Acres	Application of organic materials to enrichment and protect soil
			Plant propagation/nursery	Acres	Use of nurseries to raise plants for habitat improvement
			Submerged aquatic vegetation	Acres	Restoration of vegetation that lives at or below the water surface
			Trees/shrubs	Acres	Planting trees or shrubs
			Vegetation buffer	Acres	Maintenance or establishment of strips of land with permanent vegetation to intercept stormwater runoff and minimize soil erosion
			Woody debris	Acres	Placement of limbs, bush, trees and stumps to improve habitat
				Acres	Physical manipulation of vegetation to maintain fish and wildlife habitats and/or restore ecological functions

NOTE: The asterisk (*) denotes required activity level data

Wildlife TRACS Project Action Levels with Indicators 8/20/14

Project Level	Action Level 1	Action Level 2	Action Level 3	Level 2 and Level 3 Output Measures	Description/Examples/Notes
		Vegetation management	Chaining	Acres	Dragging heavy chains to remove unwanted vegetation
			Clearing and snagging	Acres	Use of varied techniques to clear vegetation (e.g., brush shearing to set back early successional plant communities)
			Dixie harrow/Lawson aerator	Acres	Removal of vegetation and treating soil by pulling devices behind a tractor (e.g., removing sagebrush for improved herbaceous cover for sage grouse)
			Forest stand improvement	Acres	Removal of trees to improve forest habitat for wildlife (e.g., forest management that promotes a particular serial stage)
			Mowing	Acres	Cutting down grass or grain to maintain habitat for wildlife
			Plowing/Discing	Acres	Plowing or other mechanical means of disturbing existing vegetation and exposing soil
		Water management		Number	Management of water to benefit fish and wildlife and their habitats
			Ditch plugs	Number	Installation of earthen plugs into drainage ditches to restore wetlands
			Diversion/headgate	Number	Installation or maintenance of structures to divert water
			Drainage	Number	Removal of tile drains or drainage ditches to restore wetland hydrology
			Public fishing lake enhancement	Number	Enhancements made to public fishing lakes (e.g., installation of aerators)
			Spring development	Number	Application of techniques to improve the flow, quantity and yield of water from a natural spring
			Tide gate	Number	Installation or maintenance of structures to increase the hydro-period and water depth of a wetland
			Waterfowl impoundment maintenance	Number	Maintenance of impoundments for waterfowl habitat (e.g., renovation of impoundment dikes)
			Water control structure	Number	Installation or maintenance of structures to simulate natural hydrological processes
			Watering facilities	Number	Installation or maintenance of structures to collect and store water for the benefit of wildlife (e.g., water holes, guzzlers, wells)

NOTE: The asterisk (*) denotes required activity level data

Wildlife TRACS Project Action Levels with Indicators 8/20/14

Project Level	Action Level 1	Action Level 2	Action Level 3	Level 2 and Level 3 Output Measures	Description/Examples/Notes
		Wildlife damage management		Interventions	Assessment and management of damage from nuisance native fish and wildlife. Includes control of predators by biological, chemical or mechanical means to maintain populations of species at risk and restore ecological functions (e.g., gull or cormorant control, nest exclusion devices, cave gating) Note: Limited eligibility for funding through WSFR grant programs
		Wildlife disease management		Interventions	Assessment and management of wildlife disease situations. Includes control or treatment of diseased animals to maintain populations of species at risk and restore ecological functions (e.g., chronic wasting disease, brucellosis, tuberculosis, plague management activities)
	Data Collection and Analysis				
		Database development and management		Databases	Information technology development and maintenance to support project objectives (e.g., statewide database development) Note: This is different from other Data Collection and Analysis activities in that it refers to the hardware, software, and supporting infrastructure that support multiple data collection efforts
			Database development	Databases	Information technology development to support project objectives (e.g., statewide database development) Note: This is different from other Data Collection and Analysis activities in that it refers to the hardware, software, and supporting infrastructure that support multiple data collection efforts
			Information systems operations and maintenance	Databases	Information technology maintenance to support project objectives (e.g., GIS analyses) Note: This is different from other Data Collection and Analysis activities in that it refers to the hardware, software, and supporting infrastructure that support multiple data collection efforts

NOTE: The asterisk (*) denotes required activity level data

Wildlife TRACS Project Action Levels with Indicators 8/20/14

Project Level	Action Level 1	Action Level 2	Action Level 3	Level 2 and Level 3 Output Measures	Description/Examples/Notes
		Research, survey or monitoring - fish and wildlife populations		Projects	Collection and analysis of data as part of research, survey or monitoring primarily focused on fish and wildlife populations Note: includes compilation, management, synthesis, analysis and reporting of spatial and non-spatial data Note: Code work on fish and wildlife diseases to Wildlife Disease Management within Direct Management of Natural Resources
			Abundance determination	Projects	Determination of relative abundance or estimation of size of fish and wildlife populations (e.g., adult population estimate, juvenile relative abundance)
			Age, size and sex structure	Projects	Determination of age, size or sex structure of fish and wildlife populations (e.g., age and growth, length frequency, sex ratio)
			Baseline inventory	Projects	Baseline survey and inventory to understand distribution of fish and wildlife populations
			Food habits	Projects	Studies on food habits of fish and wildlife species or their utilization as prey
			Genetics	Projects	Genetics studies of fish and wildlife populations (e.g., population connectivity, hybridization)
			Movement	Projects	Studies of fish and wildlife movements (e.g., tagging, telemetry)
			Population assessment	Projects	Assessments of biological information to determine status of fish and wildlife populations (e.g., population viability analysis, fisheries stock assessment)
			Reproduction	Projects	Studies of reproduction of fish and wildlife populations (e.g., fecundity, nesting success)

NOTE: The asterisk (*) denotes required activity level data

Wildlife TRACS Project Action Levels with Indicators 8/20/14

Project Level	Action Level 1	Action Level 2	Action Level 3	Level 2 and Level 3 Output Measures	Description/Examples/Notes
		Research, survey or monitoring - habitat		Projects	Collection and analysis of data as part of research, survey or monitoring primarily focused on fish and wildlife habitats Note: includes compilation, management, synthesis, analysis and reporting of spatial and non-spatial data
			Baseline inventory	Projects	Baseline survey and inventory to understand distribution of fish and wildlife habitat quality and quantity (e.g., wetland mapping)
			Monitoring	Projects	On-going monitoring of fish and wildlife habitat quality and quantity (e.g., annual early successional habitat survey, artificial reef condition)
		Research, survey or monitoring - utilization		Projects	Collection and analysis of data as part of research, survey or monitoring primarily focused on utilization of fish or wildlife resources and demographics of users Note: includes compilation, management, synthesis, analysis and reporting of data
			Facility usage/inventory	Projects	Collection and analysis of data as part of research, survey or monitoring primarily focused on number and usage of facilities (e.g., survey of boat pumpout usage; inventory of fish screen devices)
			Harvest	Projects	Collection and analysis of data as part of research, survey or monitoring primarily focused on utilization of fish or wildlife resources (e.g., lake creel surveys; deer harvest statistics)
			Human dimensions	Projects	Collection and analysis of data as part of research, survey or monitoring primarily focused on human dimensions (e.g., demographic surveys; resource economics analyses)

NOTE: The asterisk (*) denotes required activity level data

Wildlife TRACS Project Action Levels with Indicators 8/20/14

Project Level	Action Level 1	Action Level 2	Action Level 3	Level 2 and Level 3 Output Measures	Description/Examples/Notes
		Techniques development		Studies	Research and development of techniques important for the conservation and management of fish and wildlife
			Artificial propagation studies	Studies	Research on artificial propagation of fish and wildlife (e.g., nutrition studies, culture methods)
			Educational methods research	Studies	Research on educational instruction and evaluation methods
			Habitat restoration methods	Studies	Development or improvement of methods to restore habitats and natural processes (e.g., evaluations of water level fluctuations)
			Fish and wildlife research, survey and management techniques	Studies	Development or improvement of research techniques or management tools (e.g., tag retention studies, sampling device improvements, testing of animal control devices)
	Education				
		Educator/Instructor training		Instructors	Training of educators/instructors on aquatic resources, firearm safety, and archery-related activities
			Aquatic resource education (*)	Instructors	Training of new instructors and teachers in aquatic resource education who will teach others Note: This includes angler education volunteer instructors, teachers, nature center staff and camp counselors who attend ARE workshops, teachers who help the agency write curriculum, etc.
			Hunter education - firearms (*)	Instructors	Training of new and in-service volunteer instructors in hunter education who will teach others Note: Could be funded through Wildlife Restoration basic or Section 10 enhanced hunter education
			Cumulative number of active instructors (*)	Instructors	Number of active hunter education volunteer instructors including those just trained within a given year Note: Could be funded through Wildlife Restoration basic or Section 10 enhanced hunter education

NOTE: The asterisk (*) denotes required activity level data

Wildlife TRACS Project Action Levels with Indicators 8/20/14

Project Level	Action Level 1	Action Level 2	Action Level 3	Level 2 and Level 3 Output Measures	Description/Examples/Notes
		Student training		Students	Training of students on aquatic resource education, firearm safety, or archery-related activities Note: Could include Section 10 enhanced hunter education non-range related enhancements to the program (e.g., training supplies acquired, operations and maintenance, etc.)
			Aquatic resource education (*)	Students	Instruction of students on aquatic resources in an educational setting (contact hour of 0.5 or more) Note: This does not include people who have no personal educational interaction - reading an article, borrowing a video, walking by an exhibit booth, etc.; or people that the agency trained to help deliver the program
			Hunter education - firearms (*)	Students	Instruction of students on firearm safety in an educational setting leading to hunter education certification Note: Could be funded through Wildlife Restoration basic or Section 10 enhanced hunter education Note: Could include participation in programs intended to recruit and retain hunters that are only eligible through Section 10 enhanced hunter education
			Hunter education - Archery in the Schools (*)	Students	Instruction of students on archery-related activities specifically through the Archery in the Schools program Note: Can only be funded with Section 10 enhanced hunter education Note: Usage started with TRACS launch at start of FY 2013.
			Hunter education - other archery (*)	Students	Instruction of students on archery hunting-related activities not through the Archery in the Schools program Note: Could be funded through Wildlife Restoration basic or Section 10 enhanced hunter education Note: Pre-TRACS data could have included Archery in the Schools information.

NOTE: The asterisk (*) denotes required activity level data

Wildlife TRACS Project Action Levels with Indicators 8/20/14

Project Level	Action Level 1	Action Level 2	Action Level 3	Level 2 and Level 3 Output Measures	Description/Examples/Notes
			Wildlife education	Students	Instruction of students on wildlife species and their habitats in an educational setting Note: This activity has a limited eligibility for reimbursement through WSFR grant programs
	Facilities and Areas (Major Renovation)	Agency support facilities		Sites	Major renovation of facilities used by agency personnel in support of programs/projects (e.g., office buildings, garages, equipment sheds)
		Aquatic resource education centers		Sites	Major renovation of facilities for aquatic resource education
		Boating access facilities		Number	Major renovation of facilities providing access for anglers and others using motor boats
			Launch ramps (*)	Number	Boat ramp lanes at boat launch sites
			Docks/piers (*)	Number	Docks/piers at boat launch sites
			Parking areas (*)	Number	Parking areas at boat launch sites
			Parking spaces (*)	Number	Parking spaces at boat launch sites
			Access roadways (*)	Number	Roadways to access launch ramps
			Restrooms (*)	Number	Restrooms at boat launch sites
			Fish cleaning stations (*)	Number	Fish cleaning stations at boat launch sites
			Shelters (*)	Number	Shelters at boat launch sites
		Boat pump out and dump stations		Number	Major renovation of facilities for pumping sewage from boats Note: Typically funded through the Clean Vessel Act program
			Pump out stations (*)	Number	Pump out stations
			Dump stations (*)	Number	Dump stations
			Floating restrooms (*)	Number	Floating restrooms
			Pump out boats (*)	Number	Pump out boats
		Fish passage facilities		Number	Major renovation of facilities designed to allow fish to move past instream barriers (e.g., fish ladders; counting stations) Note: Not related to removal of dams and other barriers coded elsewhere
			Counting traps/stations	Number	Counting traps/stations
			Downstream bypass facilities	Number	Facilities designed specifically for downstream movement of fish

NOTE: The asterisk (*) denotes required activity level data

Wildlife TRACS Project Action Levels with Indicators 8/20/14

Project Level	Action Level 1	Action Level 2	Action Level 3	Level 2 and Level 3 Output Measures	Description/Examples/Notes
			Fish ladders	Number	Fish ladders
			Fish lifts	Number	Fish lifts
			Nature-like fishways	Number	Fishways whose designs are based on simulating natural stream characteristics and are constructed of natural materials
		Fish screening and related facilities		Sites	Major renovation of screening systems that prevent fish from passing into areas that do not support their survival (e.g., into irrigation diversion channels). Note: Primarily funded by FRIMA grant program in Region 1
		Hatcheries (recreational purposes)		Sites	Major renovation of facilities to propagate fish or wildlife species for restoration
		Hatcheries (restoration)		Sites	Major renovation of facilities to propagate fish or wildlife species for recreational purposes
		Hunter education - archery ranges		Sites	Major renovation of archery ranges for hunter education purposes
		Hunter education - classrooms		Sites	Major renovation of classrooms for hunter education purposes Note: Could be funded through Wildlife Restoration basic or enhanced hunter education
		Hunter education - firearm shooting ranges		Sites	Major renovation of firearm shooting ranges for hunter education purposes Note: Could be funded through Wildlife Restoration basic or enhanced hunter education
		Public fishing areas/access		Number	Major renovation of non-boating access public fishing areas Note: Activities primarily for restoration and management of species and habitats should be coded to Create, Restore or Enhance Habitat and Natural Processes
			Carry-down access	Number	Access points for carry-down boats
			Fishing piers	Number	Fishing piers
			Parking areas	Number	Parking areas for fishing
			Jetties	Number	Jetties for fishing
			Access roadways	Number	Roadways to access fishing areas
			Restrooms	Number	Restrooms at fishing areas
			Fish cleaning stations	Number	Fish cleaning stations at fishing areas
			Shelters	Number	Shelters at fishing areas

NOTE: The asterisk (*) denotes required activity level data

Wildlife TRACS Project Action Levels with Indicators 8/20/14

Project Level	Action Level 1	Action Level 2	Action Level 3	Level 2 and Level 3 Output Measures	Description/Examples/Notes
		Transient boat tie up - primary facilities		Number	Major renovation of primary facilities for tie-up of transient boats Note: Typically funded through Boating Infrastructure Grant program
			Docks/slips (*)	Number	Spaces for tie-up to docks
			Moorings (*)	Number	Moorings
			Gangways (*)	Number	Gangways
		Transient boat tie up - secondary facilities		Number	Major renovation of secondary facilities for tie-up of transient boats Note: Typically funded through Boating Infrastructure Grant program
			Restrooms (*)	Number	Restrooms
			Fuel stations (*)	Number	Fuel stations
			Laundry facilities (*)	Number	Laundry facilities
		Wildlife Management Areas		Number	Major renovation of facilities at Wildlife Management Areas
			Campgrounds	Number	Campgrounds
			Dikes/levees	Number	Dikes/levees
			Observation structures	Number	Wildlife blinds, towers, platforms, etc.
			Parking lots	Number	Parking lots
			Roads	Number	Roads
	Facilities and Areas (New Construction)	Agency support facilities		Sites	Construction of new facilities used by agency personnel in support of programs/projects (e.g., office buildings, garages, equipment sheds)
		Aquatic resource education centers		Sites	Construction of new facilities for aquatic resource education
		Boat pump out and dump stations		Number	Construction of new facilities for pumping sewage from boats Note: Typically funded through the Clean Vessel Act program
			Dump stations (*)	Number	Dump stations
			Floating restrooms (*)	Number	Floating restrooms
			Pump out boats (*)	Number	Pump out boats
			Pump out stations (*)	Number	Pump out stations

NOTE: The asterisk (*) denotes required activity level data

Wildlife TRACS Project Action Levels with Indicators 8/20/14

Project Level	Action Level 1	Action Level 2	Action Level 3	Level 2 and Level 3 Output Measures	Description/Examples/Notes
		Boating access facilities	Access roadways (*)	Number	Roadways to access fishing areas

			Jetties	Number	Jetties for fishing
			Parking areas	Number	Parking areas for fishing
			Restrooms	Number	Restrooms at fishing areas
			Shelters	Number	Shelters at fishing areas
		Wildlife Management Areas		Number	Routine operations and maintenance of Wildlife Management Areas Note: Activities primarily for restoration and management of species and habitats should be coded to Create, Restore or Enhance Habitat and Natural Processes
			Boundary designation	Number	
			Campgrounds	Number	Campgrounds
			Dikes/levees	Number	Dikes/Levees
			Observation structures	Number	Wildlife blinds, towers, platforms, etc.
			Parking lots	Number	Parking Lots
			Trails	Number	

NOTE: The asterix (*) denotes required activity level data

Wildlife TRACS Project Action Levels with Indicators 8/20/14

Project Level	Action Level 1	Action Level 2	Action Level 3	Level 2 and Level 3 Output Measures	Description/Examples/Notes
			Trash Collection	Number	
			Roads	Number	Roads
	Land and Water Rights Acquisition and Protection (Potential High Level Purposes: Conservation/ Management, Recreation, Administration)			Acres	
		Land acquisition	Fee title	Acres	Acquisition of lands through fee title acquisition
			Non-fee title	Acres	Acquisition of lands through leases, permanent easements, cooperative agreements, contracts or other non-fee title arrangements
		Water rights acquisition	Fee title	Acres Feet	Purchase of water rights through fee title acquisition (e.g., purchase of water rights to maintain adequate flows for endangered stream fishes)
			Non-fee title	Acres Feet	Acquisition of water rights through leases, permanent easements, cooperative agreements, contracts or other non-fee title arrangements (e.g., purchase of water rights to maintain adequate flows for endangered stream fishes)
		Conservation area designation		Acres	Designation of a site or landscape as having unique and important value to fish and wildlife with or without legal protections (e.g., waterfowl breeding area, Marine Protected Area)
		Private lands agreements		Acres	Number of acres that are protected by agreement with private landowners, but which do not involve active habitat improvement Note: Used extensively within the Landowner Incentive Program
	Law Enforcement (Potential High Level Purposes: Conservation/ Management, Recreation)	Law enforcement		Cases	Enforcement of laws and regulations related to the protection of fish and wildlife

NOTE: The asterisk (*) denotes required activity level data

Wildlife TRACS Project Action Levels with Indicators 8/20/14

Project Level	Action Level 1	Action Level 2	Action Level 3	Level 2 and Level 3 Output Measures	Description/Examples/Notes
	Outreach				
		Partner/stakeholder engagement		Number	Engagement of partners to achieve shared objectives and broader coordination across overlapping areas
			Government agency	Number	Engagement of federal, state and local agencies and tribal entities to achieve shared objectives and broader coordination across overlapping areas (e.g., outreach with tribal governments for habitat restoration)
			Non-governmental organization	Number	Engagement of the NGO community to achieve shared objectives and broader coordination across overlapping areas (e.g., coordinate with an NGO on a fish and wildlife GIS analysis)
			Others	Number	Engagement of other partners to achieve shared objectives and broader coordination across overlapping areas (e.g., convene an advisory committee from academia to assist with management planning for a species)
		Recruitment and retention activities		Number	Participation in programs intended to recruit and retain anglers, boater, hunters or wildlife watchers
			For fishing and boating (SFR outreach and communications)	Number	Provision of information on fishing and boating opportunities to current and future anglers and boaters (e.g., creation and dissemination of maps of boat ramps, participation in angler recruitment and retention programs) Note: the cost of these activities counts toward the 15 percent SFR apportionment cap on ARE and outreach and communications
			For hunting and shooting	Number	Participation in programs intended to recruit and retain hunters and shooters. Note: Non-hunting related shooting activities are only eligible for Multi-State Grant Program or Section 10 enhanced hunter education funding
			For wildlife watching	Number	Participation in programs intended to recruit and retain wildlife watchers Note: this activity has limited eligibility for funding through WSFR grant programs

NOTE: The asterisk (*) denotes required activity level data

Wildlife TRACS Project Action Levels with Indicators 8/20/14

Project Level	Action Level 1	Action Level 2	Action Level 3	Level 2 and Level 3 Output Measures	Description/Examples/Notes
		WSFR program/ subprogram outreach		Number	Provision of educational information on WSFR grants and grant programs to a variety of audiences through a variety of means (e.g., participating in trade shows to share information WSFR funded work; building kiosks to display WSFR program information at supported areas and facilities)
			Displays, exhibits, kiosks	Number	Activities associated with producing displays, exhibits or kiosks
			Presentations, workshops, seminars, conferences	Number	How many presentations, workshops, seminars and conferences were conducted (not attended). Note: an outdoor writers conference, a speech to a hunting club, and media training for biologists count as a total of 3
			Outreach research	Number	Survey or research projects undertaken
			Brochures, Fliers	Number	The number of distinct brochures and flyers prepared, not the press run
			Public service announcements	Number	The number of original public service announcements prepared
			Stories, interviews, news releases	Number	The number of original stories produced, interviews given to the media and/or news releases prepared for the media
			Trade shows	Number	Participation in trade shows including setting up and maintaining booths
	Planning				
		Land use planning		Plans	Leading or participating in land use planning for rural, urban or agricultural lands (e.g., assist in developing county-wide zoning plans, participate in workgroup regarding low impact development siting)

NOTE: The asterisk (*) denotes required activity level data

Wildlife TRACS Project Action Levels with Indicators 8/20/14

Project Level	Action Level 1	Action Level 2	Action Level 3	Level 2 and Level 3 Output Measures	Description/Examples/Notes
		Organizational strategic and CMS planning		Plans	Development of agency strategic and operational plans and fish and wildlife comprehensive management systems Note: Does not include actions to implement plans
			Organizational strategic and operational planning	Plans	Development of agency strategic and operational plans Note: Does not include actions to implement plans
			CMS planning	Plans	Development of fish and wildlife comprehensive management systems Note: Does not include actions to implement comprehensive management systems
		Species and habitat management planning		Plans	Development of management plans for fish and wildlife species and habitats
			Species management planning	Plans	Development of management plans for fish and wildlife species (e.g., interjurisdictional fisheries management planning)
			Listed species recovery planning	Plans	Development of recovery plans for federal or state listed species
			Habitat management planning	Plans	Development of management plans for habitats and natural processes (e.g., management planning for longleaf pine habitat; Habitat Conservation Plan development)
			Habitat Conservation Plan (HCP) Development	Plans	
		State Wildlife Action planning		SWAPs	Conduct activities to develop and revise State Wildlife Action Plans (e.g., convene interagency work groups to revise portions of a SWAP, hold public hearings to help set priorities for SWAP conservation actions)
		WSFR program/ subprogram planning		Plans	Conduct planning activities for a specific WSFR program or subprogram (e.g., CVA planning, hunter education planning)

NOTE: The asterisk (*) denotes required activity level data

Wildlife TRACS Project Action Levels with Indicators 8/20/14

Project Level	Action Level 1	Action Level 2	Action Level 3	Level 2 and Level 3 Output Measures	Description/Examples/Notes
	Species Re-introduction and Stocking				
		Native species restoration		Animals	Re-introduction, rehabilitation and relocation of native animals or plants in their historic habitats
			Propagation and stocking	Animals	Re-introduction of propagated native animals or plants to their historic habitats (e.g., restore American shad to rivers within their historic range, head-starting rare turtles)
			Rehabilitation	Animals	Rehabilitation of injured fish and wildlife
			Translocation	Animals	Relocation of native species (including plants) to suitable habitats (e.g., translocate/breed in captivity black-footed ferrets to establish new populations in suitable habitat)
		Production and stocking for recreational purposes		Animals	Production and stocking of animals for recreational purposes
			Forage species	Animals	Production and stocking species that serve as forage for recreational species (e.g., rainbow smelt for salmonid species)
			Put-and-take	Animals	Production and stocking harvestable-size animals that are not expected to reproduce or grow significantly before they are harvested (e.g., catchable trout stocking for recreational purposes)
			Put-grow-and-take	Animals	Production and stocking sublegal-size animals for the purpose of maintaining populations with insufficient natural reproduction for sustainable harvest (e.g., walleye fry stocking for future sport fishing)
	Technical Assistance				
				Reviews	Review of agency and private sector policies, projects and plans (primarily related to development and adverse impacts to natural resources) to help ensure potential impacts to fish and wildlife are avoided, minimized and/or compensated/mitigated (e.g., review of municipal pier development, review of transmission corridor siting)

NOTE: The asterisk (*) denotes required activity level data

Wildlife TRACS Project Action Levels with Indicators 8/20/14

Project Level	Action Level 1	Action Level 2	Action Level 3	Level 2 and Level 3 Output Measures	Description/Examples/Notes
		Environmental review	Review of proposed projects	Reviews	Review of proposed development projects to help ensure that impacts to fish and wildlife are minimized and resource benefits are maximized
			Review of proposed policies and plans	Reviews	Review of non-conservation oriented policies and plans to help ensure that impacts to fish and wildlife are minimized and resource benefits are maximized (e.g., review of harbor dredging plan, review of state highway plans)
		Technical assistance		Assists	Provision of professional training and technical assistance to others on fish and wildlife assessment and management
			With individuals and groups involved in resource management decision making	Assists	Provision of professional training and technical assistance on fish and wildlife assessment and management to individuals and groups involved in resource management decision-making (e.g., provide agency-collected data to other governmental officials, train non-governmental organizations on new trapping methods, review of conservation-oriented policies and plans)
			With private landowners	Assists	Provision of technical assistance on fish and wildlife management practices to private landowners Note: Could Include development and delivery of economic incentives to private landowners to influence responsible stewardship of land/water and specific species

Appendix N: Glossary

Glossary

2006 Plan: The first State Wildlife Action Plan prepared by New Jersey.

2008 Revised Plan: The State Wildlife Action Plan for New Jersey with some revisions.

2017 Revised Plan: The first comprehensive revision of the 2006 Plan and 2008 Plan, designed to guide wildlife conservation in New Jersey from 2017 to 2027.

Action: Steps taken to advance conservation of a wildlife species, typically to address a threat.

Action Development Workshops: A series of three workshops conducted in 2015 in which wildlife and habitat experts met to identify the broad suite of actions necessary for wildlife conservation between 2017 and 2027.

Action driver: A term from the TRACS lexicon referring to research and outreach needed to advance wildlife conservation.

Adaptive Management: A process for continuously improving management policies and practices through learning from the outcomes of operational programs. Successful adaptive management requires that six steps be completed: (1) assess a problem by acknowledging that there is uncertainty about what policy or practice is best for a particular issue; (2) design a strategy through the careful selection of a policy or management practice to be employed; (3) implement a policy or practice that is likely to identify knowledge that is lacking; (4) monitor key response indicators; (5) analyze the outcomes in relation to the original objectives to determine the effectiveness of the applied policy or practice; and (6) adjust the policy or practice based on an analysis of the results and incorporate into future decisions.

Biodiversity: The variety of life on Earth and the interactions, cycles, and processes of nature that link it all together. In its broadest definition, biodiversity includes individual species, genetic diversity within species, natural communities in which these species interact, and the ecosystems and landscapes in which species evolve and coexist.

Best Management Practices (BMPs): A collection of management approaches implemented in the course of land management that minimize injury to rare wildlife, and maintain or enhance the value of habitat, for rare wildlife populations.

Biotics database: A comprehensive database with information on rare plants and animals in New Jersey and across their ranges.

Connecting Habitat Across NJ (CHANJ); A partnership of 40 government agencies and nonprofit organizations in New Jersey that collaboratively identifies key areas and actions needed to preserve and restore habitat connectivity for terrestrial wildlife in the state.

Conservation Focal Areas (CFAs): Key geographic areas for the conservation of wildlife in New Jersey.

Conservation partners: Government agencies, nonprofit organizations, academic institutions, and members of the public who are working with NJDEP to protect and restore New Jersey's imperiled wildlife.

Critical habitat: Habitat that is essential to the persistence and recovery of rare species populations.

Delphi Technique: A systematic method for reaching consensus among experts in which absolute, quantitative answers are either unknown or unattainable.

DFW: The Division of Fish and Wildlife in the New Jersey Department of Environmental Protection.

Ecological Systems: Recurring groups of biological communities that are found in similar physical environments and are influenced by similar dynamic ecological processes and are based on biogeographic region, landscape scale, dominant cover type, and disturbance regime.

ENSP: The Endangered and Nongame Species Program in the Division of Fish and Wildlife.

Extirpation: Loss of a species from a given area. In this plan, it is typically used in the context of a species disappearing from the state.

Focal SGCN: A subset of New Jersey's SGCN consisting of species that are the highest priority for conservation and for which conservation actions are both feasible and likely to succeed. Key criteria for identifying Focal SGCN included regional concern, and New Jersey's importance for the species' persistence, feasibility of known and tested conservation actions, and the likelihood of success to improve New Jersey's populations.

Habitat Conservation Plan: A plan for mitigating loss of wildlife habitat (particularly for endangered species), that usually includes significantly improving habitat condition in one location to compensate for reduction in habitat value in another.

Important Bird Area: A geographic location identified for its value to nesting and/or migrating birds and which meets criteria defined by National Audubon Society. Criteria include use by species of conservation concern, more than 1% of the state or flyway population of a species, and/or other criteria specific to the state, flyway, or hemisphere.

Indigenous wildlife: Wildlife that are native to a particular area or ecosystem, having originated in that area or whose occurrence is the result of natural processes.

International Union for the Conservation of Nature (IUCN) lexicon: Standardized language, primarily relating to threats and actions, that facilitates regional communication and coordination across state and national borders.

Invasive species: A species that is not native to New Jersey or eastern U.S. ecosystems, and whose introduction causes or is likely to cause economic or environmental harm.

IUCN primary threat category: Ten broad groups of threat types that are composed of finer scale threats.

Job: A segment of a project with specific task(s) to accomplish the larger project goal.

Landscape Project: A mapping effort led by ENSP that maps critical wildlife habitat using species sighting data applied to suitable habitat types. Adopted by the NJDEP in 1993 to define habitats, it is a powerful tool for conservation planning and measuring habitat change over time.

Landscape Regions: Broad areas of New Jersey characterized by similar landforms, soils, vegetation, and hydrological regimes that collectively support distinctive habitat and species mixes. New Jersey has five (Delaware Bay, Piedmont/Inner Coastal Plain,

Pinelands, Skylands, and Marine (which is exclusively aquatic) plus a sixth (Atlantic Coast) characterized by marine features.

Native Species: A species that originated in and occurs naturally in a particular region.

NJDEP: The New Jersey Department of Environmental Protection.

Northeast Lexicon system: A blend of the IUCN lexicon and TRACS lexicon that facilitates communication and collaboration on efforts to conserve species that cross state and boundaries.

Northeast Regional Conservation Synthesis: A methodology developed by Terwilliger Consulting to rank conservation need at a regional level by considering (1) the level of concern for the species across its range in the Northeastern U.S., and (2) a state's responsibility for the species' persistence range wide.

NETWHCS: Northeast Terrestrial Wildlife Habitat Classification System.

Northeast U.S.: The region encompassing these 13 states: Connecticut, Delaware, Maryland, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont, Virginia, West Virginia.

Overabundant species: A population of a species in which the number of individuals is at a point where ecological and/or economic damage is occurring.

Project: A collection of tasks or actions to accomplish goals and objectives. In the context of this Plan, a project refers to the collected actions to identify and address threats to wildlife species or their habitats to restore viable and sustainable populations of rare wildlife.

Recovery plan: A detailed set of conservation actions designed to address specific threats in order to preserve and restore an imperiled wildlife species in New Jersey.

Regional Conservation Opportunity Area (RCOA) Project: The project by the North Atlantic Landscape Conservation Cooperative to identify and map a connected network of resilient and ecologically intact habitats that will support biodiversity under changing conditions. The resulting mapping has been presented under the name "Nature's Network." More information is available via the Project website: <http://naturesnetwork.org/>.

Restoration: The process of re-establishing the functional aspects of an ecosystem to a semblance of its pre-disturbed state.

Results Chain: Diagrams that show the connections between threats, actions, and conservation outcomes. Results chains are not only useful for thinking through and selecting conservation actions, they are a powerful tool for identifying monitoring strategies.

Subsidized predators: Native wildlife species, such as raccoons, foxes, coyotes, skunks, gulls, and crows, that are able to subsist and thrive on resources provided inadvertently (or deliberately) by humans and human communities.

Species of Greatest Conservation Need (SGCN): Species in need of active support to ensure that they remain part of New Jersey's biological heritage. These at-risk birds, mammals,

reptiles, amphibians, fish, and invertebrates are acknowledged as SGCN due to their low and/or declining populations and/or vulnerability to threats.

Species Profiles Report: The presentation, in Appendix F, of information on each of New Jersey's 107 Focal SGCN, including brief life history facts, status and conservation concerns, important habitats, and range in the state.

State Wildlife Action Plan: A 10-year statewide plan for protecting a state's most imperiled wildlife that focuses on Species of Greatest Conservation Need (SGCN), their habitats, threats, and conservation actions to protect them. State Wildlife Action Plans approved by USFWS are required for states to receive State Wildlife Grants for the conservation of SGCN and their habitats.

State Wildlife Grants program: Annual funding from USFWS for conservation of SGCN in each state.

SWAP executive committee: A group composed primarily of conservation partners that helped DFW guide the development of the 2017 Revised Plan.

Threat: Things that place the long-term persistence of wildlife at risk. In the context of this report, the term threats also includes action drivers. Responding to and addressing threats is the driving consideration for conservation actions.

Tracking and Reporting on Actions for Conservation of Species (TRACS) lexicon: A standardized system managed by USFWS that helps standardize language to facilitate collaboration across state and national borders.

USFWS: The United States Fish and Wildlife Service.

Attachment I: Northeast Lexicon Report

THE NORTHEAST LEXICON: TERMINOLOGY CONVENTIONS AND DATA FRAMEWORK FOR STATE WILDLIFE ACTION PLANS IN THE NORTHEAST REGION

ABSTRACT

State Wildlife Action Plans have been required for federal funding of conservation actions through the Wildlife Conservation and Restoration Program and the State Wildlife Grants Program since 2005 but there is growing recognition of the value of this comprehensive and strategic approach beyond the funding context. In particular, the potential of these state plans to enhance interstate collaboration for habitat management and biodiversity conservation is evident. To facilitate this collaboration, the states in the northeastern U.S. developed a common lexicon for State Wildlife Action Plans which will make possible a regional database of Species of Greatest Conservation Need (SGCN), threats these species face, habitats they rely on, and conservation actions proposed to support their populations. A thorough review of existing systems and a survey of northeastern states were used to develop this set of common terminology. Here we describe a menu of criteria for screening species to be included on lists of SGCN and a set of basic information to document SGCN in a regional database. Regional habitat classification systems for terrestrial and aquatic systems were adopted for use in State Wildlife Action Plans. Northeast region states have adopted the international standard for classification of threats (IUCN) along with a qualitative assessment of urgency, severity, extent, and reversibility. The US Fish and Wildlife Service Wildlife TRACS classification system for conservation actions was adopted as a naming convention and elements of a detailed description to improve the clarity of conservation actions based on S.M.A.R.T. goals and results chain planning were also recommended. National guidance for assessing project results, along with an agreement to utilize standard protocols for species' population and habitat quality assessment whenever possible, constitute the guidance for Element 5, Monitoring. Elements 6-8, related to plan review and public participation rely on existing guidance, leaving states with considerable flexibility. This Northeast Lexicon will improve inter-state communication, facilitating regional planning processes and helping states compare species, habitats, threats, actions, and monitoring plans to find opportunities for collaboration.

This report was coordinated by Karen Terwilliger and prepared by Elizabeth Crisfield, for the Northeast Fish and Wildlife Diversity Technical Committee of the Northeast Association of Fish and Wildlife Agencies and may be cited as:

Crisfield, E and the Northeast Fish and Wildlife Diversity Technical Committee. 2013. The Northeast Lexicon: Terminology Conventions and Data Framework for State Wildlife Action Plans in the Northeast Region. A report submitted to the Northeast Fish and Wildlife Diversity Technical Committee. Terwilliger Consulting, Inc., Locustville, VA.

EXECUTIVE SUMMARY

The Northeast Lexicon provides a customized language and data framework for required elements of State Wildlife Action Plans. The Lexicon was proposed and developed by the Fish and Wildlife Diversity Technical Committee of the Northeast Association of Fish and Wildlife Agencies to facilitate inter-state planning in the Northeast Region. State Wildlife Action Plans have the potential to enable states to learn from each other and to allow the region to determine shared threats and priorities – but the diversity of the content and format of the 2005 plans prevented the region from realizing this vision. The Northeast Lexicon establishes a common language and data framework for State Wildlife Action Plans, without prescribing planning procedures or requirements thereby providing both flexibility and guidance to states for their 2015 plan revisions.

The process to develop this common language included extensive research on existing language and planning systems (Appendix A) and a survey of northeastern states tested receptivity and brought prior experience and knowledge to bear on the Lexicon development (Appendix B). The Association of Fish and Wildlife Agencies' *Best Practices for State Wildlife Action Plans* (hereafter "Best Practices Report") also strongly influenced the choices made in the Northeast Lexicon. A series of meetings, with State Wildlife Action Plan Coordinators and Wildlife Diversity Program managers working together to develop a viable Lexicon that balanced regional consistency and state flexibility, ended with the September 2013 meeting of the Fish and Wildlife Diversity Technical Committee where the Northeast Lexicon was finalized.

The Northeast Lexicon is organized around the congressionally required eight elements for State Wildlife Action Plans (page 6). Hierarchical naming systems are adopted for

- 1) species (existing scientific nomenclature),
- 2) landscape-scale habitat types,
- 3) threats to species or habitats, and
- 4) actions typically recommended to address these threats.

By using these consistent naming systems, common threats to priority species in specific habitats, along with actions proposed to address them, can be identified across the region.

In addition to these systematic naming systems, data structures provide consistent and complete description of species, habitats, threats, actions, and monitoring plans.

- 1) For species (Element 1), the Northeast Lexicon documents many of the most important status and trend assessments which demonstrate the conservation need of the species.
- 2) For habitats (Element 2), the Lexicon provides descriptions of extent and condition, both of which are required in State Wildlife Action Plans.

- 3) For threats (Element 3), the Northeast Lexicon responds to the Best Practices Report developed for the 2015 revision period by outlining six characteristics (immediacy, spatial extent, reversibility, certainty, severity, and likelihood) which are important for assessing threat risk.
- 4) Offering improvements to the 2005 plans and addressing the Best Practices Report guidance to develop clearer action items (Element 4), the Northeast Lexicon provides a comprehensive guide for describing actions. Using the minimal descriptions in the Lexicon produces a catalog of proposed actions, while adding the second tier of descriptions can assist in action prioritization. A third tier of descriptions is provided for actions that are ready for implementation.
- 5) A system for developing monitoring plans (Element 5) to assess project success, and basic elements explaining protocols to monitor species status and trend or habitat quality are also included in the Northeast Lexicon.
- 6) Highlights of guidance for plan review and revision (Element 6) and public/stakeholder/partner engagement (Elements 7 and 8) are provided for easy reference.

As states work through the 2015 State Wildlife Action Plan revision process, the Northeast Lexicon is being applied, tested, and revised. While it is anticipated that some modifications may emerge, State Wildlife Action Plan coordinators are confident that the scope and structure of the Lexicon provides a solid foundation but also believe in its adaptive capacity to continue to evolve with future knowledge and applications. This report recommends that the Northeast Association of Fish and Wildlife Agencies proceed toward the development a regional database of wildlife action plans, incorporating the data format and structure of the Lexicon and developing a pilot database application. This pilot will allow us to test and demonstrate the function of the Lexicon in a database context. The Fish and Wildlife Diversity Technical Committee anticipates this pilot database could be available for states by September 2014, a year before the State Wildlife Action Plan deadline.

The Northeast Association of Fish and Wildlife Agencies Fish and Wildlife Diversity Technical Committee should continue to work toward development of a regional web-accessible database to house individual state's Wildlife Action Plan content. The completed Lexicon forms the foundation of a regional database that will facilitate the sharing of information between states. Such a database will help states share information on priority species, known threats for these species and needed actions to address these threats – the required elements of State Wildlife Action Plans.*

A web-accessible regional State Wildlife Action Plan database incorporating the key elements of individual State Wildlife Action Plans would benefit the region by providing a systematic and

objective way to understand priority species, habitats, and threats in the region. It would help states coordinate actions and use similar monitoring protocols by facilitating the sharing of information. Finally, it would help non-governmental conservation partners support actions on behalf of wildlife in the northeast region. Because many of these opportunities for collaboration are dynamic and outside conventional funding streams, facilitating searches for specific conservation needs can help make these priority actions reality.

This collaborative effort in the northeast region has been highlighted in the Best Practices Report for State Wildlife Action Plans. It can serve other regions as a template for the development and the implementation of a Lexicon and regional database. It exemplifies 50 years of collaborative conservation planning in the northeast and visionary leadership of the Northeast Fish and Wildlife Diversity Technical Committee, Northeast Association of Fish and Wildlife Agencies and the Directors of the fourteen northeast Fish and Wildlife agencies.

**As of September 4, 2014, the NEFWDTC adopted a database developed for the Delaware State Wildlife Action Plan and based on this report as the template for the regional database. A proposal to the NEAFWA Directors was accepted to fund the adaptation of this state database to a regional database with the expectation that State Wildlife Action Plan data will populate the regional database beginning in the Fall of 2015 after revised plans are submitted, making regional SWAP data searchable on the web.*

This report, the result of Northeast State Wildlife Action Plans: Database Framework for Common Elements (RCN2011-08) was supported by State Wildlife Grant funding awarded through the Northeast Regional Conservation Needs (RCN) Program. The RCN Program joins thirteen northeast states, the District of Columbia, and the U.S. Fish and Wildlife Service in a partnership to address landscape-scale, regional wildlife conservation issues. Progress on these regional issues is achieved through combining resources, leveraging funds, and prioritizing conservation actions identified in the State Wildlife Action Plans. See RCNGrants.org for more information.

SECTION I: INTRODUCTION

In the northeastern U.S., states are numerous and borders often ignore landscape features which delineate habitat types. Here, states have a history of employing collaborative approaches for the protection and management of fish and wildlife. This collaboration has been enhanced through a partnership of the member states of the Northeast Association of Fish & Wildlife Agencies (NEAFWA), in particular its Northeast Fish and Wildlife Diversity Technical Committee, and the U.S. Fish & Wildlife Service's (USFWS) North Atlantic and Appalachian Landscape Conservation Cooperatives (LCCs).

The development of State Wildlife Action Plans in 2005 provided a new opportunity to coordinate conservation actions. While all Wildlife Action Plans had to meet or exceed the eight Congressionally required elements (see inset text box) (Fiscal Year 2001 Commerce, Justice, State, and Related Agencies Appropriations Act 2000) to be accepted by the USFWS, differing approaches taken by states in developing their Action Plans have made it difficult to compile and compare information regionally and nationally (Lerner et al. 2006). Among the Wildlife Action Plans under the jurisdiction of the NEAFWA states, there exists broad commonality in focus and approach as well as substantial differences because states used different organizational structures for their plans, different criteria for defining Species of Greatest Conservation Need (SGCN), different habitat classification systems, and different ways to describe threats and actions. Most are lengthy documents that are difficult to search, making it excessively difficult and time consuming, if not impossible, to compare similar conservation needs across the region or sub-regions.

To address these challenges, in 2012 the Northeast Fish and Wildlife Diversity Technical Committee received matching funds from NEAFWA Directors to develop a framework that would allow states, LCC's, and other partners to compare Wildlife Action Plans across state lines. At the same time, the Association of Fish and Wildlife Agencies prepared guidance entitled *Best Practices for State Wildlife Action Plans* to help states learn from each other and provide resources to improve the effectiveness of these comprehensive plans (Association of Fish and Wildlife Agencies, Teaming With Wildlife Committee, State Wildlife Action Plan (SWAP) Best Practices Working Group 2012) (hereafter "Best Practices Report"). For states that share Species of Greatest Conservation Need and habitat types, these best practices encourage the use of common classification systems. In fact, the Best Practices Report highlighted the proposal for the Northeast Lexicon as Case Study 3c (p. 21), effectively endorsing this as a viable solution to the nationally recognized problem of regional collaboration and integration.

Required Elements for State Wildlife Action Plans

Element 1: "... information on the distribution and abundance of species of wildlife, including low population and declining species as the state fish and wildlife department deems appropriate, that are indicative of the diversity and health of wildlife of the state;"

Element 2. "identifies the extent and condition of wildlife habitats and community types essential to conservation of species identified under *Element 1*;"

Element 3. "identifies the problems which may adversely affect the species identified under *Element 1* or their habitats, and provides for priority research and surveys to identify factors which may assist in restoration and more effective conservation of such species and their habitats;"

Element 4. "determines those actions which should be taken to conserve the species identified under *Element 1* and their habitats and establishes priorities for implementing such conservation actions;"

Element 5. "provides for periodic monitoring of species identified under *Element 1* and their habitats and the effectiveness of the conservation actions determined under *Element 4*, and for adapting conservation actions as appropriate to respond to new information or changing conditions;"

Element 6. "provides for the review the State wildlife conservation strategy and, if appropriate revision at intervals not to exceed ten years;"

Element 7. "provides for coordination to the extent feasible the State fish and wildlife department, during development, implementation, review, and revision of the wildlife conservation strategy, with Federal, State, and local agencies and Indian tribes that manage significant areas of land or water within the state, or administer programs that significantly affect the conservation of species identified under *Element 1* or their habitats."

Element 8. "A State shall provide an opportunity for public participation in the development of the comprehensive plan required under *Element 1*."

(Fiscal Year 2001 Commerce, Justice, State, and Related Agencies Appropriations Act. Public Law 106-553, codified at U.S. Code 16 (2000) 669(c))

The need for consistent systems for conservation planning has long been recognized and important progress has been made. The U.S. Fish and Wildlife Service is implementing a national conservation action reporting system with uniform metadata for all Wildlife and Sport Fish Restoration Program funded projects called Wildlife TRACS (Tracking and Reporting Actions for the Conservation of Species). Independently, the International Union for Conservation of Nature has adopted a system to classify threats, and actions taken to address these threats.

The northeastern states (Connecticut, Delaware, the District of Columbia, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont, Virginia, and West Virginia) worked together to develop the Northeast Lexicon (this report) – terminology, definitions, and classifications systems for use in State Wildlife Action Plans. Terminology has been developed for each of the eight congressionally required elements in State Wildlife Action Plans. The proposed Wildlife Action Plan terminology can: 1) facilitate the development of multi-state, regional proposals, 2) clarify how each state's proposals guide, align with, or contribute to regional priorities, 3) translate the regional context for state planning purposes, and 4) make it more likely that other partners will implement recommended actions.

Thus, the Northeast Lexicon is consistent with recommendations of the Best Practices Report, meets regional planning goals, and functions holistically, recognizing inter-dependencies between elements. The Northeast Lexicon is designed to be selectively implemented by states to meet their diverse needs – balancing state flexibility and regional consistency. It is viewed as a menu of choices, all of which could be supported by a regional database to facilitate data sharing between states. The practicality of application of the Lexicon in Wildlife Action Plan revision and the feasibility of using the information included in the Lexicon for the prioritization or ranking of threats and actions was also considered.

Planning processes used to develop Wildlife Action Plans are not incorporated in the Northeast Lexicon. For example, the Best Practices Report emphasizes the importance of prioritization in conservation planning because it is a strategic approach which is important in light of limited resources and capacity. Methods for prioritization are a very active area of research and states are currently exploring approaches. Therefore, terminology and methods for prioritization are not provided within the Northeast Lexicon, although attempts were made to ensure that the lexicon outlines the kind of information needed for prioritization.

METHODS

Several key meetings of the Northeast Fish and Wildlife Diversity Technical Committee facilitated discussion regarding the scope, purpose, and format of the Northeast Lexicon. The process of developing the Northeast Lexicon began with an exhaustive review of existing approaches for conservation planning and associated terminology and definitions from states in the northeast region. Other State Wildlife Action Plans were reviewed, along with the USFWS Wildlife TRACS and the International Union for Conservation of Nature's systems for describing threats and actions (developed by Foundations of Success). This comprehensive literature search was conducted to identify other common, consistent terminology which could inform this lexicon development. This literature review included assessments of Elements 1-5,

including species and habitat status, prioritization, vulnerability, threat assessment, and action definition and prioritization and were summarized in a comprehensive report (Appendix A).

Surveys of the NE jurisdictions were developed to gauge regional receptivity to a more consistent terminology and a regional database. The March 2013 survey directed toward Lexicon terminology also intended to identify what states were planning to use in their 2015 revision. Fifteen survey responses, representing ten states provided a basis to understand areas of potential agreement and disagreement. The June 2012 survey directed toward database development has 14 responses and showed broad interest in a regional database for State Wildlife Action Plans, with 54% indicating they were “definitely interested” and the balance indicating they were “probably interested”. Results of both surveys are summarized below.

These surveys were followed by a series of four meetings and face-to-face deliberations to identify a balance between state flexibility and regional consistency that the group was comfortable implementing in their Wildlife Action Plan revisions. Finally, a draft of the agreed upon Lexicon was reviewed by states and adopted on September 24, 2013.

SURVEY RESULTS

The state survey of Lexicon Terminology (Appendix B) revealed areas of strong agreement, disagreement, and, in some cases, concepts that were poorly understood or had uncertain outcomes in State Wildlife Action Plans. These results are summarized here.

Question 3: There was strong agreement on the use of State (100%) and Federal (93%) Listing status and State Heritage rank (85%) as criteria for including species on lists of Species of Greatest Conservation Need.

Question 4: The majority (83%) of respondents agreed that attempts should be made to qualitatively assess population trends for all SGCN while recognizing that abundance data are lacking for many species.

Question 5: While the most appropriate spatial unit for conservation may be habitat type, 85% of respondents identified State, County, or Town Boundary as the most practical unit for use in Wildlife Action Plans, although 77% of respondents also identified Watersheds and 70% identified Habitat Patches.

Question 6: 77% or more identified the following characteristics as important in describing data sources for species distributions: the data source, scale, resolution, age, quality, type, and sensitivity.

Question 7: Regarding the types of data that could be used to document species distributions, 92% agreed element occurrence was appropriate, and 62-80% agreed that source feature,

presence/absence points, habitat classes, and habitat patches were also acceptable. 31% or less supported the use of habitat suitability models, niche models, habitat compatibility models, and buffers.

Questions 8 and 9: Previous work to develop the Northeast Terrestrial and Aquatic Habitat Classification Systems was accepted by 69% of respondents with none dissenting (Q8), however the further work to develop GIS systems and spatial habitat condition classifications is not broadly understood (Q9).

Question 10: Using Northeast Partners in Amphibian and Reptile Conservation and the Northeast Fish and Wildlife Diversity Technical Committee as examples of approaches for selecting Species of Greatest Conservation Need based on conservation need and responsibility, 69% of respondents were willing to work toward a common practice for selecting species of greatest conservation need.

Questions 11, 12, 13, and 14: More than 92% of responses agreed that immediacy, certainty, extent, and reversibility are characteristics of threats that should be considered when determining “conservation need” in combination (Q11) and 85% agreed this makes sense when considering single threats affecting single species (Q13). Each of these threat characteristics can be considered in terms of the immediacy and certainty of the impact. There was no agreement on whether or not a useful approach using just 2 or 3 simple categories could be developed (Q12). Scale and extent were supported by 85% of the respondents, while immediacy and reversibility were considered key elements in describing threats by more than 92% of respondents (Q14).

Questions 15 and 16: Most responses (85%) indicated support for movement toward actions with measureable goals, and the ability to measure plan effectiveness as a whole (Q15). The terms Goal; Objective, Desired Outcome, and Indicator were seen as useful words in linking resources with actions and outcomes (>92%) but other aspects of the linkage were poorly understood by respondents (Q 16).

Question 17: Regarding adaptive management, there was agreement that the following terms are useful: Performance Indicator (85%), Start (69%), Duration (77%), and Evaluation Cycle (87%). Fewer responses (55%) supported data management capacity.

Question 18: The link between actions and threats is not always easy to explain. Roughly 83% of responses indicated “threat addressed by action”, “human factors addressed by action”, “environmental factors addressed by action”, “biological stresses addressed by action”, and “expected direct benefits” were all useful in describing the nature of the action-threat link.

Questions 19 and 20: Improving planning processes by employing systematic descriptions of actions, such as S.M.A.R.T. goals-setting, received strong support with 85% agreeing that the lexicon should propose terminology in support of this kind of planning process. The same level of agreement was reached on the idea of assessing the feasibility and efficacy of conservation actions.

Questions 21 and 22: Many respondents (77%) were willing to work toward a regional scheme to prioritize conservation (Q21) and effectiveness and cost were considered important factors. Funding availability, implementer availability, and start date were listed as potential considerations but opinions on their use in action prioritization were mixed (Q22).

Question 23: In Wildlife Action Plans, actions should be spatially explicit. More than 92% responses indicated that geo-political boundaries (like counties or towns) would be very important in defining action locations, but 62% indicated that watersheds and management planning boundaries would also be useful. Habitat classes and patches were supported as a geospatial descriptor by only 50% of respondents.

Questions 24, 25, and 28: The importance of identifying data gaps and uncertainties was well recognized (92%) (Q24) and 75% or more agreed that “uncertainty of causality”, “uncertainty of effectiveness”, “uncertainty of status” and “information gap” were all relevant in descriptions of uncertainty in State Wildlife Action Plans (Q25). 75% thought it would be useful to categorize the “level” of uncertainty, but fewer understood how they would categorize the “risk of consequence” or the “feasibility of reducing [uncertainty or risk]”.

Question 26: Of the 82% of respondents that agreed that numerous categories might be used to organize research and monitoring actions proposed in Wildlife Action Plans, 70% or more supported the following categories: threat detection, change in threat status, presence/absence surveys for SGCN distribution, relative abundance/density, reproduction/demography, detect habitat change, survey habitat quality, genetics, detect contaminants/pollution/air and water quality.

Question 27: At the time of the survey, the majority of respondents could not assess the usefulness of the Wildlife TRACS system in the Northeast Lexicon (75%).

Questions 29 and 30: Common keyword, metadata, and bibliographic standards were acceptable to 92% of respondents.

The results of the survey related to a regional database to support inter-state collaboration indicate relatively strong agreement on the benefits and are summarized here.

Question 1: With 7 respondents “definitely interested” and 6 “probably interested”, there was strong interest in the development of a web-enabled database tool for State Wildlife Action Plans.

Question 2: Respondents identified the ability to search for recommended actions by species or location, and the ability to group species by habitat as the most important services of the database, but also saw the ability to search for actions by habitats or threats as important. The ability to group species or habitat by threat, or perform more complex correlative searches, was identified as a secondary capability.

Question 3: Respondents identified a number of other potential services the database could provide including identifying actions intended to mitigate climate change impacts, serving to assist in scaling the regional data up and down across jurisdictions, and offering user-friendly report formats.

Question 4: Indicating the likelihood that each state would use the regional database for their Wildlife Action Plan revision process, 78% reported they would be “Very likely” or “Somewhat likely” to use the database with the remainder reporting they were “Not sure”.

Question 5: At the time of the survey, most respondents indicated the database would be most useful if available sometime in 2013, with the majority identifying a summer month.

SECTION II: THE NORTHEAST LEXICON – USER GUIDE

The Lexicon is organized according to the required Elements. Each Element is organized by the anticipated sequence of the workflow or by degree of complexity. In either case, it is anticipated that the first components of an element are most likely to be implemented by all states (for example, see Element 4, below).

While the 8 elements are identified as unique requirements, there is considerable interaction between them. The identification of Species of Greatest Conservation Need (Element 1) considers direct threats to the population (Element 3) or threats to the habitats (Element 2) on which the species depends. Actions (Element 4) and Monitoring activities (Element 5) are responses to these identified threats to species and/or habitats. Because of these inter-dependencies and the availability of data required to assess each Element, there are many practical approaches to applying the Lexicon within a State Wildlife Action Plan.

In Elements 3 and 4 (Threats and Actions) some states may find the need for additional classifications to name the relevant threats and proposed actions. In the interest of regional consistency, states should share these new classifications so other states can also use them.

The detailed outline on the next page provides a quick reference for Elements and their components.

States are encouraged to use the bibliographic standard of the Journal of Conservation Biology (<http://joomla.wildlife.org/documents/JWMguidelines2011.pdf>). To help readers find unpublished sources, website links (URL) to reports should be provided at the end of the reference. Free bibliographic managers are available including Zotero (<http://www.zotero.org/>), Mendeley (<http://www.mendeley.com/>) and the Council of Science Editors' Citation Wizard (http://21cif.com/tools/citation/cse/citeWizard_cse_1.0.html).

To improve the consistency of citing Wildlife Action Plans, an example citation should be provided in the front matter. For example:

Pennsylvania Game Commission and Pennsylvania Fish and Boat Commission. 2015. Pennsylvania Wildlife Action Plan. Harrisburg, PA. (link to report)

If prepared by a consultant:

Rhode Island Department of Environmental Management. 2015. Rhode Island Wildlife Action Plan. Prepared by Terwilliger Consulting, Inc. and the RI Chapter of the Nature Conservancy. Providence, RI. (link to report)

Element 1 (Species) Northeast Lexicon provides

- a menu of established conservation assessments used by states when selecting their Species of Greatest Conservation Need (page 19)
 - Federal Legal Listing (<http://www.fws.gov/endangered/>)
 - Regional SGCN
 - State Legal Listing
 - State Natural Heritage Program and NatureServe Rankings
 - Regional or Species Group Conservation Prioritization
 - IUCN Red List (<http://www.iucnredlist.org/>)
- a list of foundational criteria used to explain the addition or exclusion of species from the Species of Greatest Conservation Need list (page 19)
 - Species Abundance and Trend
 - Threat
 - State Responsibility
 - Habitat Trend
 - Information Deficient
- a set of species characteristics (e.g. scientific name, habitat type) needed for regional database integration (pages 20-21)
 - Scientific Name
 - Common Name
 - Detailed Scientific Name
 - Associated Habitat Type
 - Associated Habitat Features
 - Habitat Preferences
 - Federal Listing
 - State Listing
 - G-rank (<http://www.natureserve.org/explorer/servlet/NatureServe?init=Species>)
 - S-rank
 - Distribution within the state
 - Threats impacting the species
 - Population Trend
 - Data Confidence
 - Data Age
 - Data Completion
 - Climate Vulnerability Assessment Tool
 - Climate Vulnerability Score

Element 2 (Habitats) Northeast Lexicon provides

- a recommendation to use the Northeastern Terrestrial Wildlife Habitat Classification System (with consistency at the Macrogroup Level) and the Northeast Aquatic Habitat Classification System to classify and name habitat types (pages 24-26) *A ninth formation class was added to the Terrestrial System for Subterranean Habitats.*
- a new marine habitat classification system developed for Maine's SWAP and many states will work consistently
- terminology to consistently describe habitat characteristics (page 27)
 - Habitat extent
 - Habitat condition
 - Threats to Habitat

Element 3 (Threats) Northeast Lexicon provides

- a recommendation to use the IUCN hierarchical threat classification system (Salafsky et al. 2008) and a table that displays the top tier of the system (page 29) along with a crosswalk to Wildlife TRACS threats
- a set of threat characteristics to assess risk or impact (page 30)
 - Severity
 - Reversibility
 - Immediacy
 - Spatial extent
 - Certainty
 - Likelihood

Element 4 (Actions) Northeast Lexicon provides

- a recommendation to use the Wildlife TRACS hierarchical action classification system and a table displaying the system along with a crosswalk to IUCN actions
- a set of action characteristics to provide a complete description of the proposed action, including monitoring and adaptive management plans (page 34-36)
 - Name (For all actions)
 - Title (For all actions)
 - Objective (For all actions)
 - General Strategy (For all actions)
 - Purpose (For all actions and for prioritization of actions)
 - Benefits (For prioritization of actions)
 - Estimated Costs (For prioritization of actions)
 - Performance Metric (For implementation of actions)

- Urgency (For prioritization of actions)
- Duration (For prioritization of actions)
- Longevity of results (For prioritization of actions)
- Likelihood of Implementation (For prioritization of actions)
- Likelihood of Success (For prioritization of actions)
- Constraints/Other factors (For prioritization of actions)
- Implementing Organizations (For implementation of actions)
- Key Stakeholders (For implementation of actions)
- Location (For implementation of actions)
- Detailed Strategy (For implementation of actions)

Element 5 (Monitoring) Northeast Lexicon provides

- a recommendation to use the Association of Fish and Wildlife Agencies recommendations from “Measuring the Effectiveness of State Wildlife Grants” to assess action results (page 41) (http://www.fishwildlife.org/files/Effectiveness-Measures-Report_2011.pdf)
- a recommendation to use standard protocols or well-described protocols for species monitoring (page 41)
- a recommendation to use standard protocols or well-described protocols for habitat quality monitoring (page 42)

Element 6 (Plan Review) Northeast Lexicon provides

- a summary table of guidance provided by the national Best Practices Report explaining the differing requirements for Comprehensive Review, Major Revision, and Minor Revision related to the following (page 44)
 - Date of review
 - Summary of changes
 - Explanation of no change
 - Web access to the plan
 - Public review
 - Documentation of public review
 - Taxa experts

Elements 7 and 8 (Public Engagement) Northeast Lexicon provides

- Definitions for *public*, *stakeholders*, and *partners* (page 46)
- An explanation of the differences in communication strategies for each group (page 46)

SECTION III: THE NORTHEAST LEXICON

CHAPTER 1: ELEMENT 1, SPECIES OF GREATEST CONSERVATION NEED

Identifying “Species of Greatest Conservation Need” (SGCN) implies the use of a method to select species based on fundamental considerations such as population status and trend or known threats. After identifying potential screening criteria based on the experiences of the NEAFWA states, drawing on Wildlife Action Plans around the U.S., and reviewing approaches used by other conservation organizations, the Northeast Lexicon represents common sources and considerations for selection of SGCN. These criteria are practical and functional and aim to encompass the range of criteria used by northeastern states when determining Species of Greatest Conservation Need.

The choice of criteria and methods for their application will be made by each state. In the interest of transparency and consistency with the Best Practices Report, Wildlife Action Plans should specify the criteria selected and the methods used so that differences between state lists can be understood and explained. If thresholds specific to an established assessment source are selected (e.g., the range of S-ranks and use of uncertain S-ranks for selecting a subset of species from Natural Heritage Program data, or the categories of vulnerability assigned to species on the IUCN Red List) these choices should also be noted in the explanation of methods.

Most states will use established species assessments (Table 1) as a starting point for selecting SGCN because these established species lists provide a ranking of species concern based on some of the fundamental considerations used to select SGCN (Table 2). Species found on the established assessment lists (Table 1) could all be considered for inclusion as state SGCN, but after reviewing the fundamental considerations (Table 2) some species may not be listed as state SGCN. Conversely, some species not found on the established assessment lists (Table 1) may be listed as state SGCN after reviewing the fundamental considerations (Table 2). If states choose not to list Regional SGCN as state SGCN, even though they occur in the state, the Wildlife Action Plan should include a description of the species’ current status in the state and any conservation or monitoring activities occurring in the state. Also, some states have elected to include indicator, keystone or representative species as SGCN even if the species is not vulnerable.

Once species are identified as SGCN, information to identify and describe the species, their habitats, their threats, and the quality of available data should be included in Wildlife Action Plans (Table 3). Choices related to taxonomic conventions should be documented. The Association of Fish and Wildlife Agencies recommends the following taxonomic conventions for use in Wildlife Action Plans.

Reptiles and Amphibians: The Society for the Study of Amphibians and Reptiles (SSAR) is the official taxonomy for North American amphibians and reptiles north of Mexico. http://www.ssarherps.org/pages/comm_names/Index.php

Birds: The American Ornithologists' Union *Check-list of North American Birds* is the official source on the taxonomy of birds found in North and Middle America, including adjacent islands. <http://www.aou.org/checklist/north/>

Mammals: Wilson and Reeder's (2005) *Mammal Species of the World: a taxonomic and geographic reference*. Available as an online database at <http://www.vertebrates.si.edu/msw/mswcfapp/msw/index.cfm>

Fishes: Page, L.M., H. Espinosa-Perez, L.T. Findley, C.R. Gilbert, R.N. Lea, N.E. Mandrak, R.L. Mayden, and J.S. Nelson. 2013. Common and scientific names of fishes from the United States, Canada, and Mexico, 7th edition. American Fisheries Society, Special Publication 34, Bethesda, Maryland. <http://fisheries.org/shop/51034c> (for purchase)

Invertebrates: use NatureServe Explorer. <http://www.natureserve.org/explorer/>

Plants: USDA Natural Resources Conservation Service PLANTS Database. <http://plants.usda.gov/java/>

Table 1. The Northeast Lexicon recommends considering the species in these established assessments for inclusion as state SGCN:

Federal Legal Listing	species that are federally-listed as threatened or endangered <i>if</i> the species occurs within the state; some states may also consider candidate or petitioned species after positive 90-day finding
Regional SGCN	species that are listed as NEAFWA Regional SGCN (2013) <i>if</i> the species occurs within the state
State Legal Listing	species that are state-listed with a legal designation that indicates need for conservation (e.g., threatened, endangered)
State Natural Heritage Program and NatureServe Rankings	species with global ranks (G1-G3) and state ranks (S1-S3); some states may also consider historical, extirpated or possibly extirpated species (GX, GH, SX, SH) or species with uncertain ranks
Regional or Species Group Conservation Prioritization	conservation prioritizations are available for some species groups through prominent organizations and planning systems (e.g. Partners in Flight, National Marine Fisheries Service, and Partnership for Amphibian and Reptile Conservation)
IUCN Red List	species that are Critically Endangered (CR), Endangered (EN), Vulnerable (VU) or Near Threatened (NT)

Table 2. The Northeast Lexicon recognizes these fundamental considerations for assessing species conservation need:

Species Abundance and Trend	Population status and trends for a species, including extirpation status
Threat	The number, immediacy, extent, and/or reversibility of known threats to species populations
State Responsibility	The relative importance of the state to conservation of the species, compared to other states or countries in the species' range.
Habitat Trend	Changes in the extent or condition of habitat which may be closely related to threats (e.g. climate change, land use change associated with development, or insect pests which can change the composition of a forest)
Information Deficient	Species that lack sufficient documentation to appear in sources listed in Table 1, or to be justified based on abundance, trend, threat, or habitat concerns may be considered SGCN with an interest in research to better understand conservation needs

Table 3: Information about each species that could be included in State Wildlife Action Plans and the regional database.

Data Name	Data Description	Data Format and example
Scientific Name	Naming conventions should follow taxonomic standards recommended by the Best Practices Report (p. 10).	Genus and species i.e. <i>Glaucomys sabrinus</i>
Common Name	Naming should follow standards when available (e.g., American Ornithologists' Union checklist for birds).	i.e. Northern Flying Squirrel
Detailed Scientific Name	If used as a conservation target, subspecies or population segment may be provided.	i.e. <i>Glaucomys sabrinus macrotis</i>
Associated Habitat Type	Species should be linked to habitat types using the Northeast Terrestrial Wildlife Habitat Classification System or the Northeast Aquatic Habitat Classification System (see Element 2). Multiple habitats may be selected considering core, supporting, breeding, migratory, wintering or other special habitat use.	NETWHCS or NEAHCS (dropdown menus) (see Element 2)
Associated Habitat Features	If the species is associated with particular sites within the habitat classification systems, these site conditions should be identified. (e.g. Boulder fields, springs, seeps, vernal pools, rocky outcrops, caves, manmade structures, cliffs, talus slopes, flat rocks in stream beds)	i.e. Old-growth
Habitat Preferences	This is a narrative field to explain, in more detail, the habitat requirements or preferences of the species.	i.e. Northern flying squirrels prefer old-growth boreal forests that contain a heavy coniferous component, moist soils, and lots of downed woody debris.
Federal Listing	This documents the federal listing of species.	Endangered, Threatened, Candidate, Petitioned with 30-day finding, no status i.e. no status
State Listing	This documents the state listing of species.	State listing classes i.e. Endangered

G-rank	Global ranks can be downloaded from NatureServe for all species in a state.	G1, G2, G3, G4, G5, G1G2, G2G3, G3G4, G1G3, G2G4, G3G5, GU, GX, GH, GNR, GNA
S-rank	The most up-to-date state ranks should be sourced from State Natural Heritage Programs or other in-state source.	S1, S2, S3, S4, S5, S1S2, S2S3, S3S4, S4S5, S1S3, S2S4, S3S5, SU, SX, SH, SNR, SNA
Distribution within the state	Species distributions may be defined in terms of mapped units such as watersheds, habitat classification systems, geopolitical boundaries, models or other useful spatial units.	i.e. Sites are located in the following counties: Wayne, Pike, Monroe, Carbon, Luzerne, Warren and Potter
Threats impacting the species	Threats should be listed and anticipated interactions between these threats should also be noted.	IUCN Threats, as amended i.e. 5.3.4 Biological Resource Use/ Logging and Wood Harvesting / unintentional effects large scale
Population Trend	Quantitative assessments or qualitative assessments such as increasing, decreasing, stable, or unknown (used by the IUCN RedList) may be suitable.	
Data Confidence	Quality of available data, considering completeness, age, and other factors, should be assessed. Excellent – very useful for management decisions, recent, complete, accurate. Poor – data are unreliable for management decisions because it is historical, sparse, and/or has questionable accuracy and cannot be verified.	Excellent, Good, Fair, Poor, Data Deficient
Data Age	This field could recognize data as historical vs current, or it could provide a date range	
Data Completion	consistency of data over time or space.	
Climate Vulnerability Assessment Tool	This field could describe the methods of an original climate vulnerability assessment or simply refer to an existing tool	Name of Tool
Climate Vulnerability Score	This field contains the results of the assessment.	Numeric score or code

Climate Vulnerability Factors	This field contains notes about the factors that most contributed to the species' vulnerability	Name of factor
-------------------------------------	--	----------------

BACKGROUND AND RATIONALE

State Wildlife Action Plans are required to identify “species in greatest need of conservation”. These species should include low, declining, and otherwise vulnerable populations that are indicative of the diversity and health of the state’s wildlife. For each of these species, the distribution and abundance should be reported.

This Northeast Lexicon will help northeastern states communicate which factors were used and how they were used to select the state’s Species of Greatest Conservation Need. Differences between state lists will be more easily understood, and a regional database will more readily document methodological differences between states if criteria have standard descriptions. This transparency was highly recommended in the national Best Practices Report for Wildlife Action Plans.

The species screening criteria selected for the Northeast Lexicon are very commonly applied in Wildlife Action Plans nationwide (see Appendix A). Specifically:

- **Threatened and Endangered species status** (federal and state) implies that sufficient documentation of species vulnerability has already been provided and warrants inclusion on the state’s SGCN list, provided the species relies on habitat within the state. Likewise, species included on the **Regional SGCN** list have already been screened and vetted within the northeast region. Survey results showed nearly unanimous agreement with using federal and state listing as a criteria for state SGCN.
- **State Natural Heritage Programs** provide state-specific data, including abundance and trend, to assess species population stability. The Best Practices Report recommends the NatureServe conservation status assessment methodology (described below), used by State Heritage Programs, as a standardized method for assessing extinction/extirpation risk. Additional assessments of abundance and trend information (required in Element 1) and species-specific assessment tools may also be included in the screening criteria for SGCN through established **independent assessment programs**, such as Partners in Flight.
- **Global rankings** can highlight species vulnerability and/or importance from the broadest possible perspective.
- While **abundance and trend** data may be lacking for some species, this information is typically the foundation for identifying vulnerable species and is required by Element 1.
- **Threat severity** is a factor in predicting vulnerability especially when species do not yet exhibit impacts (e.g. climate change effects) and the Best Practices Report recommends

that immediacy and magnitude of threats be considered in the process of assessing species' conservation needs.

- The Best Practices Report encourages the consideration of the **importance of state habitat** in determining SGCN (pg. 6) and this consideration has been calculated (albeit in different ways) in the northeast region for some time.
- **Trends in habitat extent or condition** can be important indicators of population trends. This information also helps determine which conservation objectives and strategies will benefit multiple species.
- Species that lack information to determine the appropriate level of conservation concern may be included as SGCN so that population surveys and research to understand habitat requirements can lead to a more informed decision about conservation needs. However, research projects for species that are not SGCN may be proposed to determine the degree of conservation concern.

NatureServe's Conservation Status Assessment (Master et al. 2012) is highly recommended in the Best Practices Report. The fundamental considerations provided in the Northeast Lexicon encompass the scope of factors used in the NatureServe Conservation Status Assessment (Table 4).

Table 4. Factors used in the NatureServe Conservation Status Assessment.

Factor Category	Factor	Condition (Rule)
Rarity	Range Extent	Always use, if available
	Area of Occupancy	Always use, if available
	Population	Always use, if available (species only)
	Number of Occurrences	Always use, if available
	Number of Occurrences or Percent Area with Good Viability/Ecological Integrity	Always use, if available
	Environmental Specificity	Only use if both the Number of Occurrences and Area of Occupancy are Unknown or Null
Trends	Long-term Trend	Always use, if available
	Short-term Trend	Always use, if available
Threats	Threats	Always use, if available
	Intrinsic Vulnerability	Only use if Threats is Unknown or Null

CHAPTER 2: ELEMENT 2, HABITATS

The word “habitat” can be interpreted in many ways, even within the Wildlife Action Plan. Commonly, “habitat” either describes the specific needs of a particular species/guild or is a classification of vegetation or other structure underlying habitat type. While it is clearly linked to the Species of Greatest Conservation Need in plan requirements, Wildlife Action Plans are comprehensive planning documents that guide conservation actions statewide, and thus benefit from taking a landscape-scale perspective that can produce multi-species plans. Furthermore, for the vast majority of species, insufficient data on habitat use and requirements prevents detailed species-specific habitat descriptions. To resolve these disparate interpretations of “habitat”, the Northeast Lexicon Element 2 primarily views habitat classification from the landscape scale while providing for species-specific habitat description in Element 1.

Habitat Type. The Northeastern Terrestrial Wildlife Habitat Classification System (hereafter Terrestrial Habitat Classification) (Figure 1) was developed in 2008 to provide a coarse but cohesive system to describe the physical and biological characteristics relevant to wildlife conservation (Gawler 2008). The habitat classification consists of two levels – a habitat system (Table 5) and a structural modifier (Table 6). The habitat system corresponds to the ecological system units developed by NatureServe which occur in the Northeast, with additional systems for altered habitats and land-use types. The hierarchical system includes 7 Formation Classes at the top level, 15 Formations in the second tier, 35 Macrogroups in the third tier and 143 habitat types comprise the bottom level (fourth tier) of a hierarchical system (Table 5). Structural modifiers can be added to describe cover (herbaceous, shrub, open water), age classes, disturbance history, or geologic features like karst (Table 6).

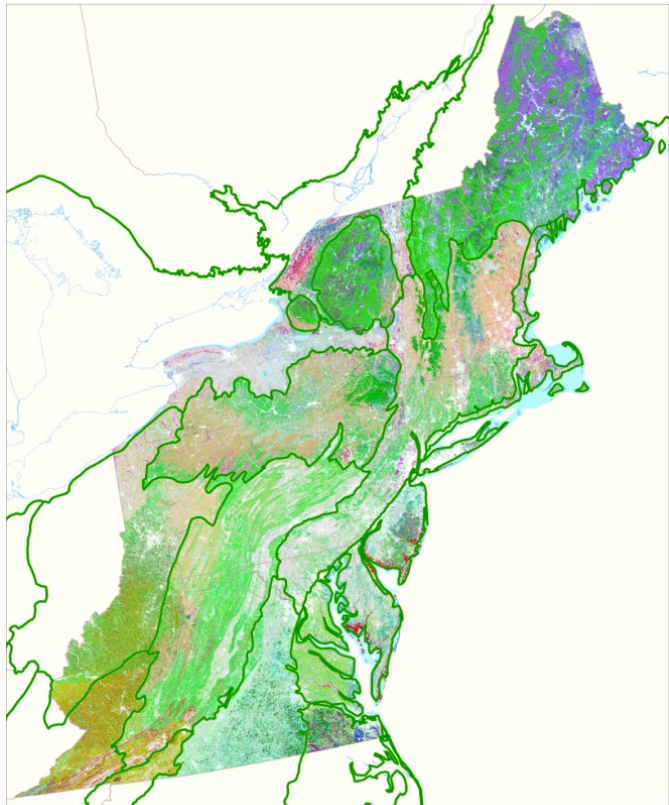

Figure 1. Northeast Terrestrial Wildlife Habitat Classification System.

Table 5. Formations and Macrogroups comprising the Northeast Terrestrial Wildlife Habitat Classification System. Formation 9 (Subterranean) was added for NE SWAPs.

Formation Class	Formation Name	Macrogroup
1. Forest and Woodland	Southeastern Upland Forest	Longleaf Pine
	Northeastern Upland Forest	Southern Oak-Pine Central Oak-Pine Northern Hardwood & Conifer Plantation and Ruderal Forest Exotic Upland Forest
	Northeastern Wetland Forest	Southern Bottomland Forest Coastal Plain Swamp Central Hardwood Swamp Northeastern Floodplain Forest Northern Swamp
	Boreal Upland Forest	Boreal Upland Forest
	Boreal Wetland Forest	Boreal Forested Peatland
2. Shrubland and Grassland	Grassland and Shrubland	Glade and Savanna Outcrop & Summit Scrub Lake & River Shore Ruderal Shrubland & Grassland
	Coastal Scrub-Herb	Coastal Grassland & Shrubland
	Peatland	Northern Peatland Coastal Plain Peatland Central Appalachian Peatland
	Freshwater Marsh	Coastal Plain Pond Emergent Marsh Wet Meadow / Shrub Marsh Modified / Managed Marsh
	Salt Marsh	Salt Marsh
4. Polar and High Montane	Alpine	Alpine
5. Aquatic (in part)	Intertidal	Intertidal Shore
6. Sparsely Vegetated Rock	Cliff & Rock	Cliff and Talus Flatrock Rocky Coast
7. Agricultural	Agricultural	Agricultural
8. Developed	<i>No name provided</i>	Maintained Grasses and Mixed Cover
		Urban/Suburban Built
		Extractive
9. Subterranean	Caves and karst	
	Mines, tunnels, and other developed	

Table 6. Structural modifiers to provide additional detail about the habitat condition. Quantitative classes are provided for each modifier type (see NETWHCS documentation).

Gross Cover Type	Modifier Type
Forest (>10% tree cover of >5m)	Canopy cover Evergreen:deciduous ratio (% evergreen) Number of canopy layers Recently burned (detectable) Stand development Understory shrub/herb layer
Shrubland and mixed shrub/herb (not forest, and >10% shrub cover)	% shrub cover Shrub height Evergreen:deciduous (as % evergreen)
Herbaceous (nor forest or shrubland, and >10% herb cover)	Cover Grass/forb height Native/introduced Scattered tall shrubs/small trees
Special modifiers for wetlands	Saltmarsh elevation Open water
Special modifiers - other	Karst

States are encouraged to use the macrogroup level (Table 5) without modification for regional consistency. However, habitat systems may be customized within each state to match classification systems used in 2005 or to better describe the habitats of greatest conservation need. In instances for which more specific habitat requirements are known for a given species, the structural modifier may be used.

The Northeast Aquatic Habitat Classification System (hereafter Aquatic Habitat Classification) is a standardized classification system and GIS dataset to describe and map stream systems across the Northeast (Olivero and Anderson 2008). The system and data consistently represents the natural flowing-water aquatic habitat types across this region in a manner that is useful for conservation planning. The system was designed to unify state classifications and promote an understanding of aquatic biodiversity patterns across the entire region. It is not intended to override local stream classifications but rather to put them into a broader context. This approach can be implemented across regional scales using GIS modeled variables that shape aquatic habitats such as stream size, slope, elevation, climate, and geology and lake size, elevation, shoreline sinuosity, and connectivity. This dataset can be used similarly to the Terrestrial Habitat Classification. The Aquatic Habitat Classification is being revised to better represent lakes and ponds, so Wildlife Action Plans should refer to updated documentation.

States worked together to develop a classification system for marine habitats in Fall 2014. Although not formally adopted, states generally agree that Maine's system is comprehensive and sufficiently detailed to represent the important marine habitats for SWAPs. Like the terrestrial and aquatic systems, the marine system is hierarchical:

Formation	Macrogroup
Intertidal	Mudflat
	Sandy Shore
	Molusc Reefs
	Bedrock
	Gravel Shore
	Tidal Marsh (peat-forming)
	Water Column
Subtidal	Mud Bottom
	Sand Bottom
	Molusc Reefs
	Bedrock Bottom
	Coarse Gravel Bottom
	Pelagic (Water Column)

Habitat Extent. Both the terrestrial and aquatic systems are available with GIS coverage for the entire region. A map of the habitat type being described could be included in Wildlife Action Plans along with the acreage and the percent of the state classified in the habitat type. For the purposes of describing state habitat, extents of habitat types occurring within the state should be provided. For individual species, habitat extent (habitat used) may be less than the full extent of the habitat type. When this information is available, states may choose to describe habitat extent for a species' population, rather than the entire habitat type, but it should be made clear which extent is quantified.

Habitat Condition. Condition may be described as a result of the Geospatial Condition Analysis of Northeast Habitats currently being prepared as RCN Project 2009-02. The project evaluates the current condition of terrestrial and aquatic habitats across the northeast focusing on indicators of human modification, securement, land impacts (such as hydraulic fracturing), and connectivity since these directly reflect the quality or degradation of habitat. Other potentially useful sources of condition assessment include the UMASS Index of ecological integrity and the NALCC "condition ranks". States may wish to downscale the regional dataset using more specific data available for their state.

Threats to Habitat. All threats that have impacts on the habitat type can be selected from the classification system provided for Element 3.

BACKGROUND AND RATIONALE

State Wildlife Action Plans must describe the extent and condition of habitats and community types that are essential to the conservation of “Species of Greatest Conservation Need”. The Best Practices Report recommends a regional approach and specifically mentions the Northeast Habitat Classification System (Terrestrial Wildlife and Aquatic) as examples.

While the northeastern states used different vegetation classification systems in their initial Wildlife Action Plans, the Northeastern Terrestrial Wildlife Habitat Classification System (which is based on ecological systems developed by NatureServe) and Northeastern Aquatic Habitat Classification System were developed under funding from the northeast states, as they determined this was an essential tool for use in multi-state species recovery efforts. Crosswalks between habitat systems used by northeastern states in previous Wildlife Action Plans are provided in Appendix D of The Northeast Terrestrial Wildlife Habitat Classification System Report (Gawler 2008).

Additional work by Mark Anderson (The Nature Conservancy) provides the most applicable and feasible method to describe and quantify habitat condition, consistent with the choice to use the habitat classification systems developed for the region. However, states will rely on higher resolution or ground-truthed habitat condition information when it is available.

In addition, this lexicon suggests that threats specific to habitat types also be identified to facilitate project prioritization, funding, and reporting.

CHAPTER 3: ELEMENT 3, THREATS

Threats come from many different sources, and impacts can be observed at different spatial, temporal, and biological scales. As a result, the risk of the impacts is wide-ranging, as are actions taken in response. The Northeast Lexicon provides a hierarchical system for classifying and naming threats, based on the IUCN classification system (Salafsky et al. 2008) and threat characteristics that are important in determining threat risk and appropriate responses.

Threat Classification System: The Northeast Lexicon adopts the IUCN threat classification system to classify and name threats. This system is hierarchical, with three tiers and is used in the NatureServe rank calculator (see Element 1). The top tier indicates the broadest categorization of threats and includes:

1. Residential and Commercial Development
2. Agriculture and Aquaculture
3. Energy Production and Mining
4. Transportation and Service Corridors
5. Biological Resource Use
6. Human Intrusions and Disturbance
7. Natural System Modifications
8. Invasive and Other Problematic Species and Genes
9. Pollution
10. Geological Events
11. Climate Change and Severe Weather.

Within this structure, regionally agreed upon or state-specific threats may be added when necessary. For example, in recognition of the need to identify administrative motivations for conservation actions, the TRACS action drivers were added to this list (a more detailed list of action drivers can be found in Table 9):

12. Resource Management Needs
13. Recreation Needs
14. Education / Outreach Needs
15. Administrative Needs

An excel spreadsheet providing a crosswalk between IUCN and TRACS threat classification systems is provided as a reference at: <http://rcngrants.org/content/northeast-regional-conservation-synthesis-state-wildlife-action-plan-revisions-0>

Threat risk. To rank threats by risk (level of impact considering severity and likelihood), the Northeast Lexicon provides definitions for the severity, reversibility, immediacy, spatial extent,

certainty, and likelihood of threats (Table 7). These definitions may apply to single threats, or the compounding impact of interacting threats.

Table 7. Threat characteristics and categorical ratings.

Threat Characteristic	<i>Low Impact</i>	<i>Moderate Impact</i>	<i>High Impact</i>
Severity	Slight Severity: Degree of ecological change is minor	Moderate Severity: Degree of ecological change is substantial	Severe: Degree of ecological change is major
Reversibility (Consider the likelihood of reversing the impacts within 10 years)	Reversible: Effects of the threat can be reversed by proven actions	Reversible with difficulty: Effects of the threat may be reversed but costs or logistics make action impractical	Irreversible: Effects of the threat are irreversible
Immediacy (This characteristic assesses the time scale over which impacts of the threat will be observable.)	Long-term: Effects of the threat are expected in 10-100 years given known ecosystem interactions or compounding threats	Near-term: Effects of the threat are expected within the next 1 - 10 years	Immediate: Effects of the threat are immediately observable (current or existing)
Spatial Extent (Consider impact of threat within 10 years)	Localized: (<10%) A small portion of the habitat or population is negatively impacted by the threat.	Dispersed or Patchy: (10-50%)	Pervasive: (>50%) A large portion of the habitat or population is negatively impacted by the threat.
Certainty	Low Certainty: threat is poorly understood, data are insufficient, or the response to threat is poorly understood	Moderate Certainty: some information describing the threat and ecological responses to it is available, but many questions remain	High Certainty: Sufficient information about the threat and ecological responses to it is available
Likelihood (Consider impact of the threat within 10 years) (This characteristic is used to assess the certainty surrounding the threat and its impacts.)	Unlikely: Effects of the threat are unlikely to occur (less than 30% chance)	Likely: Effects of threat are likely to occur (30-99% chance)	Occurring: Effects of the threat are already observable (100% chance)

BACKGROUND AND RATIONALE

State Wildlife Action Plans must include descriptions of problems adversely affecting Species of Greatest Conservation Need or their habitats. The Best Practices Report for State Wildlife Action Plans recommends the use of the IUCN threat classification system (Salafsky et al. 2008). Threats are viewed as important factors in prioritization of actions and ranking of conservation need.

After considering the applicability of the Wildlife TRACS and IUCN threat classification systems and the scope of threats addressed by conservation actions proposed in Wildlife Action Plans for northeastern states, the IUCN classification system appears most useful at this time, due in part to the more limited number of threats addressed in Wildlife TRACS. The IUCN system is also the recommended choice in the Best Practices Report. However, because actions will often be reported through the Wildlife TRACS system, a translation from IUCN to Wildlife TRACS is provided to facilitate data management.

In addition to naming threats, understanding threat characteristics can help highlight opportunities for species and habitat management or protection. Proposals to fund conservation actions typically explain the threat being addressed in the project justification, and reporting systems, such as Wildlife TRACS, integrate threat identification. To best meet these planning, funding, and reporting needs, utilizing this lexicon will help ensure that all needed information is available in the Wildlife Action Plan. It may also minimize workload as each proposed action is considered for funding or final results are reported and presented. In addition, it may be possible to prioritize threats (and/or associated actions) for regional coordination if multiple states have identified them as pervasive, severe, and/or immediate.

The extensive review of existing conservation planning approaches (see Appendix A) along with needs presented by northeastern states led to the threat characteristics described above. The first four characteristics were widely used by the organizations surveyed. Many of the reviewed approaches used four levels of impact. The three-level approach described here provides a more rapid assessment yet still distinguishes threats. Some approaches characterize past, present, and future threats. Current and future threats are represented here by the “immediacy” characteristic, but past threats are not included.

Immediacy – Other approaches have used the terms urgency or timing. The choice presented above is very similar to Master et al. (2012) and Salafsky et al. (2003).

Spatial extent – Several alternatives were found in the literature, especially “scope”. The Northeast Lexicon uses the term “spatial extent” because it is more specific, and many of the other words used by conservation organizations are employed in the impact descriptions for spatial extent, such as “localized”, “patchy”, “pervasive”, and the reference to a “portion” of

habitat. The possibility of interpreting “spatial extent” in the context of populations distributed across the state was added. NALCC and the Geospatial Habitat Condition Analysis provide additional information from models and predictions of spatial extent (NALCC 2013 and Anderson 2013- both ongoing)

Reversibility – The impact levels for this characteristic are adapted from Salafsky et al. (2003).

Certainty – Uncertainty is a long-standing and challenging issue for natural resource managers. In the IUCN guidance for assessors (related to assigning CR/EN/VU ratings), uncertainty is seen as being derived from three sources: natural variability, vagueness in the terms and definitions used in the criteria, and measurement error (Akçakaya et al. 2000, IUCN Standards and Petitions Subcommittee 2013). Lack of data is not considered a part of uncertainty in the IUCN approach. In the discussion of how to deal with uncertainty, IUCN recognizes that risk tolerance and dispute tolerance are factors in decision-making with uncertain information. IUCN recommends a “precautionary but realistic attitude”. For the purposes of the Lexicon, lack of data has been included as a source of uncertainty.

Severity – Other approaches have variously used the terms “severity”, “intensity”, and “impact”. The lexicon reserves the word “severity” for the overall assessment based on all of the threat characteristics and uses “intensity” to represent the degree of impact associated with the threat. “Impact” was used for all characteristics to represent the scale of influence the threat would have on resources.

Likelihood – Sometimes referred to as probability as in (Salafsky et al. 2003).

Other options were considered but not included in the lexicon. “Duration” has not been included because few threats will have short durations making this characteristic less useful for distinguishing threat severity, however, it will probably be considered in the assessment of “intensity” since longer “duration” threats will have greater “intensity” impacts. “Persistence” was not included for similar reasons. “Contribution”, referring to sources, is addressed outside the severity assessment table. “Impact”, as used to describe species or habitat threats, is incorporated in lexicons for Elements 1 and 2.

CHAPTER 4: ELEMENT 4, ACTIONS

Conservation actions often involve physical management of natural resources, but many other types of actions have been proposed in support of wildlife conservation such as property easements to influence land management, recreational use guidelines, education or outreach, and species reintroduction. In some cases, a lack of knowledge about species' requirements inhibits the planning of these more tangible actions, and research or survey actions are required to fill these knowledge gaps.

A complete description of a proposed action would include who is responsible for the action, what will be done, with what benefits, when and where it will be done, how the desired results will be achieved, how progress will be measured, and why the action is being taken. However, because Wildlife Action Plans are planning documents encompassing the wide range of actions listed above, action descriptions must be adaptable. All actions can be classified and named using one naming convention system but not all actions can be fully detailed using all the descriptive prompts provided for in the Lexicon.

Action Classification System: The Northeast Lexicon adopts the Wildlife TRACS action classification system with a small number of amended categories. The system is sufficiently broad in scope with an appropriate level of detail. It is hierarchical, with three tiers. The top tier (listed below) indicates the broadest level of actions. Official TRACS resources (found at <https://tracs.fws.gov/wiki/> in the Classroom Handouts Space) should be used as a reference.

- Coordination and Administration
- Direct Management of Natural Resources
- Data Collection and Analysis
- Education
- Facilities and Areas
- Land and Water Rights Acquisition and Protection
- Law Enforcement
- Outreach
- Planning
- Species Reintroduction and Stocking
- Technical Assistance
- Law and Policy (not in Wildlife TRACS)
- Species Management (such as Harvest Management and Trade Management) (not in Wildlife TRACS)
- Partnerships (not in Wildlife TRACS)

An excel spreadsheet providing a crosswalk between TRACS and IUCN action classification systems is provided as a reference at: <http://rcngrants.org/content/northeast-regional-conservation-synthesis-state-wildlife-action-plan-revisions-0>

Action Description: To address the challenge of systematically describing actions, the Northeast Lexicon provides a set of descriptors that can be used as a template for comprehensive action description (Table 8). The Northeast Lexicon recommends that states strive to provide, for all actions, a name, objective, general strategy, and purpose. This level of description is likely to be appropriate for all actions regardless of the readiness for implementation. The additional descriptors can be selected, as appropriate, to describe actions in a Wildlife Action Plan providing a guide for information that would need to be prepared before implementation of the action. For action prioritization, the purpose (identifying target species or habitats and threats), benefits, costs, urgency, longevity of results, and likelihood of success are common factors that are helpful for deriving maximum conservation benefit given limited funding.

Table 8. Action descriptors.

Lexicon Terminology	Content	Explanation
Name	The Action name is selected from Wildlife TRACS classification system (amended)	The lexicon described here uses the Wildlife TRACS classification system with hierarchical codes developed. This system includes amendments to incorporate a few actions from the IUCN system (above). Every action should be classified according to the amended Wildlife TRACS system at as detailed a level as possible.
Title	Short descriptive name unique to action	Unique action/species or action/habitat combination
Objective	A concise statement of the objective of the action	An objective is “a specific, measurable, achievable, relevant, and time-limited statement that describes the desired short, medium, or long-term outcomes of a conservation action.”
General Strategy	A concise description of the nature of the strategy for achieving the objective	The strategy to address the objective should be described generally. (More detailed explanation can be provided in the answer to the question “How?”)
Purpose	Identify Species or Habitats directly benefiting from the action, or threats being reduced by the action	Linking an action to a threat (Element 3) or action driver (Table 9) and to the resource that will benefit such as target species (Element 1) or habitats (Element 2) provides a clear explanation of the motivation for the action and begins to reveal the results chain linking the

		strategy to the threat and the expected ecosystem response to mitigating the threat.
Benefits	Depending on the action, benefits (direct or indirect) may be habitat improvements, species' responses, reductions in threat risk, or public or stakeholder benefits.	These answers will likely be suggested by defining what the action is and why it is being taken. However, efforts to prioritize actions will probably require specific benefits to be considered. Answering this question clearly may also help define the measures of project success. It may be helpful to explain the direct benefits and contrast them with the indirect benefits.
Estimated Costs	<p>This should include total future costs in current dollar values, but not include any past expenses for infrastructure that will be used by proposed action.</p> <p>Categories:</p> <ul style="list-style-type: none"> • Unknown • < \$10,000 • \$10,000 - \$49,999 • \$50,000 - \$99,999 • \$100,000 - \$499,999 • \$500,000 - \$999,999 • > \$1,000,000 	<p>If action descriptions are intended to be used for action prioritization, cost estimates, even very rough ones, may be helpful. This should include total future costs in current dollar values, but not include any past expenses for infrastructure that will be used by proposed action. Estimates are available from business plans, Joint Ventures, and Partners in Flight.</p> <p>For prioritization purposes, states may choose to calculate cost/acre treated or cost/species to compensate for the fact that multi-species projects may be more expensive than single species projects. A very detailed process for action prioritization is described and evaluated in "Optimal Allocation of Resources among Threatened Species: a Project Prioritization Protocol" (Joseph et al. 2009).</p> <p>States may add subcategories as needed, but should avoid using the unknown category if possible.</p>
Performance Metric	From TRACS or other more specific sources	The performance metric is how success is measured and defined.
Urgency	<p>The urgency of the action should estimate the ideal timeframe for completing the action.</p> <p>Categories:</p> <ul style="list-style-type: none"> • Initiate immediately (2016) • Initiate within 5 years (2017-2020) • Initiate within 5-10 years (2020-2025) • Can wait 10 years to initiate (2025) 	This is a relative estimate of the urgency of the action given the severity of the threats and the priority of the species or habitat

Duration	How long will action take to complete (or need to persist)? <ul style="list-style-type: none"> • <1 year • 1-2 years • 2-5 years • 5-10 years • >10 years 	
Longevity of results	What is the longevity of the results? <ul style="list-style-type: none"> • <3 years • 3-10 years • 10-20 years • 20-50 years • >50 years 	How long will the benefits continue after the action is completed?
Likelihood of Implementation	Can the action be implemented: Categories <ul style="list-style-type: none"> • Unlikely/Unknown (<30%) • Likely (30-90%) • Certain/Very Likely (90-100%) 	
Likelihood of Success	To what degree will the action address the threat or improve species' populations or habitats? Categories <ul style="list-style-type: none"> • Unlikely/Unknown <30% (not tested/implemented anywhere) • Likely 30-90% (e.g., BMP or sufficient information available) • Certain/Very Likely 90-100% (demonstrated by other projects) 	
Constraints/Other factors (narrative)	Describe constraints?	For example: Regulations or Administrative, Environmental (risks to other habitats/SGCN), or Resource (financial or personnel)
Implementing Organization	TRACS needs "Lead Organization" and "Partners". (Organizations or individuals responsible for implementing the action or partners who	If possible, an individual or agency responsible for managing the action could be identified. Partners that should be consulted or engaged could also be identified.

	can assist.) Categories at Regional Level: e.g. federal, state, non-profit, university, commercial/consulting	
Key Stakeholders	Identify stakeholders	Identify any parties that might be affected by the action and prepare for education, outreach or public relations that could assist in a successful implementation of the project
Location	Most states will use counties or watersheds which is consistent with TRACS. However, some states are using TNC ecoregions or physiographic provinces.	Although County and Watershed are the most common spatial units being used by states for SWAPs and are the units endorsed by TRACS, some actions will require more specific location information and others may be more appropriately tied to ecoregions or physiography. Aside from the habitat type, descriptions of where actions take place may include specific locations around the state, specific sites within a smaller locale, or any other geographical designation appropriate to the action. If the action requires monitoring, this description may complement the use of a standard protocol by defining the sampling strategy in a spatial context.
Detailed Strategy	A detailed description of the action, how it will result in the desired effects, how project success will be measured and assessed, and plans for adaptive management	Actions that are ready for implementation may have very developed ideas for accomplishing the objective of the action. Compared to the strategy described above, this is a much more detailed explanation of how the action will be implemented. In cases where actions are not so well developed, this element may include a couple alternatives for implementation. The hypothesis explaining how the proposed action will impact the target by mitigating the threat would ideally be presented in the form of a results chain (See Background and Rationale, below) or theory of change. Wildlife Action Plans are called upon to identify how action results will be monitored so indicators of the impact on the target should be identified along with adaptive management strategies which might be used to improve the results of the action. Monitoring protocols may be identified by reference to standard protocols or development of specific monitoring plans. (Both of these address Element 5).

Table 9. A subset of TRACS action drivers complements the IUCN threat list to provide a complete set. “Resource Threats” are included in the TRACS action drivers but are redundant with IUCN threats and not specific enough and have been omitted from the following list. Official TRACS resources (found at <https://tracs.fws.gov/wiki/> in the Classroom Handouts Space) should be used as a reference, this table is provided only as an example.

Level 1	Level 2	Level 3
Resource Management Needs	Resource information collection needs	Lack of initial baseline inventory
		Lack of up-to-date existing information
		Need to answer research question
		Need to develop new technique
	Management decision needs	Need to provide technical assistance
		Need to conduct environmental reviews
		Lack of fish, wildlife and/or habitat planning
Recreation Needs	Training needs	Need for more and/or improved training in outdoor recreation methods
		Need to improve safety/ethics in outdoor recreation
	Public access needs	Need for more public access to areas or facilities for outdoor recreation
		Lack of maintenance/improvements on areas or facilities for outdoor recreation
	Utilization needs	Lack of information on how fish and wildlife resources are utilized
		Lack of information on how outdoor recreation areas and facilities are utilized
		Lack of information on locations of fish and wildlife resources and public access areas and facilities
		Need to maintain or increase recruitment and/or retention of outdoor recreationalists
		Need to maintain or increase supply of fish to support fishing.
Education / Outreach Needs	Education Needs	Need for improved knowledge of fish and wildlife and their habitats
		Need to provide aquatic resources and wildlife education facilities
		Need for improved knowledge of WSFR grant programs and their accomplishments
	Outreach Needs	Need to develop and/or maintain a broad base of support for agency goals and objectives
		Need to maintain and/or increase constituent base
Administrative Needs	Infrastructure Needs	Need to maintain or improve fish and wildlife agency administrative facilities
		Need to maintain or improve information management systems
		Need for agency organizational planning to meet goals and objectives

	Organizational / program planning needs	Need for WSFR program/subprogram planning to meet goals and objectives
	Coordination / administration needs	Need for agency administrative support for effective operations
		Need for coordination for effective program/project management

BACKGROUND AND RATIONALE

State Wildlife Action Plans must describe actions proposed to conserve identified species and habitats and priorities for implementing such actions are needed to develop a plan for wildlife conservation.

In addition to this Wildlife Action Plan requirement, the Best Practices Report recommends the use of the IUCN Hierarchical Action Classification System (Salafsky et al. 2008). Actions are described as “abating known threats” and involving “metrics to measure effectiveness”. An important recommended best practice involves the prioritization of actions using decision theory approaches that consider resource vulnerabilities but also cost, feasibility, and likelihood of success (e.g. pg 5, 14-15).

Given the benefit of using action terminology that is largely compatible with the Wildlife TRACS system, and the desire to clearly justify each action, the Northeast Lexicon connects actions with threats and/or action drivers and species or habitats to show exactly how the action contributes to state wildlife conservation.

The Best Practices Report identifies “a need for more specificity with regard to on-the-ground actions”. During the Development of this Northeast Lexicon, S.M.A.R.T implementation goals (Doran, 1981) were discussed as a way to improve the clarity of action descriptions in response to the Best Practices Report’s recommendation. S.M.A.R.T. goals are Specific, Measurable, Attainable, Relevant, and Time-bound. Because Wildlife Action Plans are planning documents and some proposed actions will not be ready for implementation, it may be difficult to describe these aspects of an action – but being able to answer these questions improves the likelihood of implementation and project success.

The action descriptors listed here were developed based on S.M.A.R.T. planning and are well-aligned with the action development process outlined in the Conservation Measures Partnership’s Open Standards for the Practice of Conservation (CMP 2013). Steps 1 and 2 (see figure below) are the basis of the action development process provided in the “Suggestion for Use”. Steps 3, 4, and 5 call on information provided in the Northeast Lexicon for Elements 4 and 5.

While the Northeast Lexicon does not specifically recommend any existing prioritization method, advice from the best practices helped ensure that the Lexicon incorporated information typically used in action prioritization. The Lexicon also generally provides the information required for the prioritization method presented and evaluated in “Optimal Allocation of Resources among Threatened Species: a Project Prioritization Protocol” (Joseph et al. 2009)

Using a results chain can provide explicit documentation of the linkages between the action, threat, threat mitigation, targets and indicators (Foundations of Success 2007):

The Strategy explains, generally, how the “Objective” of the action will be achieved. The first outcome identifies the threat or action driver that is motivating the action. The second

outcome identifies the change in the threat, or the mitigation of the threat, that is expected to result in the positive impact on the target or the goal. See *Using Results Chains to Improve Strategy Effectiveness: An FOS How-To Guide* to learn more about creating results chains.

CHAPTER 5: ELEMENT 5, MONITORING

To increase the capacity of the region to share data and to minimize the replication of work developing monitoring plans, monitoring plans would be detailed consistently and shared within the region as much as possible. The three distinct purposes for monitoring (assessing project results, measuring population status and trends, and describing habitat quality) called for in Elements 1, 2, and 4 suggest unique formats. Status assessments of species or habitats are referred to as ‘surveys’, ‘research’ includes monitoring to understand links between species, their habitats, and threats impacting both, and assessing the results of ‘actions’ implies a more dynamic situation resulting from implementing a project in an attempt to mitigate a threat or otherwise support a Species of Greatest Conservation Need.

Assessing the effectiveness of conservation actions

Monitoring plans aiming to assess project results should follow the guidance provided by the Association of Fish and Wildlife Agencies in “Measuring the Effectiveness of State Wildlife Grants” (Association of Fish and Wildlife Agencies 2011). This framework is premised on the definition of a theory of change linking the action with intermediate results, threat reduction, and the conservation target outcomes. (This approach to action planning is also supported by the Northeast Lexicon for Element 4.) Several effectiveness measures may be identified to assess intermediate results, especially in the case of actions with results expected on the long-term.

Measures of success should be (Association of Fish and Wildlife Agencies 2011) (pg 9):

- Linked – tied to key factors in the theory of change laid out in the results chain
- Measureable – in either quantitative or qualitative terms
- Precise – defined the same way by all agencies
- Consistent – unlikely to change over time
- Sensitive – changing proportionately in response to actual changes in the condition or item being measured
- Overarching – available to be measured at various points through the life of a project
- Achievable – not onerous for states or their partners to support.

To improve consistency, the suggested measures terminology used in Wildlife TRACS should be used to measure action outcomes.

Measuring population status and trend

Region-wide use of standard protocols would facilitate data-sharing and make possible an assessment of population status and trend throughout the region. Standard protocols for some

species have been developed (e.g. Grassland Bird Protocol and Standard Operating Procedures). In addition, NEAFWA has funded development of integrated, cross-jurisdictional monitoring programs and methods for New England cottontail, wood turtle, Eastern black rail, dragonflies and damselflies (Order Odonata), tidal marsh birds, and frogs. Required elements of monitoring plans differ between species groups, between species using different habitat types, and between monitoring programs with differing objectives. To enhance the possibility of comparing monitoring protocols between states, monitoring protocols should identify target species, monitoring goals (e.g. estimating abundance and trend, understanding demography, behavior, habitat use, reproduction, etc.), the reference protocol, and contact information for an office or individual familiar with the protocol.

Describing Habitat Quality

Monitoring programs for habitat quality may include soil, vegetation, climate monitoring or any variable hypothesized to influence the use of a place by a species. Unlike species population surveys which are prompted by the need for Wildlife Action Plans to describe wildlife abundance and trend, habitat monitoring is used to explain species' population trends (a research action), design conservation actions in support of single or multiple species, or measure achievement of objectives of conservation actions. Standard protocols may be useful in developing effective, efficient habitat monitoring programs. For example, the Forest Inventory and Analysis plot protocol measures tree species, age classes, shrub and herbaceous cover, snags, and fuel loads – all of which characterize forests and can be used as surrogates for wildlife habitat, not to mention assessing fire risk. The USFS Field Guide for Invasive Plant Inventory, Monitoring, and Mapping Protocol is another example of an existing tool that could be employed by Wildlife Action Plans when invasive plants threaten habitat quality. In general, habitat monitoring protocols should identify the target habitat and the purpose for monitoring.

BACKGROUND AND RATIONALE

State Wildlife Action Plan must propose plans to monitor Species of Greatest Conservation Need (Element 1) and their habitats (Element 2), for monitoring the effectiveness of conservation actions (Element 4), and for adapting these conservation actions to respond appropriately to new information or changing conditions.

The Best Practices Report recognizes that “Assessing and reporting on the success of Wildlife Action Plans as required by Element 5 is extremely challenging due to the complexity of biological and ecological interactions, and the extended timeframes often required for conservation benefits to become apparent.” “Measuring the Effectiveness of State Wildlife Grants: Final Report” (Association of Fish and Wildlife Agencies 2011) provides specific guidance to compensate for these challenges.

A strong movement throughout conservation organizations toward standardized protocols supports the Northeast Lexicon philosophically and technically. The Best Practices Report specifically recommends the use of standard protocols because it facilitates data integration and provides a more complete picture of the status of wildlife across political jurisdictions and spatial scales. These best practices also recognize the importance of monitoring to demonstrate the effectiveness of conservation actions and documenting the long-term benefits to fish and wildlife populations. Projects supported by Northeast Regional Conservation Needs funds, such as The Northeast Bird Monitoring Handbook (Lambert et al. 2009) and development of regional species monitoring protocols, provide detailed guidance for species and habitat monitoring in the northeastern states. The National Park Service Inventory and Monitoring Program provides a database of standard protocols (<https://irma.nps.gov/App/ProtocolTracking>) which may provide a useful example for the northeast region in the future.

The exhaustive investigation of effectiveness measures published by the Association of Fish and Wildlife Agencies (Association of Fish and Wildlife Agencies 2011) and slated for incorporation in Wildlife TRACS provides a level of consistency nationwide that was seen as the best-developed guidance to date. The Northeast Regional Conservation Needs project “Regional Monitoring and Performance Framework” (Stem et al. 2008) provided earlier progress toward the standards developed in the national guidance put forth by the Association of Fish and Wildlife Agencies.

CHAPTER 6: ELEMENT 6, PLAN REVIEW

The Best Practices Report provides the most current comprehensive source for Wildlife Action Plan preparation guidance. The Best Practices Report includes valuable guidance on many topics not incorporated in the Lexicon. Here we have highlighted important aspects as a reference and focused on aspects of review that may be of interest in comparing State Wildlife Action Plans.

Table 10. Overview of plan review requirements.

Type of review	Comprehensive Review	Major Revision	Minor Revision
Date of Review	At a minimum, every 10 years. (October 1, 2015)	No deadline: a state may choose to do a major or minor revision at any time. These revisions do not restart the 10-year clock for comprehensive review.	
Summary of Changes	A tabular summary of any changes made as a result of any revision, and where those changes can be found is needed.		
Explanation of No Change	Document and explain why no changes were necessary after review, and describe the process used to make that determination including public review	There is no explanation needed for any sections of the document that remain unchanged after major or minor revisions.	
Web access to Plan	Wildlife Action Plans are not required to be posted online however most states do post them. A regional website listing these links would be a valuable resource for regional conservation organizations and other states. In addition, online locations for data sources, partner organizations, and any supporting information should be listed.		
Public Review	Public Review is required (Element 7&8) for the entire Wildlife Action Plan.	Public Review is required (Element 7&8) only for portions of the plan under revision.	Public Review is not required.
Documentation of Public Review	Document specific roles and measures of success for conservation partner teams that contribute information and complete tasks. Provide mechanisms for conservation partner engagement and provide regular updates (e.g. crosswalks, online comment retention)		
Taxa experts	For key taxa or other scientific questions outside the expertise of state staff, outside partners (e.g. taxa-based or targeted professional societies,		

	conservation organizations, other agencies with authority, or universities) should be engaged to develop assessments of conservation need, habitat use, threats, actions, or monitoring plans.
--	--

BACKGROUND AND RATIONALE

State Wildlife Action Plan Requirements include the need to describe procedures to review the plan at intervals not to exceed ten years.

States should refer to the Best Practices Report for additional requirements and detailed suggestions for implementing comprehensive review and major or minor revision.

CHAPTER 7: ELEMENT 7 AND 8, PUBLIC PARTICIPATION

The *public* is the general, uninvolved public and, for the purposes of Wildlife Action Plan communications, the goal is to inform them of the process and results through standard media outlets.

Stakeholders are interested or affected groups or individuals and the goal is to inform and involve them in the planning and implementation processes.

Partners are collaborators and the goal is to involve and engage them in the planning and implementation processes and inform them of progress. Wildlife Action Plans should list any formalized partnerships.

Partners usually include federal, state, and local government agencies, as well as private conservation organizations, and other parties. The following are examples of these partners:

Governmental:

- Federal agencies (e.g. US Fish and Wildlife Service, US Forest Service, US Department of Agriculture, US National Park Service, US Natural Resource Conservation Service, and any other federal agency managing natural resource within a state.)
- Tribal Nations
- State agencies (e.g. Departments of Transportation, Parks, Forests, Planning, and any other state agency affecting natural resources)
- Local municipalities (counties, townships or other municipal designation)

Non-governmental organizations:

- Non-Profit Conservation Organizations (Local, State, Regional, National)
- Recreational Organizations (Local, State, Regional, National)
- Scientific Societies and Institutions
- Academic Institutions

Committees: List committees and members. Consider needed skills, knowledge, and authority in composing committees. An example of an advisory committee charter with roles and responsibilities from Pennsylvania is provided in Appendix C.

Communications Plan: Identify key constituent groups and audiences. Set goals for each. Develop outreach strategies and vehicles for receiving input from these groups. Ask partners to help with outreach by relaying information and requests for comment to their constituents. Link the Wildlife Action Plan to established community values. (See Appendix C for an example communications plan matrix to identify audiences and outreach methods based on Bleicher.)

BACKGROUND AND RATIONALE

State Wildlife Action Plan requirements include a plan for coordinating the development, implementation, review, and revision of the plan with federal, state, and local agencies and Indian tribes that manage significant land and water areas within the state or administer programs that significantly affect the conservation of identified species and habitats.

In addition, broad public participation is an essential element of developing and implementing these plans, the projects that are carried out while these plans are developed and the species in greatest need of conservation.

States may find useful guidance in the USFWS Human Dimensions team and the Cornell University Department of Natural Resources Human Dimensions Research Unit.

SECTION IV: CONCLUSION AND RECOMMENDATIONS

Recommendation

The Northeast Association of Fish and Wildlife Agencies Fish and Wildlife Diversity Technical Committee should continue to work toward development of a regional web-accessible database to house individual state's Wildlife Action Plan content. The completed Lexicon forms the foundation of a regional database that will facilitate the sharing of information between states. Such a database will help states share information on priority species, known threats for these species and needed actions to address these threats – the required elements of State Wildlife Action Plans. A Northeast State Wildlife Action Plan database will:

1. Enhance consistency of information for species including taxonomy and nomenclature, conservation status in state, national and global systems, and literature references, preventing each state from having to individually compile this information;
2. Facilitate access to northeast State Wildlife Action Plans for state agencies, federal agencies, conservation partners, legislators and the public;
3. Facilitate more effective and efficient collaboration within and between NEAFWA states;
4. Improve accuracy of data transfers between states;
5. Assist NEAFWA in prioritizing regional conservation needs, focused on common threats across state lines.

Next Steps

Implement the common lexicon through the 2015 State Wildlife Action Plan revision process and refine language as needed.

Those participating in the development of State Wildlife Action Plans are encouraged to use this lexicon during their congressionally required comprehensive review and revision and assist in refining the language and processes as needed. Through use of the lexicon such refinements may be prompted as approaches are discovered that meet the needs with less work effort, components that work better for prioritization processes, or alternative terminology that increases the compatibility of the Northeast Lexicon with related systems nationwide.

Form a Northeast Lexicon Working Group comprised of Northeast Wildlife Diversity Program Managers and State Wildlife Action Plan Coordinators.

Achieving the ultimate vision of a web-accessible database involves several more steps, yet it can be accomplished in a relatively short timeframe given the work accomplished to date through this project. The Lexicon outlines the data content, but the database will need an

intuitive user interface, a potentially complicated network of relationships between elements, and a management system for quality control and updating data. A working group representing the northeast state agencies (Wildlife Action Plan Coordinators, Data Managers and other staff as appropriate), USFWS LCC and Region 5, and key NGO partners should be convened to advance this discussion, leading to development of a pilot database application.

Develop a Northeast State Wildlife Action Plan database application

The Northeast Lexicon Working Group and a database developer should convene to work through development steps including:

1. Define the key/priority functions of the database application (mostly done)
2. Determine the scope of the database to meet the key functions (mostly done)
3. Trial implementation of the Lexicon, with coordination and technical assistance, during Wildlife Action Plan revisions (2013-2014)
4. Develop a database application (2014)
5. Test the database (2015)
6. Refine the database as needed (2015)
7. Launch the database application (2016)

Work with the Northeast Conservation Information and Education Association to refine terminology related to outreach for incorporation in a toolkit to support states in their State Wildlife Action Plan revision and implementation.

The support of partners, stakeholders, and the public is essential to both the revision process and to the implementation of State Wildlife Action Plans. While states may differ in the composition of these audiences, the approaches used to communicate with each of them will be similar. Wildlife Action Planners anticipate using a combination of media such as websites, press releases, public events, and focused meetings to engage partners, stakeholders, and the public. The toolkit will encourage the use of common terms and shared outreach processes and methods for regional outreach consistency and effectiveness.

Conclusion

This effort has been a productive exercise in adaptive management that has reflected the evolving needs of the states and their partners in the development of the State Wildlife Action Plan revisions. State Wildlife Action Plans have been criticized for their lack of consistency in terminology that would allow wildlife managers, land managers and conservation partners to effectively and efficiently compare conservation priorities across state borders, thereby advancing landscape-scale conservation for Species of Greatest Conservation Need. The Northeast Fish and Wildlife Diversity Technical Committee had a vision to address this

shortcoming – develop a common language for State Wildlife Action Plan elements to allow the thirteen states and District of Columbia to ‘roll-up’ state-level priorities within a searchable framework to inform regional priorities. The foundation for the database was built through this Northeast Lexicon project. This unprecedented collaboration is nationally regarded as a model for effective landscape-scale conservation.

The Lexicon serves as a communication and coordination tool. By constructing cohesive sets of components to meet the requirements for each Wildlife Action Plan element and adopting terminology for each, the Northeast Lexicon facilitates the intra- and inter-state coordination needed to manage wildlife and their habitats with maximum efficiency and effectiveness. It facilitates translation between State Wildlife Action Plans, enables a regional context, and a formal structure through which states can learn from each other to integrate new planning resources and improve planning processes. These benefits will be maximized while states implement the Lexicon during the 2015 Wildlife Action Plan revision process.

SECTION VI: APPENDICES

APPENDIX A: JUNE 2013 LITERATURE REVIEW

This report was prepared for the Northeast Fish and Wildlife Diversity Technical Committee by Stephanie Egger through Terwilliger Consulting, Inc..

Synthesizing and Summarizing Conservation Decision Tools for State Wildlife Action Plans (Final June, 2013)

A State Wildlife Action Plan (SWAP) database tool is envisioned by the Northeast Fish and Wildlife Diversity Technical Committee (NEFWDT) to be a tool primarily for delivery of SWAPs, and secondarily for development of plans. Language and consistent operational definitions for important terms (e.g. threats, conservation actions, habitats), and the agreement to the use of those terms and their operational definitions, are needed for species of greatest conservation need (SGCN). The following will examine the similarities and differences between the agreed-to terms (per Philadelphia meeting) of the Northeast (NE) Region Draft “lexicon” and other similar efforts undertaken, developed and published by conservation organizations and within peer-reviewed literature. This literature review report strives to contribute to advancing common agreement on terms and definitions.

Threats assessment for SGCN

Preliminary terms were chosen by NEFWDT to describe threat assessment and include *Spatial Extent*, *Intensity*, *Reversibility*, *Likelihood of Impact and Occurrence*, *Cumulative and Compounding*, *Immediacy*, *Duration*, and *Persistence*. These terms were then compared with terminology for threats found through the literature search (Table 1). The same or analogous terms were found for *Spatial Extent* (*scope*), *Intensity* (*severity*), *Reversibility* (*irreversibility*), *Likelihood of Impact and Occurrence* (*probability*), and *Immediacy* (*urgency*). Further details regarding the definition of the terminology and scoring/ranking criteria are described below and also included in Appendix A. For a regional approach any combination of these threat criteria can be used to identify the dominant, regional threats for a given ecoregion. Rationalization for conducting a regional approach of threats will only be increased as more terms are considered in an assessment (Wisdom et al. 2003).

Spatial Extent

The NE Draft Lexicon defines *Spatial Extent* as the percentage of threat to the applicable area - distribution of threat within a state (spp, habitat or threat). However, the term *scope* was used more often by conservation organizations and throughout the literature rather than *Spatial Extent*. Earlier versions of threat assessment by organization used the term *extent* such in TNC Southeastern Division (2003) and WWF (Ervin 2002) or other terms such as *proportion of the area/area* have also been used (WCS Living Landscapes and Salafsky & Margoluis 1999). *Spatial Extent* or *pervasiveness* of the threat across the ecoregion was used by Wisdom et al. (2003).

In the NE Draft Lexicon, *Spatial Extent* of threats is scored/ranked by percentages 76-100%, 51-75%, 26-50%, and 0-25%. NatureServe (2012) scored *scope* by percentages into *pervasive* (71-100%), *large* (31-70%), *restricted* (11-30%), *small* (1-10%). IUCN (2102) *scope* categories include *whole*, *majority*, *minority*, and *negligible*, while TNC (2007) categorizes *scope* into *very high*, *high*, *medium*, and *low* categories. CMP (2007) and WWF (2007) also assumes the same categories as TNC (2007) and ranks *scope* by percentages similar to NatureServe (2012)

Specific Threat Variables Used by Different Systems Variables in each column are used in an analogous fashion.

Systems	Variables Used by Different Systems									
NatureServe April 2012	Scope	Severity					Timing (immediacy)	Impact Magnitude		
IUCN 2012	Scope	Severity						Impact		
TNC CAP 2007	Scope	Severity	Contribution	Irreversibility						
TNC's SE Division 2003	Extent (% targets)	Severity								
TNC 5-S (precursor to CAP) 2000	Scope (spatial)	Severity	Contribution	Irreversibility						
CMP. 2007. Open Standards	Scope	Severity		Permanence/ Irreversibility			Urgency			
WWF Project & Programme Standards 2007	Scope	Severity		Irreversibility Permanence						
WWF RAPPAM 2002	Extent			Permanence	Probability			Impact & Trend		
WWF Root Causes	Scope			Permanence				Impact		
Ecoregional Assessments: Standard 10. 2006	Scope	Severity					Time			
WCS Living Landscapes	Proportion	Severity		Recovery Time	Probability		Urgency			
Salafsky et al. 2003	Scope	Severity	Contribution	Reversibility	Likelihood		Timing	Magnitude (Scope and Severity)		
Bunnell et al.2009							Immediacy	Magnitude		
Salafsky & Margoluis 1999	Area	Intensity					Urgency			
Wisdom et al. 2003	Spatial Extent								Timeframe required	
Case Study: Caribbean										Persistence
Florida WAP	Scope	Severity		Irreversibility				Degree to which they contribute		
Draft NE Lexicon	Spatial Extent	Intensity		Reversibility	Likelihood of Impact and Occurrence	Cumulative and Compounding	Immediacy		Duration	Persistence

very high (71-100%), *high* (31-70%), *medium* (11-30%) and *low* (1-10%). The Ecoregional Assessment and Biodiversity Vision Toolbox (2006) categorizes *scope* of threats and their *severity* to the target occurrences and areas as *widespread* (>50% are affected by the threat), *common* (10-50%), and *limited* (<10%). Salafsky et al. (2003) rated *scope* much differently and subdivided *scope* into *scope (spatial)* and *scope (percentage of targets)*: *Scope (spatial)* is defined as the area of the project site (or target occurrence) affected by a threat within 10 years (4 = *throughout* (>50%), 3 = *widespread* (15 – 50%), 2 = *scattered* (5 – 15%), 1 = *localized* (< 5%)). *Scope (percentage of targets)* is defined as the number of target occurrences affected by a threat within 10 years (4 = *most or all* (>50%), 3 = *many* (25 – 50%), 2 = *some* (5 – 25%), 1 = *few* (< 5%)).

Intensity

The NE Draft Lexicon defines *Intensity* similar to the way others define *severity* of threat. The term *severity* was used more often by conservation organizations and throughout the literature than *Intensity*. Other than in the NE Draft Lexicon, the term *Intensity* was only used in Salafsky and Margoluis 1999.

NatureServe (2012) and others WAPS (e.g. Florida Wildlife Conservation Strategy) do not use the past threats to describe threat impact, considering only present and future threats, whereas IUCN allows for past, ongoing, or future. NatureServe, IUCN, CMP, TNC, WWF all use a similar time frame for assessing the *severity* of threats either within a 10-year window or three species generation time frame whichever is longer (not to exceed 100 years). However, TNC (2000, 2007) also measures *severity* as the level of damage to the conservation target that can reasonably be expected within 10 years under current circumstances. TNC (2007) makes note that some threats, such as climate change or invasive species may not fully express themselves over a 10-year time frame. To this end, practitioners may wish to consider a longer time horizon for some threats if appropriate but should be sure to document their decisions. Similar effort such as Florida WAP (2005) and Salafsky et al (2003) measure the degree to which a threat has an impact on the viability/integrity of targets within the project area within 10 years only.

In the NE Draft Lexicon, the proposed categories for scoring/ranking the *severity* of threats are *high*, *medium* and *low*; and are similar to TNC (2007) and CMP (2007) that measures *very high*, *high*, *medium*, and *low*. IUCN categories for *severity* include *very rapid*, *rapid*, *slow*, and *negligible* (IUCN 2012). CMP (2007) and WWF (2007) scored *severity* by percentages and similar category terms: *Very High* (71-100%), *High* (31-70%), *Medium* (11-30%), and *Low* (1-10%). NatureServe (2012) is also scored by percentages, but by different category terms: *extreme* (71-100%), *serious* (31-70%), *moderate* (11-30%), *slight* (1-10%). Salafsky et al (2003) rated *severity* much differently (4 = *serious damage or loss*, 3 = *significant damage*, 2 = *moderate damage*, 1 = *little or no damage*).

Reversibility

The NE Draft Lexicon defines *Reversibility* as the degree to which the impact of the threat is reversible. *Reversibility* was used by different conservation organization and the literature as well as the terms *irreversibility* and *permanence*.

The NE Draft Lexicon scores *Reversibility* with a yes/no option. CMP (2007) and WWF (2007) ranks/score *permanence (irreversibility)* as *very high* - the effects of the threat cannot be reversed, it is very unlikely the target can be restored, and/or it would take more than 100 years to achieve this; *high* - the effects of the threat can technically be reversed and the target restored, but it is not practically affordable and/or it would take 21-100 years to achieve this; *medium* - the effects of the threat can be reversed and the target restored with a reasonable commitment of resources and/or within 6-20 years; and *low*- the effects of the threat are easily reversible and the target can be easily restored at a relatively low cost and/or within 0-5 years.

While Salafsky et al. (2003) scored/ranked *Reversibility* numerically: 4 = *irreversible* e.g., extinction, 3 = *reversible with difficulty*, 2 = *reversible with some difficulty* and 1 = *easily reversible*.

Likelihood of Impact and Occurrence

The NE Draft Lexicon uses similar terms to those found in the literature, *likelihood* and *probability*, but was only seen in Salafsky et al. (2003), WWF (2002), and WCS (2002). The NE Draft Lexicon scored *Likelihood of Impact and Occurrence* as *high*, *medium*, *low*, and *none*. Salafsky et al. (2003) score/ranked *likelihood* as the probability that a threat will occur within the next 10 years numerically: 4 = *existing threat* (100%), 3 = *high probability* (50-99%), 2 = *moderate probability* (10-49%) and 1 = *low probability* (0-9%).

Cumulative and Compounding

No similar terms or scoring/ranking criteria was found during this literature search.

**Internal note: Do we need to revisit whether to should include Cumulative and Compounding?

Immediacy

The NE Draft Lexicon defines *Immediacy* as the temporal scale of the threat. Other interchangeable terms such as *urgency* (Salafsky and Margoluis 1999, WCS 2002, CMP 2007) and *timing* (Salafsky et al. 2003 and Ecoregional Assessment and Biodiversity Vision Toolbox 2006,) as well as *immediacy* (Bunnell et al. 2009 and NatureServe 2012) were found during the literature search.

The NE Draft Lexicon scored *Immediacy* as *long term*, *near term*, and *now*, which is similar to NatureServe (2012) and Salafsky et al. (2003). NatureServe (2012) scores *timing (Immediacy)* as *high* (continuing), *moderate* (could happen in the short term), *low* (could happen in the long term), and *insignificant/negligible* (only in the past and unlikely to return). This scoring was based on Birdlife International and draft proposed IUCN-CMP (and NatureServe) scoring of threat timing. Salafsky et al. (2003) defined *timing* as the time until a threat will start having impact on targets and scored it numerically: 4 = *current* (< 1 year), 3 = *imminent* (1-3 years), 2 = *near-term* (3-10 years), and 1 = *long-term* (> 10 years). Bunnell et al. (2009) scored *Immediacy* of the threat as *high*, *medium* and *low*.

Duration

The NE Draft Lexicon scored *Duration* as *less than a year*, *1–5 years*, *6–10 years*, or *greater than 10 years*. One term found during the literature search is *timeframe required* (to implement effective treatments across the ecoregion); although no scoring was available (Wisdom et. al 2003). No terms analogous to *Duration* were found.

**Internal note: Does this mean we should revisit inclusion of Duration?

Persistence

The NE Draft Lexicon defines *Persistence* as the “degree to which the cause (threat) is persistent over time in the absence of action” and scored it as *inevitable*, *highly likely*, *probable*, *unlikely*, and *none*. In this search of the literature, only one source was found that used *Persistence* (Case Study 2006). This use of “persistence” was not analogous to that defined in the NE Draft Lexicon as it referred to the persistence of the target as opposed to the threat, i.e., *Persistence* was defined as “the degree to which a particular habitat, community or population will tend to retain its present status should the current level of human pressure on the system remain unchanged. *Persistence* was scored/ranked as *highest*, *high*, *moderate*, *low*, and *unknown* (Case Study 2006).

Threat terms used by others with no analogous term in the NE Draft Lexicon

Contribution

TNC (2000, 2007) similarly define *contribution* as the expected contribution of the source, acting alone, to the full expression of a stress (as determined in the stress assessment) under current circumstances (i.e., given the

continuation of the existing management/conservation situation). TNC (2007) scored/ranked *contribution* as *very high* - the source is a very large contributor of the particular stress; *high* - the source is a large contributor of the particular stress; *medium* - the source is a moderate contributor of the particular stress; and *low* - the source is a low contributor of the particular stress. Salafsky et al. 2003 also include *contribution* as a threat assessment term, defining it as the degree to which a threat causes multiple and cascading threats and/or has widespread ecological impact, scoring it numerically as 4 = *very high*, 3 = *high*, 2 = *moderate*, and 1 = *low*.

Impact/Magnitude

NatureServe (2012) defined threat *impact* (or *magnitude*) as the degree to which a species or ecosystem is observed, inferred, or suspected to be directly or indirectly threatened in the area of interest. The *impact* of a threat is based on the interaction between assigned *scope* and *severity* values, and includes categories of *very high* (75% declines), *high* (40%), *medium* (15%) and *low* (3%). Threat *impact* is calculated considering only present and future threats. IUCN (2012) has a similar definition and scoring. Threat *impact* scores are a measure between *scope* and *severity* values and include categories of *high impact*, *medium impact*, *low impact*, and *negligible/no impact* (IUCN 2012). However, WWF (Ervin 2002) defined *impact* differently as “the degree, either directly or indirectly, to which the threat affects overall protected area resources.”

Conservation Actions assessment for SGCN

Preliminary terms were chosen by NEFWDT to describe conservation action assessment and include *Feasibility*, *Effectiveness*, *Funding Availability*, *Capacity Internal and External*, *Immediacy*, *Sequencing*, *Support for Action*, *Duration*, and *Cost Estimate*. These terms were then compared with terminology for conservation action assessment found through the literature search (Table 2). The same or analogous terms were found for *Feasibility (probability*

Table 2. Specific Conservation Action Variables Used by Different Systems Variables in each column are used in an analogous fashion.

Systems	Variables Used by Different Systems									
NatureServe April 2012	Probability of Success			Availability of Funds	Personnel to carry out such actions & Legal frameworks					
IUCN 2012	Probability of success			Availability of Funds	Personnel to carry out such actions & Legal frameworks

Georgia WAP	Probability of Success		Providing Multiple Benefits for High Priority Species/Habitats & Overall Importance	Addressing Un(der)funded Needs		Timeliness or Urgency	Connections with Other Conservation Actions	Building Public Support		
Florida WAP	Feasibility		Benefit				Sequencing (not included but mentioned as important)			Cost
Davis et al. 2003	Feasibility							Flexibility (engaging stakeholders)		
Bunnell et al.2009	Feasibility									
Draft NE Lexicon	Feasibility		Effectiveness	Funding Availability	Capacity Internal and External	Immediacy	Sequencing	Support For Action	Duration	Cost Estimate

of success), *Effectiveness* (benefit), *Funding Availability*, *Capacity Internal and External* (leadership and support & legal framework), *Support for Action* (stakeholder support), *Duration*, and *Cost Estimate*. Further details regarding the definition of the terminology and scoring/ranking criteria are described below and also included in Appendix B. Specific conservation action variables used by different systems were compared in an analogous fashion.

Feasibility

The NE Draft Lexicon defined *Feasibility* as conservation action that is capable of being done or carried out; capable of being used or dealt with successfully; reasonable, likely. *Feasibility* was a common term used to evaluate conservation actions found within the literature (Sutter and Szell 2006, TNC 2003 and 2007, CMP 2007, NC WAP 2005, FL WAP 2005, Davis et al. 2003, Bunnell et al. 2009). TNC (2006) elaborated on this definition as a measure of how likely conservation success (based on conservation of the majority of conservation targets by implementation of priority strategies) can be obtained at a conservation area. Further, *Feasibility* is a combination of the ease of implementation of the project (for example, logistics, number of landowners) and the ecological integrity of the site (TNC 2006). TNC (2007) emphasizes that overall *Feasibility* of a strategic action is based on three factors: Lead individual and institution, the ability to motivate key constituencies, and the ease of implementation. NC and Florida WAPS more simply define *Feasibility* as a cost/benefit analysis and the ease of implementation, respectively. Bunnell et al. 2009 adds that *Feasibility* has little relation to status or risk, but is critical in planning and establishing priorities. NatureServe (2012), IUCN (2012), and the Georgia WAP (2005) used a different term, *probability of success*. The Georgia WAP (2005) defines *probability of success* as the conservation action is likely to succeed because it employs tested methodologies, has strong support from stakeholders, and has clearly identified and readily achievable objectives.

The NE Draft Lexicon scored/ranked *Feasibility* as 1 (*low capacity for being done/carried out*) to 3 (*high capacity for being done/carried out*). TNC (2003) did score/rank three factors that contribute to *Feasibility* from *very high*, *high*, *medium*, and *low* for lead individual and institution, the ability to motivate key constituencies, and the ease of implementation. CMP (2007) also scores/ranks *Feasibility* on a similar scale (*very high* to *low*) and Bunnell et al. (2009) *high*, *medium*, and *low*.

Effectiveness

The NE Draft Lexicon defines *Effectiveness* as producing a decided, decisive, or desired effect. Only TNC (2007) used a similar term, *effective management potential* which was defined as the potential for an entity to be effective in implementing activities to achieve stated protection and/or management objectives. Other analogous terms that were used were *benefit*, *potential impact leverage*, and *providing multiple benefits for high priority species/habitats & overall importance*. *Benefit* was further defined as *scope and scale of outcome*, *contribution*, *duration* and *leverage* by TNC (Higgins et al. 2007). TNC (Low 2003) also further defined *benefit* as *threat abatement*, *viability*, and *enhancement*, as well as *contribution*, *duration*, *leverage*. Both the North Carolina (2005) and Florida (2005) WAPS included the term *benefit* in their conservation action assessments. CMP (2007) used the term *potential impact* and asked the question if implemented will the strategy lead to desired changes in the situation at the project site?

The NE Draft Lexicon scores *Effectiveness* as 1 (*low probability of having desired effect*) to 3 (*high probability of having desired effect*). *Effective management potential* was ranked by TNC (Higgins et al. 2007) as *very good* (*adequate likelihood*), *fair* (*inadequate likelihood*) and *poor* (*no likelihood*) of activities achieving the designated intent. CMP (2007) scoring/ranking of *potential impact* was *very high*, *high*, *medium*, and *low* for contributing to meaningful threat mitigation or target restoration. TNC (Low 2003) scored the individual components under *benefit* (also *threat abatement*, *viability*, *enhancement*, *contribution*, *duration* and *leverage*) on a similar scale (*very high* to *low*). Florida WAP also ranked similarly.

Funding Availability

The NE Draft Lexicon described *Funding Availability* as present and ready for use; at hand; accessible; capable of being gotten; obtainable. Several other organizations noted the importance of *Funding Availability* when assessing

conservation actions (e.g. NatureServe 2012, IUCN 2012, TNC 2003 and 2006). Funding may come from both private and public sectors and be available through a variety of mechanisms and sources, such as appropriation of public funds, contributions by donors, endowment, and other sources (Low 2003) or match opportunities (NC WAP 2005).

The NE Draft Lexicon scored/ranked *Funding Availability* as 3 (*funding in hand*), 2 (*funding is available but no earmarked*), and 1 (*no funding*). TNC (2006) ranked *funding* on an ordinal scale *very high, high, medium, or low* and then translated into numeric values from 1-4 (*low* = 1, *very high* = 4) and funding was weighted by 2. TNC (Low 2003) ranked funding on a similar scale, *very high to low*.

Capacity Internal and External

The NE Draft Lexicon described *Capacity Internal and External* as the facility or power to produce, perform, or deploy individual actions not the plan as a whole. NatureServe (2012) and IUCN (2012) described similar actions such as the *personnel to carry out such actions & legal frameworks* similar to TNC (Low 2003) with *leadership and support & legal framework* and TNC (2003) *project leadership and support*. Low (2003) describes the necessary *staff leadership, multidisciplinary team* (could be onsite or partner organizations), and *institutional leadership* (some combination of institutions is providing leadership for developing and implementing conservation strategies at the project area). *Legal framework* includes the existence of an appropriate framework of protection tools and policy instruments that can be deployed to secure enduring conservation results at the project area (Low 2003).

The NE Draft Lexicon separate *capacity* into 2 questions – internal and external and ranked each as 3 (*all capacity to perform is in place*), 2 (*some, but inadequate*), and 1 (*no capacity*). TNC (Low 2003) ranks *leadership and support & legal framework* on a scale of *very high, high, medium, and low*.

Immediacy

The NE Draft Lexicon defined *Immediacy* as when something is important or urgent because it relates to a situation that is happening now. Similarly, the Georgia WAP (2005) used the terms *timeliness* or *urgency* as the conservation action that addresses a problem that is particularly urgent. If this specific action is not implemented or continued in the next ten years, the state will experience a significant loss of biological diversity or habitat quality. No other sources in the literature search produced the term *Immediacy* or an analogous term.

The NE Draft Lexicon ranked *Immediacy* at 3 (*now*), 2 (*near term*), and 1 (*long term*).

Sequencing

The NE Draft Lexicon defined *Sequencing* as an action that is one of several that must be done in some order. In the Florida WAP (2005) *Sequencing* was not included, but mentioned as an important conservation action to consider. In the Georgia WAP (2005) *connections with other conservation actions* serves as a critical component that enables or facilitates one to several other important conservation measures. Without this component, other efforts will be crippled or made ineffectual. TNC (2003) offered a *strategic approach* term. No other literature sources from this search yielded terms analogous to “sequencing.”

The NE Draft Lexicon ranks *Sequencing* as 1 (*step 3 or more*), 2 (*step 2*), 3 (*first step of 2 or more*), or 4 only step in sequence and will add a factor of dependency of *yes/no*.

Support for Action

In the NE Draft Lexicon *Support for Action* was defined as social/political/landowner ability to approve of an action and help it to be successful. TNC (2006) suggested the *presence of support in key agencies/partners and stakeholder support/opportunity* as well *community & constituency support* (TNC (Low 2003)) as conservation action assessment terms similar to *Support for Action*. NC WAP (2005) and Georgia WAP (2005) offer *partnerships/opportunity* and

building public support, respectively, as similar conservation assessment terms. Davis et al. 2003 also contributed the *flexibility* (engaging stakeholders).

The NE Draft Lexicon ranks *Support for Action* as 1 (*no support*) to 3 or 5 (*very high support*).

TNC (2006) ranked *presence of support in key agencies/partners* and *policy and constituency (stakeholder) support* on an ordinal scale (*low, medium, high, or very high*) for assessing relative conservation opportunities. Both *presence of key agencies/partners* and *policy and constituency (stakeholder) support* were weighted by 1.5. Similarly, TNC (Low 2003) ranked *community & constituency support* as *very high, high, medium, and low*.

Duration

Duration is another term that the NE Draft Lexicon intends to include. In both TNC (2006) and TNC (Low 2003) *Duration* was included as a subheading under *benefits* and subsequently placed in the similar column as *Effectiveness* for the NE Draft Lexicon Terminology). However, it could also be included as a stand-alone term as well. TNC (Higgins et al. 2007) includes the term *tenure* defined as the duration of the commitment to the protection and/or management activities. *Tenure* is measured by *very good* (permanent) (or in perpetuity), *good* (long-term commitment) (25 years or greater), *fair* (short-term commitment) (less than 25 years) commitment, or *poor* (no Commitment).

****Internal note:** It is unclear whether NE Lexicon wanted “duration” to reflect the time commitment required (i.e., the need for sustained action over time vs. short term action). The TNC use seems to be about the likelihood of a sustained duration i.e., the time commitment available. NE will need to be clear on this and draw the comparison based on what we determine.

Cost Estimate

The NE Draft Lexicon defines *Cost Estimate* as the approximation of the cost of a program, project, or operation. The *Cost Estimate* is the product of the cost estimating process. The *Cost Estimate* has a single total value and may have identifiable component values. A few of the literature sources provided *cost* as a conservation action assessment consideration. TNC (2007) further broke down *cost* as *one time cost, annual costs, staff time, and number of years*. TNC (Low 2003) defined *cost* as *cost in discretionary dollars* – estimate the total cost of implementing the Strategic Action, including staff time, in unrestricted or discretionary dollars that are available to the project. The Florida WAP (2005) defines *cost* as the order of magnitude in dollars with the total cost of implementing the action estimated for the time horizon of the action, but no longer than 10 years.

****Internal note:** NE will need to be clear about how we want this term applied, annual costs? Total costs? For duration? For no more than 10 years?

TNC (Low 2003) ranked *cost* as *very high* (total cost is \$1,000,000 or more), *high* (total cost is \$100,000 or more), *medium* (total cost is \$10,000 or more), and *low* (total cost is less than \$10,000).

Identification of SGCN

Most SWAPs refer to the National and State Rank criteria as the develop SGCN list in addition to other lists from Birds of Conservation Concern or Other approved or peer reviewed regional plans and systems including (Partners in Flight, Bird Conservation Regions, U.S. Fish and Wildlife Service, American Fisheries Society etc.). Further details regarding the definitions of the scoring/ranking criteria are included in Appendix C.

This literature search included the Arizona SWAP, which did not base their selection of SGCN on such criteria. Arizona SWAP notes "This vulnerability assessment did not use available national or global vulnerability rankings (e.g.,

NatureServe) because rankings based on species evaluations across their entire geographical distribution are too coarsely scaled. Also no attempt to match rankings done previously by the Department (e.g., Wildlife of Special Concern in Arizona, or rankings done by other agencies or entities, e.g., U.S. Forest Service Southwestern Region Sensitive Animals list, Bureau of Land Management sensitive species list for Arizona, Birds of Conservation Concern 2008, Southwest Partners in Amphibian and Reptile Conservation (PARC) again because of issues of scale, as well as differing management and conservation priorities across agencies, NGOs, etc. It is important to note that lists compiled by other entities are based on other, perhaps similar or dissimilar, criteria in different geographic and management settings, therefore the resulting vulnerability ranks herein are not meant to replace, update or invalidate any of those lists."

Abundance and Trends of SGCN

Florida WAP (2005) and Mississippi WAP (2005) used similar categories for describing species trends: *Declining*, *Stable*, and *Increasing*. Florida WAP (2005) also adds the *Unknown Category*. Mississippi assigned each category a point value for species abundance and trends. For example for measuring species: 4 points - *Species endemic to State*, 3 points - *State encompasses >25% of the species' range*, 2 points - *State encompasses 5-25% of the species' range*, and 1 point - *State encompasses < 5% of the species' range*. NatureServe (2012) divides trends into long-term and short-term and further categorized them by letter and corresponding percentage value. Further details regarding abundance and trend of SGCN are included in Appendix D.

Habitat Conditions for SGCN

EPA (2012) used a letter scoring system (A-D) of assessment of wetland ecosystem condition. For example an A category would correspond with highest quality habitat - the landscape context contains largely natural habitats that are minimally fragmented with few stressors; the size is large or above the minimum dynamic area, the vegetation structure and composition, soils, and hydrology are functioning within natural ranges of variation; invasives and exotics (non-natives) are present in only minor amounts, or have or minor negative impact; and many key plant and animal indicators are present. When evaluating terrestrial habitat, the Arkansas WAP (2006) used the categories *poor level*, *fair level*, *good level*, and *very good level* and weighted a range of measurements to assess the relative health of associated key factors, which in turn reflect the integrity of the associated habitat. Georgia WAP (2005) acknowledged that data on abundance and condition of habitats are not sufficient to assign quantitative scores or values for most habitat types. Further details regarding assessing habitat condition of SGCN are included in Appendix E.

8	We are developing a decision model with Cornell based on the above, plus others	3/5/2013 2:44 PM

Q4 Information is often available to assess the distributions of species, even though it may vary widely in quality. With the exception of a certain groups, such as birds, there are little or no hard data about trends in abundance that could be used to select SGCN. What is your opinion about including in our common lexicon some qualitative terms to describe trends in abundance (check all that apply)?

Answered: 14 Skipped: 1

	Strongly agree	Agree	Disagree	Strongly disagree	Total Respondent
We recommend NatureServe's population/status ranking terminology	30.77% 4	38.46% 5	30.77% 4	0% 0	13
Birds are the only group with legitimate abundance trend data	0% 0	28.57% 4	71.43% 10	0% 0	14
Birds are a good model of a lexicon for abundance	0% 0	61.54% 8	38.46% 5	0% 0	13
For all SGCN we should assign "stable, increasing, unknown"	15.38% 2	69.23% 9	7.69% 1	7.69% 1	13
For every population we should assign "stable, unknown"	0% 0	38.46% 5	38.46% 5	23.08% 3	13
Qualitative terms should NOT be used to describe abundance	7.69% 1	15.38% 2	61.54% 8	15.38% 2	13
Our common lexicon should NOT address abundance	7.69% 1	7.69% 1	61.54% 8	23.08% 3	13

#	Comment	Date
1	Even qualitative data can be useful when attempting to prioritize (generally inevitable!) an array of topics	3/12/2013 10:45 AM
2	we may not have enough data for populations or quantitative vs. qualitative	3/10/2013 9:15 AM
3	There are many ways to measure and state bird abundance	3/8/2013 6:36 PM
4	Assigning current status in a common lexicon would be appropriate but determining trends may become problematic particularly when trend data is often lacking or with such great uncertainty that it is unreliable.	3/8/2013 2:23 PM
5	birds are not under PFBC jurisdiction; defer to PGC. For population, it is often not known. If abundance is known, why not use it in the lexicon?	3/7/2013 4:56 PM
6	Our common lexicon should make it possible to say that we don't always know "the" answer. For a regional assessment we need information	3/7/2013 3:50 PM
7	For non-T&E species, it is rare for us to have enough detail to discuss population. Although we don't like to admit it, we use Qualitative measures constantly to justify actions. No reason not to include them within the SWAP.	3/7/2013 3:07 PM
8	There will be some difficulty in assigning status, but we should try to agree on an approach. For "populations" there will be issues of addressing what comprises a "population." Will we need to understand population status to assign status to species?	3/7/2013 12:59 PM

Q5 Species distributions may be described using many different spatial units. Check all that apply to our common lexicon.

Answered: 13 Skipped: 2

Answer Choices	Responses
State, county, or town boundary	84.62% 11
Management or planning districts	46.15% 6
Watersheds	76.92% 10
Habitat patches	69.23% 9
Population points	38.46% 5
Total Respondents: 13	

#	Other (please specify)	Date
1	Ecoregions would be our top choice for terrestrial species. Perhaps political units (state / county / township) could be summarized in tabular for geographic clarity but should not be the primary spatial units.	3/12/2013 10:58 AM
2	don't have enough data on the last 2	3/10/2013 9:33 AM
3	will be data driven	3/10/2013 9:18 AM
4	Unsure of the definition of a "population point".	3/7/2013 5:17 PM
5	Biophysical regions, eco-regions	3/7/2013 4:04 PM
6	We need geospatial units that are fine enough to be descriptive and coarse enough to buffer points and allow us to compensate for localized changes that are problematic with point locations. We don't want to redraw the map every two weeks. Our habitat patches can change too rapidly.	3/7/2013 3:15 PM
7	not exactly sure what is meant by "population points"	3/7/2013 1:14 PM
8	Poorly written question	3/5/2013 2:47 PM
9	Ecoregion	3/5/2013 11:39 AM

Q6 Each SWAP is supposed to consider the distribution and abundance of all “major groups” of species (taxonomic groups or guilds) when selecting SGCN. Such data are tracked for some species by Natural Heritage programs, but in many cases, SGCN are not tracked by any formal program. For our common lexicon, which terms do we need to define in order to describe the data that are available for SGCN distribution?

Answered: 13 Skipped: 2

Answer Choices	Responses
We do NOT need to describe distribution data	0% 0
Data source	76.92% 10
Scale	76.92% 10
Resolution	76.92% 10
Precision	61.54% 8
Age	76.92% 10
Quality	76.92% 10
Type	76.92% 10
Contact	69.23% 9
Link	46.15% 6
Sensitivity	84.62% 11
Total Respondents: 13	

#	Other (please specify)	Date
1	We generally screen out imprecise occurrences = not a factor if that is generally true? Species with data sensitivity issues merit some general discussion.	3/12/2013 10:58 AM
2	is link connectivity or web link?	3/10/2013 9:18 AM
3	Does "age"=date of a record? What is "link"? Does "quality" refer quality of location or species identification? A "confidence" field is needed.	3/7/2013 4:04 PM
4	I checked everything, but I am not sure what this question is asking. Do we need to define these terms or are we determining if these are fields that need to be included in some metadata structure? Or am I misunderstanding? The system won't let me leave this blank.	3/7/2013 3:15 PM
5	While it would be ideal to have this information for species not "tracked" by NHP's, the degree to which we will be able to provide such information will be very inconsistent.	3/7/2013 1:14 PM
6	Huh?	3/5/2013 2:47 PM

Q7 Many different types of data are available to represent distributions of SGCN. Please select all that you believe should be described in our common lexicon.

Answered: 13 Skipped: 2

Answer Choices	Responses	
Element Occurrence	92.31%	12
Source Feature	69.23%	9
Presence/absence points	61.54%	8
Habitat classes	76.92%	10
Habitat patches	69.23%	9
Habitat suitability model	30.77%	4
Niche model	7.69%	1
Habitat capability model	23.08%	3
Buffer	30.77%	4
Total Respondents: 13		

#	Other (please specify)	Date
1	Migration / connectivity corridors are sometimes a key data type. Observation points can be tracked in our "faunal heritage database" to promote evaluations of species status, but we usually subset a more refined type of data for flagging via environmental review or triggering management activity. Modeling is generally not an acceptable alternative.	3/12/2013 10:58 AM
2	not sure any of the last 5 are available in many states but should be included if possible	3/10/2013 9:33 AM
3	the latter 5 are likely not to be available	3/10/2013 9:18 AM
4	Confusing. We assume "class" refers to habitat type and "patch" to the habitat where a species is found.	3/7/2013 4:04 PM
5	I checked everything but I don't understand what this question is asking me. What will it mean if I check a box? The system won't let me leave this blank.	3/7/2013 3:15 PM
6	For those that we did not agree should be described, we would agree that they could be included if all we are doing is indicating their availability or providing a link or reference.	3/7/2013 1:14 PM

Q8 For each SGCN, we need to identify habitat associations. Do you accept a crosswalk to the Northeast Terrestrial and Aquatic Habitat Classifications as a common standard for describing SGCN habitats?

Answered: 13 Skipped: 2

Answer Choices	Responses	
Yes	69.23%	9
No	0%	0
Don't know	30.77%	4
Total Respondents: 13		

#	Comment required if answer is no.	Date
1	but we will use our more specific system as well	3/10/2013 9:34 AM
2	but we will use our more specific system as well	3/10/2013 9:20 AM
3	Depends upon how the crosswalks will be applied. Both classifications are great, but uncertain of the useable scale for resource managers.	3/7/2013 5:28 PM
4	VT uses natural community classification which dovetails w/ this model but natural communities is at a finer scale.	3/7/2013 4:05 PM
5	We need to determine if these classifications actually facilitate better management. Other states have abandoned similarly complex models because staff couldn't apply them. They adopted more basics systems like the National Landcover Dataset. On a separate note, we often don't know enough about our SGCN to talk intelligently about their habitat tolerances.	3/7/2013 3:19 PM
6	Caveat -- there still needs to be significant work done to QA/QC both habitat classifications and their applications (mapping) and the crosswalk. We have less concern with the classification approach than we do with the actual data layers (mapping)	3/7/2013 1:25 PM
7	Still doesn't exist for aquatic	3/5/2013 2:49 PM

Q9 The RCN program funded habitat classifications, habitat mapping, and the "Geospatial Condition Analysis", which will provide relative indices of condition for each class of habitat. The indices will be based on available spatial data, such as conservation status, resiliency, road density, patch size, etc. The scores can be applied at any relative scale, such as the whole region or within states, answering such questions as where is the highest ranked patch of pine barrens in New Jersey? In summary, this project will define and estimate specific parameters to describe the relative condition of each habitat class, in each state, and across states. Do you agree that this approach will satisfy our needs with regard to a common lexicon for habitat condition?

Answered: 13 Skipped: 2

#	Comment required if answer is no.	Date
1	Maine needs more info on "geospatial condition analysis" Of course, our small patches of pine barrens are inconsequential relative to those in NJ, but jurisdictions attempting to conserve species at risk near range limits can't always cope with such comparisons!	3/12/2013 11:02 AM
2	its a good start	3/10/2013 9:34 AM
3	its a good start	3/10/2013 9:20 AM
4	Unclear about the scope of this question	3/7/2013 5:28 PM
5	We are not willing to adopt these systems until we have determined their accuracy. If the habitat map does not accurately represent "on the ground" conditions, we won't use it to make important planning decisions.	3/7/2013 3:19 PM
6	It will be the only game in town across a regional scale, so yes. Would like the capability to include other more local approaches that exist now or in the future.	3/7/2013 1:25 PM

Q10 Both NEPARC and NEFWDTC have adopted an approach to select Species of Greatest Conservation Need (SGCN) using conservation need and responsibility as screening factors. In this approach, need was measured by the proportion of Northeast states identifying a species as an SGCN, and responsibility was measured by the proportion of a species distribution occurring in the Northeast. Is your agency willing to work toward developing a similar common practice to select SGCN?

Answered: 13 Skipped: 2

Answer Choices	Responses	
Yes	69.23%	9
No	30.77%	4
Total	13	

Q11 Above, the distribution-based "responsibility" factor is fairly objective to measure, however "conservation need" is very inconsistently defined across organizations. Which of the following terms would you be willing to accept as common descriptors of the overall "conservation need" for a species, considering the cumulative effect of all the threats that impact a species (check ALL that apply):

Answered: 13 Skipped: 2

Answer Choices	Responses
Immediacy [needs conservation now vs. later]	92.31% 12
Certainty [need is nearly certain vs. uncertain]	92.31% 12
Extent [current impacts are sustainable vs. not sustainable]	76.92% 10
Reversible [impacts may be reversed vs. irreversible]	92.31% 12
Total Respondents: 13	

#	Other (please specify)	Date
1	Regional endemics (and especially state endemics) may not be getting sufficient priority & are often among the most vulnerable in diversity programs.	3/12/2013 11:09 AM
2	might be others	3/10/2013 9:34 AM
3	we may not be able to determine this for all species	3/10/2013 9:23 AM
4	Concepts (i.e., phrases) are good, but terminology needs to be adjusted. Example: Extent is a geographic term-use Sustainable. Response to 12: Nice try-we want to comment anyway. Categories should provide a gradient of responses	3/7/2013 5:46 PM
5	How does one apply "immediacy" if Action Plans/SWG are supposed to prevent species from becoming endangered	3/7/2013 4:08 PM
6	These terms haven't been explained well enough for me to make an informed decision about what criteria should or should not be considered. The system wouldn't let me leave them all blank, so I checked them all, instead.	3/7/2013 3:29 PM
7	If these terms or similar were used to determine conservation need as opposed to using the NEPARC approach, we would be more comfortable with our 'yes' to 10 above.	3/7/2013 1:44 PM

Q12 Please read the choices above again, and notice each term can be represented by an "either / or" type of category, such as now/later, certain/uncertain. Do you agree that using only 2 or 3 simple categories is a useful approach to achieve consistent assessments of species conservation needs across organizations?

Answered: 13 Skipped: 2

Answer Choices	Responses	
yes	61.54%	8
no	46.15%	6
Total Respondents: 13		

Q13 The questions above describe the use of several categorical factors to summarize the overall conservation need (or degree of threat) as a tool to help select SGCN. Once SGCN are selected, a similar approach could be used to go one step further and assess several categorical factors for each specific threat that is impacting "species x". Do you agree that our common lexicon should include terminology to define categorical factors to assess specific threats, species by species?

Answered: 13 Skipped: 2

Answer Choices	Responses	
yes	84.62%	11
no	15.38%	2
Total Respondents: 13		

Q14 What terms do we need to use to adequately describe key attributes of threats? Check ALL that apply.

Answered: 13 Skipped: 2

Answer Choices	Responses	
Human factors	69.23%	9
Environmental factors	76.92%	10
Biological stress	61.54%	8
Scale	84.62%	11
Extent	84.62%	11
Immediacy	92.31%	12
Reversibility	92.31%	12
Total Respondents: 13		

#	Other (please specify)	Date
1	Duration (acute / chronic). Even scale, extent & reversibility may be useful attributes but not if this planning is not dynamic or feedback via adaptive management is constrained.	3/12/2013 11:09 AM
2	there might be others but not enough time to do here	3/10/2013 9:23 AM
3	Couldn't Biological Stress be an attribute of Human or Environmental factors. Do you mean Biological Factors such as genetic or interspecific competition?	3/7/2013 5:46 PM
4	Use Salafsky et. al. Taxonomy of Direct Threats	3/7/2013 4:08 PM
5	Category, scope, severity	3/7/2013 3:29 PM
6	As a comment to this question and 13 above, we agree that the inclusion of such terminology would be useful, but we may not be in a position to apply it now or in the near future.	3/7/2013 1:44 PM

Q15 In planning, some refer to a natural resource as an "element" or a "target;" others refer to planning processes as "elements", and still others call the desired outcome of implementing planned actions "targets". Is your agency willing to work toward a series of common terms (such as resource, goal, objective, desired outcome, indicator, level) that can be used to connect natural resources to actions and measurable outcomes, so that performance can be tracked logically as progress toward specific results that contribute to larger goals?

Answered: 13 Skipped: 2

Answer Choices	Responses	
Yes	84.62%	11
No	15.38%	2
Total	13	

Q16 Tell us what you think of the following as sequence of terms to link resources to actions to results: Resource; Goal; Objective; Desired outcome; Indicator; Level. Is each term as useful part of the sequence as a whole?

Answered: 13 Skipped: 2

	Useful	Not useful	I do not understand this term	Total
Resource	8 61.54%	0 0%	5 38.46%	13
Goal	12 92.31%	0 0%	1 7.69%	13
Objective	12 92.31%	0 0%	1 7.69%	13
Desired outcome	13 100%	0 0%	0 0%	13
Indicator	12 92.31%	0 0%	1 7.69%	13
Level	5 38.46%	2 15.38%	6 46.15%	13

#	Other (please specify)	Date
1	Goal & desired outcome could be fairly similar, unless one factors more realism! "Level" is too vague without clarification.	3/12/2013 11:20 AM
2	clarify level?	3/10/2013 9:36 AM
3	not sure what level means here	3/10/2013 9:27 AM
4	Should consider defining "indicator", "resource" & "resource". What about "measures" as in "performance measures" that we are required to use as part of Wildlife TRACS.	3/7/2013 6:09 PM
5	Strategies (a way to achieve an objective) and actions (the steps to implementing a strategy)? Would that be too fine-scaled?	3/7/2013 4:12 PM
6	these terms will be useful as the definitions we apply to them and the clarity/distinctions among them.	3/7/2013 2:37 PM

Q17 Do you agree the following terms are useful to describe an adaptive management framework for actions? Check ALL that apply.

Answered: 13 Skipped: 2

	Strongly agree	Agree	Disagree	Strongly disagree	Total
Performance indicator	23.08% 3	61.54% 8	15.38% 2	0% 0	13
Start	7.69% 1	61.54% 8	30.77% 4	0% 0	13

Evaluation cycle	23.08% 3	53.85% 7	23.08% 3	0% 0	13
Data management capacity	0% 0	54.55% 6	45.45% 5	0% 0	11

#	Other (please specify)	Date
1	"Effectiveness" was cited by some staff but may overlap with performance indicator?	3/12/2013 11:20 AM
2	not sure what data capacity means	3/10/2013 9:36 AM
3	please clarify data mgmt capacity	3/10/2013 9:27 AM
4	It's difficult to agree or disagree without definition of the terms.	3/7/2013 6:09 PM
5	Such terms should align with Wildlife TRACS adaptive mgmt module (if there is one).	3/7/2013 4:12 PM
6	I don't understand the term "Data management capacity" so I clicked "Disagree"	3/7/2013 3:37 PM
7	In the context of SWAPs and the level of action detail and specificity that needs to be in SWAPs, most of these terms go "too far." They are useful for adaptive management of projects, but SWAPs are not meant to be project plans.	3/7/2013 2:37 PM

Q18 In SWAPs, actions are supposed to be linked to specific threats. However, that relationship is not always direct or obvious. Yet, in order to prescribe the right kind of action, specific attributes of the threats addressed need to be identified. Are the following terms useful to help describe how a particular action might be related to or address certain threats? Rate each one.

Answered: 13 Skipped:

	Useful	Not useful	Total
Threat addressed by action	84.62% 11	15.38% 2	13
Human factors addressed by action	83.33% 10	16.67% 2	12
Environmental factors addressed by action	83.33% 10	16.67% 2	12
Biological stresses addressed by action	83.33% 10	16.67% 2	12
Expected direct benefits	84.62% 11	15.38% 2	13
Expected indirect benefits	75% 9	25% 3	12
Expected change in resource status	69.23% 9	30.77% 4	13

#	Other (please specify)	Date
1	All seem reasonable concepts. An implementation phase might better reveal which are more useful than others.	3/12/2013 11:20 AM
2	If we are talking about wildlife, we should really stick to wildlife rather than a calling it a resource.	3/8/2013 5:18 PM
3	Not sure what this is trying to address.	3/7/2013 6:09 PM
4	These sound good but we don't know if all are needed or if these are comprehensive.	3/7/2013 4:12 PM
5	Change in threat status/level.	3/7/2013 2:37 PM

Q19 Many organizations use the S.M.A.R.T. system to ensure that goals are developed with enough detail to make implementation possible. If you are not familiar with this concept, please google it. Do you agree that the common lexicon should use a similar model, including who, what, where, when etc. to describe actions?

Answered: 13 Skipped: 2

Answer Choices	Responses	
Yes	84.62%	11
No	15.38%	2
Total Respondents: 13		

Q20 Do you agree it is valuable to have a common way to describe the feasibility and efficacy of proposed conservation actions?

Answered: 13 Skipped: 2

Answer Choices	Responses	
yes	84.62%	11
no	15.38%	2
Total	13	

Q21 Is your agency willing to work toward a common approach to prioritizing actions, where factors such as the urgency of the threat addressed are considered in conjunction with the feasibility, cost and efficacy of the proposed action?

Answered: 13 Skipped: 2

Answer Choices	Responses	
Yes	76.92%	10
No	23.08%	3
Total	13	

Q22 Do you agree the following terms are useful to categorize actions for prioritization? Check ALL that apply.

Answered: 13 Skipped: 2

	Stongly agree	Agree	Disagree	Strongly disagree	Total
Expected effectiveness	30.77% 4	61.54% 8	7.69% 1	0% 0	13
Cost estimate	7.69% 1	76.92% 10	15.38% 2	0% 0	13
Funding availability	7.69% 1	61.54% 8	30.77% 4	0% 0	13
Implementer availability	0% 0	69.23% 9	30.77% 4	0% 0	13
Start date	7.69% 1	46.15% 6	46.15% 6	0% 0	13

Q23 Species distributions, habitat conditions, threats and actions may all be related spatially. The "eight required elements" for SWAPs refer to spatially explicit actions. For example, an action or threat could apply to one, many, or all patches of a habitat type, or only those in a certain town. Which spatial units do we need to accommodate in our lexicon in order to describe the location actions are intended to be implemented? Check all that apply, recognizing that some may be used in combination.

Answered: 13 Skipped: 2

Answer Choices	Responses	
State, county, or town boundary	92.31%	12
Management or planning districts or conservation zones	61.54%	8
Watersheds	61.54%	8
Habitat classes	46.15%	6
Habitat patches	53.85%	7
Population points	30.77%	4
Total Respondents: 13		

#	Other (please specify)	Date
1	Ecoregions for terrestrial species & watersheds for aquatic/ riparian species seem preferable as overall spatial units. Political units or management / planning / conservation districts are secondary-scale units at best.	3/12/2013 11:20 AM
2	last 2 if possible but likely not to have enough data	3/10/2013 9:36 AM
3	don't think we'll have the last 2 for many species or habitats	3/10/2013 9:27 AM
4	Implementation happens at a finer scale (e.g., site) which is not represented by these categories. For Questions 19-21: seem bias to obtain a "yes".	3/7/2013 6:09 PM
5	ecoregions	3/5/2013 12:01 PM

Q24 Identifying data gaps and uncertainties is a requirement throughout SWAPs, for the purpose of framing the adaptive management process. Is your agency willing to adopt some common ways to describe uncertainties, so they can be consistently addressed by monitoring, performance tracking, and/or research in an adaptive management context?

Answered: 12 Skipped: 3

Answer Choices	Responses
Yes	91.67% 11
No	8.33% 1
Total	12

Q25 Identifying data gaps and uncertainties applies to multiple SWAP elements: species/habitat distribution, status, and condition, and also threats and actions. Therefore, our common lexicon needs to accommodate a means to identify uncertainties and corresponding monitoring or research for each SWAP element. Are the following terms sufficient to describe different general TYPES of uncertainty that might be identified across all SWAP elements, even though some of the suggested types may not apply to all SWAP elements?

Answered: 12 Skipped: 3

	Agree	Disagree	Don't know	Total
Uncertainty of Causality	75% 9	0% 0	25% 3	12
Uncertainty of Effectiveness	83.33% 10	0% 0	16.67% 2	12
Uncertainty of Status	83.33% 10	8.33% 1	8.33% 1	12
Uncertainty of Measurement	58.33% 7	8.33% 1	33.33% 4	12
Information Gap	81.82% 9	9.09% 1	9.09% 1	11

#	Other (please specify)	Date
1	A variety of limiting factors could be influential over time & space: presumably these could overlap with "uncertainty of causality" and "information gap" but they are not a clear fit within the above matrix.	3/12/2013 11:35 AM
2	These need to be defined.	3/7/2013 6:21 PM
3	Information gap seems like a driver of 1-4	3/5/2013 12:05 PM

Q26 Which general categories of monitoring and research does the lexicon need to accommodate? Check all that apply.

Answered: 12 Skipped: 3

	yes	no	Total
It is not necessary for the lexicon to categorize monitoring and research actions	2 18.18%	9 81.82%	11
Threat Detection	8 72.73%	3 27.27%	11
Change in Threat Status	9 81.82%	2 18.18%	11
Presence/Absence Surveys for SGCN Distribution	11 100%	0 0%	11
Relative Abundance/Density	10 90.91%	1 9.09%	11
Reproduction/Demography	10 90.91%	1 9.09%	11
Detect Habitat Change	10 90.91%	1 9.09%	11
Survey Habitat Quality	10 90.91%	1 9.09%	11
Genetics	10 90.91%	1 9.09%	11
Detect Contaminants/Pollution/Air & Water Quality	9 81.82%	2 18.18%	11

#	Please list others.	Date
1	Most of these could be a need given the array of taxa under consideration, but they should be not addressed routinely for all SGCN species in the Northeast. Is this necessary or useful in regional coordination, or is it implicit that some flexibility is needed here amongst participants? For instance, "relative abundance / density" & "survey habitat quality" might sufficient in core range within the region, but other categories could be crucial at periphery of range. I can see some standardization for basic presence / absence surveys on SGCN species, but other topics are uncertain in general.	3/12/2013 11:35 AM
2	last one is one threat	3/10/2013 9:37 AM
3	the last one is a specific threat so why separate it out	3/10/2013 9:29 AM
4	determine the habitat requirements of a species; determine life history of a species; identify locations of habitat	3/7/2013 4:17 PM
5	Threat detection should include threat characterization. Not sure which of these would cover/include disease monitoring.	3/7/2013 2:57 PM
6	gack	3/5/2013 3:05 PM

Q27 Does TRACS provide sufficient guidance toward a SWAP lexicon for tracking the performance of implemented SWAP actions?

APPENDIX C: EXAMPLES OF COMMITTEE CHARTER AND OUTREACH STRATEGY

Example Committee Charter

Pennsylvania Wildlife Action Plan *Revising the PA WAP (2015)*

Advisory Committee: Roles and Responsibilities

Background: In September 2005, the Pennsylvania Game Commission (PGC) and Pennsylvania Fish & Boat Commission (PFBC) submitted the first Pennsylvania Wildlife Action Plan (PA WAP). With a Wildlife Action Plan submitted by each state and U.S. Territories, this congressionally mandated document maintained the eligibility of Pennsylvania for receipt of State Wildlife Grant (SWG) funding. After rigorous regional and national review, the U.S. Fish & Wildlife Service (FWS) approved the Pennsylvania WAP in 2006.

To maintain eligibility for ongoing SWG funds, Congress also required regular updates of the WAP by each state/territory, at an interval not to exceed 10 years. The next version of the PA WAP is due to the FWS no later than 30 September, 2015. Considering the extensive volume and scope of this document, the PGC and PFBC have initiated the process for revising the PA WAP.

As part of this revision process, the PGC and PFBC are requesting advice and recommendations from partners who were involved in the development of the first PA WAP or who may have a critical role in the implementation of the current plan or the revised plan (PA WAP 2015). In addition, consultation with federal, state and tribal agencies, as well as partners and the public, are required as part of the Wildlife Action Plan revision process (Elements 7 & 8). Therefore, this Advisory Committee (hereafter Committee) can further assist in addressing this requirement.

For efficiency and effectiveness, we have identified the following Roles and Responsibilities as well as Operational Guidance for participants of this Committee. We are genuinely seeking your candid and constructive advice in the revision of the PA WAP.

Roles & Responsibilities

1. Advisory:

- a. This committee will function in an advisory role only.
- b. PGC and PFBC reserve the right to use, modify or to limit use of any recommendations or materials provided by the Committee.

2. Participation:

- a. Participation in the Committee is voluntary and members should not feel obligated to participate.

- b. To maintain a manageable committee size, participation is by invitation.
 - i. Additional members may be recommended, but their participation must be approved by both PFBC and PGC.
 - ii. Committee members may consult with other partners who may not be part of the Committee to gather pertinent information.
 - c. PGC and PFBC recognize that participants have obligations to their agency or organization. We will strive to minimize the time and inconvenience of participants.
 - d. Participation in this committee will not provide any advantage in securing current or future funding from State Wildlife Grants or other sources, provided by either the PGC or PFBC.
 - e. Participants will provide all professional courtesy to other members (see details in Operational Guidance below).
3. **Meetings:** The PGC and PFBC recognize that increasing travel expenses are impinging upon the budgets of state, federal and non-governmental organizations. Therefore:
- a. In-person meetings will be kept to a minimum (estimated 2 per year).
 - b. Conferencing and web-ex will be used to foster communication between in-person meetings.
 - c. If technical teams/sub-committees are formed, the leaders of these groups will be responsible for coordinating technical team meetings and conference calls. PFBC and PGC will assist in facilitating these meetings/calls.
4. **Travel Expenses:**
- a. Participants will be responsible for their own travel expenses, unless funding is available to offset travel costs.
5. **Tasks:**
- a. Committee participants may be asked to develop new materials, provide existing materials, gather information or other necessary tasks, to assist with the revision process.
 - b. Copyrighted or restricted material must be acknowledged and thoroughly referenced.
 - c. Due dates for tasks will be developed through mutual consent by the participants.
6. **Acknowledgement:**
- a. The conservation and protection of Pennsylvania's natural resources is a collaborative effort. PGC and PFBC are truly appreciative of the efforts and support from partners.
 - b. All participants will be gratefully acknowledged in the revised PA WAP.

Operational Guidance

Overview: This is a statewide effort with national significance and we recognize that participating members of this Committee will represent the interests of their respective agencies and organizations. We also respect that this project is *in addition to* each member's standard duties and responsibilities. The following operational guidance provides a foundation for the responsibilities of participants to ensure timely completion of the revised Wildlife Action Plan.

Collegiality: This project has a common goal (i.e., a completed, revised plan) and provides an opportunity to build camaraderie.

- Have fun!
- Make new acquaintances and build upon existing relationships.
- Share your knowledge and learn from others.

Timelines: Established timelines are to ensure timely completion of the project.

- Please abide by timelines for meetings, draft documents; conference calls, and related activities
- When participating (e.g., verbal or written ideas), please be mindful of time constraints. If a topic requires further discussion, propose an alternative venue.

Mutual Respect & Trust: A strength of this Committee is the diverse knowledge and experience of its members. Committee products will be based upon our collective contributions. Scientific discourse can be productive (and occasionally messy), so keep in mind the following guidance for participation:

- Respect all contributions & ideas.
- Critiques should be directed at the ideas not the person. The tone of such critiques should be constructive and not degrading, condescending, or inflammatory.
- Minimize non-subject discussions. Keep to the topic, unless absolutely necessary.
- Be considerate of distractions and avoid speaking while others are speaking -- wait until you are called upon or there is an appropriate time for providing your comment.
- Minimize “side bar” conversations.
- Encourage participation by all members.
- Avoid hidden agendas. Be open about potential conflicts of interests.
- Place cell phones on “manner mode” and if receiving a call, minimize disruption to the group.

Shared Roles & Responsibilities: The complexity and requirements of this project require shared roles and responsibilities. Participants will strive to share the tasks and responsibilities by:

- Volunteering for tasks, especially those for which they have special expertise or interests.
- Being proactive in providing information that can assist with filling data gaps and advancing ideas.
- Being responsible for keeping current on the status of the project, even if they are unable to participate in all meetings, conference calls, or similar discussions.

Decision-Making: It is unlikely we will all fully agree on all aspects of the various products. Further, as Advisory Committee members, information provided represents *recommendations* to the Commissions. The PGC and PFBC are responsible for the final Wildlife Action Plan. Therefore, the following guidance is provided for decision-making:

- Members present during specific meetings or conference calls are encouraged to participate fully in the decision-making process.
- Adapt a “will live with” decision-making format.
- Given the short project timelines, not all members will be present at each meeting or conference call. As decisions are made or conclusions reached, those not in attendance agree to move forward as a team and not retrace discussions or decisions causing unnecessary backtracks for the team as a whole.
- Be open-minded and creative. As differences in viewpoints arise, strive to actively listen to the other person’s views and rationale.

- Decisions not receiving “will live with” support will be provided to the PFBC and PGC for resolution. Explanations will be provided for any final decision.

Example Public Input Plan

This plan identifies three types of stakeholders and sets general and specific communication goals for each.

	Audiences Targeted				#
	Tier 1 Stakeholders- TWW, DNR, Fed/sate partners Collaborators Goal: Consult and collaborate	Tier 2 Stakeholders- Interested but limited investment Goal: Inform and involve	Tier 3 General Public Goal- Inform		
Type of Promotion				Target Date

VERSION 3.3

WILDLIFE HABITAT MAPPING FOR COMMUNITY
LAND-USE PLANNING AND SPECIES CONSERVATION

New Jersey Department of Environmental Protection
Division of Fish and Wildlife
Endangered and Nongame Species Program

ACKNOWLEDGEMENTS

Since its inception, the Landscape Project has been a collaborative effort that has relied on the collective knowledge and labor of the entire staff at the Division of Fish and Wildlife's Endangered and Nongame Species Program (ENSP). ENSP is indebted to former staff members who played a role in laying the foundation upon which the project has developed, including Pete Winkler, Mick Valent, Dave Golden, Patrick Meola, Jim Myers, former Bureau Chief Larry Niles, Steve Paturzo, Jim Sciascia, Eric Stiles, Jeff Tash, Jason Tesauro, and Melissa Woerner.

Special thanks are due to Mike Davenport who played a critical role in incorporating marine species into the Landscape Project.

Finally, a special thanks to those who contributed to various sections of this report: Tim Dunne, USDA Natural Resources Conservation Service; Gail Kenny, NJDEP Natural and Historic Resources; John Thomas, NJDEP Green Acres Program; Larry Torok, NJDEP Division of Land Use Regulation; Eric Schrading, U.S. Fish and Wildlife Service; and staff from the Endangered and Nongame Species Program.

The Landscape Project has been supported by:

United States Fish and Wildlife Service
Federal Aid in Wildlife Restoration Act (Pittman-Robertson Act)
Partnerships for Wildlife Act
State Wildlife Grants
NJ Department of Environmental Protection
National Fish and Wildlife Foundation
Geraldine R. Dodge Foundation
Conserve Wildlife Foundation of New Jersey

The citizens of New Jersey, who have purchased the Conserve Wildlife License Plate, checked-off for wildlife on their state income tax return or made a direct donation to the Division of Fish and Wildlife's (DFW) Endangered and Nongame Species Program (ENSP) or the Conserve Wildlife Foundation of New Jersey.

The general methods described in this document have been peer reviewed by: John F. Bunnell, Pinelands Commission; Dr. Joanna Burger, Rutgers University; Dr. William Cromartie, The Richard Stockton College of New Jersey; Dr. Michael Gochfeld, Rutgers University; Dr. John Hasse, Rowan University; Dr. Daniel Hernandez, The Richard Stockton College of New Jersey; Dr. Eric Karlin, Ramapo College of New Jersey; Dr. Richard Lathrop, Rutgers University; Dr. Howard Reinert, The College of New Jersey; Dr. Lance S. Risley, William Paterson University; and Dr. David Tulloch, Rutgers University.

Report layout design based on Massachusetts' *BioMap2* Summary Report.

Report prepared by: Patrick Woerner, Brian Henderson, Peter Winkler, William Pitts, and Melanie Mason.

CHAPTER 1

A Tool for Strategic Wildlife Habitat Conservation

Although New Jersey is one of the smallest states in the nation, it is home to a diverse assemblage of natural landscapes. From the ridgetops and extensive forests of the Highlands in the northwest, to the waterways of the Delaware River Basin, to the Atlantic and Delaware Bay coastal beaches and salt marshes, to the unique ecosystem of the Pinelands, New Jersey is composed of a remarkable assortment of habitats. People have begun to appreciate the benefits and necessity of protecting these natural areas. For example, we know that wetlands play a critical role in lessening the severity of floods and naturally breaking down contaminants in the environment. Forests and grasslands protect the quality of our drinking water, improve the quality of the air we breathe and provide important areas for outdoor recreation. Collectively, these habitats are of critical importance to the diverse array of wildlife found in New Jersey, including endangered, threatened and special concern species.

Meanwhile, wildlife populations, particularly imperiled wildlife, face an array of interrelated pressures that impede their ability to maintain themselves in the state. These include invasive species, chemical contaminants, road mortality, human disturbance, and, most importantly, habitat loss, fragmentation and degradation resulting from poorly planned development patterns. These and other stressors are all occurring in the context of the developing impacts of climate change that will likely exacerbate the existing threats to wildlife species and habitats.

Originating high atop the Kittatinny Ridge in Stokes State Forest, small, clean, flowing streams provide critical habitat for a variety of imperiled and special concern species.

Habitat loss due to large lot low-density residential development.

LANDSCAPE PROJECT 3.3: CONSERVING IMPERILED WILDLIFE OF NEW JERSEY

The Landscape Project provides a starting point from which to develop strategies for the protection and enhancement of habitat for New Jersey's imperiled wildlife. In 1994, the New Jersey Division of Fish and Wildlife's (DFW) Endangered and Nongame Species Program (ENSP) adopted a landscape level approach to endangered, threatened and special concern species conservation by developing the Landscape Project. Through geographic information systems (GIS) technology, the Landscape Project uses documented species location data and land-use/land-cover as well as species life history information to produce maps that depict habitat for endangered, threatened and special concern wildlife species throughout the state. The goal of the project is to provide a tool that fosters protection of New Jersey's biological diversity by facilitating the recovery and sustainability of endangered, threatened and special concern wildlife populations within healthy, functioning ecosystems.

Piping Plover, Federal Threatened.

Spatterdock Darner, Special Concern.

A NEW VERSION OF THE LANDSCAPE PROJECT

The previous version of the Landscape Project was based on species occurrence data collected prior to 2012 and habitat data derived from 2007 Land Use/Land Cover (LULC). Since that time, more than 3,400 new species occurrence records have been added to New Jersey's Biotics database and habitat data has been updated to reflect the most recent (2012) LULC. In addition, the new version incorporates species not previously represented in the Landscape Project, including Atlantic sturgeon and northern long-eared bat (northern myotis).

Version 3.3 of the Landscape Project applies to the entire state a methodology that was

Atlantic Sturgeon, Federal Endangered.

Northern Myotis, Federal Threatened.

developed under peer-review. It includes precise methods for delineating habitat based on species-specific habitat associations. In addition to providing access to a list of species that occur in an area of interest defined by a user, Version 3.3 provides detailed information, including the type of occurrence, or feature label (e.g., colony, den, nest, foraging, etc.), and the last recorded year of occurrence.

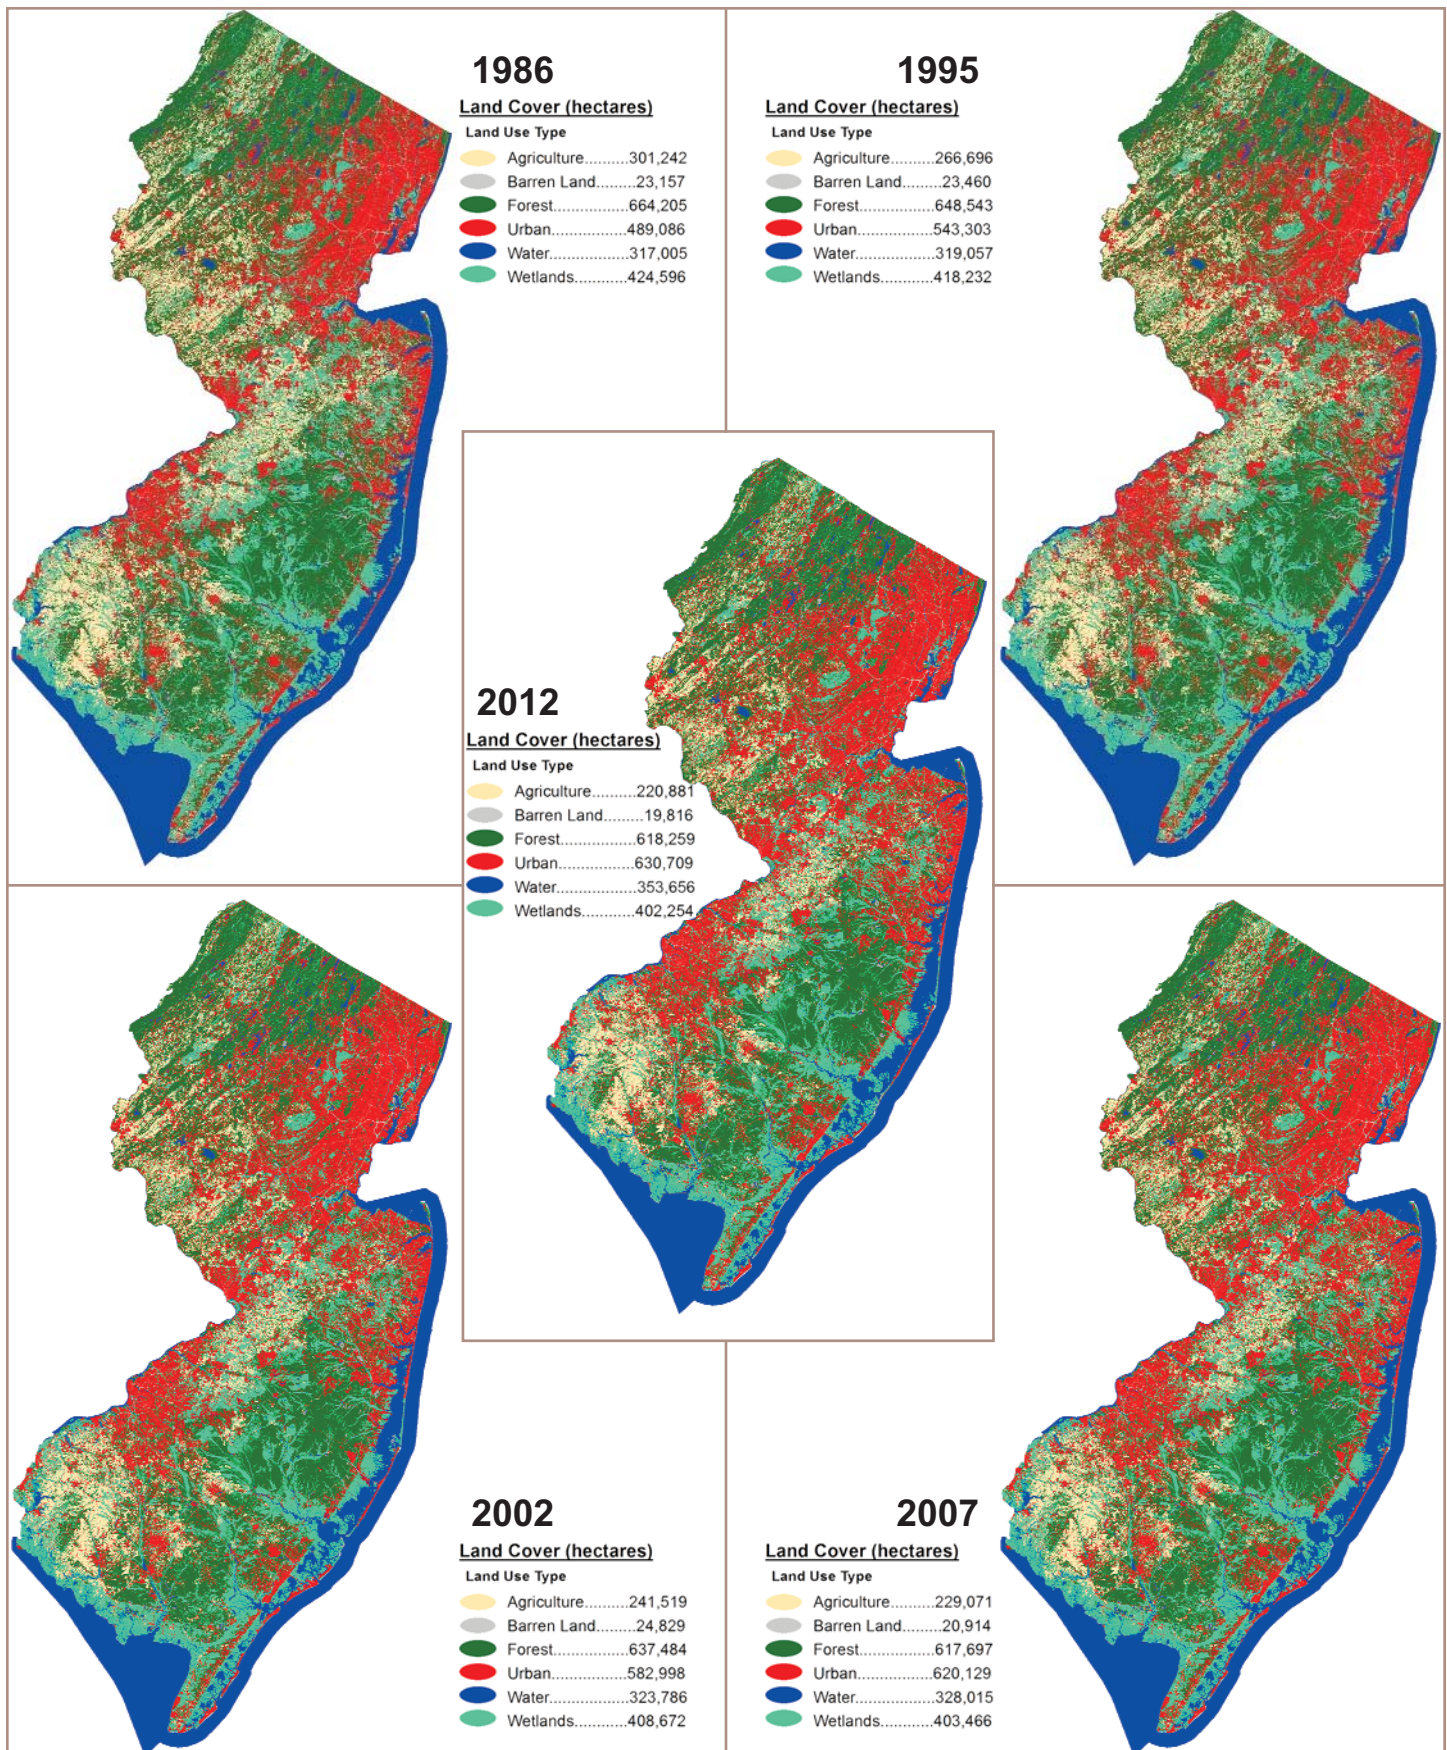

In Version 3.3 of the Landscape Project, all information has been updated to reflect	The information available in Version 3.3 includes enhancements that
▶ the existing endangered species list and the nongame wildlife list	▶ provide precise habitat mapping built on species-specific habitat associations
▶ a standard, consistent, peer-reviewed method applied throughout the state	▶ encompass species previously not represented, including Atlantic Sturgeon, Carpenter Frog and Northern Long-eared Bat
▶ over 3,400 new species occurrence records in the Biotics database	▶ provide detailed species information, such as type of occurrence and last year of occurrence
▶ the most recent Land Use/Land Cover data from 2012	▶ transparently document the mapping method that is based on scientific literature

Perhaps most importantly, Version 3.3 features easily accessible documentation that includes transparent descriptions of the methods used and references to supporting scientific literature. Many of these enhancements are a result of recommendations that ENSP has received from the public through outreach efforts and information obtained from evaluation forms completed by attendees of Landscape Project training and information sessions conducted over several years. Additional feedback was received during an evaluation of the Landscape Project maps conducted in partnership with the Endangered and Nongame Species Advisory Committee (ENSAC). The evaluation process included two stakeholder meetings that generated constructive input from a cross-section of Landscape Project end-users representing federal agencies, county governments, environmental commissions and the consultant community.

WHY WE NEED THE LANDSCAPE PROJECT

New Jersey’s landscape is rapidly changing. As the most densely populated state in the nation, pressure to consume land for development has increased as the population has grown. Yet population growth cannot be isolated as the only, or even the primary, driving force of habitat loss in New Jersey. Instead, land has been consumed for residential development at nearly twice the rate of population growth over the past two decades as a result of a large-lot, area-intensive land use zoning and development pattern that has encroached on rural landscapes throughout the state (Hasse & Lathrop 2008, 2010; Hasse et al. 2010). Such a land development pattern also contributes to higher traffic volumes that can lead to increased wildlife mortality or create complete barriers to movement for certain species (Seiler 2003; Fahrig & Rytwinski 2009).

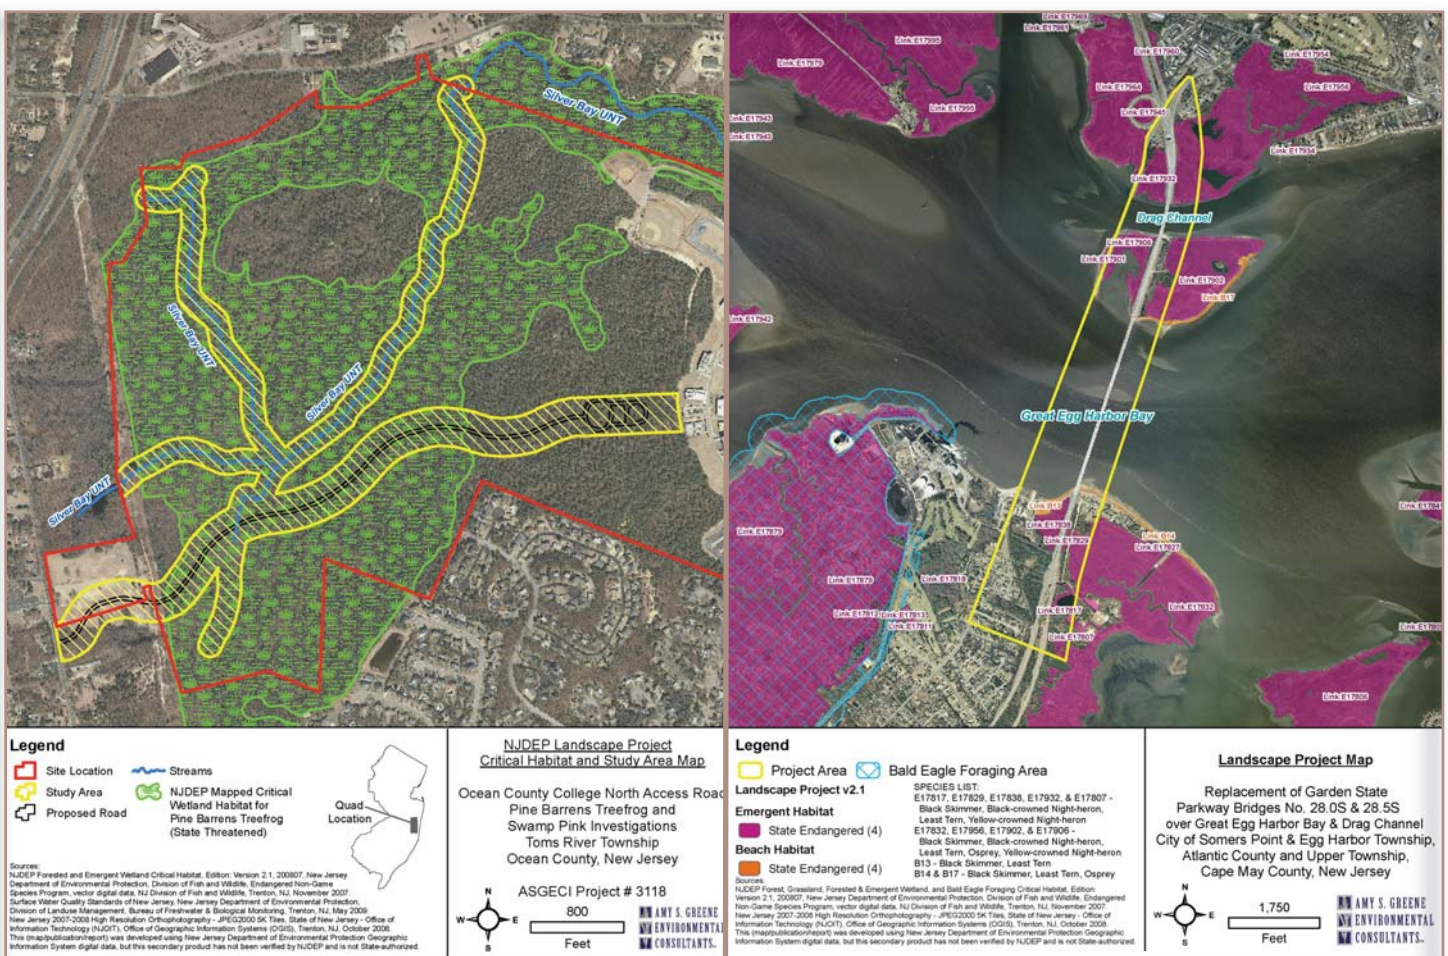

A detailed landscape analysis performed by Hasse and Lathrop (2010) that utilized DEP Land Use/Land Cover (LULC) datasets from 1986 to 2007 revealed that a sprawl development pattern continued undeterred and actually gained momentum over the two decade period. Breaking the study into three time periods (1986-1995, 1995-2002, 2002-2007), the analysis shows a “7% increase in the development rate to 16,061 acres of urbanization per year by 2007, up from the previous rate of 15,123 acres per year during the 1995 through 2002 time period,” which also experienced an increase up from the rate of 14,866 acres per year in the 1986 through 1995 time period (Hasse & Lathrop 2010, p.4). Increasing deforestation, largely due to sprawling residential development, led to urban land surpassing forest land as the most prominent land type covering the state as of 2007 (Hasse & Lathrop 2010). Studies project that if the current building pattern continues, all remaining available land will be developed sometime in the middle of this century, making New Jersey possibly the first state in the nation to reach build-out (Hasse & Lathrop 2001, 2010). The Landscape Project serves as a tool to help facilitate growth patterns more sensitive to the needs of wildlife and their habitats.

NJDEP Land Use/Land Cover 1986 - 2012. New Jersey's Landscape is rapidly changing. In the 1986 - 2007 period, urbanization resulted in the loss of approximately 5,000 hectares of wildlife habitat per year. Although this rate slowed significantly in the 2007 - 2012 period, much of the habitat that remains is less suitable for wildlife due to habitat fragmentation. This is especially detrimental to imperiled wildlife, as many of these species require large, contiguous tracts of habitat.

THE PURPOSE OF THE LANDSCAPE PROJECT

The Landscape Project was designed to provide users with peer-reviewed, scientifically sound information that transparently documents threatened and endangered species habitat. Landscape Project data are easily accessible and can be integrated with the planning, protection and land management programs of non-government organizations and private landowners and at every level of government – federal, state, county and municipal. Landscape maps and overlays provide a foundation for proactive land use planning, such as the development of local habitat protection ordinances, zoning to protect critical wildlife areas, management guidelines for imperiled species conservation on public and private lands, and land conservation projects. The maps help increase predictability for local planners, environmental commissions, and developers, and help facilitate local land use decisions that appropriately site and balance development and habitat protection. The Landscape Project maps allow the regulated public to anticipate potential environmental regulation in an area and provide some level of assurance regarding areas where endangered, threatened or species of special concern are not likely to occur, affording predictability to the application and development process. Thus, Landscape Project maps can be used proactively by regulators, planners and the regulated public in order to minimize conflict and protect imperiled species. This minimizes time and money spent attempting to resolve after-the-fact endangered and threatened species conflicts.

Landscape Project data used for project review: Left) Landscape Project data used to show the extent of Pine Barrens Treefrog habitat in order to determine if a proposed new access road for the Ocean County College campus would impact this species. Right) Landscape Project data used to help conduct a habitat assessment for a proposed Garden State Parkway bridge replacement project over Great Egg Harbor Bay and Drag Channel in Atlantic and Cape May counties. The map shows areas of suitable habitat capable of supporting State and Federal listed threatened and endangered species within the project area, including Black Skimmer, Black-crowned Night-heron, Yellow-crowned Night-heron, Least Tern, and Osprey.

A volunteer plants a native tree seedling on an old fairway inside Cox Hall Creek Wildlife Management Area to help restore forested habitat that will benefit migratory songbirds and other wildlife.

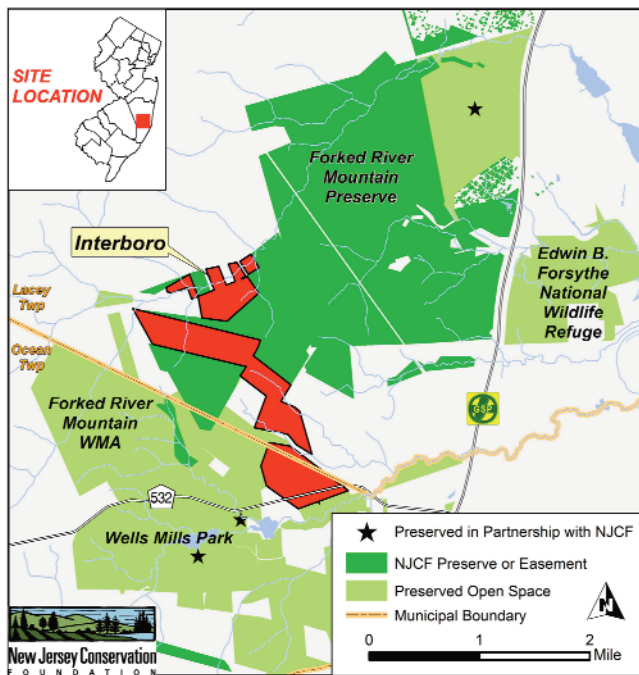

LANDSCAPE PROJECT APPLICATIONS

DEP Agencies:

NJDEP's Natural and Historic Resources: The Natural & Historic Resources (N&HR) programs within NJDEP are responsible for managing over 900,000 acres of parks and forests, recreation areas, historic sites, wildlife management areas, and natural areas. Managing these lands in a manner that avoids harm to imperiled species habitats requires that land managers subject proposed activities to an internal review process before undertaking any activity on state lands that may modify the terrestrial or aquatic landscape. Land managers use Landscape Project maps to conduct an initial screening to determine the presence of habitat patches ranked 3, 4 or 5. If these features are on the proposed project site the land manager is required to request a detailed review by ENSP. This review allows land managers to alter proposed activities in a manner that avoids or minimizes damage to critical imperiled species habitat.

Division of Fish and Wildlife's Landowner Incentive Program: The Landscape Project is an important tool for the Landowner Incentive Program (LIP). When applications are submitted to LIP, biologists use the Landscape Project as a screening tool to determine the species that may inhabit the site. Based on the Landscape Project and the project description, biologists determine if the project warrants a site visit and use the Landscape Project to create a map of the site and surrounding landscape. LIP staff also use the Landscape Project to support the species and habitat management plan developed for each property.

Green Acres: The Landscape Project is used by the Department's Green Acres Program to support the preservation of high quality natural resources in three valuable ways. First, the mapped data is represented on site-specific planning maps showing habitat locations so that consideration is given to these prime areas during decision making. Site specific maps are also submitted as part of the application for the Federal Land and Water Conservation Fund to show characteristics of those applicant properties. Lastly, but perhaps most importantly, the data is used in the evaluation of lands offered to the State for acquisition. The Green Acres Program scores all land offers based on their natural resource values. Wildlife occurrence is one of the criteria evaluated. The Landscape Project data format allows for statistical analysis to determine the quality and quantity of state and federal endangered species habitats on the offered properties.

Green Acres provided grant funding to the New Jersey Conservation Foundation to help purchase the Interboro tract in the Forked River Mountains area that serves as habitat for a number of threatened and endangered wildlife species.

Division of Land Use Regulation: The Division of Land Use Regulation (DLUR) uses the Landscape Project maps to identify habitat for endangered and threatened species and to help apply regulations designed to protect those areas. Several state land use regulations contain provisions for the protection of habitats determined to be critical to endangered and threatened wildlife. These include the Coastal Permit Program Rules (N.J.A.C. 7:7), the Coastal Zone Management Rules (N.J.A.C. 7:7E), the Freshwater Wetlands Protection Act Rules (N.J.A.C. 7:7A), the Flood Hazard Area Control Act Rules (N.J.A.C. 7:13), the Highlands Water Protection and Planning Act Rules (N.J.A.C. 7:38), and the Water Quality Management Planning Rules (N.J.A.C. 7:15).

Landscape Project data are reviewed to help determine whether a particular site contains “documented habitat” for State or Federal listed species. Within areas of documentation, ground surveys are typically conducted to confirm actual site suitability for a specific documented species. Permit applications received by DLUR are now better prepared because the public has access to the Landscape Project data. Since applicants now have access to baseline data concerning endangered and threatened species occurrences, they can better address potential impacts to State or Federal listed species in their permit applications or environmental impact statements, thereby minimizing environmental impacts and the time required to issue permits.

Federal Agencies:

U.S. Fish and Wildlife Service: The U.S. Fish and Wildlife Service (USFWS), New Jersey Field Office staff use the data layers in the Landscape Project to assist with project planning, assessment, and implementation of habitat restoration projects through the *Partners for Fish and Wildlife* program. Specifically, information in the Landscape Project on wetlands, sensitive species, grasslands, and other habitat types assist USFWS in large-scale geographic planning and targeting of habitat restoration projects. The Landscape Project is also useful for site-specific assessments of wetland restoration and creation opportunities.

U.S. Department of Agriculture Natural Resources Conservation Service: The Natural Resources Conservation Service (NRCS) has utilized the Landscape Project for several years as part of its day to day activities. NRCS field staff conducts environmental evaluations for all projects where federal funds are utilized as part of its National Environmental Policy Act (NEPA) responsibilities. These evaluations include threatened and endangered species assessments of planned NRCS actions.

The Landscape Project provides invaluable information regarding the possibility of threatened and endangered species occurrence at a site and helps guide NRCS planning efforts. The Landscape Project has also been used for several years in the competitive ranking of Wildlife Habitat Incentive Program (WHIP) projects. Projects that will have positive impacts to threatened and endangered species habitat receive additional points in the WHIP ranking system and have a greater chance of being funded. The Landscape project data is used as the basis for the threatened and endangered portion of the ranking.

This farm in Harmony Township, Warren County, falls within a high-priority grassland bird conservation area. The landowner planted more than 100 acres of perennial grasses with assistance from the NJ Landowner Incentive Program (LIP), US Fish and Wildlife Service, NRCS, New Jersey Audubon, and Conserve Wildlife Foundation of NJ. The fields remain un-mowed during the bird nesting season to allow species like the bobolink, grasshopper sparrow, and eastern meadowlark to nest and fledge their young.

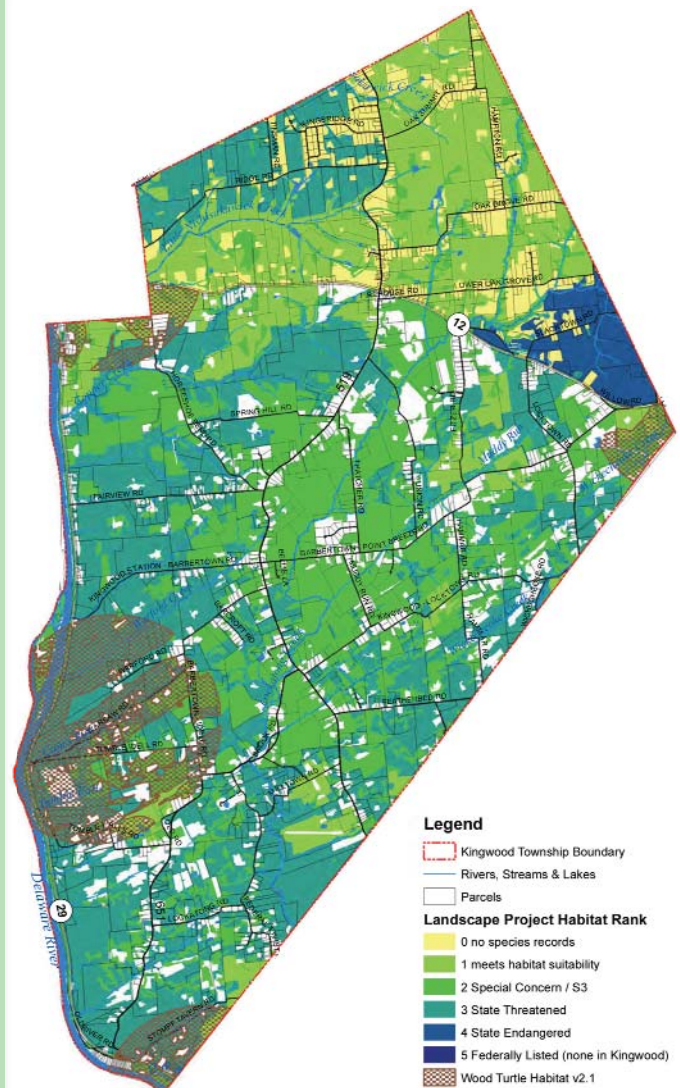

Landscape Project maps enable state, county, municipal and private agencies to identify important habitats and protect them in a variety of ways:

Prioritize conservation acquisitions: The Landscape Project is used to assist with prioritizing land parcels for purchase through acquisition programs such as Farmland Preservation and the USFWS's refuge system.

Guide regulators and planners: Landscape Project maps provide those who administer land use regulations and state, county and local planners with a crucial tool used to enhance protection and properly plan development through the regulatory and planning process.

Provide citizens with conservation tools: The Landscape Project provides a transparent and readily accessible tool to help guide citizen actions to protect imperiled and special concern species habitat at the local level.

Guide stewardship of conserved areas: New Jersey has more than 400,000 hectares of open space. These lands are managed by a variety of agencies and organizations, both public and private. Landscape Project maps identify important imperiled and special concern species habitats on these lands. ENSP staff work closely with land managers and landowners to develop appropriate best management practices for the long-term conservation of imperiled and special concern species.

Landscape Project maps are widely used in municipal and county Environmental Resource Inventories (ERI) to document threatened and endangered wildlife habitat. ERI for Kingwood Township, Hunterdon County, shown above.

WHO BENEFITS

Conservation of large expanses of fields, forests and wetlands helps to ensure that wildlife will remain a part of New Jersey's future. Conserving imperiled and special concern species habitat identified in the Landscape Project also results in more land contributing ecosystem services and more open space for outdoor recreation. Surveys by the US Fish and Wildlife Service (2006) reveal more than 87.5 million U.S. residents sixteen and older participate in some form of wildlife-related recreation. Open spaces provide places where people can escape the confines and stresses of urban and suburban living. Retaining habitats in their natural state provides other benefits such as reducing the threat of flooding, allowing for the biodegradation and filtering of environmental contaminants and recharging ground water reserves. In short, planning that employs the Landscape Project habitat mapping provides potential benefits for everyone.

CHAPTER 2

New Jersey's Diverse Landscapes

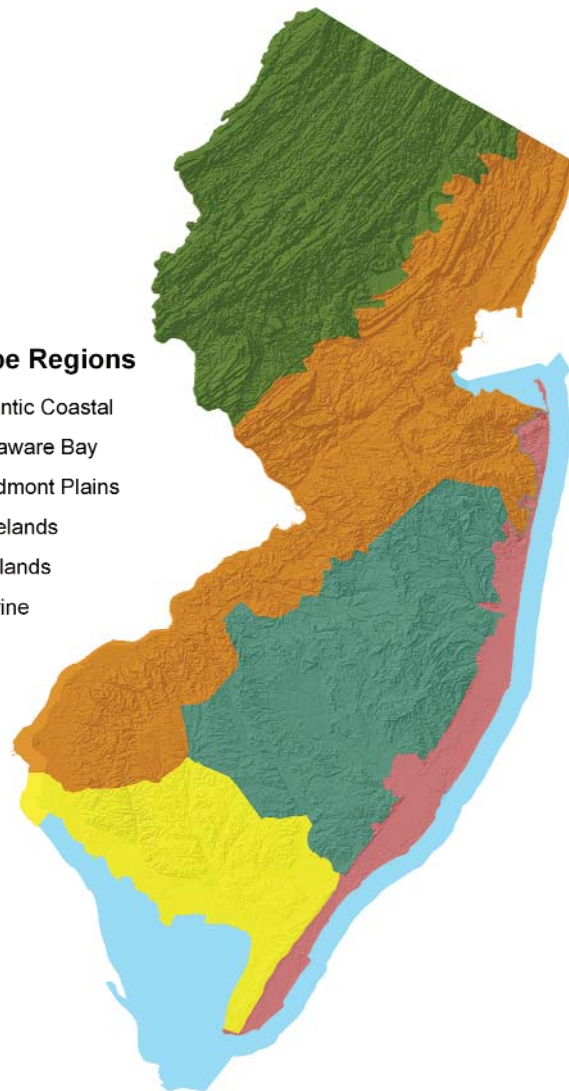

New Jersey's dunes, beaches, tidal marshes, cedar swamps, vast pitch pine forests, extensive grasslands, peat bogs, maple-oak forests, ridgetops, brackish bays, rivers, streams and the Atlantic Ocean support an amazing array of wildlife. That is true despite the fact that much of its diverse landscape has been greatly altered by human enterprises such as agriculture and development that fragments and degrades wildlife habitat. Sustaining wildlife populations over time requires large healthy landscapes with broad expanses of natural habitat. Thus, the Landscape Project focuses on ecoregions or Landscape Regions where plant and animal communities are ecologically similar and closely interlinked.

The Palisades cliffs rising next to the Hudson River are one of the historic habitats for nesting Peregrine Falcons, which recolonized the area in 2003 after an absence of more than 50 years.

Landscape Regions

-  Atlantic Coastal
-  Delaware Bay
-  Piedmont Plains
-  Pinelands
-  Skylands
-  Marine

New Jersey's Landscape Regions.

The delineation of the state into regions serves as a spatial framework for management and conservation of species and their habitats, and as a means to organize information so that it is meaningful and widely accessible to end-users. Geographic features and landforms (e.g., rivers, watershed boundaries, ridgelines, soils, vegetation, etc.) were used to delineate the general area of five Landscape Regions in New Jersey. Region boundaries were shifted to align with major roads (county level or larger) that serve as barriers to movement for many species. A sixth region, the Marine Region, is an exclusively aquatic region that includes the New Jersey portion of the Delaware and Raritan bays as well as the portion of the Atlantic Ocean along the coast of New Jersey. ENSP has identified and mapped habitat for endangered, threatened and special concern wildlife within each Landscape Region utilizing an extensive database that combines species occurrence information with Land Use/Land Cover classification data and species habitat requirements. The resulting Landscape maps provide an accurate, reliable and scientifically sound basis for habitat protection within each region.

One of the Landscape Project's unique features is that it enables users to focus on the big picture, and not just on individual locations of imperiled and special concern species as those areas come under threat. Thus, within large landscapes, the Landscape Project identifies areas of habitat that are important to the maintenance and recovery of New Jersey's endangered and threatened wildlife populations.

ATLANTIC COASTAL LANDSCAPE

This landscape encompasses parts of Monmouth, Ocean, Cape May, and Atlantic counties. New Jersey's Atlantic Coast beaches and marshes are among the most productive coastal habitats in the country. Despite heavy development, they support important portions of Atlantic Coast populations of colonial nesting birds, such as common tern, little blue heron and great egret, and endangered beach-nesting birds such as least tern and piping plover. The coastal habitats also support most of the state's ospreys, peregrine falcons, northern harriers and northern diamond-back terrapins, as well as large concentrations of migrating birds and wintering waterfowl.

Aerial view of Stone Harbor Point, a critically important coastal site for breeding, migrating and wintering shorebirds of conservation concern.

The Maurice River and its tributaries and adjacent forests support many of the State's endangered and threatened wildlife species, including large numbers of wintering and nesting Bald Eagles, Barred Owls, Pine Snakes and Frosted Elfin.

DELAWARE BAY LANDSCAPE

This landscape encompasses all or parts of Cape May, Atlantic and Cumberland counties. It features significant populations of bald eagle, barred owl, eastern tiger salamander, Cope's gray treefrog and 30 other endangered and threatened species. The vast woodland tracts of this region are among the largest in the state and support a large portion of New Jersey's neotropical birds and interior-forest bird populations. The extensive saltwater marsh and sandy overwash beaches support a significant horseshoe crab breeding area and shorebird migrations of worldwide ecological significance, including that of the red knot. Despite significant losses of habitat, the Cape May Peninsula remains one of the country's most important migratory "stopovers" for hundreds of bird and insect species. The expansive habitat mosaic of rivers and streams flowing into the tidal Delaware Bay supports concentrations of rare wildlife and wintering waterfowl.

PIEDMONT PLAINS LANDSCAPE

This landscape region also combines two of New Jersey's physiographic regions, the Piedmont and the Inner Coastal Plain. It encompasses all or parts of Burlington, Camden, Gloucester, Salem, Mercer, Middlesex, Monmouth, Hunterdon, Somerset, Union, Essex, Hudson, Passaic, and Bergen counties. It is dominated by the Delaware and Raritan rivers and is characterized by farmed areas, extensive grasslands, fragmented woodlands and productive tidal marshes. Imperiled species within this landscape include grassland birds such as the endangered upland sandpiper and raptors such as the American kestrel and barred owl.

Native warm season grasses in central New Jersey serve as habitat for a variety of grassland birds, including the Grasshopper Sparrow and Savannah Sparrow.

Vast tracts of pine and pine-oak forests of the Pinelands Region provide habitat for many imperiled species including the Threatened Northern Pine Snake and Pine Barrens Treefrog.

PINELANDS LANDSCAPE

This landscape encompasses all or parts of Atlantic, Ocean, Burlington, Camden, and Gloucester counties. An internationally recognized ecosystem, the Pinelands supports extremely diverse reptile, amphibian and invertebrate populations including northern pine snake, corn snake, Pine Barrens treefrog, and Pine Barrens bluet. Extensive cedar swamps and wetland systems contain numerous insect species, as well as sustainable populations of many neotropical birds. Its waterways support aquatic communities unique among mid-Atlantic states.

SKYLANDS LANDSCAPE

This landscape region combines two of New Jersey's physiographic regions, the Ridge and Valley and the Highlands. It encompasses all or parts of Sussex, Warren, Hunterdon, Somerset, Passaic, Essex, Bergen, and Morris counties. The region contains extensive tracts of contiguous upland and wetland forests that support diverse animal populations including red-shouldered hawk, northern goshawk, cerulean warbler, timber rattlesnake, long-tailed salamander, arogos skipper and the state's only known wintering populations of Indiana bat. Bog turtles and great blue herons inhabit the extensive freshwater wetland systems found throughout the region.

Arogos Skipper (Endangered) nectaring on Milkweed in the Skylands Region.

MARINE REGION

This region is an exclusively aquatic region that includes the New Jersey portion of the Delaware and Raritan bays. It also includes the portion of the Atlantic Ocean within New Jersey's jurisdiction, which is defined as the area

New Jersey's coastal waters provide a critical migratory corridor to Humpback Whales (Federal Endangered).

within 3-nautical miles of the New Jersey shoreline. This region supports commercially valuable shellfish resources as well as a number of fish species of commercial and recreational importance. Over half of New Jersey's Federal listed species are found exclusively within this region, including several species of whales and sea turtles. The endangered shortnose sturgeon is also found within Delaware Bay. Waters of the Delaware Bay are also critical habitat to one of the largest populations of horseshoe crab in the world. During the summer, near-shore Atlantic Ocean waters are calving and nursery grounds for bottlenose dolphins while many additional species utilize these waters as a migratory corridor.

CHAPTER 3

A Method for Delineating Imperiled and Special Concern Wildlife Habitat

Version 3.3 of the Landscape Project is composed of three spatial components: Species-Based Habitat, Freshwater Mussel Habitat and Vernal Habitat. **Species-Based Habitat**, the main component of the project, identifies imperiled and special concern wildlife habitat within each Landscape Region, with the exception of freshwater mussels. **Freshwater Mussel Habitat** is a separate layer that identifies those stretches of stream that serve as habitat for endangered, threatened and special concern freshwater mussel species. Lastly, **Vernal Habitat** identifies not only vernal and potential vernal pools themselves, but also surrounding habitat that allows for successful breeding, dispersal, foraging, overwintering, and migration of species that use vernal pools.

SPECIES-BASED HABITAT

Illegal collection continues to impact the Bog Turtle (Federal Threatened).

The Landscape Project combines documented wildlife locations with NJDEP aerial photo-based 2012 Land Use/Land Cover (LULC) to delineate imperiled and special concern species habitat within New Jersey. Many species occurrence locations cannot be published because they may represent nest sites, roost sites, dens and other sites used by species that are vulnerable to human disturbance and, in some cases, susceptible to illegal collecting. At the same time, wildlife moves and individual animals use various habitat features within the landscape to fulfill their foraging, sheltering and breeding needs. Therefore, protecting individual occurrences or the area used by one individual is generally not sufficient to

protect the local population. Landscape Project maps address these issues by displaying habitat patches that animals use and that are required to support local populations, rather than pinpointing exact locations of the most sensitive wildlife sites or simply protecting points where species happened to be observed at one point in time. Prior to combining species occurrence data with LULC data to form the habitat patches that make up the Species-Based Habitat layer, each dataset is generated according to a specific data development process.

Left) Shown in yellow are locations of a male Bobcat (Endangered) fitted with a GPS collar by ENSP between March 2004 and July 2005 near the Delaware Water Gap, NJ. The cat crossed the Delaware River into Pennsylvania on three different occasions. Above) Bobcat at the Delaware Water Gap in early spring.

SPECIES OCCURRENCE DATA DEVELOPMENT

Imperiled and special concern wildlife occurrence data are stored and managed in the New Jersey Biotics database. Developed by NatureServe, Biotics software provides established scientific standards for biological inventory and biodiversity data management used by most states, Canada, Latin America and the Caribbean, for tracking species. Imperiled and special concern species records within the New Jersey Biotics database are based on field observations from a variety of sources including reports from the general public, ENSP surveys, and other professional surveys, including those conducted by government agencies and environmental consultants. All records undergo rigorous evaluation performed by ENSP biologists for inclusion into the system according to an established protocol to ensure reliability (**Appendix I**). Moreover, in order for a species occurrence in Biotics to be used in the Landscape Project, it must meet the following additional criteria: the species status must be endangered, threatened or special concern; it must be a “high accuracy” record according to NatureServe (accurate within 6-50 meters [most fall within 20 meters]); it must have a 1980 or later last observation date; and it must be an occurrence associated with habitat essential for survival such as a breeding or foraging site. For example, an occurrence of a migrating bird that is included in Biotics may not be included in the Landscape Project maps if it does not rely on habitat within New Jersey for survival.

Data development process for species occurrence areas.

All occurrences receive a “location use class” as well as a “feature label” designation. Both of these are used to record more information about the occurrence. A location use class is specified for migratory species and indicates the season or behavior that is associated with the occurrence. A feature label describes the type of occurrence (e.g., nest, den, etc.). A single species occurrence may represent one individual animal (for example, a single timber rattlesnake observed on a rock) or multiple individuals (for example, a timber rattlesnake den supporting many individuals), distinctions indicated by the feature label.

Timber Rattlesnake (Endangered) dens support multiple snakes that return year after year to the same den location.

ENSP has defined a “species occurrence area” (SOA) for every feature label assigned to a species (**Appendix II**). A SOA is a polygon specific to each species-feature label combination that is applied to each occurrence location and used to value habitat in the Landscape Project. The size of each SOA is generally based on the average home range or territory size, or other appropriate life-history parameters as reported in peer-reviewed scientific literature, or from information obtained through ENSP research and expert opinion. In the context of the Landscape Project, a SOA represents the habitat that supports the individual occurrence and often indicates the presence of a species population beyond the individual documented occurrence. A depiction of the SOAs for different types of Indiana bat feature labels is included in the table below.

Indiana Bats (Federal Endangered) with a small cluster of Little Brown Bats at a hibernaculum in northern New Jersey.

Feature Label	SOA
Hibernaculum	4 kilometer buffer
Non-breeding Sighting	2 kilometer buffer
Maternity Colony	2 kilometer buffer
Breeding Sighting	2 kilometer buffer

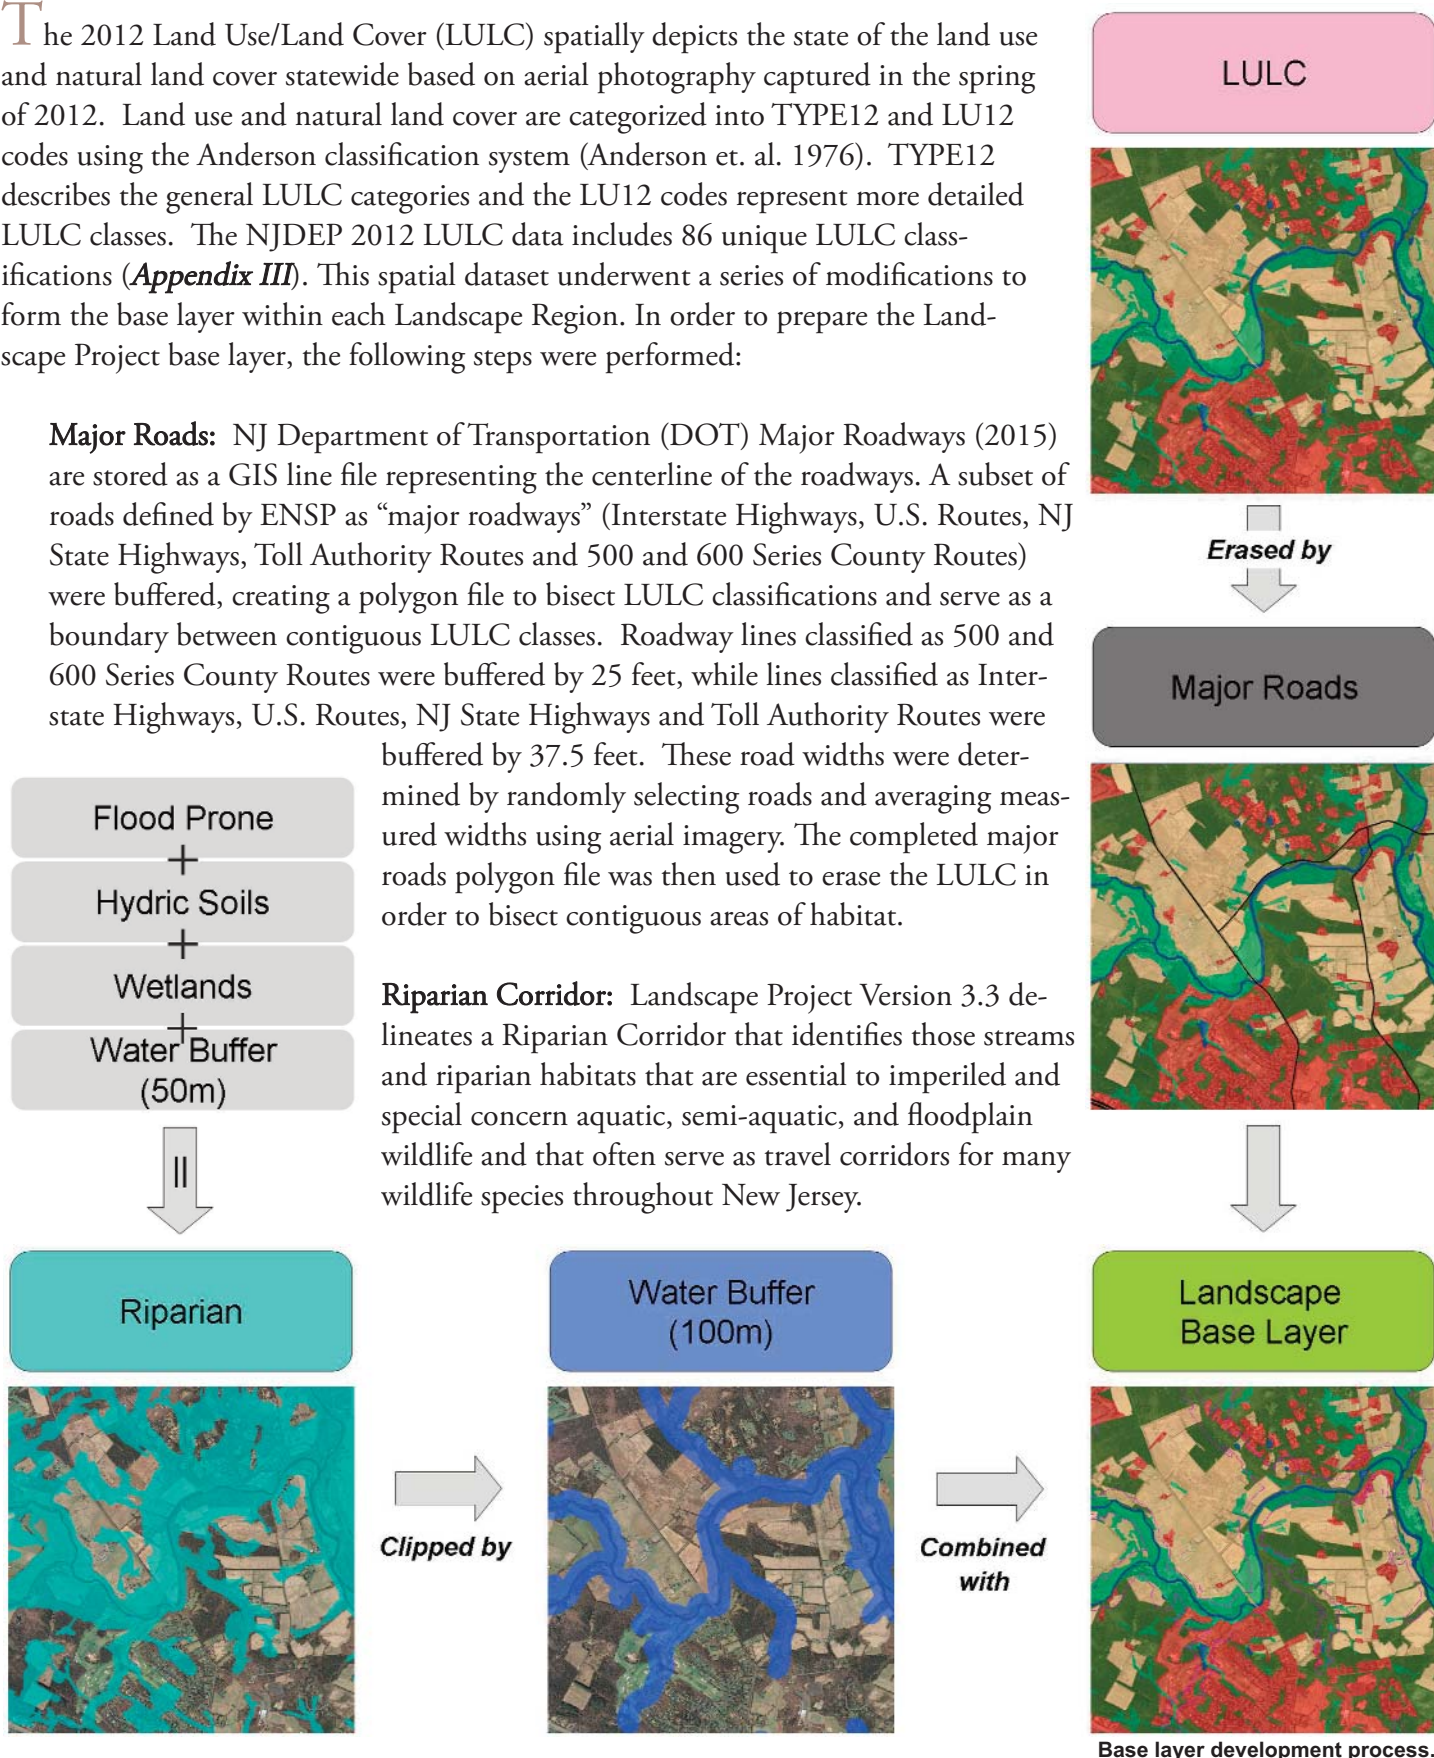

Indiana Bat Feature Labels and SOAs

LANDSCAPE BASE LAYER DEVELOPMENT

The 2012 Land Use/Land Cover (LULC) spatially depicts the state of the land use and natural land cover statewide based on aerial photography captured in the spring of 2012. Land use and natural land cover are categorized into TYPE12 and LU12 codes using the Anderson classification system (Anderson et. al. 1976). TYPE12 describes the general LULC categories and the LU12 codes represent more detailed LULC classes. The NJDEP 2012 LULC data includes 86 unique LULC classifications (**Appendix III**). This spatial dataset underwent a series of modifications to form the base layer within each Landscape Region. In order to prepare the Landscape Project base layer, the following steps were performed:

Major Roads: NJ Department of Transportation (DOT) Major Roadways (2015) are stored as a GIS line file representing the centerline of the roadways. A subset of roads defined by ENSP as “major roadways” (Interstate Highways, U.S. Routes, NJ State Highways, Toll Authority Routes and 500 and 600 Series County Routes) were buffered, creating a polygon file to bisect LULC classifications and serve as a boundary between contiguous LULC classes. Roadway lines classified as 500 and 600 Series County Routes were buffered by 25 feet, while lines classified as Interstate Highways, U.S. Routes, NJ State Highways and Toll Authority Routes were buffered by 37.5 feet. These road widths were determined by randomly selecting roads and averaging measured widths using aerial imagery. The completed major roads polygon file was then used to erase the LULC in order to bisect contiguous areas of habitat.

Riparian Corridor: Landscape Project Version 3.3 delineates a Riparian Corridor that identifies those streams and riparian habitats that are essential to imperiled and special concern aquatic, semi-aquatic, and floodplain wildlife and that often serve as travel corridors for many wildlife species throughout New Jersey.

Riparian areas provide habitat for a myriad of aquatic and semi-aquatic species including dragonflies, turtles, frogs, and salamanders. They also serve as critical travel corridors for many wildlife species in an otherwise fragmented landscape.

The inclusion of the Riparian Corridor makes the Landscape Project mapping a more comprehensive tool for planners, land managers, watershed agencies and associations, and other conservation organizations to protect aquatic wildlife habitat.

The Riparian Corridor was produced according to a modified version of a method developed at the Rutgers University Center for Remote Sensing and Spatial Analysis (CRSSA) by Hughes and Lathrop (2001). An area is defined as riparian if it is prone to flooding, contains hydric soils, or is delineated as freshwater wetlands. A number of changes were made to the CRSSA method as described below. There are multiple GIS datasets used to create the ENSP riparian corridor: NJDEP USGS Flood-Prone Areas; FEMA flood data composite (DFIRMS, Preliminary FIRMS, Preliminary Work Maps, Q3) current as of April 2015; U.S. Department of Agriculture, Natural Resources Conservation Service Soil Survey Geographic Soils 2014 (SSURGO); NJDEP 2012 Land use/Land cover Update for New Jersey; NJDEP 2002 Streams Update for New Jersey. Unlike the CRSSA model, these datasets were used in their native vector format instead of converting them to a grid, or raster, format for analysis. Each dataset was recoded as follows:

NJDEP USGS Flood-Prone Areas – all areas coded as “1 USGS Documented Flood-prone Area” or “8 Water” are recoded as “1,” all others recoded as “0.”

FEMA flood data composite – all areas coded as A, AE, AH, AO, Open Water, VE recoded as “1.”

SSURGO – all soils defined as “hydric” recoded as “1,” all others recoded as “0.”

NJDEP 2012 LULC – all Type12 coded as “wetlands” recoded as “1,” all others recoded as “0.”

All polygons coded as “1” from the above layers are combined and dissolved into one layer. Next, all streams (NJDEP 2002 Streams Update for New Jersey) and water bodies (NJDEP 2012 Land use/Land cover Update for New Jersey) with LU12 codes 1419, 5100, 5190, 5200, 5300 and 5410 are buffered by 50 meters to create a continuous corridor surrounding all water sources and to capture any areas that were not previously included because they were not coded as flood prone, hydric, or wetlands, or they occur as an urban LULC class, or are bounded by steep slopes. This 50 meter buffer is combined and dissolved with the previous layer into a riparian corridor. Next, all streams and water bodies are buffered by 100 meters. The dissolved riparian corridor created is then clipped by this maximum distance. Next, the streams layer is overlaid the resultant corridor. Any polygon that does not intersect the streams layer is deleted. The resulting layer is the final Landscape Project Riparian Corridor. This layer is combined with the NJDEP 2012 LULC dataset, to form the base layer for Version 3.3.

Marine Waters: The addition of the Marine Region in Version 3.3 allows for the inclusion of aquatic marine species that were not represented in previous versions of the Landscape Project. New Jersey’s marine waters within the 2012 LULC dataset are mapped as extremely large polygons that are of little utility within the Landscape Project framework. Therefore, all marine waters coded as “Atlantic Ocean,” “Open Tidal Bays,” and “Tidal Rivers, Inland Bays, and Other Tidal Waters” are broken into a grid consisting of cells approximately 1.3 x 1.3 kilometers in size. This method thereby creates polygons which are much smaller, more meaningful, and consistent in the manner of their creation.

For marine species, a more refined approach towards mapping habitat would utilize mapped variables such as bathymetry, slope, sea surface temperature, current direction and velocity, submerged aquatic vegetation, and salinity. Although such information is available for some marine waters, it is absent in other areas and/or often incompatible across the region. It is this lack of a statewide multi-variable marine dataset that necessitates the current use of the gridded approach to mapping marine waters in the Landscape Project base layer.

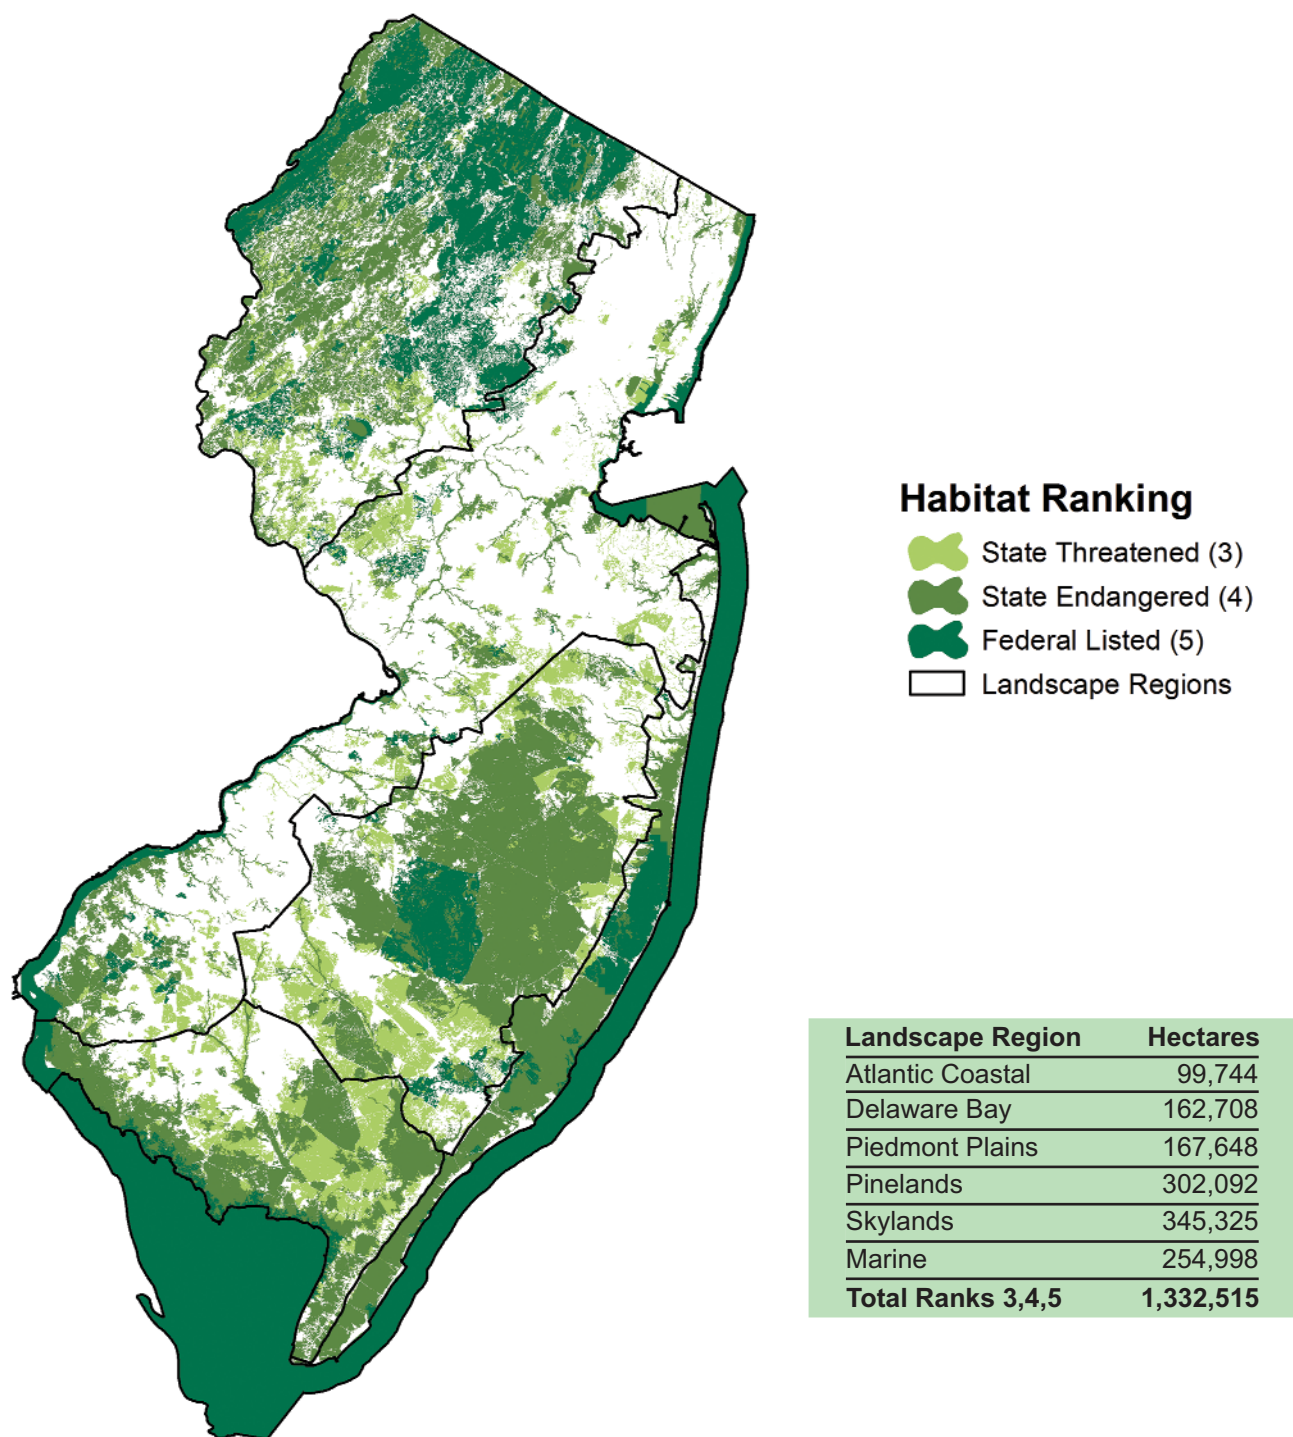

DELINEATING SPECIES-BASED HABITAT

In Version 3.3 a species-based habitat method is implemented by associating each species with a specific set of LULC classes according to the habitat needs of the species. Detailed LULC class delineations allow for an accurate representation of imperiled and special concern species habitat by providing ENSP biologists with the ability to designate a specific set of LULC classes for each individual species-feature label combination. Each species-habitat association is developed by performing a review of scientific literature and/or from information obtained through ENSP research and expert opinion. In addition, a special analysis of the LULC for species and their feature label components is used to guide the selection of particular LULC classes for the creation of species-specific patches of habitat (*Appendix IV*).

In order to create species-based patches of habitat, the relevant LULC polygons from the Landscape base layer are combined into a potential habitat layer specific to each species-feature label. Spatially explicit species occurrence data that meet the criteria required for inclusion in the Landscape Project are then exported from the Biotics database and a species occurrence area (SOA) is applied for every feature label assigned to a species. SOAs are then overlaid onto species-specific habitat patches and patches are classified, or “valued,” based on the status of the species present as follows:

- ▶ **Rank 5** - assigned to species-specific habitat patches containing one or more occurrences of wildlife listed as endangered and threatened pursuant to the Federal Endangered Species Act of 1973.
- ▶ **Rank 4** - assigned to species-specific habitat patches with one or more occurrences of State endangered species.
- ▶ **Rank 3** - assigned to species-specific patches containing one or more occurrences of State threatened species.
- ▶ **Rank 2** - assigned to species-specific habitat patches containing one or more occurrences of species considered to be species of special concern.
- ▶ **Rank 1** - assigned to species-specific habitat patches that meet habitat-specific suitability requirements such as minimum size or core area criteria for endangered, threatened or special concern wildlife species, but that do not intersect with any confirmed occurrences of such species (see *Appendix V* for descriptions of all habitat-specific suitability requirements). Rank 1 habitat patches without documented occurrences are not necessarily absent of imperiled or special concern species. Patches with a lack of documented occurrences may not have been systematically surveyed. Thus, the Rank 1 designation is used for planning purposes, such as targeting areas for future wildlife surveys.

A SOA will value habitat that it overlays only if that habitat is appropriate for the species. Habitat patches ranked 2, 3, 4, or 5 intersect with or contain at least one documented SOA. Since imperiled species are typically not abundant across the landscape, a single occurrence may represent a significant portion of the local population and often indicates the presence of a larger population within a habitat patch. The Landscape Project habitat patch mapping approach is designed to capture and represent the habitat needed to support the local population indicated by the individual SOA.

Federal Listed (5), Endangered (4) and Threatened (3) Species-Based Habitat.

In the delineation of Species-Based Habitat, each species-feature label combination is assigned a “Patch Type,” or category that describes the method employed to form the valued habitat area from polygons in the Landscape base layer. In addition, for each LULC class selected for a particular species-feature label combination, a “LULC Treatment,” or rule, is applied that determines how polygons of a LULC class will interact with a SOA and/or with polygons of other LULC classes in order to construct patches of habitat. The four general patch types are described below and the LULC treatments are defined in **Appendix V**. A comprehensive list of species-feature labels and their assigned patch type is included in **Appendix V**. For those species-feature label combinations that utilize variations, or subtypes of the four general types, an explanation of the subtype is also included within **Appendix V**.

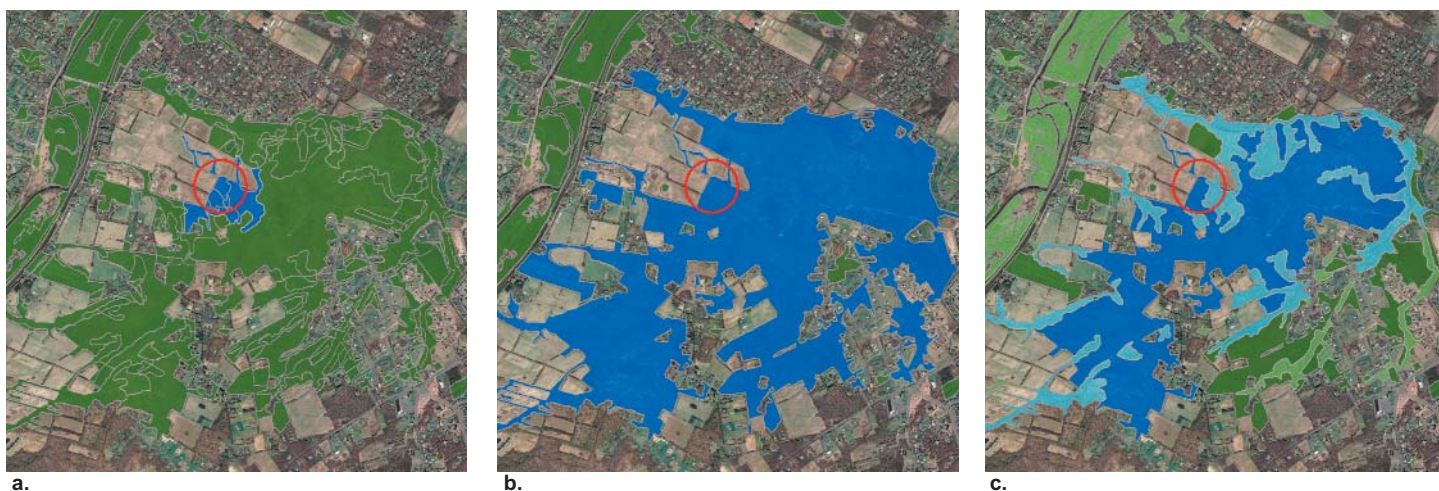

Each species-feature label combination is grouped into one of the following patch type categories.

Limited Extent – polygons from a select set of LULC classes are valued upon intersection with a SOA. Once the valued habitat area is identified, any internal holes or gaps containing polygons of selected LULC classes are also valued if they are completely enclosed by, and contiguous with, the valued area.

Contiguous Area – polygons from a select set of LULC classes are dissolved/combined into contiguous areas and valued upon intersection with a SOA.

Cardinal-Proximate – polygons from an initial, or cardinal, set of LULC classes are valued upon intersection with a SOA and then polygons from a second, proximate set of LULC classes are valued based on a spatial relationship (e.g., adjacency) with polygons from the cardinal set of LULC classes and/or a SOA. Once the valued habitat area is identified, any internal holes or gaps containing polygons of selected LULC classes are also valued if they are completely enclosed by, and contiguous with, the valued area.

Stream Centerline – stream centerlines are valued upon intersection with a SOA. In Version 3.3 of the Landscape Project, only freshwater mussel species utilize the Stream Centerline patch type, described more thoroughly in the next section.

Examples of patch types. The red circle represents a SOA. Areas depicted in green are LULC polygons that can be valued, while the valued LULC polygons are depicted in blue. a) Limited Extent - LULC polygons that directly intersect the SOA are valued. b) Contiguous Area - LULC polygons are dissolved/combined into contiguous areas and then valued upon intersection with the SOA. c) Cardinal-Proximate - a cardinal set of LULC classes that can be valued is depicted in dark green and dark blue, while a proximate set that can be valued is depicted in light green and light blue. The cardinal LULC polygons are valued upon intersection with the SOA (dark blue) and the proximate set is valued based on adjacency to the valued cardinal set. Valued cardinal LULC polygons are depicted in dark blue, while valued proximate LULC polygons are depicted in light blue.

FRESHWATER MUSSEL HABITAT

DEP maintains a Stream Network data layer that is a subset of the USGS 1:24,000 high-resolution National Hydrography Dataset (NHD). In Version 3.3 of the Landscape Project, stream and water body centerlines from the NHD Streams 2002 data layer are used to represent freshwater mussel habitat.

The Eastern Pondmussel (Threatened) can be found in the lower half of the Delaware River and several of its tributaries.

Water body centerline and stream centerline data are valued exclusively by freshwater mussel species occurrence areas while other aquatic species habitats are represented with polygons from the Species-Based Habitat layer. In order to form representative “patches” of habitat from the NHD Streams 2002 layer, centerlines were broken at the confluence of two or more streams or the inflow/outflow of a water body.

Stretches of stream intersected by a mussel SOA are valued as habitat. All valued streams are buffered by 0.75 kilometers upstream and downstream. The 0.75 kilometer distance is chosen as a conservative buffer estimate because scientific literature based largely upon larval transport by host fishes, indicates that if there are two occurrences within two kilometers of each other (assuming unsuitable habitat between), these occurrences should be considered as part of the same local population (NatureServe 2011). In the cases where stream buffers of separate occurrences of the same species meet, either upstream or downstream, the stream segments between those occurrences are also valued for that species. In addition, in cases where dams are barriers the extent of stream valued was limited.

The tidewaters of Pompeston Creek in Burlington County provide ideal habitat for the Eastern Pondmussel.

Stream centerlines are used to represent freshwater mussel habitat in Version 3.3 of the Landscape Project.

VERNAL HABITAT

In 2001, ENSP partnered with Rutgers University Center for Remote Sensing and Spatial Analysis (CRSSA) to develop a method for mapping potential vernal pools throughout New Jersey. Through an on-screen visual interpretation of digital orthophotography, CRSSA identified over 13,000 potential pools throughout the state. A subset of these pools was field verified and confirmed, with an 88% accuracy rate, to meet the physical characteristics to qualify as a vernal pool (Lathrop et al. 2005).

Eastern Tiger Salamander (*Desmognathus tigris*), a vernal pool breeder.

In accordance with N.J.A.C. 7:7A-1.4, the term “vernal habitat” includes a vernal pool - or the area of ponding - plus any freshwater wetlands adjacent to the vernal pool. Vernal habitat areas mapped in the Landscape Project rely upon those data developed by the DEP and CRSSA to identify sites that should be field checked for

possible identification as vernal habitat areas. DEP staff is in the process of field-verifying these pools. The Department also maps vernal habitat areas based upon on-the-ground assessment of sites not captured by the CRSSA mapping. The Landscape Project includes all of the CRSSA-identified sites, as well as sites identified by on-the-ground reconnaissance, categorized as either “potential vernal habitat areas” or “vernal habitat areas” as defined below.

- ▶ **Potential vernal habitat area** - These are areas identified by CRSSA as possibly containing a vernal pool that meets the criteria of a “vernal habitat” pursuant to N.J.A.C. 7:7A-1.4. These sites include sites that have been field inspected and have been found to meet the physical characteristics of a vernal habitat, but for which biological criteria have not yet been measured, as well as sites that have not been checked by DEP staff.
- ▶ **Vernal habitat areas** - These are areas that contain pools that have been field-verified by the Department and have been determined to meet both the physical and biological characteristics of a vernal habitat in accordance with N.J.A.C. 7:7A-1.4.

A vernal pond in northern New Jersey.

Vernal habitat areas identified in the Landscape Project.

All areas mapped as “potential vernal habitat areas” and “vernal habitat areas” are derived from a point location estimated to be the center of an individual vernal pool and include all areas within 300 meters of the point. Note that the occurrence area is not intended to suggest or correspond with any specific regulatory requirement. Rather, the area added around the point accounts for variations in the size of individual vernal pools, variations in the width of freshwater wetlands adjacent to the pool, plus adjacent habitats sufficient to include the estimated home range for vernal pool obligate species. If there is an overlap between areas mapped around two or more nearby points, the boundaries are conjoined to generate contiguous patches. If the resulting patch contains areas mapped as “vernal habitat area” and areas mapped as “potential vernal habitat areas,” the entire patch is labeled as a “vernal habitat area.”

DATA AVAILABILITY

Landscape Project maps are available in file geodatabase format and projected to New Jersey State Plane feet, datum NAD 83, zone 4701. The maps are best viewed using ArcGIS 10.x. These software products allow the user full functionality for viewing and manipulating Landscape Project data. Non-GIS users can view the maps using the DEP's interactive mapping application listed below or ArcGIS Explorer, a free GIS data browser that can be downloaded from the ESRI Web site: <http://www.esri.com/software/arcgis/explorer/index.html>

Landscape Project data and maps are available by the following methods:

GIS Data

- Download on NJDEP's Bureau of GIS website (<http://www.nj.gov/dep/gis>).

Online Mapping Application

- Access GIS layers on NJDEP's interactive mapping application site (<http://www.nj.gov/dep/gis/>).

GLOSSARY

Biological and Conservation Database (BCD) - Biodiversity data management software developed by NatureServe that was formerly used by the New Jersey Department of Environmental Protection's Natural Heritage Program and Division of Fish and Wildlife's Endangered and Nongame Species Program before it was replaced by Biotics in 2004.

Biotics - Biodiversity data management software used by the Endangered and Nongame Species Program (ENSP). The successor to the Biological and Conservation Database, this data management software is developed by NatureServe and, within New Jersey, is maintained jointly by ENSP (animal data) and the Natural Heritage Program (plant and ecological community data).

certified vernal pool - Four criteria must be satisfied in order for a vernal pool to be classified as certified. These criteria are: 1. The area must occur in a confined basin or depression without a permanently flowing outlet; 2. The pool must feature evidence of breeding by at least one obligate or two facultative vernal habitat species (these species are identified in N.J.A.C. 7:7A, Appendix 1); 3. The area must maintain ponded water for at least two continuous months between March and September of a normal rainfall year, and; 4. The area must remain free of fish populations throughout the year, or it must dry up at some time during a normal rainfall year.

endangered species - A species included on the list of endangered species at N.J.A.C. 7:25-4.13 and any species or subspecies of wildlife appearing on any Federal endangered species list. The Endangered and Nongame Species Conservation Act (N.J.S.A. 23:2A et seq.) defines an endangered species (with respect to wildlife) to be a species or subspecies of wildlife whose prospects for survival or recruitment are in jeopardy or are likely within the foreseeable future to become so due to any of the following factors: (1) the destruction, drastic modification, or severe curtailment of its habitat, or (2) its over-utilization for scientific, commercial or sporting purposes, or (3) the effect on it of disease, pollution, or predation, or (4) other natural or manmade factors affecting its prospects of survival or recruitment within the State, or (5) any combination of the foregoing factors. The term shall also be deemed to include any species or subspecies of wildlife appearing on any Federal endangered species list.

feature label - A label assigned to each occurrence that describes the occurrence type (e.g., nest, den, dead on road, etc.).

Highlands Region - The New Jersey Highlands Region is the area designated pursuant to the Highlands Water Protection and Planning Act, at N.J.S.A. 13:20-7; an over 800,000 acre region covering over 1,250 square miles and 88 municipalities in seven counties (Bergen, Hunterdon, Morris, Passaic, Somerset, Sussex and Warren). The Highlands Region is an essential source of drinking water for half of the residents of New Jersey.

imperiled species - Includes all wildlife species considered to be endangered or threatened as defined elsewhere in this document.

location use class - A label used for aerial and marine migrants that occupy disjunct locations by season (i.e. breeding or nonbreeding). Applies to migratory species only.

Land Use/Land Cover (LULC) - A geographic information system (GIS) dataset produced by visually interpreting color infrared aerial photography of New Jersey. Through this process, photo-interpreters examine each

image, and based on their knowledge of photo signatures, classify the image into various land use/ land cover categories. The classifications are converted into a land use/land cover GIS digital file, with each delineated polygon representing a distinct land use/land cover type.

LULC treatment - A specific rule applied to an individual LULC class that determines how that LULC class will interact with a SOA and/or other LULC classes in order to construct patches of habitat for each species-feature label combination.

major roadway - A roadway classified by the New Jersey Department of Transportation as a 600 Series County Route or higher. Major roadways are Interstate Highways, U.S. Routes, NJ State Highways, Toll Authority Routes and 500 and 600 Series County Routes.

Natural Heritage methodology - A set of standard procedures for gathering, organizing, and managing information on biodiversity, used throughout the NatureServe network.

NatureServe - A non-profit conservation organization that provides scientific information and tools to help guide effective conservation action. NatureServe represents an international network of biological inventories (known as natural heritage programs or conservation data centers) operating in all 50 states, Canada, Latin America, and the Caribbean.

patch type - A category that describes the method employed to form the valued habitat area from the Landscape base layer for each species-feature label combination. Each species-feature label combination is grouped into one of the patch type categories.

riparian - Of, or pertaining to, the bank of a river or stream.

Rutgers University Center for Remote Sensing and Spatial Analysis (CRSSA) - An active research and development program focusing on advancing the application of various geo-spatial technologies including remote sensing, geographic information systems and global positioning systems. CRSSA also develops spatial-statistical analysis/modeling techniques for the environmental, agricultural and natural resource sciences and management.

species occurrence area - A polygon specific to each species-feature label combination that is applied to all occurrences in the Biotics database and that is used to value habitat in the Landscape Project. The area of the polygon is generally based on the average home range/territory size, or other appropriate life-history parameter as reported in peer-reviewed scientific literature or from information obtained through ENSP research. When searching the scientific literature to gather information to support the occurrence area polygon size, efforts were made to select research that was conducted in habitat types similar to those found in New Jersey. For many species that value habitat patches in the Landscape Project maps, insufficient information exists in the scientific literature to support the designation of an occurrence area. In these cases, a default occurrence area (71.25m radius) is applied to take into account locational uncertainty.

species of special concern - Nongame wildlife species that warrants special attention by the Department because of inherent vulnerability to environmental deterioration or habitat modification that would result in its becoming threatened if conditions surrounding the species begin or continue to deteriorate. Factors that can lead to classification as special concern include, but are not limited to, species rarity in the State, highly specialized food and/or habitat requirements, low reproductive rate, isolated populations of the species within the State

and/or other characteristics that make the species particularly susceptible to environmental or habitat changes. This category includes a species that meets the foregoing criteria and for which there is little understanding of its current population status in the State. Species determined to be “special concern” are so-designated at N.J.A.C. 7:25-4.17.

threatened species - An indigenous nongame wildlife species of New Jersey designated pursuant to the Endangered and Nongame Species Conservation Act, N.J.S.A.23:2A et. seq., and its implementing rules, N.J.A.C. 7:25-4.17, as most recently amended. Threatened species are generally defined to be species that may become endangered if conditions surrounding them begin or continue to deteriorate.

vernal pool - Vernal pools are confined depressions, either natural or man-made, that hold water for at least two consecutive months out of the year, and are devoid of breeding fish populations. Vernal pools provide habitat to many species of amphibians, insects, reptiles, plants, and other wildlife. The absence of fish is the essence of these ecosystems.

Geographic Information Systems Terminology from Environmental Systems Research Institute's Online GIS Dictionary (<http://support.esri.com/index.cfm?fa=knowledgebase.gisDictionary.gateway>)

ArcView - Full-featured geographic information system software for visualizing, analyzing, creating, and managing data with a geographic component.

ArcView Shapefile - A vector data storage format for storing the location, shape, and attributes of geographic features. A shapefile is stored in a set of related files and contains one feature class.

dissolve - A geoprocessing command that removes boundaries between adjacent polygons that have the same value for a specified attribute.

feature class - In ArcGIS, a collection of geographic features with the same geometry type (such as point, line, or polygon), the same attributes, and the same spatial reference. Feature classes can be stored in geodatabases, shapefiles, coverages, or other data formats. Feature classes allow homogeneous features to be grouped into a single unit for data storage purposes.

feature dataset - In ArcGIS, a collection of feature classes stored together that share the same spatial reference; that is, they share a coordinate system, and their features fall within a common geographic area. Feature classes with different geometry types may be stored in a feature dataset.

geodatabase - A database or file structure used primarily to store, query, and manipulate spatial data. Geodatabases store geometry, a spatial reference system, attributes, and behavioral rules for data. Various types of geographic datasets can be collected within a geodatabase, including feature classes, attribute tables, raster datasets, network datasets, topologies, and many others.

geoprocessing - A geographic information system (GIS) operation used to manipulate GIS data. A typical geoprocessing operation takes an input dataset, performs an operation on that dataset, and returns the result of the operation as an output dataset. Common geoprocessing operations include geographic feature overlay, feature selection and analysis, topology processing, raster processing, and data conversion. Geoprocessing allows for definition, management, and analysis of information used to form decisions.

- GIS** - Acronym for geographic information system. An integrated collection of computer software and data used to view and manage information about geographic places, analyze spatial relationships, and model spatial processes. A GIS provides a framework for gathering and organizing spatial data and related information so that it can be displayed and analyzed.
- GPS** - Acronym for Global Positioning System. A system of radio-emitting and –receiving satellites used for determining positions on the earth. The orbiting satellites transmit signals that allow a GPS receiver anywhere on earth to calculate its own location through trilateration. Developed and operated by the U.S. Department of Defense, the system is used in navigation, mapping, surveying, and other applications in which precise positioning is necessary.
- raster** - A spatial data model that defines space as an array of equally sized cells arranged in rows and columns, and comprised of single or multiple bands. Each cell contains an attribute value and location coordinates. Unlike a vector structure, which stores coordinates explicitly, raster coordinates are contained in the ordering of the matrix. Groups of cells that share the same value represent the same type of geographic feature.
- union** - A topological overlay of two or more polygon spatial datasets that preserves the features that fall within the spatial extent of either input dataset; that is, all features from both datasets are retained and extracted into a new polygon dataset.
- vector** - A coordinate-based data model that represents geographic features as points, lines, and polygons. Each point feature is represented as a single coordinate pair, while line and polygon features are represented as ordered lists of vertices. Attributes are associated with each vector feature, as opposed to a raster data model, which associates attributes with grid cells.

Attachment III: Climate Change Summary for the New Jersey Wildlife Action Plan

Climate Change Summary for the New Jersey Wildlife Action Plan

A report prepared for the
NJ Dept. of Environmental Protection
Division of Fish & Wildlife
by
David E. VanLuven
VanLuven Environmental

July, 2015

EXECUTIVE SUMMARY

Climate change is already underway in New Jersey, and the State Climatologist at Rutgers University has clearly documented increases in average temperatures, fluctuating extremes in precipitation, and sea level rise. These and other climate change impacts are projected to affect New Jersey's wildlife and ecological communities well into the future – exacerbating many long term challenges while presenting new challenges as well.

- Rising sea levels will **inundate intertidal wetlands and beaches**. Extreme storms and storm surge will prompt coastal communities to **further armor coastlines** which can lead to both short- and long-term impacts on coastal habitats and wildlife. **Post-storm replenishment of ocean and estuarine beaches** can deleteriously affect shoreline nesting birds if poorly planned or timed. Higher sea levels will also **push the saltwater toe landward**, making low elevation freshwater wetlands brackish. Excessive groundwater withdrawal could exacerbate this problem.
- Shifting temperatures and altered precipitation patterns will **shuffle species compositions** of ecological communities at the southern edges of their ranges, altering habitat for dependent wildlife species.
- Higher temperatures and altered precipitation patterns could **warm rivers, streams, wetlands, and other aquatic systems**, with deleterious consequences for freshwater mussels, turtles, amphibians, and invertebrates.
- More intense precipitation could cause **more flooding and erosion in streams and rivers**, with a variety of deleterious consequences for fish, mussels, and aquatic invertebrates. In turn, the flooding could motivate landowners within riparian areas to **harden river and stream banks** to protect property and infrastructure, further altering important wildlife habitats.
- Lower water levels in rivers and streams could **impede fish access** to spawning and overwintering areas, and less consistent rainfall into vernal pools could result in drying that eliminates and further isolates these important wildlife habitats. Heavier surface and groundwater withdrawal by humans during droughts could exacerbate these problems.
- Warmer winter temperatures will allow less cold-tolerant species, including problematic **invasives and pathogens**, to expand their ranges into New Jersey, impacting native wildlife and their habitats.

Adapting to climate change doesn't require new strategies, it requires widespread implementation of strategies that have been well known for decades, like maintaining and recreating connectivity between key wildlife habitats.

There is consensus across the scientific community that climate change is happening and recognition that strategies to address its projected impacts on wildlife and their habitats need to be undertaken now. And we know what to do, as the majority of these strategies have been recognized as being necessary for many years regardless of climate change. Further, climate change, with its broad impacts across all sectors of New Jersey interests, could be a catalyst that brings diverse stakeholders with many different motivations together to advance common strategies.

CLIMATE CHANGE & IMPLICATIONS

Climate change is underway in New Jersey, with well documented increases in average temperatures, fluctuating extremes in precipitation, and sea level rise (ONJSC, 2013). A suite of climate change impacts are projected to affect New Jersey's wildlife and ecological communities, exacerbating many long term challenges and presenting new ones. In this chapter, we will briefly consider the relevant elements of climate change on New Jersey's wildlife and ecological communities, identify likely implications, and present potential adaptation strategies.

Temperature

If emissions remain high, average winter temperatures could increase by 8° to 12° F, and summer averages by 6° to 14° F by the end of the century (NCIA, 2006). If emissions are dramatically lowered, winter average temperatures could still warm by 5° to 7.5° F and summer averages by 3° to 7° F (NCIA, 2006).

Implications: Warmer winter temperatures will allow less cold-tolerant invasive species and pathogens to expand their ranges into New Jersey (NCIA, 2006) with deleterious consequences for ecological communities and wildlife. Shifting temperatures across seasons could alter the phenologies of species so they are no longer synchronized – a particular issue for migratory species who may suffer lower reproductive rates as a result (Carey 2009). These temperature changes, combined with altered precipitation patterns, will likely also shift the plant compositions of ecological communities at the edges of their ranges, with comparable shifts in wildlife species (Staudinger *et al.*, 2013).

Higher temperatures, combined with altered precipitation patterns, could further warm rivers and streams, wetlands, and other aquatic systems, making them less suitable for cold water fish, mussels, turtles, amphibians, and invertebrates (Trumbo *et al.*, 2014; Manomet and NWF, 2013a; Brooks, 2009; Hastie *et al.*, 2003; Gibbons *et al.*, 2000). This is especially a concern in waters with marginal temperatures or with isolated populations where cold water fish could be gone by 2030 (Jones *et al.*, 2013). These changes in water temperature, however, are likely to be highly site specific, as key determinants appear to be shading from riparian vegetation, cold water input from springs, surrounding land use, and elevation (Trumbo *et al.*, 2014; Manomet and NWF, 2013a).

Precipitation & Flooding

Winter precipitation totals are projected to increase, while models predict summer totals will remain about the same as we see today (ONJSC, 2013; NCIA, 2006). Precipitation, however, is projected to increasingly come in less frequent but more intense storms (Broccoli *et al.*, 2013; NCIA, 2006).

Implications: More intense precipitation could cause more flooding and erosion in streams and rivers, with a variety of deleterious consequences for fish, mussels, and aquatic invertebrates, from smothering siltation to transport downstream to unsuitable habitats (Manomet and NWF, 2013a; Hastie *et al.*, 2003). In turn, this flooding could motivate landowners within riparian areas to harden shorelines to protect properties and infrastructure, further altering important wildlife habitats.

Drought & Low Stream Flows

Summers in New Jersey are projected to be hotter, with both higher average temperatures and 30 to 60 more days above 90°F by the end of the century (NCIA, 2006). Higher summer temperatures – combined with steady summer precipitation averages, more rapid evaporation, and more rapid evapotranspiration – will likely lead to more frequent short-term summer droughts and lower stream and river flows in summer (Manomet and NWF, 2013a; ONJSC, 2013; NCIA, 2006).

Implications: Droughts and earlier peak flows could impede migratory fish from reaching spawning areas (Faass *et al.*, 2012). Heavier water withdrawal by humans during droughts could further lower water levels in rivers, streams, and wetlands. Vernal pools are particularly vulnerable to drought and altered precipitation patterns, and the wildlife habitat they provide will change with alterations to their hydroperiods (Brooks 2009). Drying trends will cause some vernal pools to disappear, leaving remaining pools increasingly isolated and less able to support dependent amphibian metapopulations (Brooks 2009).

Sea Level Rise

Records show steady rises in sea level along New Jersey's shores, with an average increase of 1.5 inches per decade at Atlantic City since 1912 (Broccoli, *et al.*, 2013). Climate change will speed this rate – potentially dramatically. Broccoli *et al.* (2013) project increases of 7 to 16 inches by 2030 (best estimate = 10 inches), 13 to 28 inches by 2050 (best estimate = 18 inches), and 30 to 71 inches by the end of the century (best estimate = 42 inches). Analyses by Miller *et al.* (2013) project sea levels in 2100 to be 3 to 3.5 feet higher if emissions are lowered, or 5.5 to 6 feet if emissions remain high.

Implications: Higher sea levels will inundate intertidal habitats (notably salt and brackish marshes), estuarine and ocean beaches, and low-lying freshwater wetlands and streams. If these ecological communities are able to migrate landward, they and the important wildlife habitat they provide can persist – especially if the rates of sea level rise are lower and there is sufficient sediment for intertidal wetlands to accrete on pace with the rising waters (NWF and Manomet, 2014; Hartig *et al.*, 2002). However, more intense storms and storm surge will trigger additional shoreline armoring, as was observed after Hurricane Sandy, thus making inland migration nearly impossible. NWF and Manomet (2014) project that ocean and estuary beaches will be reduced between 20% and 75% through the century, and salt marshes by 45% to 65%, depending on rates of sea level rise. Inundated and eroded salt marshes would likely be replaced by intertidal flats, providing a benefit for migratory shorebirds and waterfowl that depend on these habitats (NWF and Manomet, 2014) but a sharp decline in nesting habitat for wading birds, terns, gulls and other species that breed in salt marshes. Other researchers give more dire predictions, with one predicting that 89% of New Jersey's salt marshes will disappear with a 1-foot rise in sea level, and 95% being inundated with a 3-foot rise (Faass *et al.*, 2015).

Sea level rise will also increase saltwater intrusion into inland freshwater systems. Low-lying river and stream reaches will become tidal and brackish, and the ecological communities and wildlife they support will transition accordingly (Najjar *et al.*, 2000). The underground saltwater toe will also shift landward, making low elevation freshwater wetlands brackish, especially if accompanied by excessive groundwater withdrawal (Werner and Simmons, 2009). This will be particularly damaging to isolated systems, like vernal pools, and the amphibians and bird species that depend on them.

Extreme Storms

The confidence levels for models of tropical cyclone activity are low, leaving it unclear whether New Jersey will experience more frequent extreme storms or if past patterns will continue (Broccoli *et al.*, 2013). One researcher (Miller *et al.*, 2013), however, noted the possibility that by 2050 storms with 10-year recurrence intervals could be more intense than all historic storms that have hit Atlantic City.

Implications: Storm surge will inundate higher elevations due to sea level rise. If the frequency of damaging storm surge increases, then coastal communities will likely undertake more aggressive shoreline armoring to protect imperiled or damaged properties and infrastructure (Berry *et al.*, 2013). This armoring, in turn, could create a sense of safety in shoreline communities and stimulate further coastal development (Franck, 2009). This additional

shoreline hardening and development would exacerbate the impacts of sea level rise on intertidal habitats and beaches by further impeding their ability to migrate landward – a process that is already a severe challenge with development along 67% of New Jersey’s sandy oceanfront and 59% of these beaches armored with hard stabilization structures (Rice, 2015).

Severe storms can benefit wildlife, with new overwashes and inlets creating ideal foraging and breeding habitat for species like piping plover. These benefits can be rapidly undone, however, by post-storm management that closes new inlets and seals dune breaches. Further, post-storm replenishment of ocean and estuarine beaches can also deleteriously affect shoreline nesting birds if not carefully planned and timed.

Human Responses to Climate Change

As noted above, human responses to climate change can present serious challenges for wildlife and ecological communities in New Jersey (Manomet and NWF, 2013b; Faass *et al.*, 2012). For example, more variable precipitation patterns are projected to deliver more protracted periods of drought. During these times, municipalities may draw more heavily on surface and groundwater to supply clean water for drinking, watering lawns, and other purposes. These withdrawals could have a variety of implications for New Jersey wildlife, from lower stream flows that impede the movement of migratory fish to less seepage that alters wetlands vital for wildlife species of greatest conservation need. In another example, the typical response to flooding along the coast is to harden shorelines (Berry *et al.*, 2013), which can increase erosion and impede the ability of coastal habitats, and subsequently, coastal-dependent wildlife, to migrate landward with sea level rise. As such, adapting to climate change requires strategies not only that address climate challenges, but that also account for human responses to climate change.

TAKING ACTION DESPITE UNCERTAINTY

One of the biggest difficulties climate change presents to wildlife managers is uncertainty (Trumbo *et al.*, 2014). We can see climate change happening around us and know that it will continue. Across North America, researchers are recording rising sea levels, earlier or later fish and bird migrations, earlier peak flows in rivers and streams, and a northward expansion of pests (Manomet and NWF, 2013b; ONJSC, 2013). However, the magnitude of climate change over the next 80 to 100 years is unclear, and in turn the consequences of it are uncertain as well. For example, sea level in New Jersey is projected to rise by about 3 feet if emissions are lowered dramatically and by about 6 feet if emissions remain high (Miller *et al.*, 2013). Salt marshes may be able to accrete on pace with the low-emission rate of sea level rise with adequate deposition of sediments and reductions in non-climate change threats like pollution and shoreline hardening (NWF and Manomet, 2014). They are, however, unlikely to accrete on pace with the high-emission rate, which means their persistence will largely rely on the availability of adjacent uplands to convert to salt marsh habitat. So for which scenario should wildlife managers plan?

The answer is both, or rather, decision-makers should pursue climate change adaptation strategies that will yield benefits across a range of climate change scenarios (Staudinger *et al.*, 2015; The Nature Conservancy, 2009). Since we don’t know exactly what the future will hold, we should advance strategies that are most likely to yield benefits regardless of what happens.

This raises the additional challenge of moving forward on actions – some of which would be financially or politically costly – without a clear guarantee that they will be successful. Wildlife management has long worked in a world of incomplete information, as the data ideal for decision making (e.g., population sizes, habitat requirements, and in some cases even life histories) are not always available. But climate change exacerbates this difficulty by introducing variability in

parameters that have historically been considered relatively stable (e.g., average seasonal temperatures, precipitation patterns, etc.).

Not only is there consensus across the scientific community that climate change is happening, there is recognition that strategies to address its projected impacts on wildlife and their habitats need to be undertaken now (Staudinger *et al.*, 2015). And we know what to do, as the majority of these strategies have been recognized as being necessary for many years regardless of climate change. Further, climate change, with its broad impacts across all sectors of New Jersey interests, could be a catalyst that brings diverse stakeholders with many different motivations together to advance common strategies (The Nature Conservancy, 2009).

OLD THREATS REMAIN

Climate change is affecting wildlife habitats and ecological communities in New Jersey with more rapidly rising sea levels, more variable precipitation patterns, higher temperatures, and more. In addition to direct impacts, climate change is interacting with other stressors like habitat destruction, pollution, invasive species, off-road vehicle use, and an overabundance of white-tailed deer to deleteriously affect New Jersey's wildlife and ecological communities (Johnson and Strakosch Walz, 2013; Manomet and NWF, 2013b; Staudinger *et al.*, 2013; Faass *et al.*, 2012). As adaptation strategies are developed, wildlife managers need to continue addressing these serious threats as well, incorporating approaches that address multiple issues whenever possible.

MULTIPLE APPROACHES TO ADAPTATION

Wildlife conservation planning has typically focused on maintaining existing conditions that will allow local populations to persist in healthy sites that are able to rebound after local disturbances (Stein *et al.*, 2013; Staudinger *et al.*, 2015). Unfortunately, the challenges created and exacerbated by climate change may make the goals of this approach infeasible as altered precipitation patterns, higher temperatures, and other factors lead to fundamental changes in the landscape and at local sites. As a result, managers need to consider conservation goals that manage change in addition to maintaining existing conditions (Staudinger *et al.*, 2013; Stein *et al.*, 2013).

This shift in perspective is further developed in the two approaches to adaptation that are briefly outlined below. Both approaches have similar intents of protecting healthy ecological communities and wildlife populations that can rebound from perturbations while supporting a diversity of native species. But while one approach focuses on the persistence of *current* ecological communities and species in particular places, the other focuses on the geophysical conditions that underlie *future* species richness.

Current Species and Ecological Communities

This approach is the most common one seen across the United States. It focuses on the factors that affect a species' or habitat's vulnerability to climate change and strives to implement strategies that will overcome these challenges to ensure the species' or habitat's persistence. This includes approaches referred to as "resistance" and "resilience." Key elements include increasing connectivity between protected areas and other refugia, and sustaining ecological processes and functions (Staudinger *et al.*, 2015). While this approach recognizes that there will be major changes across the state, the emphasis is on protecting the species and the habitats that are in New Jersey now.

Geophysical Foundations of Future Species and Ecological Communities

This approach was developed by Anderson and Ferree (2010) and focuses on protecting places with the geophysical features (including geology, topography, elevation, and moisture gradients) that are most likely to support species richness regardless of climate change (Anderson *et al.*, 2011). Because the focus is on the abiotic features that support biodiversity, this approach may not prevent immediate local extinctions (Anderson and Ferree, 2010), a particular risk for species living at the extremes of their climactic tolerances or within habitats that are expected to experience major changes (Staudinger *et al.*, 2013).

LANDSCAPE REGIONS

New Jersey has six landscape regions which contain similar ecological communities and processes (NJ Division of Fish and Wildlife, 2012). Brief descriptions of these regions, concise notes on primary climate change threats, and potential adaptation strategies are provided below.

DELAWARE BAY LANDSCAPE REGION

Description

This landscape encompasses all or parts of Cape May, Atlantic, and Cumberland counties. It features significant populations of bald eagle, barred owl, eastern tiger salamander, and Cope's gray treefrog, and. It also provides habitat for 30 other endangered and threatened species. The vast woodland tracts of this region are among the largest in the state and support a large portion of New Jersey's neotropical birds and interior-forest bird populations. The extensive saltwater marshes and sandy overwash beaches support a significant horseshoe crab breeding area and migrating shorebirds including the red knot, a species of worldwide ecological significance. The expansive habitat mosaic of rivers and streams flowing into the tidal Delaware Bay supports concentrations of wildlife species of greatest conservation need and wintering waterfowl. Despite the heavy loss of habitat, the Cape May Peninsula remains one of the country's most important migratory "stopovers" for hundreds of bird, bat, and insect species. The peninsula's habitats, however, have been degraded by continuing development and invasions of exotic vegetation that crowd out native plants. The loss of peninsula habitat is a significant threat to migratory birds and to other species that reside permanently in this limited area. The region has many interior forests in conservation ownership, but forest management approaches do not necessarily secure the future for many wildlife species of conservation greatest conservation need. The largest threat to the region's habitats is the continuing conversion of habitat to development that fragments the remaining natural landscape.

Primary Climate Change Threats & Adaptation Strategies

- Rising sea levels will **inundate intertidal wetlands and beaches**. Extreme storms and storm surge will prompt coastal communities to **further armor coastlines** which can lead to both short- and long-term impacts on coastal habitats and wildlife. **Post-storm replenishment of estuarine beaches** can deleteriously affect shoreline nesting birds if poorly planned or timed. Higher sea levels will also **push the saltwater toe landward**, making low elevation freshwater wetlands brackish. **Excessive groundwater withdrawal** could exacerbate this problem.
Strategies: - limit coastline hardening and development to allow beaches and intertidal wetlands to migrate landward
- implement dune protection policies that protect dunes and ensure space for landward migration
- integrate wildlife conservation into beach replenishment programs to minimize deleterious effects on nesting shorebirds
- implement groundwater withdrawal policies that account for saltwater intrusion
- Shifting temperatures and altered precipitation patterns will **shuffle species compositions** of ecological communities at the southern edges of their ranges, altering habitat for dependent wildlife species.
Strategy: - undertake site-specific and landscape-level programs to maintain and recreate connectivity between key habitats and areas of high geophysical diversity
- Higher temperatures and altered precipitation patterns could **warm rivers, streams, wetlands, and other aquatic systems**, with deleterious consequences for freshwater mussels, turtles, amphibians, and invertebrates.
Strategies: - maintain and restore riparian vegetation to increase shading
- limit and remove impervious surfaces near waterways to reduce their warming effect on runoff

- during droughts, limit water withdrawal that could reduce input of cold groundwater
- More intense precipitation could cause **more flooding and erosion in streams and rivers**, with a variety of deleterious consequences for fish, mussels, and aquatic invertebrates. In turn, the flooding could motivate landowners within riparian areas to **harden river and stream banks** to protect property and infrastructure, further altering important wildlife habitats.
Strategies: - maintain and restore floodplains and wetlands to slow runoff
 - guide development away from flood-prone areas
 - limit river and stream bank hardening
 - integrate more intense precipitation and flooding considerations into soil erosion and sediment control best management practices
- Lower water levels in rivers and streams could **impede fish access** to spawning and overwintering areas, and less consistent rainfall into vernal pools could result in drying that eliminates and further isolates these important wildlife habitats. Heavier surface and groundwater withdrawal by humans during droughts could exacerbate these problems.
Strategies: - implement water conservation strategies during droughts to maintain flows
 - remove barriers that could impede movement during low flows
 - maintain vegetated buffers around vernal pools to increase their resiliency
- Warmer winter temperatures will allow less cold-tolerant species, including problematic **invasives and pathogens**, to expand their ranges into New Jersey, impacting native wildlife and their habitats.
Strategy: - manage sites to limit establishment of invasives and to control their spread

ATLANTIC COASTAL LANDSCAPE REGION

Description

This landscape encompasses parts of Monmouth, Ocean, Cape May, and Atlantic counties. New Jersey's Atlantic Coast beaches and marshes are among the most productive coastal habitats in the country. Despite heavy development, they still support important portions of Atlantic Coast populations of colonial nesting birds, such as common tern, little blue heron, and great egret, and endangered beach-nesting birds such as least tern and piping plover. The coastal habitats also support most of the state's ospreys, peregrine falcons, and northern diamondback terrapins, as well as northern harriers and large concentrations of wintering waterfowl. However, human development has played a large role in degrading the quality of the habitat and there are very few natural areas remaining to support wildlife. By and large, this region has been shaped by the heavy hand of man. Upland portions of the barrier islands are almost entirely developed with residential and commercial properties. Due to this propensity for building permanent structures in a dynamic system, the need to stabilize the islands through extensive use of groins, seawalls, jetties, and intense beach replenishment programs has translated into a reduced ability of the coastal system to function normally. This tug of war is intensified by erosion, which has noticeably affected both the marsh and barrier islands in this landscape, and has diminished the suitability of the landscape for wildlife.

Primary Climate Change Threats & Adaptation Strategies

- Rising sea levels will **inundate intertidal wetlands and beaches**. Extreme storms and storm surge will prompt coastal communities to **further armor coastlines** which can lead to both short- and long-term impacts on coastal habitats and wildlife. **Post-storm replenishment of estuarine beaches** can deleteriously affect shoreline nesting birds if poorly planned or timed. Higher sea levels will also **push the saltwater toe landward**, making low elevation freshwater wetlands brackish. **Excessive groundwater withdrawal** could exacerbate this problem.

Strategies: - limit coastline hardening and development to allow beaches and intertidal wetlands to migrate landward and undergo other coastal processes (including the development of new inlets and overwash areas)

- educate communities on the benefits of naturally functioning coastal systems that better protect people and important wildlife habitats
- implement dune protection policies that protect dunes and ensure space for landward migration
- integrate wildlife conservation into beach replenishment programs to minimize deleterious effects on nesting shorebirds and rare plants
- implement groundwater withdrawal policies that account for saltwater intrusion

- Shifting temperatures and altered precipitation patterns will **shuffle species compositions** of ecological communities at the southern edges of their ranges, altering habitat for dependent wildlife species.

Strategy: - undertake site-specific and landscape-level programs to maintain and recreate connectivity between key habitats and areas of high geophysical diversity

- Warmer winter temperatures will allow less cold-tolerant species, including problematic **invasives and pathogens**, to expand their ranges into New Jersey, impacting native wildlife and their habitats.

Strategy: - manage sites to limit establishment of invasives and to control their spread

PIEDMONT PLAINS LANDSCAPE REGION

Description

This landscape region combines two of New Jersey's physiographic regions, the Piedmont and the Inner Coastal Plains. It encompasses all or parts of Burlington, Gloucester, Salem, Mercer, Middlesex, Monmouth, Hunterdon, Somerset, Union, Essex, Hudson, Passaic, and Bergen counties. It is dominated by the Delaware and Raritan rivers and is characterized by farmed areas, extensive grasslands, fragmented woodlands, and tidal freshwater marshes that are among the world's most productive. Imperiled species within this landscape include grassland birds such as the endangered upland sandpiper, and it is the only landscape in NJ where the endangered Allegheny woodrat resides. The Piedmont Plains Landscape has been, and continues to be, greatly influenced by human settlement. Most of this region has been logged, farmed, and developed, resulting in contaminated wetlands, fragments of even-aged forest, large fields planted in corn, soybean, or cool-season hay, a plethora of exotic invasive plants, a collection of roads and residential areas, and ideal sanctuaries for white-tailed deer.

Primary Climate Change Threats & Adaptation Strategies

- Shifting temperatures and altered precipitation patterns will **shuffle species compositions** of ecological communities at the southern edges of their ranges, altering habitat for dependent wildlife species.
Strategy: - undertake site-specific and landscape-level programs to maintain and recreate connectivity between key habitats and areas of high geophysical diversity
- Higher temperatures and altered precipitation patterns could **warm rivers, streams, wetlands, and other aquatic systems**, with deleterious consequences for freshwater mussels, turtles, amphibians, and invertebrates.
Strategies: - maintain and restore riparian vegetation to increase shading
- limit and remove impervious surfaces near waterways to reduce their warming effect on runoff
- during droughts, limit water withdrawal that could reduce input of cold groundwater
- More intense precipitation could cause **more flooding and erosion in streams and rivers**, with a variety of deleterious consequences for fish, mussels, and aquatic invertebrates. In turn, the flooding could motivate landowners within riparian areas to **harden river and stream banks** to protect property and infrastructure, further altering important wildlife habitats.
Strategies: - maintain and restore floodplains and wetlands to slow runoff
- guide development away from flood-prone areas
- limit river and stream bank hardening
- integrate more intense precipitation and flooding considerations into soil erosion and sediment control best management practices
- Lower water levels in rivers and streams could **impede fish access** to spawning and overwintering areas, and less consistent rainfall into vernal pools could result in drying that eliminates and further isolates these important wildlife habitats. Heavier surface and groundwater withdrawal by humans during droughts could exacerbate these problems.
Strategies: - implement water conservation strategies during droughts to maintain flows
- remove barriers that could impede movement during low flows
- maintain vegetated buffers around vernal pools to increase their resiliency
- Warmer winter temperatures will allow less cold-tolerant species, including problematic **invasives and pathogens**, to expand their ranges into New Jersey, impacting native wildlife and their habitats.
Strategy: - manage sites to limit establishment of invasives and to control their spread

PINELANDS LANDSCAPE REGION

Description

This landscape encompasses all or parts of Atlantic, Ocean, Burlington, Camden, and Gloucester counties. New Jersey's pinelands are an internationally recognized ecosystem consisting predominantly of pine and pine-oak mesic upland forests, pitch pine lowlands, and cedar swamps supporting extremely diverse reptile, amphibian, and invertebrate populations including interior-forest and area-sensitive species. Extensive cedar swamps and wetland systems contain numerous insect species, as well as sustainable populations of many neo-tropical birds. Its waterways support aquatic communities unique among the mid-Atlantic states.

Primary Climate Change Threats & Adaptation Strategies

- Shifting temperatures and altered precipitation patterns will **shuffle species compositions** of ecological communities at the southern edges of their ranges, altering habitat for dependent wildlife species.
Strategy: - undertake site-specific and landscape-level programs to maintain and recreate connectivity between key habitats and areas of high geophysical diversity
- Higher temperatures and altered precipitation patterns could **warm rivers, streams, wetlands, and other aquatic systems**, with deleterious consequences for freshwater mussels, turtles, amphibians, and invertebrates.
Strategies: - maintain and restore riparian vegetation to increase shading
- limit and remove impervious surfaces near waterways to reduce their warming effect on runoff
- during droughts, limit water withdrawal that could reduce input of cold groundwater
- More intense precipitation could cause **more flooding and erosion in streams and rivers**, with a variety of deleterious consequences for fish, mussels, and aquatic invertebrates. In turn, the flooding could motivate landowners within riparian areas to **harden river and stream banks** to protect property and infrastructure, further altering important wildlife habitats.
Strategies: - maintain and restore floodplains and wetlands to slow runoff
- guide development away from flood-prone areas
- limit river and stream bank hardening
- integrate more intense precipitation and flooding considerations into soil erosion and sediment control best management practices
- Lower water levels in rivers and streams could **impede fish access** to spawning and overwintering areas, and less consistent rainfall into vernal pools could result in drying that eliminates and further isolates these important wildlife habitats. Heavier surface and groundwater withdrawal by humans during droughts could exacerbate these problems.
Strategies: - implement water conservation strategies during droughts to maintain flows
- remove barriers that could impede movement during low flows
- maintain vegetated buffers around vernal pools to increase their resiliency
- Warmer winter temperatures will allow less cold-tolerant species, including problematic **invasives and pathogens**, to expand their ranges into New Jersey, impacting native wildlife and their habitats.
Strategy: - manage sites to limit establishment of invasives and to control their spread

SKYLANDS LANDSCAPE REGION

Description

This landscape region combines two of New Jersey's physiographic regions, the Ridge and Valley and the Highlands. It encompasses all or parts of Sussex, Warren, Hunterdon, Somerset, Passaic, Essex, Bergen, and Morris counties. The region contains extensive tracts of contiguous upland and wetland forests that support diverse animal populations including interior-forest and area-sensitive species. Forests on conserved lands suffer from a long-term lack of management and consist more typically of even-aged stands of similar structure. The forest tracts' understories range from a semi-barren landscape of mostly leaf litter and humus due to extensive deer browse and/or a lack of sunlight to an invasive species-dominant (or at least present at significant percentages) ground and shrub cover. Scrub-shrub habitat is minimal and geographically scattered, but is vital to various rare, common, and game wildlife species in this region. The lack of scrub-shrub habitat is also a result of long periods of unmanaged forests, habitat loss to development and infrastructure, and lack of regeneration due to over-browsing by deer.

Primary Climate Change Threats & Adaptation Strategies

- Shifting temperatures and altered precipitation patterns will **shuffle species compositions** of ecological communities at the southern edges of their ranges, altering habitat for dependent wildlife species
Strategy: - undertake site-specific and landscape-level programs to maintain and recreate connectivity between key habitats and areas of high geophysical diversity
- Higher temperatures and altered precipitation patterns could **warm rivers, streams, wetlands, and other aquatic systems**, with deleterious consequences for freshwater mussels, turtles, amphibians, and invertebrates.
Strategies: - maintain and restore riparian vegetation to increase shading
- limit and remove impervious surfaces near waterways to reduce their warming effect on runoff
- during droughts, limit water withdrawal that could reduce input of cold groundwater
- More intense precipitation could cause **more flooding and erosion in streams and rivers**, with a variety of deleterious consequences for fish, mussels, and aquatic invertebrates. In turn, the flooding could motivate landowners within riparian areas to **harden river and stream banks** to protect property and infrastructure, further altering important wildlife habitats.
Strategies: - maintain and restore floodplains and wetlands to slow runoff
- guide development away from flood-prone areas
- limit river and stream bank hardening
- integrate more intense precipitation and flooding considerations into soil erosion and sediment control best management practices
- Lower water levels in rivers and streams could **impede fish access** to spawning and overwintering areas, and less consistent rainfall into vernal pools could result in drying that eliminates and further isolates these important wildlife habitats. Heavier surface and groundwater withdrawal by humans during droughts could exacerbate these problems.
Strategies: - implement water conservation strategies during droughts to maintain flows
- remove barriers that could impede movement during low flows
- maintain vegetated buffers around vernal pools to increase their resiliency
- Warmer winter temperatures will allow less cold-tolerant species, including problematic **invasives and pathogens**, to expand their ranges into New Jersey, impacting native wildlife and their habitats.
Strategy: - manage sites to limit establishment of invasives and to control their spread

MARINE REGION

Description

This region is exclusively aquatic and includes the New Jersey portion of the Delaware and Raritan bays and the Atlantic Ocean within three-nautical miles of the New Jersey shoreline. It supports shellfish of commercial value as well as a variety of fish species of commercial and recreational importance. Over half of New Jersey's federal listed species are found exclusively within this region, including several species of whales and sea turtles. Federally endangered sturgeons (shortnose and Atlantic) can be found in Delaware Bay (with Atlantic sturgeon migrating into ocean areas). Waters of the Delaware Bay are also critical habitat to one of the largest populations of horseshoe crabs in the world. During the summer, near-shore Atlantic Ocean waters are calving and nursery grounds for bottlenose dolphins while many additional species utilize these waters as a migratory corridor.

Threats

The likely responses of ocean ecological systems and marine species to climate change are not well known (Staudinger *et al.*, 2015), and articles tend to consider the issue on a global scale (for example, Kaschner *et al.* (2011) and Herr and Galland, 2009). That said, projected effects include decreased growth and reproduction in some marine fish species, range shifts for species at the northern or southern edges of their ranges, increases in diseases and pathogens, and a “reshuffling” of marine plants and animals (Staudinger *et al.*, 2013).

Adaptation Strategies

While researchers have speculated on potential challenges that climate change poses to marine systems, they have not identified many options that states might take to directly address them. But in a summary report on tools and guidelines for action (Herr and Galland, 2009), the International Union for Conservation of Nature (IUCN) did recommend a variety of strategies, including the following.

- Implementing various mitigation activities to reduce the effects of climate change on marine systems by decreasing its magnitude.

- Addressing unsustainable human activities, such as overfishing, pollution, and habitat destruction to help keep ocean systems and species more resilient.

- Creating networks of Marine Protected Areas to buffer ocean ecosystems from non-climate change challenges and to increase their resiliency.

- Restoring degraded ecosystems to make them more resilient. For New Jersey, this would likely be most important in coastal ecological systems that serve, for example, as nurseries for a variety of fish species.

Attachment IV: Guidelines for Integrating Plant Species of Conservation Concern into Wildlife Action Planning and Implementation

Guidelines for Integrating Plant Species of Conservation Concern into Wildlife Action Planning and Implementation

Part 1: “Integrated Management Guidelines for Four Habitats and Associated State Endangered Plants and Wildlife Species of Greatest Conservation Need in the Skylands and Pinelands Landscape Conservation Zones of the New Jersey State Wildlife Action Plan,” by E. Johnson and K. Walz.

This Plan explicitly focuses on the development and implementation of actions to conserve New Jersey's wildlife species of greatest conservation need (SGCN) and the habitats on which they depend. However, New Jersey also supports an extraordinarily diverse flora, described in Chapter 3, Section VI, including natural communities that provide significant habitat for wildlife SGCN and associated rare plants.

The actions, projects, and monitoring programs presented in this plan for wildlife also provide an opportunity to contribute to the conservation of rare plants and natural communities. At the same time, without proper precautions, actions directed at enhancing wildlife, especially on-the-ground actions that modify habitats, may pose risks to rare plants.

As such, it is important that land and wildlife managers consider plant communities when implementing conservation actions and monitoring programs. The resulting report, presented in Part 1 of this Appendix, focused on four habitat types within two landscape regions that are critical to a suite of plant and wildlife species. The report provides examples of how to integrate rare plant and wildlife conservation planning and adaptive management. Note the report follows the geographic organization of the 2008 Revised State Wildlife Action Plan.

Part 2: Distribution of Rare Plants and Natural Communities within New Jersey

The second part of this appendix provides location information on the distribution of rare plants and natural communities throughout New Jersey's six Landscape Regions described in Chapter 3. Understanding where such plant communities exist enables land and wildlife managers and researchers to consider plant communities in research and management planning and implementation.

Project Summary:

New Jersey is the first state projected to reach build-out, and pressure from competing land use interests and associated threats is high on the remaining open space. Therefore it is imperative to strategically protect and manage these natural areas for resiliency, as it is on these lands where the future of conservation lies for plants, animals and their critical habitats. Strengthening New Jersey's State Wildlife Action Plan (SWAP) will help address the growing need for guided protection and integrated management for species of greatest conservation need (SGCN).

While broad habitat categories based on vegetation communities are referenced in the New Jersey SWAP, plant species of conservation concern are not addressed (NJDEP 2008). The purpose of this project is to develop rare plant conservation strategies that complement conservation actions for animal species in the context of biodiversity protection and climate change in New Jersey. The project focused on two high-priority regions of the state with the development of a spatial framework and conservation strategy prototype that can be used in other regions of the state. Integrated rare plant and wildlife SGCN management guidelines will be incorporated into New Jersey's updated 2015 SWAP and implemented, as practicable, with state and NGO conservation partners.

The outcomes of this project include:

- ✧ Integrated management guidelines were developed for State Endangered plants and wildlife SGCN using a habitat approach. The four habitats include calcareous fens and sinkhole ponds in the Kittatinny Valley of northern New Jersey and coastal plain intermittent ponds and wet savannas in the Pine Barrens of southern New Jersey.
- ✧ Tables with Wildlife Conservation Management Plan (CMP) Threats and Wildlife Tracking and Reporting Actions for the Conservation of Species (TRACS) Conservation Actions were created for all 70 State Endangered plant species and 30 wildlife SGCN.
- ✧ Examples of supplemental sidebars were created for the SWAP featuring integrated management recommendations for relevant rare plant and wildlife SGCN/guilds by habitat within the SWAP Landscape Conservation Zones.
- ✧ The project opened a constructive dialogue between ENSP and NHP on integrated management issues with respect to rare plants, animals and their habitats.
- ✧ A significant outcome of the project was an awareness of the gap that exists in coordinating the management of natural resources in a state reaching build-out with limited areas left for habitat and species protection. We have realized that multiple projects occur on private or NGO lands that are not necessarily coordinated with other state efforts to integrate management of all elements of biodiversity (e.g., bog turtle habitat restoration projects). This understanding underscores the importance of reaching out to landowners involved in incentive programs in the future to educate them about rare plant conservation.

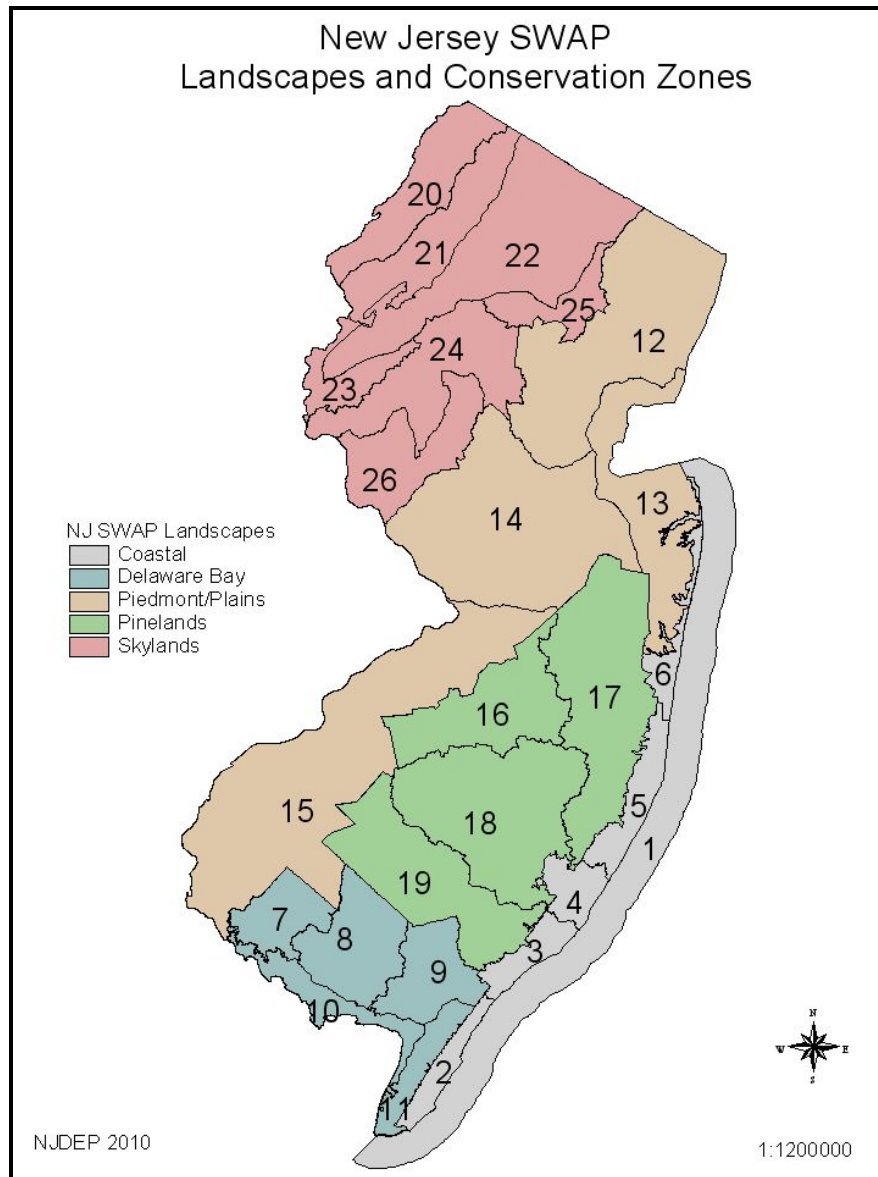

Introduction:

In 2005, as part of a national effort, New Jersey developed a State Wildlife Action Plan (SWAP) that seeks, in part, to identify the threats to wildlife and the conservation actions needed to address them. Since that time, the SWAP was updated in 2008 and has been used as a guiding document for agencies, organizations, and individuals working to conserve New Jersey's wildlife species of greatest conservation need (SGCN). Yet while the focus of the SWAP has been on animal species of conservation concern, many rare plants are also found in the same habitats as the animals. Unfortunately, plants were not included in the definition of "wildlife" provided in the federal guidelines for plan development and as a result, most plans do not address plants in any significant way (Stein and Gravuer 2008). This has led to some management conflicts over the years, where rare plant populations inadvertently were damaged due to incompatible management actions implemented for rare animal conservation.

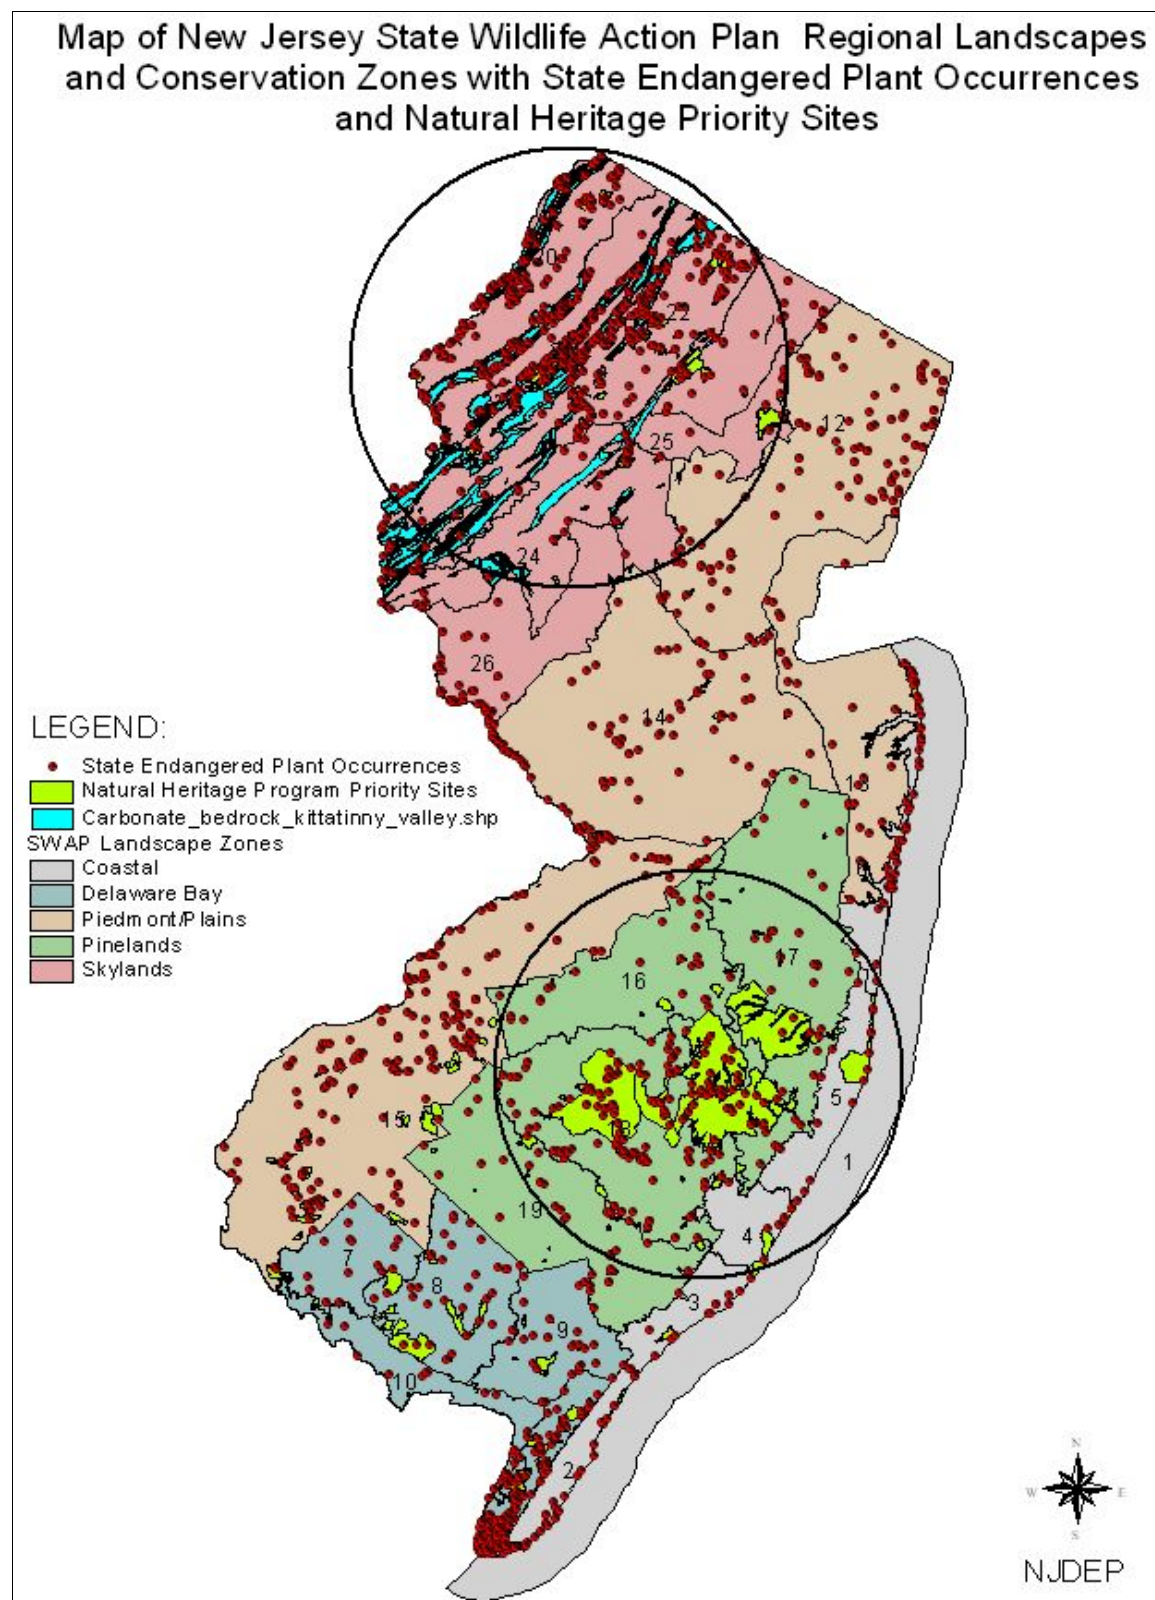

New Jersey is a small state, and predicted to be the first state to reach build-out. For these reasons, there is a very clear limit to the amount of habitat available to support biodiversity, New Jersey's plants and wildlife species, natural communities, and ecological processes. While New Jersey has protected close to 30 percent of its land area (Hasse and Lathrop 2010), many of these protected habitats are fragmented from each other and face significant external stresses. Another complication is the fact that most of New Jersey's endangered plant populations are found outside of state- or federally-protected lands (Breden et al. 2006) where protections for plants and/or their habitats are either non-existent or significantly weaker than for wildlife. Essentially, there are fewer safe habitats for plants than animals in New Jersey. While working with willing landowners to protect species and habitats on private lands are important conservation actions, it may be that the more lasting conservation actions are the ones taken on public lands. The challenge is how to meet the conservation needs of all species, plants and animals, in these remaining protected habitats.

To illustrate how this might be done in New Jersey, we selected four rare wetland habitats (Pine Barrens savannas, coastal plain intermittent ponds, calcareous fens, and calcareous sinkhole ponds). These wetlands support the highest diversity of both rare plants and wildlife SGCN in the state and the habitats themselves are also regionally and globally significant. For details on each of the four wetlands including habitat classification crosswalk, see individual habitat discussions.

For each of these four habitats we compiled a list of state endangered plant species from the 2012 Natural Heritage Program list of Plant Species of Conservation Concern, and a list of the animal species of greatest conservation need (game and nongame) identified from the 2008 New Jersey State Wildlife Action Plan and for which active management is anticipated in the near future. The following maps illustrate the habitat based conservation strategy approach and the tables list the species addresses in this report by habitat.

MAP LEGEND: NJ SWAP Landscape Regions and Conservation Zones		
MAP ID	LANDSCAPE REGION	CONSERVATION ZONE

STATE ENDANGERED PLANT SPECIES LIST BY SWAP LANDSCAPE REGION AND HABITAT		
REGION: SKYLANDS	Common name	Scientific name
Habitat type: Calcareous Fen (28 species)		
	Bog Rosemary	<i>Andromeda glaucophylla</i>
	Rush Aster	<i>Aster borealis</i>
	Foxtail Sedge	<i>Carex alopecoidea</i>
	Water Sedge	<i>Carex aquatilis</i>
	Lesser Panicked Sedge	<i>Carex diandra</i>
	Handsome Sedge	<i>Carex formosa</i>
	Cyperus-like Sedge	<i>Carex pseudocyperus</i>
	Tuckerman's Sedge	<i>Carex tuckermanii</i>
	Wood's Sedge	<i>Carex woodii</i>
	Marsh Cinquefoil	<i>Comarum palustris</i>
	Hemlock-parsley	<i>Conioselinum chinense</i>
	Small White Lady's-slipper	<i>Cypripedium candidum</i>
	Showy Lady's-slipper	<i>Cypripedium reginae</i>
	Few-flower Spike-rush	<i>Eleocharis quinqueflora</i>
	Variegated Horsetail	<i>Equisetum variegatum</i> var. <i>variegatum</i>
	Queen-of-the-prairie	<i>Filipendula rubra</i>
	Labrador Marsh Bedstraw	<i>Galium labradoricum</i>
	Small Bedstraw	<i>Galium trifidum</i> var. <i>trifidum</i>
	Northern Panic Grass	<i>Panicum boreale</i>
	Capillary Beaked-rush	<i>Rhynchospora capillacea</i>
	Orange Coneflower	<i>Rudbeckia fulgida</i> var. <i>fulgida</i>
	Shining Willow	<i>Salix lucida</i> ssp. <i>lucida</i>
	Bog Willow	<i>Salix pedicellaris</i>
	Strict Blue-eyed Grass	<i>Sisyrinchium montanum</i> var. <i>crebrum</i>
	Arborvitae	<i>Thuja occidentalis</i>
	Seaside Arrow-grass	<i>Triglochin maritima</i>
	Spreading Globe Flower	<i>Trollius laxus</i> ssp. <i>laxus</i>
	Sessile Water-speedwell	<i>Veronica catenata</i>
Habitat type: Calcareous Sinkhole Pond (13 species)		
	Large Water-plantain	<i>Alisma triviale</i>
	Appalachian Mountain Boltonia	<i>Boltonia montana</i>
	Cloud Sedge	<i>Carex haydenii</i>
	Hop-like Sedge	<i>Carex lupuliformis</i>
	Small Floating Manna Grass	<i>Glyceria borealis</i>

	Larger Canadian St. John's Wort	<i>Hypericum majus</i>
	Water-marigold	<i>Megalodonta beckii</i>
	Lake Water-cress	<i>Neobeckia aquatica</i>
	Wiry Panic Grass	<i>Panicum flexile</i>
	Arum-leaf Arrowhead	<i>Sagittaria cuneata</i>
	Torrey's Bulrush *	<i>Schoenoplectus torreyi</i>
	Small Burr-reed	<i>Sparganium natans</i>
	Lesser Bladderwort	<i>Utricularia minor</i>
REGION: PINELANDS	Common name	Scientific name
Habitat type: Pine Barren Savanna (14 species)		
	Pickering's Reed Grass	<i>Calamagrostis pickeringii</i>
	Spreading Pogonia	<i>Cleistes divaricata</i>
	Rough Cotton-grass	<i>Eriophorum tenellum</i>
	Pine Barren Boneset	<i>Eupatorium resinosum</i>
	New Jersey Rush	<i>Juncus caesariensis</i>
	Bog Asphodel	<i>Narthecium americanum</i>
	Yellow Fringeless Orchid	<i>Platanthera integra</i>
	Knieskern's Beaked-rush	<i>Rhynchospora knieskernii</i>
	Long's Woolgrass	<i>Scirpus longii</i>
	Lace-lip Ladies'-tresses	<i>Spiranthes laciniata</i>
	False Asphodel	<i>Tofieldia racemosa</i>
	Reversed Bladderwort *	<i>Utricularia resupinata</i>
	Fringed Yellow-eyed-grass	<i>Xyris fimbriata</i>
	Death-camus	<i>Zigadenus leimanthoides</i>
Habitat type: Coastal Plain Intermittent Pond (17 species)		
	Southern Boltonia	<i>Boltonia asteroides</i> var. <i>glastifolia</i>
	Wrinkled Jointgrass	<i>Coelorachis rugosa</i>
	Marsh Flat Sedge	<i>Cyperus pseudovegetus</i>
	Hirst Brothers' Panic Grass	<i>Dichanthelium hirstii</i> (<i>Panicum hirstii</i>)
	Larger Buttonweed	<i>Diodia virginiana</i> var. <i>virginiana</i>
	Knotted Spike-rush	<i>Eleocharis equisetoides</i>
	Featherfoil	<i>Hottonia inflata</i>
	Barton's St. John's-wort	<i>Hypericum adpressum</i>
	Clasping-leaf St. John's-wort	<i>Hypericum gymnanthum</i>
	Boykin's Lobelia	<i>Lobelia boykinii</i>
	Narrow-leaf Primrose-willow	<i>Ludwigia linearis</i>
	Awed Meadow-beauty	<i>Rhexia aristosa</i>
	Small-head Beaked-rush	<i>Rhynchospora microcephala</i>
	Slender Arrowhead	<i>Sagittaria teres</i>
	Torrey's Bulrush *	<i>Schoenoplectus torreyi</i>
	Dwarf White Bladderwort	<i>Utricularia olivacea</i>
	Reversed Bladderwort *	<i>Utricularia resupinata</i>

WILDLIFE SGCN SPECIES LIST BY SWAP LANDSCAPE REGION AND HABITAT		
REGION: SKYLANDS	Common name	Scientific name
Habitat type: Calcareous Fen (17 species)		
Bird	Veery	<i>Catharus fuscescens</i>
Bird	Sedge wren	<i>Cistothorus platensis</i>
Bird	Black-billed cuckoo	<i>Coccyzus erythrophthalmus</i>
Bird	Least flycatcher	<i>Empidonax minimus</i>
Bird	Red-headed woodpecker	<i>Melanerpes erythrocephalus</i>
Bird	Northern parula *	<i>Setophaga (Parula) americana</i>
Bird	American woodcock	<i>Scolopax minor</i>
Bird	Winter wren	<i>Troglodytes hiemalis</i>
Bird	Golden-winged warbler	<i>Vermivora chrysoptera</i>
Bird	Canada warbler	<i>Cardellina (Wilsonia) canadensis</i>
Butterfly	Silver-bordered Fritillary	<i>Boloria selene myrina</i>
Butterfly	Mitchell's Satyr	<i>Neonympha mitchellii mitchellii</i>
Moth	Schweitzer's buckmoth	<i>Hemileuca nevadensis ssp. 2</i>
Dragonfly	Kennedy's Emerald	<i>Somatochlora kennedyi</i>
Dragonfly	Brush-tipped Emerald	<i>Somatochlora walshii</i>
Reptile	Spotted turtle	<i>Clemmys guttata</i>
Reptile	Bog turtle	<i>Glyptemys (Clemmys) muhlenbergii</i>
Habitat type: Calcareous Sinkhole Pond (3 species)		
Amphibian	Jefferson salamander	<i>Ambystoma jeffersonianum</i>
Amphibian	Marbled salamander	<i>Ambystoma opacum</i>
Amphibian	Long-tailed salamander	<i>Eurycea longicauda longicauda</i>
REGION: PINELANDS	Common name	Scientific name
Habitat type: Pine Barren Savanna (6 species)		
Bird	Northern parula*	<i>Setophaga (Parula) americana</i>
Butterfly	Arogos skipper	<i>Atrytone arogos arogos</i>
Butterfly	Helicta Satyr (Georgia Satyr)	<i>Neonympha helicta (Neonympha areolata septentrionalis)</i>
Mammal	Southern bog lemming	<i>Synaptomys cooperi</i>
Moth	Moth	<i>Dichagyris reliqua</i>
Moth	Carter's noctuid moth	<i>Photodes (Spartiniphaga) carterae</i>
Habitat type: Coastal Plain Intermittent Pond (5 species)		
Amphibian	Pine Barrens treefrog	<i>Hyla andersonii</i>
Amphibian	Carpenter frog	<i>Lithobates virgatipes</i>
Dragonfly	Scarlet Bluet	<i>Enallagma pictum</i>
Dragonfly	Pine Barrens Bluet	<i>Enallagma recurvatum</i>
Dragonfly	Golden-winged skimmer	<i>Libellula auripennis</i>

* Note that 2 plant species (*Schoenoplectus torreyi* and *Utricularia resupinata*) and 1 animal species (*Setophaga americana*) occur in 2 different habitats but are counted only once in the total number of species addressed in this report.

We identified key threats to plants and animals in each habitat using the Conservation Measures Partnership (CMP) THREATS classification (see Salafsky et al. 2008 for the lexicon). The Threats categories are listed below. See Appendix C for the table of CMP Threats for each of the state endangered plant species and wildlife SGCN by habitat addressed in this study.

CMP THREATS Categories:

1. Residential and Commercial Development
2. Agriculture & Aquaculture
3. Energy Production & Mining
4. Transportation & Service Corridors
5. Biological Resource Use

In future years, the USFWS will be adopting the Wildlife Tracking and Reporting Actions for the Conservation of Species (TRACS) as the reporting framework for tracking conservation actions funded by State Wildlife grants that implement actions identified in SWAPs (USFWS 2013). New Jersey will be adopting the TRACS language in their 2015 SWAP update so we have included a correlation with this report. The 13 TRACS Actions at Level 1 are listed below, are addressed in the integrated management guidelines for the four habitats in this report.

Wildlife TRACS ACTIONS

1. Coordination and Administration
2. Create, Restore, or Enhance Habitat and Natural Processes
3. Data Collection and Analysis
4. Education
5. Facilities and Areas/New Construction
6. Facilities and Areas/Major Renovation
7. Facilities and Areas/Operations and Maintenance
8. Land and Water Rights/Acquisition and Protection
9. Law Enforcement
10. Outreach
11. Planning
12. Species Reintroduction and Stocking
13. Technical Assistance

We then looked at proposed management actions identified in the 2008 SWAP that addressed threats to the habitat and/or SGCN species, to identify possible impacts to the rare plants in the same habitat. We offer suggestions for ways to avoid or mitigate management conflicts for the given suites of species. And finally, we looked at the potential effects of climate change on species and habitats with an emphasis on identifying future management conflicts that might arise from new actions proposed to adapt to projected climate changes. Following are discussion points for each of the four habitats and their rare plant and wildlife SGCN, presented as integrated management guideline, followed by a summary for all.

Integrated Management Guidelines: CALCAREOUS FEN HABITAT

Spreading globe flower (*Trollius laxus* spp. *laxus*); Calcareous Fen; Bog turtle (*Glyptemys muhlenbergii*)

Overview

Calcareous fens are distinctive wetlands that depend on a constant supply of cold, oxygen-poor ground water rich in calcium and magnesium bicarbonates. This calcium-rich environment supports a plant community dominated by “calciphiles,” or calcium-loving species. These fens typically occur on slight slopes where upwelling ground water surfaces slowly and surface water inputs are minimal. The substrate is peat, muck or marl, and usually saturated to the surface, with seeps and shallow pools of water surrounded by low, tussocky, grass- and sedge-dominated vegetation. The substrate is springy or quaking underfoot (Walz 2006).

In New Jersey, calcareous fens are located predominantly in the Kittatinny Valley of northwestern New Jersey (Sussex and Warren counties) and support numerous rare plant and animal species with diverse management needs. There are eight different calcareous fen ecological community types found in New Jersey, but for the purposes of this report we are addressing fens as a habitat system, not focusing just on one particular fen type.

Calcareous fens are included in the NE Wildlife Habitat Classification System as North-Central Appalachian Seepage; in the New Jersey Landscape Map as Emergent, Forest and Wetland Species-Based Habitat; and mapped in the New Jersey Land Use/Land Cover as Emergent Wetlands, Deciduous Scrub/Shrub Wetlands, Coniferous Scrub/Shrub Wetlands, Mixed Scrub-Shrub Wetlands (Deciduous Dominant), Mixed Scrub-Shrub Wetlands (Coniferous Dominant). See Appendix B for more details on habitat classification.

Twenty-eight (28) state endangered plant species occur in calcareous fens, including Bog Rosemary (*Andromeda glaucophylla*), Rush Aster (*Aster borealis*), Foxtail Sedge (*Carex alopecoidea*), Water Sedge (*Carex aquatilis*), Lesser Panicked Sedge (*Carex diandra*), Handsome Sedge (*Carex formosa*), Cyperus-like Sedge (*Carex pseudocyperus*), Tuckerman's Sedge (*Carex tuckermanii*), Wood's Sedge (*Carex woodii*), Marsh Cinquefoil (*Comarum palustris*), Hemlock-parsley (*Conioselinum chinense*), Small White Lady's-slipper (*Cypripedium candidum*), Showy Lady's-slipper (*Cypripedium reginae*), Few-flower Spike-rush (*Eleocharis quinqueflora*), Variegated Horsetail (*Equisetum variegatum* var. *variegatum*), Queen-of-the-prairie (*Filipendula rubra*), Labrador Marsh Bedstraw (*Galium*

labradoricum), Small Bedstraw (*Galium trifidum* var. *trifidum*), Northern Panic Grass (*Panicum boreale*), Capillary Beaked-rush (*Rhynchospora capillacea*), Orange Coneflower (*Rudbeckia fulgida* var. *fulgida*), Shining Willow (*Salix lucida* ssp. *Lucida*), Bog Willow (*Salix pedicellaris*), Strict Blue-eyed Grass (*Sisyrinchium montanum* var. *cerebrum*), Arborvitae (*Thuja occidentalis*), Seaside Arrow-grass (*Triglochin maritime*), Spreading Globe Flower (*Trollius laxus* ssp. *Laxus*), Sessile Water-speedwell (*Veronica catenata*). See Appendix A for complete list of state endangered plant species with rarity rankings. Seventeen wildlife species identified as Species of Greatest Conservation Need (SGCN) in the 2008 version of the New Jersey State Wildlife Action Plan (SWAP) also occur in fens including: two reptiles (bog turtle [*Glyptemys (Clemmys) muhlenbergii*] and spotted turtle [*Clemmys guttata*]; several Lepidoptera (Mitchell's satyr [*Neonympha mitchellii mitchellii*], Schweitzer's buckmoth [*Hemileuca nevadensis species 2*], silver-bordered fritillary [*Boloria selene*]); two dragonflies (Kennedy's emerald [*Somatochlora kennedyi*] and brush-tipped emerald [*Somatochlora walshii*]); ten nesting bird species (red-headed woodpecker [*Melanerpes erythrocephalus*], golden-winged warbler [*Vermivora chrysoptera*], Canada warbler [*Cardellina (Wilsonia) canadensis*], sedge wren [*Cistothorus platensis*], winter wren [*Troglodytes hiemalis*], northern parula [*Setophaga (Parula) americana*], black-billed cuckoo [*Coccyzus erythrophthalmus*], least flycatcher [*Empidonax minimus*], veery [*Catharus fuscescens*] and a game species of regional priority, the American woodcock [*Scolopax minor*]). See Appendix A for list of wildlife SGCN with rarity rankings.

Threats

Altered hydrology and degraded water quality associated with development (whether residential or industrial) or adjacent agricultural practices are the main threats to calcareous fens. For example, groundwater withdrawals that lower the water table or drainage ditches that divert water out of the wetlands change the habitat significantly and affect associated rare species.

Water laden with fertilizers from adjacent farmland or homeowners' lawns as well road runoff can negatively impact plants in wetlands downslope due to changes in water chemistry. Calcareous fens are characterized by high pH with high levels of calcium and magnesium in the water and the plant community in particular is adapted to this water chemistry.

Flooding from beaver activity, while a natural process, can threaten fen habitats that support rare plants, rare Lepidoptera and bog turtles. Vegetation succession (e.g., from open herbaceous vegetation to shrub swamp) can also be a threat, despite the fact that vegetation change through time is a natural process. Typically, as some fen wetlands become shrubbier, others open up on the landscape due to beaver activity or other disturbance processes. Wetland connectivity among sites enables plants and animals to disperse to more suitable habitats as these changes occur. However, today few calcareous wetland habitats remain intact and most are separated from each other by roads, development or other unsuitable habitat, so plants and animals are unable to find new suitable habitat when the vegetation structure and hydrology in a fen changes.

Invasive species, such as purple loosestrife (*Lythrum salicaria*) and common reed (*Phragmites australis*) also threaten the integrity of fen habitats, crowding out native vegetation and altering site characteristics required by plants like spreading globe flower and animals like the bog turtle (Snyder and Kaufman 2004). The use of pesticides for insect pest control (e.g., gypsy moth or mosquito control) can threaten butterfly and moth populations (Schweitzer et al. 2011). Overabundant animals like white-tailed deer may over-browse sensitive fen vegetation (NJDEP 2008). Off Road Vehicle (ORV) use and other intensive recreational activities compact soil, destroy vegetation, and can harm wetland-dependent species such as dragonflies and bog turtles (Switalski and Jones 2012). Individual taxa (e.g., orchids, some Lepidoptera, and both turtle species) are also threatened by illegal collecting (NJDEP 2008).

A summary of CMP Threats to state endangered plants and wildlife SGCN in calcareous fen habitat is found in Appendix C.

Species Ecology

Calcareous fens are wetlands characterized by sedges, grasses and brown mosses (non-*Sphagnum*), a relatively high water table, nutrient-poor, mineral-rich (calcium and/or magnesium) alkaline waters, with shallow rivulets and groundwater seepage areas among hummocky herbaceous vegetation. Each plant and animal species that occurs in calcareous fens has specific habitat and/or management needs, as each requires slightly different microclimate and vegetation zones within the fen. In fact, most calcareous fen plants have evolved with adaptations to tolerate high calcium and magnesium concentrations, which cause neutral to alkaline pH, as well as hydrology adaptations to such conditions as perpetual exposure to groundwater seepage (Bedford and Godwin 2003).

Plants:

Calcareous fens are extraordinarily diverse wetlands that support approximately 275 plant species, of which 55 are rare including 28 listed as state endangered that are addressed in this report. Many of them are northern species that reach their southern limit in or near New Jersey. Examples include arborvitae, bog rosemary, bog willow and many of the carices. A few have a wider distribution but are considered rare due mainly to the restricted distribution of calcareous fen habitat in the state. These include marsh cinquefoil (*Potentilla palustris*), variegated horsetail (*Equisetum variegatum*), orange coneflower (*Rudbeckia fulgida*), queen-of-the-prairie (*Filipendula rubra*), and Labrador marsh bedstraw (*Galium labradoricum*).

The following two tables provide a list of state endangered species that can found in calcareous fens in New Jersey with their phenology, or timing of vegetative, flowering and fruiting, and comments on their habitat/niche. The phenology and habitat information can be used to help avoid negative impacts to these state endangered plant species during wildlife surveys and management activities.

FL = Flowering; FR = Fruiting; V = Vegetative

Calcareous Fen Habitat -- State Endangered Plant Habitat/Niche Comments

<i>Scientific Name</i>	Common Name	Calcareous Fen Habitat/Niche Comments
<i>Andromeda glaucophylla</i>	Bog Rosemary	Restricted to thickets and openings in sphagnum bogs, and more rarely in calcareous fens that have well developed sphagnum hummocks
<i>Aster borealis</i>	Rush Aster	Grows in open, peaty limestone fens, marl fens, and other limestone wetlands
<i>Carex alopecoidea</i>	Foxtail Sedge	Grows in swampy calcareous meadow, low woods at edge of pond, swampy meadows, in NJ this species apparently is restricted to calcareous wetlands
<i>Carex aquatilis</i>	Water Sedge	Grows in open calcareous seepage fens
<i>Carex diandra</i>	Lesser Panicked Sedge	Swampy, marshy, or boggy areas, especially wet meadows, fens, floating mats, and peaty or marly shores of lakes and ponds
<i>Carex formosa</i>	Handsome Sedge	Typically occurs in or at the edge of limey swamps, seeps, or bottomland forests
<i>Carex pseudocyperus</i>	Cyperus-like Sedge	Grows in open calcareous marsh and open areas of a calcareous swamp
<i>Carex tuckermanii</i>	Tuckerman's Sedge	Found in rich or calcareous open wetlands
<i>Carex woodii</i>	Wood's Sedge	Grows in black, mucky peaty soil on sedge hummocks in shrubby calcareous fen habitat
<i>Comarum palustre</i>	Marsh Cinquefoil	Grows in floating turf of sedge and sphagnum moss in shallow water, sphagnum or peaty seepage areas in calcareous marshes and wooded swamps
<i>Conioselinum chinense</i>	Hemlock-parsley	Grows in wooded seepage areas along small streams or brooks in calcareous or basic soils
<i>Cypripedium candidum</i>	Small White Lady's-slipper	Grows in light to fairly heavy shade of overgrown portion of calcareous fen, reportedly associated with larch
<i>Cypripedium reginae</i>	Showy Lady's-slipper	Grows in shrub borders or open thickets in calcareous fens and wooded swamps; prefers constant moisture and full sun to semi-shaded conditions

Scientific Name	Common Name	Calcareous Fen Habitat/Niche Comments
<i>Eleocharis quinqueflora</i>	Few-flower Spike-rush	Restricted to wet, marl of ponds margins and fens
<i>Equisetum variegatum</i> var. <i>variegatum</i>	Variegated Horsetail	Occurs in seepage areas on marl deposits at edge of water
<i>Filipendula rubra</i>	Queen-of-the-prairie	Grows in brushy calcareous fens along edge of wooded swamps
<i>Galium labradoricum</i>	Labrador Marsh Bedstraw	Grows in wet sphagnum or peat of calcareous pond shores, sedge mats, and fens.
<i>Galium trifidum</i> var. <i>trifidum</i>	Small Bedstraw	Grows in sphagnum or mosses of calcareous fens and along edge of marl pond shores
<i>Panicum boreale</i>	Northern Panic Grass	Grows in open, wet swales of calcareous fens
<i>Rhynchospora capillacea</i>	Capillary Beaked-rush	Restricted to seepage areas in marl and calcareous fens.
<i>Rudbeckia fulgida</i> var. <i>fulgida</i>	Orange Coneflower	Grows in calcareous fens
<i>Salix lucida</i> ssp. <i>lucida</i>	Shining Willow	Grows in sedge meadows; vernal pools, alvars, open calcareous fens, marl bogs
<i>Salix pedicellaris</i>	Bog Willow	Grows in open to shrubby calcareous fens and swamps; occasionally in more sphagnum habitats with a calcareous substrate
<i>Sisyrinchium montanum</i> var. <i>cerebrum</i>	Strict Blue-eyed Grass	Grows in among calcareous rocks in seepage areas on river shores and in moist grassy places and calcareous fens
<i>Thuja occidentalis</i>	Arborvitae	Grows in peaty and sphagnum calcareous seepage fens
<i>Triglochin maritima</i>	Seaside Arrow-grass	Grows in open, calcareous seepage fens
<i>Trollius laxus</i> ssp. <i>laxus</i>	Spreading Globe Flower	Grows in wetlands influenced by cold, highly alkaline groundwater seepage; open fens, along swamp margins, and in partly sunny, wet openings in seepage swamps; sloping fens on sedge tussocks somewhat above the saturated soils, or on seepy mineral soil.
<i>Veronica catenata</i>	Sessile Water-speedwell	Grows in shallow water of small brooks in calcareous seepage fens

SOURCE: New Jersey Natural Heritage Program, Biotics Database

The rarest are Wood's sedge (*Carex woodii*) and handsome sedge (*Carex formosa*), which are found in only one location statewide, spreading globe flower (*Trollius laxus* ssp. *laxus*) which is globally rare, and arborvitae (*Thuja occidentalis*) which is at the southern limit of its range. *Trollius* has a very limited distribution, being found in only four states (NY, NJ, CT,

and PA), with New Jersey supporting the largest population worldwide. Calcareous fens in New Jersey also are characterized by the presence of eastern red cedar (*Juniperus virginiana*), which is found more typically in upland habitats. Both woody plants, *Thuja* and *Juniperus*, are particularly vulnerable to deer browsing as they provide succulent winter forage. Other rare plants especially targeted by deer include orchids.

All species rely on fen hydrology characterized by rich, perennial, and groundwater seepage. The groundwater dominant hydrology helps form a hummock and hollow microtopography where plant distribution is based on elevation above water level – those that need less water live on the hummocks and those tolerant of more water live in the hollows. Some plants such as few-flowered spikerush (*Eleocharis pauciflora*) need patches of bare soil without competition from other rhizomatous species to survive.

Calcareous fens are patchy habitats, often characterized by a mosaic of open sunny areas with herbaceous plants and dense shrubby areas. Plants and animals each find their own niche in this mosaic, with animals often moving between these areas at different times of the day or year.

There are a number of rare orchids that live in calcareous fen habitat and nowhere else. Orchids in particular have a complex life history. They do not bloom in every year and seed germination is highly dependent on a number of environmental factors, hence they are very sensitive to disturbance. They are also particularly sensitive to browsing by deer. In fact, the exact management needs for many of the calcareous fen-dependent species are not known. Therefore, maintaining the site hydrology and water chemistry, in part by maintaining sufficient buffers around wetlands to prevent runoff with road salt, fertilizers or other pollutants from entering the fen, minimizing deer herbivory, and preventing trampling of the vegetation and soil are all critical.

Animals:

Bog turtles live in spring fed sphagnum bogs, fens, and wet meadows with clear slow moving rivulets and a soft organic substrate that support low grasses and sedges. Active April through September, they will estivate in moist mud in rivulets or hide under sedge tussocks during extended periods of heat in summer. Bog turtles prefer nesting in raised hummocks, such as moss beds, in sunny open areas of the wetland. They hibernate from late September to March/April in soft-bottomed waterways, tree stumps, or beneath sedge tussocks (Ernst et al. 1994, Liguori and Tesauro 2003, B. Zarate, personal communication, 2013).

Spotted turtles use a variety of shallow water habitats such as bogs, wet pastures and marshes, with fens also providing important habitat. In New Jersey they are active from March through September. They nest in late May/June in grass tussocks, or hummocks of moist sphagnum moss and spend the winter in soft muddy stream bottoms (Ernst et al. 1994).

Habitat fragmentation that eliminates connectivity between wetlands, shrub encroachment that eliminates open herbaceous openings, as well as illegal collecting for the pet trade are the major threats to both turtle species.

The **Kennedy's emerald** dragonfly is a northern species that reaches its southern limit in New Jersey. It inhabits cold-water calcareous fens, often with small streams flowing through them. Adult emerald dragonflies emerge in May and are active through June, with females laying eggs in open water portions of the fen. Larvae may spend a number of years as aquatic naiads (larval stage) before emerging as adults (Nikula et al. 2003, Barlow et al. 2009).

The **brush-tipped emerald** dragonfly is active from early June through early August and is found in fens and open swamps with clear slow moving rivulets. A northern species, this emerald also reaches its southern limit in New Jersey. Females lay their eggs in open water near emergent vegetation and have an aquatic larval stage that may last more than one year. Adults forage along forest edges around the fen (Nikula et al. 2003, Barlow et al. 2009).

The main threats to these dragonflies are altered hydrology and degradation of water quality.

Mitchell's satyr butterfly was presumed extirpated from New Jersey in the mid-1980s. Satyr numbers had declined significantly prior to that time due to the loss of its wetland habitat, however over-collecting of the last remaining population may have been a contributing factor in its extirpation from the state. It is rare throughout its range, which includes isolated populations in Alabama, Indiana, Michigan, Mississippi, North Carolina, and Virginia (Hamm et al. 2013, NatureServe 2013a). Mitchell's satyr relies on open, wet meadows, as their larvae feed on sedges. They overwinter as fourth instar larvae. These butterflies may have a limited ability to colonize new fens by following narrow watercourses (Gochfeld and Burger 1997).

Schweitzer's buckmoth is only found in the limestone region of Sussex and Warren County, New Jersey. Adults fly during the day in late September and early October. Eggs are laid in a ring around the lower stem of the food plant and remain until spring, when the larvae emerge. Caterpillars feed on willow (*Salix* spp.), bog birch (*Betula pumila*), and shrubby cinquefoil (*Dasiflora fruticosa* ssp. *floribunda*), pupate in July in *Sphagnum* moss, and emerge as adults in the fall (NatureServe 2013b).

The **silver-bordered fritillary** ranges across southern Canada south to New Jersey in the East. Originally found statewide, it declined dramatically over the past 40 years, most likely due to a combination of habitat loss and pesticide use for gypsy moth and mosquito control. These fritillaries prefer open, wet meadows, rarely entering woodlands and are double-brooded (triple-brooded in the south). Larvae feed on a variety of *Viola* species and overwinter as partially grown caterpillars, likely in the litter at the base of the foodplant (Golden 2003; D. Schweitzer, personal communication, 2013).

Ten bird species listed as SGCN breed in shrubby or emergent wetlands in the Skylands region and will use fen habitats. Of these, the **Canada warbler**, **golden-winged warbler**, **winter wren**, and **least flycatcher** are more northern species that reach their southern limit for breeding in northwestern New Jersey. The golden-winged warbler is a fen nester, preferring shrubbier sections with overgrown openings, although it will use other habitats (S. Petzinger, personal communication, 2013). Least flycatchers nest in open woodlands and shrubby areas at edges of ponds, streams, and bogs. They will use a fen edge (e.g. Hyperhumus and fens along the Wallkill River), although they are not dependent on them. Canada warblers nest on or near the ground in or along the brushy edges of wetlands with low herbaceous cover (Walsh et al. 1999). They would breed in the shrubby edge of fens (S. Petzinger, personal communication, 2013). Winter wren is a forest interior nesting species that prefers old growth forests or moist coniferous forests (Walsh et al. 1999) with snags and downed logs, typically near water. Although there are not many records in New Jersey, they also would breed in the shrubby edge of fens (S. Petzinger, personal communication, 2013).

Of all the birds listed as SGCN, the **sedge wren**, although very rare and can occur in any part of the state, is most dependent on fens in northern New Jersey. Sedge wrens nest in high marsh ecotones along the coast and in fens, bogs, and wet meadows or grasslands away from the coast. They breed in calcareous fens along the Wallkill and Black Creek and have also been observed breeding in a fen in the Paulinskill River watershed (S. Petzinger, personal communication, 2013).

The **veery** nests throughout northern New Jersey and prefers shrubby habitats in or near damp, moist habitats. They are known to breed in the fens at HyperHumus and at Wallkill (S. Petzinger, personal communication, 2013).

Black-billed cuckoo and **northern parula warbler** are found locally throughout the state. Cuckoos nest along forest edges in thickets, especially in the shrubby edges of wet areas and, while not fen-dependent, they might use the shrubby edge of a fen for nesting particularly in the Wallkill and Paulinskill areas (S. Petzinger, personal communication, 2013). Northern parula warblers typically nest in trees over water, especially in riverside floodplain forests (W. and S. Wander, personal communication, 2013) but they are known to use the edges of fens in the Paulinskill drainage as well as the Flatbrook River and other isolated fens in the Delaware Water Gap (S. Petzinger, personal communication, 2013).

Also found locally state-wide, **red-headed woodpeckers** prefer to nest in standing dead trees with an open understory. They will also use standing timber in swamps and are known breeders in fens at Johnsonburg Swamp, Whittingham Wildlife Management Area, and other larger sites with open water (S. Petzinger, personal communication, 2013).

Although not dependent on fen habitats, **American woodcock** is a game species of regional concern that may nest in early successional sedge meadows and shrub fens and/or use them during migration in the spring and fall. These birds rely on different habitat types in close proximity, requiring open fields or meadows for courtship display, second growth

hardwood stands for nesting and rearing of young, and large fields as night roosting sites (Kelley et al. 2008).

Integrated Conservation Management Guidelines:

An important goal of the SWAP is to protect, maintain, and restore critical wetland habitat for wildlife SGCN. Due to the fact that there are a number of rare taxa with varying habitat preferences that use fen habitats, there is significant potential for conflicts between conservation management actions proposed for SGCN animals and rare plants at individual sites. For this reason, it is recommended that there be a thorough survey and mapping of all rare species found at a site, including population location, status and condition, such that any proposed management can avoid or minimize impacts. Ideally, fen management must be holistic, maintaining not only the core open meadow areas but also the shrubby matrix in which the grassy areas occur.

The following integrated conservation management guidelines address broad categories linked to conservation actions identified in the SWAP and correlated with the TRACS ACTIONS Level 1. We have specifically targeted discussion around the actions where there may be potential for management incompatibility between state endangered plants and wildlife SGCN.

TRACS ACTIONS

1. Coordination and Administration
- 2. Create, Restore, or Enhance Habitat and Natural Processes**
- 3. Data Collection and Analysis**

TRACS ACTION #2:

CREATE, RESTORE, OR ENHANCE HABITAT AND NATURAL PROCESSES

Hydrology and Water Quality Management

Maintaining the integrity of important and unique natural communities is a conservation goal of the SWAP and increasing the effective size and connectivity of wetlands an important conservation action. Accomplishing these will help maintain site hydrology, which will be the key to fen longevity. Additionally, research proposed in the SWAP to

identify groundwater recharge areas for calcareous wetlands habitats would be of great benefit to the rare plants and SGCN animals using these fens.

Vegetation Management

Managing succession: Rare plants, bog turtles, the emerald dragonflies, above mentioned Lepidoptera and some birds require an early successional vegetation stage characterized by low herbaceous cover. Preventing shrub or sapling encroachment or canopy closure is critical. Maintaining open habitat can be done in a variety of ways; by selective cutting of red maples or other shrubs, with the targeted use of herbicides, or the addition of grazing animals such as goats.. These management methods are typically used, in New Jersey fens to date or have been recommended in the SWAP. In addition, the SWAP recommends researching different management techniques for maintaining early successional habitats, which would be of value to the suite of species using fens.

Manual vegetation removal: Hand-pruning or selective cutting of woody vegetation can be used to set back succession and open the canopy for those plant and animal species that require it. If done in the winter months, there will be little impact to fen vegetation or other animal species that use the habitat.

Use of Herbicides: Extreme care must be taken if herbicides are used in fen habitats as most are broad spectrum. Only direct hand application (e.g., hand painting stump cuts) should be considered for vegetation control adjacent to rare plant populations.

Grazing: For degraded habitats where grazing might be used to remove common reed (*Phragmites australis*) and other invasive vegetation and restore fen-like habitat structure, a determination of which rare plants and animals remain at the site should be made and those sensitive areas fenced off from grazing and subsequent trampling. Fencing usually requires clearing of a 10-foot wide fence path and the installation of posts (B. Zarate, personal communication, 2012). Although fence construction typically occurs outside the growing season, some trampling could occur, which might affect plants, overwintering Lepidoptera larvae or odonate larvae in rivulets. Another consideration is the number of animals applied per acre. The U.S. Fish and Wildlife Service recovery plan for bog turtles (USFWS 2001) recommends one animal/acre but consultation with botanists to see if this density should be modified on a site-by-site basis, is warranted. Many plants, such as rare orchids, are particularly vulnerable to grazing pressure. (Grazers such as goats introduced to a site for bog turtle vegetation management can be in direct conflict with Schweitzer's buckmoth survival, as the goats may inadvertently consume eggs laid on stems of plants they browse or can eat so many leaves when they first emerge in the spring that there is insufficient food to support caterpillar development [D. Schweitzer, personal communication, 2012].)

Silvicultural practices on adjacent uplands: The improvement of silvicultural practices by encouraging landowners to use ecologically appropriate techniques has been identified in the SWAP as an important conservation action. Such practices would benefit both rare plants and animals in fen habitats in part by reducing erosion from surrounding uplands and protecting water quality.

Utility rights-of-way management: The SWAP recommends the development of BMPs for Rights-of-Way (ROW) management for scrub-shrub and animal species that may use them. As ROWs cut through calcareous fen habitats, the development of management guidelines should be coordinated such that all rare plants as well as wildlife SGCN using ROWs are incorporated into BMPs. This will assist the landowner in making appropriate management decisions and to avoid potentially conflicting recommendations.

Note: Maintaining appropriate wetland scrub-shrub habitat in the region has been identified in the SWAP as a priority for many breeding birds. Fens can provide this wetland scrub-shrub habitat, as there are often shrub zones in the fens and some fens are characterized by their dominance of shrubs (e.g., calcareous shrub fen and rich shrub carr). For this reason, any vegetation management plan should take into consideration the rare habitat itself and the needs of all species at a site, when possible. Some birds, like the golden-winged warbler, rely on both patches of herbaceous cover for nesting and shrub cover for foraging. In addition, Schweitzer's buckmoth larvae feed on low shrub vegetation. Maintaining shrub fens as well as both open herbaceous areas and shrub zones in other fen habitats is important to meet the habitat needs of the entire suite of plant and animal species that may occur in these habitats.

Invasive, Over-abundant, and Pest Species Management

Invasive plant species: Management and control of invasive plant species is an important conservation goal identified in the SWAP, as it is critical to maintaining the integrity of the fen habitat upon which so many rare plant and animal species depend. In particular, common reed (*Phragmites australis*), purple loosestrife (*Lythrum spicata*), and multiflora rose (*Rosa multiflora*) are often targets for removal and control. As mentioned in the vegetation management section above, control should begin with the least harmful process (hand pulling or seedhead removal) before moving toward use of chemicals or other less targeted techniques. Biocontrol may be an option for some invasive species, however consultation with experts, both botanists and zoologists is always warranted when considering the use of chemicals and/or biocontrol. Decisions should be made on a site-by-site basis to prevent (or minimize) negative impacts to non-target rare plant or animal species.

Insect pests and/or disease pathogens: A number of insect pests may be targeted for control in and around fen wetlands (e.g., mosquitoes, gypsy moths). Control measures often include application of pesticides, many of which are broad spectrum or are applied at times of the year when other invertebrates are vulnerable or are applied in a manner harmful to the rare plant community (e.g., trampling). Any proposed control measures should be site specific and the use of integrated pest management and committed, ongoing coordination

among agencies and with fen managers to reduce non-target impacts is critical. In all cases, botanists and zoologists should be included in the discussion to avoid any potential harm to rare plant or SGCN animal populations or the habitat during treatment.

Note: Proper protocols should be put into place to prevent the spread of invasive species and/or disease pathogens (e.g., Chytrid fungus, Ranavirus) among wetland sites. It is best to follow these or similar recommendations between site visits: 1) wash boots and field equipment with soap and water; 2) rinse in clean water; and 3) disinfect with a 10% bleach solution and allow to air dry (Dodd 2010; B. Zarate, personal communication, 2013).

Deer control: Management of deer populations is an important conservation goal identified in the SWAP to promote forest health and biodiversity. Deer consume rare plants, larval foodplants and nectar sources for adult Lepidoptera, alter habitat structure for nesting birds, among other impacts (Côté et al. 2004, Rawinski 2008, Schweitzer et al. 2011). Management measures may include increased hunting efforts or fencing of vulnerable habitat against deer. Managing the size of local deer herds would benefit both rare plants and animals, and any trampling of vegetation by hunters would occur when most plants are dormant.

Beaver control: Beaver control may be needed on occasion and has also been identified as a conservation action in the SWAP. Typically, this could include trapping and removing beaver from a site to prevent dam construction (or partial dam removal), and/or the installation of a water level control device. Since the rare plants and the SGCN animals all rely on a similar site hydrology, beaver control should benefit both.

Recreational Use Management

Regulating ORV and other recreational vehicle use is a goal of the SWAP and ORVs are a threat to some calcareous fen wetlands (Walz 2006). Implementation of conservation actions to either prohibit this activity or restrict use of ORVs to less sensitive areas, coupled with adequate enforcement, would benefit rare plants and animals as well as habitat integrity.

The SWAP also includes a goal to promote public education and awareness, wildlife conservation, and viewing opportunities, all worthwhile actions. However, if wildlife viewing structures or trails are planned in or near calcareous fens, care must be taken to avoid altering site hydrology, permitting unguided access into vulnerable habitat to avoid trampling, introducing invasive plant seeds, and harming sensitive plants and animals during construction.

SPECIES MANAGEMENT (= TRACS ACTION TARGETS)

Species-Specific Management Actions highlighted in the SWAP:

Silver-bordered fritillary – The SWAP identifies conservation actions for this species that include identifying critical habitat, managing for violets (the larval foodplant), and retarding succession where appropriate (see above caveats for vegetation management,

although to date no active management has been implemented). Although this fritillary is not generally a fen species (D. Schweitzer, personal communication, 2013), maintaining an intact fen community should benefit this butterfly if or when present, as well as other fen-dependent Lepidoptera species.

Red-headed woodpecker – There are two conservation actions included in the SWAP for these woodpeckers, one that recommends the use of GIS to identify wetlands with standing dead wood and the other to develop BMPs to maintain trees for nesting. Conservation actions to maintain standing dead trees in fens with the woodpeckers (e.g., in Johnsonburg Swamp) can be incorporated into ongoing vegetation management without conflict to other rare plants and animals.

Bog turtle – A number of habitat management actions are proposed in the SWAP to maintain or enhance turtle populations that could potentially conflict with other rare plant and animal species. See the earlier vegetation management discussion for details and recommendations. Other SWAP conservation actions for the bog turtle include conducting research on water quality parameters and protecting turtles from illegal collecting, neither of which would conflict with other rare plant or other animal species.

Scrub-shrub species – In addition to survey and monitoring, the SWAP recommends actions for rights-of-way (ROW) management, as many ROWs provide critical habitat for early successional bird species. If such ROWs cut through fen wetlands, care must be taken with any vegetation management measures that are applied (see vegetation management section above). Collaboration on management techniques used within ROWs may be necessary to avoid incompatibilities when managing for different species occupying the same area.

American Woodcock –The SWAP recommends increasing the number of forests that are managed to contain a mix of seral stages to benefit forest-dwelling species, including American woodcock. As long as the silvicultural practices on forests adjacent to fens are ecologically appropriate and compatible with fen conservation, this management recommendation should not be in conflict with fen plants and other SGCN animals.

TRACKS ACTION #3: ATA COLLECTION AND ANALYSIS RESEARCH, SURVEY OR MONITORING

Inventory and Long-term Monitoring

Inventory of all animal SGCN and long-term monitoring have been identified as priorities in the SWAP, however care must be taken when implementing survey and monitoring of fen species. Survey and monitoring for all animal and plant species requires some movement through the fens at various times throughout the season. Trampling of vegetation is a major threat to rare plant species and also to certain SGCN animals. Trampling may alter site hydrology by filling in rivulets with sediment; may crush odonate larva or newly emerged (teneral) adults and Lepidoptera larva or pupa; or harm nests of ground-nesting birds. For

these reasons, plant and animal population monitoring efforts at a site should be coordinated to prevent situations where multiple monitoring initiatives are occurring, potentially creating frequent, extensive, long-term disturbance without sufficient recovery periods. As mentioned previously, it is also recommended that there be a thorough survey and mapping of all rare species found at a site, including population location, status and condition, such that any proposed management can avoid or minimize impacts.

Animal survey and monitoring techniques – minimizing harm to rare plants:

Turtle surveys: Survey and monitoring for spotted and bog turtles would include multiple site visits between March and June, with later season visits also conducted. Substantial trampling may occur as bog turtle monitoring can be intensive, especially if radio telemetry or active trapping with drift fences are components. See above recommendation for coordination of survey work. Consult the plant phenology tables in this report and any rare species maps that are prepared for additional guidance when planning the location and timing of survey work.

Breeding bird surveys: Assessing the status of the ten bird species in these habitats would generally require multiple site visits in May and June during the breeding season, so may affect rare plants. Furthermore, if golden-winged warblers are breeding in an area, a single mist-net may be temporarily set up to capture and band them. Setting up this net may involve trampling and removing tall vegetation and branches near the net. If this is to be done in a fen, the net will most likely be set up along the edge where there are shrubs and trees to provide shade (S. Petzinger, personal communication, 2013). As above, prior to conducting bird surveys in fen habitats, consult the plant phenology tables in this report and any rare species maps that are prepared for additional guidance when planning the location and timing of survey work.

Lepidoptera surveys: Surveys for silver-bordered fritillary would typically occur during the peak flight periods of late June and August. The buckmoth flies in late September when turtles are entering overwintering sites so should not conflict with these animals, however, some rare plants may still be present into November. Planning for any Lepidoptera survey work should include consultation with plant phenology information in this report and any additional rare species maps that are available. The SWAP recommends expanding volunteer citizen scientist recruitment to conduct surveys at particular sites. It is important that reputable groups are chosen and that survey methodology be developed upfront, so that citizen scientists can avoid harming any rare plant species that might be present at the survey site.

Odonate surveys: Surveys would be conducted from May through August as Kennedy's emerald flies early in the season, in May and June while the brush-tipped emerald flies during the summer. Dragonfly and damselfly survey and monitoring at a fen could include netting of adults for identification in the hand, searching for larvae in rivulets and/or exuviae along the water's edge, and specimen collection if deemed necessary. Such activities may trample the plant community so care must be taken during survey work to avoid rare plant locations. Consultation with the plant phenology tables in this report and

any rare species maps that are prepared will help avoid harm to rare plants and other sensitive species.

Plant survey and monitoring techniques- ways to minimize harm to animals:

Plant surveys: Plant surveys and rare plant monitoring activities can occur throughout the growing season as phenology differs among species, and over multiple years since growing conditions vary from year to year. Such activities may include random searches through habitat, use of parallel transects, and/or the establishment of long-term vegetation monitoring plots.

Recommendations for plant surveys:

Impacts on ground-nesting birds can be minimized when doing plant surveys the following ways: If possible, conduct the surveys before May or after July to avoid the nesting season altogether. If surveys must be done during that time, care should be taken to stay on trails (paths, wildlife trails, etc.) whenever possible, avoid stepping on any tussock sedges (where some birds may be nesting) and try to walk through areas where vegetation is less dense (where you can see the ground when walking). If going off trail in dense grasses or forbs, use a walking stick to brush the vegetation in front of where you are walking. Doing this may make you aware of a nest in your path (flush a bird off the nest) as well as help you see the ground you are stepping on before you take the step (S. Petzinger, personal communication, 2013).

Impacts to turtles: Avoid stepping atop of raised hummocks and moss beds, particularly between May and September, where fen turtles tend to nest.

Climate Change Vulnerability Assessment

The year 2012 was the warmest on record nation-wide (NOAA 2013) and in the garden state (Robinson 2013), with more changes forecast to come. In New Jersey the effects of climate change are projected to include: an increase in average temperature (minimum 2-6 °F. increase by 2050) and precipitation (although the exact nature of the change in precipitation may vary across the state); more extreme weather events such as storms and droughts; and sea level rise. Generally we can expect more prolonged summer heat waves with temperatures above 90° F., and fewer cold days and nights during the winter, which may be of import for those species requiring cold dormancy. Rainfall, especially in the northern part of the state, may increase in amount mainly in the winter months (Faass et al. 2012, NJ Climate Adaptation Alliance 2013a).

Fen Habitats and Climate Change:

According to Faass et al. (2012) there are a number of stressors that should be looked at to determine whether or not a particular plant community in a habitat is vulnerable to climate change. These stressors include: 1) exacerbation of other non-climate stressors; 2) specific

hydrologic conditions; 3) vulnerability to human response; 4) sensitivity to extreme climate events; 5) intrinsic adaptive capacity; 6) species vulnerability; 7) latitudinal constraints; 8) management feasibility; 9) degree of cold adaptation; and 10) location in geographical range. (For a detailed discussion of each of these stressors, see Faass et al. 2012.)

Fen wetlands are susceptible to a number of these stressors. Fens are maintained by specific hydrologic conditions that require a fairly even distribution of precipitation throughout the year. The significant alteration to precipitation patterns anticipated with a changing climate (e.g., greater flood events, increased drought during the summer months) may alter groundwater flow and seepage. This in turn will affect plant and animal species composition, favoring species adapted to drier conditions and possibly permitting greater invasive species incursion (non-climate stressor) (NJ Climate Adaptation Alliance 2013b). Although fen communities are found wherever there is karst topography, the type of fens found in New Jersey are of northern affiliation and many plant and animal species within them are also at the southern edge of their range, making them more vulnerable to changing climate. Responses of these species to predicted warming trends may include a range contraction or shift northward.

Species and Climate Change:

Plants: Using the NatureServe Climate Change Vulnerability Assessment (CCVA) model (NatureServe 2011), state endangered plants in New Jersey calcareous fen habitat were assessed for climate vulnerability (Ring and Spencer 2013). Two sedges, Tuckerman's sedge (*Carex tuckermanii*) and cyperus-like sedge (*Carex pseudocyperus*) were considered highly vulnerable to a changing climate (both are at the extreme southern edge of their range). Most calcareous fen state endangered plant species (21 species, 75%) were considered moderately vulnerable, with the main factors being their location at the southern edge of their range and their inability to tolerate warmer conditions and altered hydrologic regime. In addition, calcareous wetland connectivity may not be sufficient to allow movement in response to climate changes. Only five plant species were presumed stable. See Ring and Spencer (2013) for more detailed discussion.

Animals: New Jersey's SGCN animals have not yet been assessed for vulnerability to climate change. However, some predictions can be made about how they would fare in future years given a warming climate by consultation with experts and other species assessments.

Although no CCVAs were conducted for these particular rare **butterflies and moths**, Lepidoptera depend on the presence of their larval food plants for survival. Climate-induced alterations to fen wetlands that change hydrology and species composition could affect persistence of these insects. A key threat to Mitchell's satyr (should any undiscovered populations persist in New Jersey) might be succession of wetland habitat such that the sedges that the larvae feed on are no longer available.

In contrast, buckmoth larvae feed on shrubby cinquefoil, bog birch, and willow, all of which have been determined to be 'presumed stable' by Ring and Spencer (2013). As long as other critical habitat characteristics remain in place (site hydrology, presence of *Sphagnum* pupation sites, etc.) the buckmoth may persist, although a more thorough assessment is needed before any stronger predictions can be made.

Silver-bordered fritillary have been declining in recent years, particularly at the southernmost edge of their range in the Washington D.C. area, and in southern New Jersey, and it is likely that the climate change that is already occurring and its associated erratic hydrologic regimes have been contributing factors (D. Schweitzer, personal communication, 2013). Silver-bordered fritillary feed on violets, although it is unknown if they require a particular species of *Viola*. CCVAs were not conducted on *Violas*. Given that New Jersey is located at the southeastern-most extent of the fritillary's range and that its range has contracted dramatically in recent years, it is possible that this species will disappear from the state in the future regardless of species management efforts and future climate change impacts.

There are other fen Lepidoptera that may be affected by climate change that were not included in the SWAP when originally written. These include northern populations of Dion skipper (*Euphyes dion*) that rely on calcareous wetlands, the eyed brown (*Satyrodes eurydice*) found at one or two fen sites in this region, (D. Schweitzer, personal communication, 2013), and the Acadian hairstreak (*Satyrrium acadica*) (W. & S. Wander, personal communication, 2013). Future updates to the SWAP may want to consider these species for inclusion.

Both **dragonflies** also rely on a specific site hydrology. Although no CCVAs were prepared for these two species, it is likely that their ranges will also contract northward with a warming climate as they are at their southern limit and dependent on cold water habitats (A. Barlow, personal communication, 2013).

Bog and spotted turtles: CCVAs were conducted for bog turtles and spotted turtles by both New York State and Pennsylvania. Bog turtles are considered by both states to be extremely vulnerable to climate change. The key factors contributing to this extreme vulnerability include their specialized habitat requirements (site hydrology), spotty distribution on the landscape, excessive collecting pressure, and poor dispersal ability (Furedi et al. 2011, Schlesinger et al. 2011). It is likely that New Jersey bog turtle populations also would be considered extremely vulnerable as the same factors apply. Spotted turtles were considered moderately vulnerable in Pennsylvania and presumed stable in New York, their lower level of vulnerability likely due in part to the fact that they are not restricted to calcareous wetlands and can use a variety of wetland habitats and that the NY/PA/NJ populations are at the center of the species' range. Although it is not known how sex is determined in bog turtles, many other turtles like the spotted turtle have temperature-dependent sex ratios, which might be altered with a changing climate. Creating and maintaining wetland connectivity in the future is vital to the persistence of viable populations of these turtle species.

Scrub-shrub nesting birds: No CCVAs were prepared for these species in New Jersey. Over time, the more northern affiliate species will likely disappear as breeders in the state as their ranges contract northward. However, a CCVA prepared in Pennsylvania for golden-winged warblers considered them not vulnerable, and likely to increase in that state (Furedi et al. 2011). Since most birds are more mobile and can move longer distances (in contrast to plants and other animals like salamanders), are not overly sensitive to temperature, and have a more generalized diet, some species may be less affected by climate change so long as sufficient habitat exists and they are not negatively affected by other competing species expanding their ranges northward into New Jersey (Furedi et al. 2011). However, a phenological mismatch, where the arrival of some migratory birds to their breeding habitat earlier in the season may put them out of synch with their invertebrate food supply, could be a problem. Generalized predictions for all scrub-shrub nesting birds are difficult to make, especially when the entire range of the species is not included in the CCVA (Furedi et al. 2011).

Climate Change Summary

Fen habitats, as well as the species most closely tied to site hydrology (i.e., bog turtles, some butterflies, and plants) are highly vulnerable to climate change. Due in part to their mobility, most of the SGCN birds covered in this report may be less vulnerable and able to find and use other early successional wetland habitats in northern New Jersey.

Maintaining site hydrology and providing calcareous wetland connectivity are the most important conservation actions in light of climate change. Maintaining wetland landscape connectivity will be crucial so that movement can occur among wetland habitats as the fen landscape changes. Typically, mobile animal fen species such as turtles and some butterflies move among habitats and colonize new habitats via stream corridors or other wetland linkages. Rare plants also move among wetlands, their propagules dispersed by water or by animals (e.g., carried as seeds or other propagules on feet or fur). Such networks of wetlands are necessary to allow movement and gene flow among populations of rare plants, bog turtles, or other species and must extend across state boundaries. Of import is linking geophysical settings, enhancing connectivity of wetlands on calcareous bedrock and following these geologic corridors into nearby New York and Pennsylvania (Anderson and Ferree 2010). Regional conservation assessments and collaboration will be essential, as species and habitat ranges shift.

No species-focused SGCN animal management actions have been identified in the 2008 SWAP to address climate change. Calcareous fen habitat and species management actions currently outlined in the SWAP should continue, modified as needed by the recommendations in this report.

Addressing existing hydrology and water quality issues, invasive species, recreational overuse, and other threats as necessary to maintain or restore existing habitat will be key to resiliency. The ability of fen habitats to withstand change over time while retaining their basic structure and function will enable them to support viable populations of rare plants and wildlife SGCN into the future (Anderson and Ferree 2010).

Overall Conclusions

While there are some areas of potential conflict in fen species management, generally it appears that with regular communication and coordination among land managers, botanists, and zoologists, calcareous fen habitats can be successfully managed for wildlife SGCN and the rare plants.

In addition, we recommend that an assessment of species and threats to calcareous fens in New Jersey on both public and private lands be conducted as there are many landowners actively managing their fens for single species (e.g., bog turtles) who may be unaware of the rare plants that may also be found in those habitats. Ultimately, some fens might be best managed for a single species, such as for bog turtles, while others could be successfully managed for a suite of fen-dependent species but a full review of all sites is critical before such determinations can be made.

Integrated Management Guidelines: Calcareous Sinkhole Pond Habitat

Appalachian Mountain Boltonia (*Boltonia montana*); Calcareous Sinkhole Pond; Long-tailed Salamander (*Eurycea longicauda longicauda*)

Overview

Calcareous sinkhole ponds and their associated rare plant communities are wetlands that occur on calcareous bedrock at the ground-water interface (Walz et al. 2000). In New Jersey, these ponds are found predominantly in the northwestern part of the state in the Appalachian valley and ridge province (Sussex and Warren counties). Typically, these ponds fill with water in winter and early spring. During the summer, as the water table drops, a diverse plant community develops on the pond shore, supporting numerous rare species. In addition, these pondshore habitats themselves are rare throughout their range and in fact, there are several types that are found only in New Jersey and nowhere else in the world (Walz et al. 2000). There are six different calcareous sinkhole pond ecological community types found in New Jersey, but for the purposes of this report we are addressing sinkhole ponds as a habitat system, not focusing just on one particular pond type.

They are included in the NE Wildlife habitat classification system as Central Interior Highlands and Appalachian Sinkhole and Depression Pond; in the New Jersey Landscape Map as Forest and Wetland Species-Based Habitat, and Vernal Habitat; and mapped in the New Jersey Land Use/Land Cover as Herbaceous Wetlands, Deciduous Wooded Wetlands and Mixed Forest Wetlands (Deciduous Dominant).. See Appendix B for more details on habitat classification.

Thirteen (13) state endangered plant species occur in calcareous sinkhole ponds, including Large Water-plantain (*Alisma triviale*), Appalachian Mountain Boltonia (*Boltonia montana*), Cloud Sedge (*Carex haydenii*), Hop-like Sedge (*Carex lupuliformis*), Small Floating Manna Grass (*Glyceria borealis*), Larger Canadian St. John's Wort (*Hypericum majus*), Water-marigold (*Megalodonta beckii*), Lake Water-cress (*Neobeckia aquatic*), Wiry Panic Grass (*Panicum flexile*), Arum-leaf Arrowhead (*Sagittaria cuneata*), Torrey's Bulrush (*Schoenoplectus torreyi*), Small Burr-reed (*Sparganium natans*), Lesser Bladderwort (*Utricularia minor*). See Appendix A for a complete list of state endangered plant species with rarity rankings.

The ponds also provide important breeding habitat for three rare salamanders identified as Species of Greatest Conservation Need (SGCN) in the 2008 New Jersey State Wildlife Action Plan (SWAP). They include Jefferson (*Ambystoma jeffersonianum*), marbled (*Ambystoma opacum*), and long-tailed (*Eurycea longicauda longicauda*) salamanders.

Threats:

General threats to the calcareous sinkhole pond habitats include changes to hydrology and to water quality and chemistry due to adjacent residential and commercial development or agriculture. These ponds rely on groundwater connection and this region of karst is very susceptible to changes in groundwater flow if development or agriculture intentionally or unintentionally diverts underground flow away from a wetland. (Karst systems are complex, and wetlands may be linked hydrologically underground even if no surface connection is evident.)

Ponds require significant habitat buffer around them to ensure water quality. In ponds adjacent to roads, the use of deicing salts and ensuing runoff alters pond chemistry. This not only affects rare plants adapted to the calcareous water chemistry of the ponds but also adversely affects amphibian development. Road traffic is also a source of significant mortality for mole salamanders and other amphibians as they cross roads to reach the ponds during the breeding season.

Other threats include invasive species, in particular nonnative plants such as purple loosestrife (*Lythrum salicaria*), Japanese stiltgrass (*Microstigium vimineum*), common reed (*Phragmites australis*), Japanese knotweed (*Polygonum persicaria*), garlic mustard (*Alliaria petiolata*), and Japanese barberry (*Berberis thunbergii*), which affect the integrity of the sinkhole pond habitat or its calcareous upland buffer. In larger ponds, recreational activities such as shoreline fishing or boating access that tramples sensitive pondshore vegetation can be a problem. The use of off-road vehicles (ORVs) and 4WD access in some ponds crushes plants and compacts the soil, while hiking trails placed adjacent to a pond edge with sensitive vegetation also can threaten the rare plant community and inadvertently introduce invasive species carried on shoes from other nearby sites. Onsite and offsite use of herbicides and pesticides also may harm nontarget plants or animals (Walz et al. 2000).

A summary of CMP Threats to state endangered plants and wildlife SGCN in calcareous sinkhole pond habitat is found in Appendix C.

Species Ecology

Plants:

Calcareous sinkhole ponds support a distinctive flora with significant populations of rare plants species that prefer calm shallow waters. Many are calcicoles found only in calcareous habitats, such as *Chara* spp., *Carex cryptolepis*, *Carex viridula*, and hop-like sedge (*Carex lupuliformis*) (Walz et al. 2000). Most are adapted to seasonal flooding and drying, even requiring a seasonal natural drawdown for reproduction and/or seed germination.

For example, many *Carex* species require exposed mud for seed germination and bare, moist mud also facilitates rooting of the stem and leaf fragments of lake water-cress (*N. lacustris*).

Boltonia montana has a very restricted range, found only in New Jersey and Delaware and likely extirpated from Pennsylvania. Of the twelve rare plants identified from sinkhole ponds and that are covered in this report, seven reach their southern limit in New Jersey. These include arum-leaf arrowhead (*Sagittaria cuneata*), large water-plantain (*Alisma triviale*), water-marigold (*Megalodonta beckii*), small floating manna grass (*Glyceria borealis*), cloud sedge (*Carex haydenii*), small burr-reed (*Spharganium natans*), and lesser bladderwort (*Utricularia minor*). Others are found at mid-range for the species overall (e.g. wiry panic grass [*Panicum flexile*], Torrey's bulrush [*Schoenoplectus torreyi*], lake water-cress [*Neobeckia lacustris*], hop-like sedge [*Carex lupuliformis*]), but are rare due to the limited distribution of the calcareous sinkhole pond habitat in New Jersey.

The following two tables provide a list of state endangered species that can found in calcareous sinkhole ponds in New Jersey with their phenology, or timing of vegetative, flowering and fruiting, and comments on their habitat/niche. The phenology and habitat information can be used to help avoid negative impacts to these state endangered plant species during wildlife surveys and management activities.

FL = Flowering; FR = Fruiting; V = Vegetative

Calcareous Sinkhole Pond -- State Endangered Plant Habitat/Niche Comments

<i>Scientific Name</i>	<i>Common Name</i>	<i>Habitat/Niche Comments</i>
<i>Alisma triviale</i>	Large Water-plantain	Shallow water of limestone sinkhole pond, often dominant in patchy mosaic, muddy substrate.
<i>Boltonia montana</i>	Appalachian Mountain Boltonia	Upper pondshores of calcareous sinkhole ponds, on silt over dolomite or rarely on marly peat.
<i>Carex haydenii</i>	Cloud Sedge	Upper pondshores of calcareous sinkhole ponds, on silt over dolomite, often stony.
<i>Carex lupuliformis</i>	Hop-like Sedge	Upper pondshores of calcareous sinkhole ponds in shallow water; open to partial shade (often under trees at edge of pond).
<i>Glyceria borealis</i>	Small Floating Manna Grass	Shallow water of calcareous sinkhole ponds, often in wet mote around edge of ponds.
<i>Hypericum majus</i>	Larger Canadian St. John's Wort	Wet marl or calcareous soils of fens and sinkhole ponds.
<i>Megalodonta beckii</i>	Water-marigold	Shallow water of calcareous sinkhole ponds, usually growing in mucky substrate.
<i>Neobeckia aquatica</i>	Lake Water-cress	Open water in marl ponds and calcareous lakes.
<i>Panicum flexile</i>	Wiry Panic Grass	Upper pondshores of calcareous sinkhole ponds, on marl or rocky dolomitic silt.
<i>Sagittaria cuneata</i>	Arum-leaf Arrowhead	Shallow water of limestone sinkhole pond, often dominant in patchy mosaic, mucky substrate.
<i>Schoenoplectus torreyi</i>	Torrey's Bulrush	Shallow water of limestone sink hole ponds, mucky substrate.
<i>Sparganium natans</i>	Small Burr-reed	Grows on muddy bottom or in shallow water of a calcareous sinkhole pond.
<i>Utricularia minor</i>	Lesser Bladderwort	Grows in shallow, calcareous water of marshes, pond shores, and marl fens.

Animals:

The three animal species of greatest conservation need identified in the 2008 State Wildlife Action Plan that use sinkhole ponds are amphibians, specifically salamanders (Jefferson, marbled, and the long-tailed salamander). Both Jefferson and marbled salamanders are mole salamanders, so named as they spend most of the year in underground retreats in forested uplands surrounding their breeding ponds (Petranka 1998). Mole salamanders breed in sinkhole ponds, taking advantage of the ephemeral nature of these wetlands and the fact that ponds typically dry out during the summer months. This drying out period reduces predation pressure from fish and other predators that require permanent water (Colburn 2004). **Jefferson salamanders** migrate to these sinkhole ponds in late winter/early spring, mate, and deposit their eggs in small clusters attached to vegetation in the water. In contrast, **marbled salamanders** migrate to the ponds in the fall. Females deposit their eggs under leaves, moss, or fallen woody debris in the dry pond basin. The females typically guard the clutch from predators until the ponds refill with water later in the season (Kenney and Burne 2000). Regardless of when the adults arrive at the ponds, once the larvae of either salamander species hatch they must complete metamorphosis before the ponds dry out in early summer.

Long-tailed salamanders are less dependent on the ephemeral hydrology of sinkhole ponds, overwintering in connected seepages and underground crevices and caves. Adults emerge from these overwintering sites in late April/early May. During the summer, they also depend on wooded buffer around breeding ponds (and in certain areas they use adjacent rocky seepage areas) but typically do not venture far from water. They return to underground aquatic retreats in the fall, and mate and lay eggs overwinter. Larvae metamorphose in June and July (Kenney and Burne 2000).

Integrated Conservation Management Guidelines

The following integrated conservation management guidelines address broad categories linked to conservation actions identified in the SWAP for SGCN animals that use calcareous sinkhole pond habitats. They are also correlated the TRACS ACTIONS Level 1. We have specifically targeted discussion around the actions where there may be potential for management incompatibility between rare plants and SGCN animals. An important first step in the planning process would be to conduct a thorough survey and mapping of all rare plant and animals species found at a site, including population location, status and condition, such that any proposed management can avoid or minimize impacts.

TRACS ACTIONS

1. Coordination and Administration
- 2. Create, Restore, or Enhance Habitat and Natural Processes**
- 3. Data Collection and Analysis**
4. Education
5. Facilities and Areas/New Construction
6. Facilities and Areas/Major Renovation
7. Facilities and Areas/Operations and Maintenance
8. Land and Water Rights/Acquisition and Protection
9. Law Enforcement
10. Outreach
11. Planning
12. Species Reintroduction and Stocking
13. Technical Assistance

TRACS ACTION #2:

CREATE, RESTORE, OR ENHANCE HABITAT AND NATURAL PROCESSES

Hydrology and Water Quality Management

The protection of water quality in critical wetlands and other aquatic habits for target animal species is an overarching goal identified in the 2008 SWAP in particular, preserving the ecological quality and integrity of vernal pool communities. Management that ensures maintenance of pond hydroperiod and water quality (e.g., limiting development near the ponds and regulating use of road salts) would benefit all taxa. The Jefferson salamander is particularly vulnerable to habitat acidification (Sadinski and Duncan 1992), as are the rare plants in sinkhole pond habitats.

Research to identify groundwater recharge areas (recommended in the SWAP) also would benefit both rare plants and animals at these sites.

Vegetation Management:

Managing succession: Shrub or sapling encroachment has not been identified as a significant threat to the rare plant community in New Jersey's calcareous sinkhole ponds to date (Walz et al. 2000), or to salamander SGCN although targeted invasive plant species control may be necessary at some sites (see below). So long as the site hydrology remains intact, there should be minimal woody vegetation management needed in calcareous ponds.

Manual vegetation removal: Hand-pruning or selective cutting of woody vegetation can be used to set back succession and open the canopy for those plant and animal species that require it. If done in the winter months, there will be little impact to pond vegetation or other animal species that use the habitat.

Use of herbicides: Extreme care must be taken if herbicides, especially broad spectrum are used in calcareous sinkhole pond habitats. Only direct hand application (e.g., hand painting stump cuts) should be considered for vegetation control adjacent to rare plant populations.

Silvicultural practices on adjacent uplands: The SWAP includes recommendations to promote ecologically sound silvicultural practices on critical upland habitats and wetland buffers. This would certainly be of benefit to rare plant and animal species that rely on pristine pond water quality and appropriate pond chemistry. In addition, the quality of the surrounding forest habitat is critically important to mole salamanders, which spend 11 months of the year there.

Utility rights-of-way management: The SWAP recommends the development of BMPs for Rights-of-Way (ROW) management for scrub-shrub and other species that may use them. As ROWs occasionally cut through calcareous sinkhole pond habitats, the development of management guidelines should be coordinated such that all rare plants as well as wildlife SGCN using ROWs are incorporated into BMPs. This will assist the landowner in making appropriate management decisions and to avoid potentially conflicting recommendations.

Invasive, Over-abundant, and Pest Species Management:

Invasive plant species: Management and control of invasive plant species is an important conservation goal identified in the SWAP and a priority in the Skylands zone, although there were no specific invasive plant species control actions proposed to improve habitat for salamanders. However, a number of invasive plant species, in particular purple loosestrife (*Lythrum spicata*), reed canary grass (*Phalaris arundinacea*), common reed (*Phragmites australis*) and Eurasian water-milfoil (*Myriophyllum spicatum*) pose significant threat to the habitat itself (e.g., Spring Lake at Swartswood State Park), as well as to rare plant populations. Should new invasive plant populations become established, control

should begin with the least harmful process (hand pulling or seedhead removal) before moving toward use of chemicals or other less targeted techniques. Biocontrol may be an option for some invasive species, however consultation with experts, both botanists and zoologists is always warranted when considering the use of chemicals and/or biocontrol. Decisions should be made on a site-by-site basis to prevent (or minimize) negative impacts to non-target rare plant or animal species.

Deer control: The management of deer populations is a major conservation action identified in the SWAP to promote forest health and biodiversity. Management measures may include increased hunting efforts or fencing of vulnerable habitat against deer. Managing the size of local deer herds would benefit both rare plants and SGCN animals in ponds and upland forest buffer areas, and any trampling of vegetation by hunters would occur when most plants are dormant. Although deer have not yet been identified as a significant problem in calcareous sinkhole pond habitats for either plants or SGCN animals, browsing activity should be regularly monitored.

Beaver control may be needed on occasion and has also been identified as a conservation action in the SWAP. Typically this could include trapping and removing beaver from a site to prevent dam construction (or partial dam removal), and/or the installation of a water level control device. Since the rare plants and the salamanders in sinkhole pond habitats all rely on a similar pond hydrology, beaver control should benefit both.

Insect pests and/or disease pathogens: Insect pests may be targeted for control in and around calcareous sinkhole ponds (e.g., mosquitoes, gypsy moths). Control measures often include application of pesticides, many of which are broad spectrum or are applied at times of the year when other invertebrates are vulnerable or are applied in a manner harmful to the rare plant community (e.g., trampling). Any proposed control measures should be site specific and the use of integrated pest management and committed, ongoing coordination among agencies and with pond managers to reduce non-target impacts is critical. In all cases, botanists and zoologists should be included in the discussion to avoid any potential harm to rare plant or SGCN animal populations or the habitat.

Note: Proper protocols should be put into place for all field biologists to prevent the spread of invasive species propagules and/or disease pathogens (e.g. Chytrid fungus, Ranavirus) among wetland sites. It is best to follow these or similar recommendations between site visits: 1) wash boots and field equipment with soap and water; 2) rinse in clean water; and 3) disinfect with a 10% bleach solution and allow to air dry (Dodd 2010; B. Zarate, personal communication, 2013).

Recreational Use Management

Although most calcareous sinkhole ponds are small and fishless, boating and shoreline fishing are popular activities at the larger sinkhole ponds in New Jersey such as Swartswood Lake (Walz et al. 2000). Without safeguards, these activities can inadvertently harm sensitive rare plants such as Appalachian Mountain *Boltonia* (*Boltonia montana*) and contribute to the spread of invasive species or pathogens from one pond to another. Use of

ORVs and other recreational vehicles also threaten certain sinkhole pond wetlands and regulating their use is a goal of the SWAP. Implementation of conservation actions to manage and/or restrict such activities in sensitive areas as appropriate, coupled with adequate enforcement, would benefit rare plants and wildlife SGCN.

Promoting public education and awareness, wildlife conservation, and viewing opportunities is an important goal of the SWAP. However, if wildlife viewing structures or trails are planned for construction in or near calcareous sinkhole ponds, care must be taken to avoid altering site hydrology, permitting unguided access into vulnerable habitat to avoid trampling and introducing invasive plant seeds, and harming sensitive plants and animals during construction.

SPECIES MANAGEMENT (= TRACS ACTION TARGETS)

Species-Specific Management Actions (Highlighted in the SWAP):

Salamanders: SWAP recommendations for the rare salamanders are general, addressing the need to protect critical habitat for these species. Salamanders require significant forested habitat around breeding ponds. Protection of this intact woodland buffer also benefits pond vegetation by reducing runoff and maintaining water quality. Onsite management for salamanders might entail allowing woody debris to accumulate on the forest floor (with perhaps the addition of cover boards), which would not negatively affect pond vegetation.

Active management for mole salamanders (and other herps) identified in the SWAP also includes monitoring road crossings during salamander migration to the breeding ponds. This typically occurs during rainy evenings in late winter/early spring, which should not affect the plant community at the pond. [Note: there is a Conserve Wildlife Foundation of New Jersey proposal to construct a road crossing culvert at one salamander breeding population at Swartswood State Park. Care must be taken to survey and map any locations of rare plants to avoid trampling and to prevent runoff from entering the wetland during and after construction.]

The SWAP also recommends conducting research that looks at the effects of various water quality parameters on salamanders identified as SGCN. Perhaps any proposed research initiatives could be broadened to include rare plants that are a significant part of the sinkhole pond community.

TRACS ACTION #3:

DATA COLLECTION AND ANALYSIS (TRACS Action Level 1)

***Research, Survey, or Monitoring* (TRACS Action Level 2)**

Inventory and Long-term Monitoring

Inventory and long-term monitoring of all animal SGCN have been identified as priorities in the SWAP. A good first step should be a vegetation assessment that maps the locations of rare plants such that future amphibian or other animal surveys can avoid locations of

sensitive plant populations. In addition, plant and animal population monitoring efforts at a site should be coordinated to prevent situations where multiple monitoring initiatives are occurring, potentially creating frequent, extensive, long-term disturbance without sufficient recovery periods.

Animal survey and monitoring techniques – minimizing harm to rare plants:

Vernal pool habitat surveys: Surveying for vernal pools has been identified in the SWAP as a priority. While this habitat is classified as “Eastern Woodland Vernal Pool Sparse Vegetation” in the National Vegetation Classification, in NJ calcareous sinkhole ponds are considered to be vernal pool habitat by the Division of Fish and Wildlife. “Vernal habitat” is defined in the NJDEP Freshwater Wetlands Protection Act as a wetland or State open water that meets four criteria including 1) confined basin depression without permanent flowing outlet, 2) evidence of breeding by one or more species of obligate and/or facultative fauna adapted to reproduce in ephemeral aquatic conditions, 3) maintains ponded water for at least two continuous months between March and September of a normal rainfall year, and 4) is free of reproducing fish populations throughout the year, or dries up at some time during a normal rainfall year. See Appendix E for more details and a list of vernal habitat obligate and facultative species. More information can also be found at. Much work has already been done with the use of remote sensing, followed by site visits to verify pond presence (see <http://www.nj.gov/dep/fgw/ensp/vernalpool.htm>). Typically, site visits to ground-truth remotely-sensed data are easiest to do in the winter when ponds are full of water (or frozen) and there is no ground cover so generally there would be little or no impact to the rare plant community. Site visits in the spring to confirm the presence of obligate wetland species (e.g., wood frogs, fairy shrimp) should also occur early enough in the season to avoid trampling rare plants.

Mole salamander surveys: Typically, survey and monitoring of mole salamander breeding at ponds occurs in the early spring and care is taken to minimize tramping in the pond to not harm salamander eggs (Heyer et al. 1994). This is well before any of the target rare plant species would have emerged so should not conflict. Follow-up survey for larvae (dip-netting) may occur later in the spring when plants may have begun growth. Adult salamanders are surveyed by searching under logs or cover boards adjacent to the pond edge and in the upland forest. When surveying for mole salamanders, avoid trampling areas of exposed vegetation or uprooting plants if using dip nets. When placing cover boards, avoid covering rare plants at pond edge or in upland areas. Consult the plant phenology tables in this report and any rare species maps that are prepared for additional guidance when planning the location and timing of survey work.

Long-tailed salamander surveys: Surveys for long-tailed salamanders usually occur later in the season when plants might be actively growing. Dip-netting for larvae, searching for adults under logs or cover boards adjacent to the pond edge, or searching seepage areas in outcrops away from the pond are all standard techniques. When conducting surveys for long-tailed salamanders, avoid trampling areas of exposed vegetation or uprooting plants if using dip nets. When placing cover boards to avoid rare plants at pond edge or in upland

areas. Consult the plant phenology tables in this report and any rare species maps that are prepared for additional guidance when planning the location and timing of survey work.

Plant survey and monitoring techniques- ways to minimize harm to animals:

Plant surveys: Plant surveys and rare plant monitoring activities can occur throughout the growing season as phenology differs among species, and over multiple years since growing conditions vary from year to year. Such activities may include random searches through habitat, use of parallel transects, and/or the establishment of long-term vegetation monitoring plots. There are no anticipated impacts to SGCN salamanders by plant surveying in calcareous sinkhole ponds.

Climate Change Vulnerability Assessment

The year 2012 was the warmest on record nation-wide (NOAA 2013) and in the garden state (Robinson 2013), with more changes forecast to come. In New Jersey the effects of climate change are projected to include: an increase in average temperature (minimum 2-6 °F. increase by 2050) and precipitation (although the exact nature of the change in precipitation may vary across the state); more extreme weather events such as storms and droughts; and sea level rise. Generally we can expect more prolonged summer heat waves with temperatures above 90° F., and fewer cold days and nights during the winter, which may be of import for those species requiring cold dormancy. Rainfall, especially in the northern part of the state may increase in amount mainly in the winter months (Faass 2012, NJ Climate Adaptation Alliance 2013a).

Calcareous Sinkhole Ponds and Climate Change:

According to Faass et al. (2012) there are a number of stressors that should be looked at to determine whether or not a particular plant community is vulnerable to climate change. These stressors include: 1) exacerbation of other non-climate stressors; 2) specific hydrologic conditions; 3) vulnerability to human response; 4) sensitivity to extreme climate events; 5) intrinsic adaptive capacity; 6) species vulnerability; 7) latitudinal constraints; 8) management feasibility; 9) degree of cold adaptation; and 10) location in geographical range. (For a detailed discussion of each of these stressors, see Faass et al. 2012.)

Calcareous sinkhole ponds are susceptible to a number of these stressors. These ponds are maintained by specific hydrologic conditions that require a fairly even (predictable) distribution of precipitation throughout the year. The significant alteration to precipitation patterns anticipated with a changing climate (e.g., greater flood events, increased drought during the summer months) may alter groundwater flow and seepage. This in turn will affect plant and animal species composition, favoring species adapted to drier conditions and possibly permitting greater invasive species incursion (non-climate stressor) (NJ Climate Adaptation Alliance 2013b).

Species and Climate Change:

Plants: All thirteen state endangered plant species present at calcareous ponds were assessed for vulnerability to climate change (see Ring and Spencer 2013), using the NatureServe Climate Change Vulnerability Assessment (CCVA) model (NatureServe 2011). Three species of rare plants (cloud sedge [*Carex haydenii*], small floating manna grass [*Glyceria borealis*] and Torrey's bulrush [*Schoenoplectus torreyi*]) were considered highly vulnerable, six (46%) were determined to be moderately vulnerable, two were presumed stable, and for two others there was not enough data to make an assessment. Although there are some exceptions based on individual life history characteristics, many of the most vulnerable are the plant species that are currently at the southern edge of their range. See Ring and Spencer (2013) for detailed discussion.

Animals: New Jersey's SGCN animals have not yet been assessed for vulnerability to climate change. However, some predictions can be made about how they would fare in future years given a warming climate by consultation with experts and species assessments from other states.

Salamanders: Climate change vulnerability analyses (CCVAs) were not conducted for New Jersey populations of the amphibian species. However, we did consult with both the long-tailed and marbled salamander CCVAs completed by the New York Natural Heritage Program and the Jefferson salamander CCVA completed by the Pennsylvania Natural Heritage Program. Long-tailed salamanders were presumed stable in New York, perhaps as they are more tied to ground water habitats that are potentially less likely to dry out. They can also use a wider array of habitats including some swamps and stream seepages in addition to sinkhole ponds. Their status in New Jersey would likely be similar to New York's vulnerability assessment.

In contrast, marbled salamander was listed as highly vulnerable in New York, due to its lack of mobility and specific habitat needs (Schlesinger et al. 2011). Because marbled salamanders are found statewide in New Jersey, a CCVA model might have come out differently, with them being only moderately vulnerable. They still would have limited dispersal capability and dependence on specific hydrology in their habitat, making them sensitive to any climate-linked alterations to site hydrology.

In the Pennsylvania assessment, Jefferson salamander was found to be highly vulnerable in that state mainly due to its limited dispersal capacity and its physical habitat requirements (e.g., vernal pools of specific pH range) (Furedi et al. 2011). It is likely that Jefferson salamander would also be ranked highly vulnerable in New Jersey for similar reasons and due to the fact they have a limited distribution in New Jersey, being restricted to the northern part of the state.

The key unifying threat exacerbated by a changing climate for the most vulnerable plant and animal species is altered hydrology and lowering of water table such that ponds no longer retain sufficient (or any) water. Preventing further drawdown from nearby wells is important, yet remains a challenge in the fractured limestone belt where sinks and springs

appear and disappear. Limestone sinkhole ponds that become disconnected from groundwater are most likely to change hydrology, to the detriment of wetland-dependent plants and mole salamanders. Although the larval period has some plasticity, there is a limit to how shortened it could be for successful transformation to the adult stage.

Climate Change Summary

Calcareous pond habitats as well as the species most closely tied to site hydrology and water chemistry (i.e., certain rare plants and mole salamanders) are highly vulnerable to climate change. Maintaining site hydrology and providing calcareous wetland connectivity are the most important conservation actions in light of climate change. Maintaining or enhancing landscape connectivity among pond sites will allow dispersing salamander juveniles to colonize other suitable pond habitats. Similarly, such connectivity of calcareous wetland habitat could allow for plant population movement via seed or other dispersal mechanisms to new or more suitable habitat as the climate changes. These landscape connections must also link geophysical settings, following limestone corridors across state boundaries to allow for northward migration of habitat or species (Anderson and Ferree 2010). Regional conservation assessments and collaboration will be essential, as species and habitat ranges shift.

Apart from this, no specific wildlife SGCN management actions have been identified in the 2008 SWAP to address climate change. The wildlife SGCN management actions currently outlined in the SWAP should continue, modified as needed by the recommendations in this report. Addressing existing hydrology and water quality issues, invasive species, recreational overuse, and other threats as necessary to maintain or restore existing habitat will be key to resiliency. The ability of calcareous sinkhole ponds habitats to withstand change over time while retaining their basic structure and function will enable them to support viable populations of rare plants and wildlife SGCN into the future (Anderson and Ferree 2010).

Overall Conclusions:

Overall, there appears to be relatively little conflict between conservation management actions proposed for rare salamanders in the 2008 SWAP and rare plant survival in calcareous sinkhole pond habitats. These ponds and their associated plant and animal species share similar threats and have similar management needs.

Integrated Management Guidelines: Pine Barren Savanna Habitat

Bog asphodel (*Narthecium americanum*); Pine Barren Riverside Savanna; Bog lemming (*Synaptomys cooperi*)

Overview

There are two main wetland savanna habitats in the New Jersey Pine Barrens. Pine Barren riverside savannas are sedge and grass dominated wetlands found along stream edges and in floodplains on the coastal plain of New Jersey. They are permanently saturated by groundwater seepage but can be seasonally inundated by stream flooding after storm events (Walz et al. 2006). Often bordered by Atlantic white cedar (*Chamaecyparis thyoides*) or pitch pine lowland swamps, these savannas support many carnivorous plants as well as numerous globally rare plants species such as Knieskerns beaked-rush (*Rhynchospora knieskernii*) and bog asphodel (*Narthecium americanum*). In fact, *Rhynchospora knieskernii* is listed as Threatened by the U.S. Fish and Wildlife Service, and *Narthecium americanum* is a Candidate species under consideration for listing (Walz et al. 2006a). Pitch pine reedgrass savannas are also found on moist soil but are predominantly maintained by fire. Depending on moisture levels, they share many rare plants species in common with the riverside savanna habitats. The majority of the pine barren riverside savanna habitats are found in natural areas within the Wharton State Forest (Walz et al. 2006a). Pitch pine reedgrass savannas are found within state protected lands including Bass River State Forest, Penn State Forest, Stafford Forge Wildlife Management Area, and federal military Joint Base McGuire-Dix-Lakehurst. There are six different Pine Barren riverside savanna ecological community types and one pitch pine reedgrass savanna type found in New Jersey, but for the purposes of this report we are addressing savanna as habitat systems, not focusing just on one particular savanna type.

Savannas are included in the NE Wildlife Habitat Classification System as Northern Atlantic Coastal Plain Stream and River (Pine Barren riverside savannas) and Northern Atlantic Coastal Plain Pitch Pine Lowland (pitch pine reedgrass savanna); in the New Jersey Landscape Map as Emergent, Forest and Wetland Species-Based Habitat; and mapped in the New Jersey Land Use/Land Cover as Herbaceous Wetlands, Coniferous Scrub/Shrub Wetlands, Mixed Scrub/Shrub Wetlands (Coniferous Dominant), and Coniferous Wooded Wetlands. See Appendix B for more details on habitat classification.

Fourteen (14) state endangered plant species occur in pine barren savannas, including Pickering's Reed Grass (*Calamagrostis pickeringii*), Spreading Pogonia (*Cleistes divaricata*), Rough Cotton-grass (*Eriophorum tenellum*), Pine Barren Boneset (*Eupatorium resinosum*), New Jersey Rush (*Juncus caesariensis*), Bog Asphodel (*Narthecium americanum*), Yellow Fringeless Orchid (*Platanthera integra*), Knieskern's Beaked-rush (*Rhynchospora knieskernii*), Long's Woolgrass (*Scirpus longii*), Lace-lip Ladies'-tresses (*Spiranthes laciniata*), False Asphodel (*Tofieldia racemosa*), Reversed Bladderwort (*Utricularia resupinata*), Fringed Yellow-eyed-grass (*Xyris fimbriata*), Death-camus (*Zigadenus leimanthoides*). See Appendix A for complete species list with rarity rankings.

Animals identified as Species of Greatest Conservation Need (SGCN) in the 2008 State Wildlife Action Plan (SWAP) that rely on Pine Barren savannas include southern bog lemming (*Synaptomys cooperi*), four Lepidoptera species including *Dichagyris reliqua*, Arogos skipper (*Atrytone arogos*), Carter's noctuid moth [*Photedes (Spartiniphaga) carterae*], and Georgia satyr (*Neonympha areolata*) and one bird species, the northern parula warbler [*Setophaga (Parula) americana*]. See Table A for a list of wildlife SGCN with rarity ranks. [note: The New Jersey and coastal plain populations of Georgia satyr are now considered a separate species, Helicta satyr (*Neonympha helicta*) (D. Schweitzer, personal communication, 2013; see NatureServe 2013).

Threats

Savannas have been present in the Pine Barrens landscape for at least 8000 years (Walz et al. 2006b). In New Jersey, savannas are maintained as open habitat by groundwater seepage and persistent soil saturation, or by fire (pitch pine reedgrass savanna), although past land use may have been a factor in some cases. Past human disturbances have included peat removal, bog iron mining, cedar logging, and cranberry farming (Walz et al. 2006b).

Any significant alteration of these processes will change the plant community composition and vegetation structure, and affect dependent wildlife. For this reason, changes in hydrology, whether a lowering of the water table due to groundwater withdrawal or, conversely, long term flooding by beaver activity, as well as changes to the fire regime can threaten these habitats. In addition, groundwater contamination from agricultural and residential land use or expansion of cranberry bogs into existing savannas on unprotected lands may also be a threat.

While fire is an important element in maintaining pitch pine reedgrass savannas, more frequent, hotter fires that burn through the duff could harm wildlife, especially Lepidoptera. Recreational overuse by ORVs harms vegetation and compacts soils and even exploring canoeists and botanical field trip participants can trample sensitive vegetation. In addition, collecting of orchids and other rare plants also threatens Pine Barrens savanna habitats (Walz et al. 2006a).

A summary of CMP Threats to state endangered plants and wildlife SGCN in pine barren savanna habitat is found in Appendix C.

Species Ecology

Plants:

The rare plants of the riverside savannas are well-adapted to the wet, acidic, nutrient-poor soils of these open savannas, with their particular hydrology. The seeds of some plants such as cotton-grass (*Eriophorum tenellum*) disperse via water, although the plant can also reproduce via spreading rhizomes (Hays 2001).

All of the plant species considered rare are perennials. One, Kneiskern's beaked-rush, is a Pine Barren endemic, found in New Jersey and nowhere else. Seven of the listed plant species are at the northern edge of their range, including the false asphodel (*Tofieldia racemosa*), bog asphodel (*Narthecium americanum*), spreading pogonia (*Cleistes divaricata*), fringed yellow-eyed grass (*Xyris fimbriata*), lace-lip ladies'-tresses (*Spiranthes laciniata*), pine barren boneset (*Eupatorium resinosum*), and the yellow fringeless orchid (*Platanthera integra*). In contrast, other species like rough cotton-grass (*Eriophorum tenellum*), Long's woolgrass (*Scirpus longii*), Pickering's reed grass (*Calamagrostis pickeringii*), and larger St. John's wort (*Hypericum majus*), are at the southern edge of their range.

While predominantly a wetland community, fire may occasionally (drought conditions) pass through riverside savannas. In contrast, pitch pine reedgrass savannas are fire-maintained, where periodic fires are needed to keep the habitat open and promote the persistence of reedgrass and other fire-dependent species. Some plants like Long's woolgrass are considered "pyrophytes", they gain competitive advantage from fire (Rawinski 2001). These species require some periodic disturbance, such as fire, flooding, or herbivory to stimulate flowering.

The following two tables provide a list of state endangered species that can found in Pine Barren Savannas in New Jersey with their phenology, or timing of vegetative, flowering and fruiting, and comments on their habitat/niche. The phenology and habitat information can be used to help avoid negative impacts to these state endangered plant species during wildlife surveys and management activities.

PINE BARRENS SAVANNAS – State Endangered Plant Habitat/Niche Comments

SCIENTIFIC NAME	COMMON NAME	Habitat/Niche Comments
<i>Calamagrostis pickeringii</i>	Pickering's Reed Grass	Most occurrences are in open, pine barren savannas, also in open, herbaceous swale under a powerline through pine-oak woodland. One of the few grasses that can be found in open Sphagnum mats.
<i>Cleistes divaricata</i>	Spreading Pogonia	Pine barren savannas and margin of Coastal Plain intermittent pond.
<i>Eriophorum tenellum</i>	Rough Cotton-grass	Frows in sedge and grass dominated pine barren savanna. Historically also collected from Atlantic white cedar swamps and various other sphagnous wetlands.
<i>Eupatorium resinosum</i>	Pine Barren Boneset	Saturated to seasonally-saturated sand, such as in pinelands shrub bogs, streambanks and disturbed wet openings. Full or mostly full sun; post-fire sprouting suspected; seedlings thought to require full sun and mineral soil for germination/growth; disturbance creates and maintains habitat.
<i>Juncus caesariensis</i>	New Jersey Rush	Typically found in open sphagnous bogs and seepage areas adjacent to Atlantic white cedar swamps and stream corridors. Also occurs in disturbed areas like roadside ditches and railroad and powerline rights-of way.
<i>Narthecium americanum</i>	Bog Asphodel	A wetland species restricted to sphagnous or peaty sedge and grass dominated savannas and seepage areas adjacent to Atlantic white cedar swamps in the Pine Barrens.
<i>Platanthera integra</i>	Yellow Fringeless Orchid	Grows in open or thicket seepage areas of sedge and grass dominated savannas along pine barren rivers. Historically collected from pitch pine lowland forests.
<i>Rhynchospora knieskernii</i>	Knieskern's Beaked-rush	Grows in saturated to seasonally-saturated fine sand and clay, in open moist areas of pinelands with exposed mineral soil; such as early successional habitats in pitch pine lowlands, riverside savannas, bog iron deposits or flood scoured areas along streams; also in disturbed roadsides, scrapes, gravel pits in wetlands.
<i>Scirpus longii</i>	Long's Woolgrass	Grows in moist to saturated sandy or peaty soils in swales, pond margins, and stream sides. Mostly in pitch pine lowland forest, especially areas with frequent fire history. This species has been observed most often in open shallow-water habitats, described as wet soggy meadows or swales, sedge meadows, sandy-peat bogs, though Sphagnum is usually absent, or depressions, associated with river-stream floodplains, or resulting from human excavations. The shallow water of these habitats is often seasonally fluctuating, subject to summer drought.

<i>Spiranthes laciniata</i>	Lace-lip Ladies'-tresses	Grows in wet, peaty or sphagnum seepage areas of open pine barren savannas and intermittent Coastal Plain ponds.
<i>Tofieldia racemosa</i>	False Asphodel	Grows in open, sphagnum seepage areas of pine barren river savannas.
<i>Xyris fimbriata</i>	Fringed Yellow-eyed-grass	Grows in sphagnum seepage areas of pine barren savannas.
<i>Zigadenus leimanthoides</i>	Death-camus	Grows in peaty thickets, swales, riverside savannas, streamsides, and occasionally open wet woods.

Animals:

The **southern bog lemming** is highly localized, preferring moist grassy areas with hummocks and sphagnum mats, and abundant vegetative cover (although they can use upland habitats (Whittaker and Hamilton 1998). They feed on leaves, stems, and seeds of wetland vegetation with small piles of grass cuttings found in burrows or along runways (Whittaker and Hamilton 1998). Lemmings appear to be most active in May, primarily nocturnal, and move to the wetter areas of the riverside savanna as the summer progresses and other sections dry out. They travel throughout these wetter areas via underground tunnels and surface runways (Buchanan 2006). Sociable animals, they usually occur in small colonies (Whittaker and Hamilton 1998).

The **northern parula warbler** nests in conifers such as Atlantic white cedar. When it is available, they will use old man's beard lichen (*Usnea barbata*) for nest construction (Leck 1979), however they also use other vegetation. Parula warblers forage for insects in the open areas of the savannas but are not restricted to this habitat. They are considered a rare breeder in the Pine Barrens region.

There are four **Lepidopera** species found in Pine Barrens savannas and three of them (*Dichagyris reliqua*, Arogos skipper, and Carter's noctuid moth depend on the presence of Pine Barrens reedgrass (*Calamovilfa brevipilis*). Reedgrass typically is found in patches around the edges of many of the wetter riverside savannas (Walz et al. 2006a). However, it is dominant in a similar community, the pitch pine reedgrass savanna that occurs in broader seepage areas in upper watersheds particularly in the pine plains. These pitch pine reedgrass habitats support the largest populations of these Lepidopteran species.

Arogos skipper prefers a moist savanna habitat in this part of its range, which extends from northern New Jersey south to Georgia. In Pine Barren populations, Arogos larvae feed on the leaves of pitch pine reedgrass. In contrast to the *Dichagyris*, which requires high intensity fire to stimulate production of its food supply, a similar fire regime could destroy populations of this skipper. The larvae overwinter on the food plant wrapped in a leaf and then resume feeding and development the following spring (Schweitzer et al. 2011). The main threats to Arogos skippers in the Pine Barrens are loss and fragmentation of habitat due to altered hydrology and/or fire regimes, depending on the habitat in which the butterfly is located (e.g., riverside savannas or pitch pine reedgrass savannas). The skipper

often occurs in metapopulations and must be able to readily move among suitable habitat patches (Schweitzer et al. 2011).

Carter's noctuid moth (aka reed grass borer moth) also relies on the persistence of *Calamovilfa brevipilis*. The moth lays its eggs on the leaves and upon hatching, the larvae crawl inside the plant stem to feed, and burrow into rhizomes over the winter. For this reason, they are more tolerant of surface fires. Carter's noctuid moth is generally found in moist pine savannas that burn only rarely (Schweitzer et al. 2011).

Although *Dichagyris reliqua* has not been seen in New Jersey since 1995 further survey is warranted (D. Schweitzer, personal communication, 2012). The larvae of this moth feed on the seeds of *Calamovilfa brevipilis* and were typically found in recently burned pitch pine reedgrass savannas. If present, adults fly in late July/early August and the larvae overwinter in the soil. Management for this species would entail frequent, intense growing season burns that promote flowering and seed set (Schweitzer et al. 2011). This moth could be expected in riverside savannas if the foodplant were in flower. Otherwise, it would be underground in diapause.

The fourth Lepidoptera, **Georgia satyr** (*Neonympha areolata*) (now helicta satyr, (*Neonympha helicta*) is also found in open bogs and wet pine savannas in New Jersey as well as in grassy openings in upland pinelands (Cech and Tudor 2005). The Pine Barrens populations are at the northern edge of the species' range and disjunct from the southern core coastal population (NatureServe 2013c). Larvae feed on sedges, and overwinter when partially grown.

Integrated Conservation Management Guidelines

The following integrated conservation management guidelines address broad categories linked to conservation actions identified in the SWAP and correlated with the TRACS ACTIONS Level 1. We have specifically targeted discussion around the actions where there may be potential for management incompatibility between rare plants and SGCN animals. An important first step in the planning process would be to conduct a thorough survey and mapping of all rare plant and animals species found at a site, including population location, status and condition, such that any proposed management can avoid or minimize impacts.

TRACS ACTIONS

1. Coordination and Administration
- 2. Create, Restore, or Enhance Habitat and Natural Processes**
- 3. Data Collection and Analysis**
4. Education
5. Facilities and Areas/New Construction
6. Facilities and Areas/Major Renovation
7. Facilities and Areas/Operations and Maintenance
8. Land and Water Rights/Acquisition and Protection
9. Law Enforcement
10. Outreach

11. Planning
12. Species Reintroduction and Stocking
13. Technical Assistance

TRACS ACTION #2: CREATE, RESTORE, OR ENHANCE HABITAT AND NATURAL PROCESSES

Hydrology and Water Quality Management

Protecting critical riverine and riparian habitat in the Pine Barrens along with establishing and maintaining wetland connectivity are key conservation measures identified in the four Pine Barrens zones of the 2008 SWAP. Actions associated with these goals include land protection, work with public and private landowners, and development of sufficient habitat buffers and landscape connectivity. Each of these actions, if implemented, would benefit rare plants and animals found in these Pine Barren savannas, especially riverside savannas. If the hydrology is maintained in these systems, these habitats should remain open and suitable for rare plants and SGCN.

Vegetation Management

Managing succession: In addition to maintaining critical ecological processes, woody vegetation management is a major component of the SWAP, especially for maintaining early successional wetlands like savannas and shrub-scrub habitats. Techniques may include manual removal (e.g., selective cutting and tree removal, mowing or brushhogging), targeted use of herbicides, and/or application of prescribed fire (see fire management section below). Currently no vegetation management has been proposed for SGCN animals in Pine Barren riverside savannas or reedgrass savannas in the core Pine Barrens. However, any future plans for woody vegetation control or management should keep in mind the life history and habitat needs of rare plants and other SGCN animals that occur at individual sites to avoid non-target impacts.

Manual vegetation removal: Hand-pruning or selective cutting of woody vegetation can be used to set back succession and open the canopy for those plant and animal species that require it. If done in the winter months, there will be little impact to savanna vegetation or other animal species that use the habitat.

Use of herbicides: Extreme care must be taken if herbicides are used in savannas as most are broad spectrum. Only direct hand application (e.g. hand painting stump cuts) should be considered for shrub control adjacent to rare plant populations.

Silvicultural practices on adjacent uplands: The SWAP recommends working with landowners to promote the use of ecologically appropriate forestry practices as a conservation action. Maintaining upland buffers around savannas and implementing such practices in these upland buffers would benefit both rare plants and SGCN animals in savannas in part by reducing erosion and protecting water quality.

Utility rights-of-way management: The SWAP recommends the development of BMPs for Rights-of-Way (ROW) management for scrub-shrub and animal species that may use them. As ROWs may cut through Pine Barren savannas, the development of management guidelines should be coordinated such that all rare plants as well as wildlife SGCN using ROWs are incorporated into BMPs. This will assist the landowner in making appropriate management decisions and to avoid potentially conflicting recommendations.

Fire Management: Most New Jersey Pine Barrens habitats have been shaped by and are maintained by fire. For this reason, fire management is an ongoing activity, whether by application of prescribed fire for fuel reduction during the winter months or by suppression of hotter growing season burns or wildfires that might affect surrounding development. The way in which fire is managed has a major effect on the persistence and quality of Pine Barrens habitats, including these savannas and their associated rare plants and SGCN wildlife, especially during times of extreme drought.

When considering the use of fire as a management tool, it is necessary to thoroughly assess what rare plant and SGCN animals are present in the habitat, their tolerances to fire, and their distribution on the landscape before developing a plan for when and if to burn, what to burn and how intensely, or whether fire prevention is warranted. In short, the needs of all species, plant and animal, at a site must be considered. This assessment and evaluation does occur on state lands during the NJDEP internal Land Management Review process. But any burn activities considered for private lands do not require this level of assessment as part of the permit application. For this reason, pitch pine reedgrass savannas on private land may be burned by private landowners (e.g., cranberry bog owners that regularly use prescribed fire to clear land and reduce fuel loads; military activity on Ft. Dix that may cause fires) that may affect rare plants and/or SGCN animals.

Without fire, other vegetation management techniques such as mowing are sometimes applied. The ecological and species-specific effects of such management practices must be assessed for each rare species as to whether the results are beneficial, harmful, or benign. Conducting research on fire and its effects on habitats and SGCN animals is another priority goal of the SWAP. A better understanding of landscape effects of fire will be of benefit to long-term viability of plant and animal populations in the Pine Barrens.

Invasive, Over-abundant, and Pest Species Management

Invasive plant species: Management and control of invasive plant species is a conservation goal for all Pine Barrens SWAP zones. To date, there are no known invasive or nonnative plants present in core riverside or pitch pine reedgrass savannas. Should new populations become established, control should begin with the least harmful process (hand pulling or seedhead removal) before moving toward use of chemicals or other less targeted techniques. Biocontrol may be an option for some invasive species, however consultation with experts, both botanists and zoologists is always warranted when considering the use of chemicals and/or biocontrol. Decisions should be made on a site-by-site basis to prevent or minimize negative impacts to non-target rare plant or animal species, or to the habitat.

Insect pests and/or disease pathogens: A number of insect pests may be targeted for control in and around Pine Barren savannas (e.g., mosquitoes, southern pine beetle). Control measures often include application of pesticides, many of which are broad spectrum or are applied at times of the year when other invertebrates may be vulnerable or are applied in a manner harmful to the rare plant community (e.g., trampling). In the case of the southern pine beetle (*Dendroctonus frontalis*), removal of infested trees and a 50 – 100 foot buffer of uninfested trees to prevent the spread of the outbreak has been recommended. Tree cutting during the breeding season may affect northern parula warblers, skidding of trees during removal may harm rare plants and habitat. Any proposed control measures should be site specific and the use of integrated pest management and committed ongoing coordination among agencies and with savanna managers to reduce non-target impacts is critical. In all cases, botanists and zoologists should be included in the discussion to avoid any potential harm to rare plants or SGCN populations or the habitat.

Deer control: Management of deer populations is an important conservation action identified in the SWAP to promote forest health and biodiversity. Deer consume rare plants and larval food plants and nectar sources for Lepidoptera, among other impacts (Côté et al. 2004, Rawinski 2008, Schweitzer et al. 2011). Management measures may include increased hunting efforts or fencing of vulnerable habitat against deer. Managing the size of local deer herds would benefit both rare plants and SGCN animals, and any trampling of vegetation by hunters would occur when most plants are dormant. To date, deer herbivory has not been identified as a major threat in these savannas but their presence and browsing activity should be regularly monitored.

Beaver control may be needed on occasion in Pine Barrens savannas and has also been identified as a conservation action in the SWAP. Typically this could include trapping and removing beaver from a site to prevent dam construction (or partial dam removal), and/or the installation of a water level control device. Since the rare plants and the SGCN all rely on a similar site hydrology, beaver control should benefit both in riverside savanna habitats.

Note: Proper protocols should be put in place to minimize spread of invasive species propagules and/or disease (e.g. Chytrid fungus, Ranavirus) among wetland sites. It is best to follow these or similar recommendations between site visits: 1) wash boots and field equipment with soap and water; 2) rinse in clean water; and 3) disinfect with a 10% bleach solution and allow to air dry (Dodd 2010; B. Zarate, personal communication, 2013). Pinelands Commission scientists have also adopted a disinfection procedure to use between sites, similar to the above (J. Bunnell, personal communication, 2013).

Recreational Use Management

Use of ORVs and 4WD vehicles is a popular pastime in the Pine Barrens, whether by individuals or as part of large-scale organized enduro events. Regulating this use is a priority of the SWAP and conservation actions identified in the SWAP that protect this

habitat from encroachment by vehicles, coupled with adequate enforcement, would be of benefit to rare plants and SGCN animals.

Passive recreation can sometimes also threaten the integrity of the savanna vegetation, for example, when canoeists stop to explore stream banks and adjacent wetlands, trampling sensitive vegetation or disturbing wildlife. Public education is an important tool for ongoing conservation of these rare habitats and their associated species and the SWAP includes conservation actions encouraging public outreach and education.

In addition, the SWAP recommends enhancing public access opportunities, also an important goal. However, if wildlife viewing structures or trails are planned in or near riverside or reedgrass savannas, care must be taken to avoid altering site hydrology, permitting unguided access into vulnerable habitat to avoid trampling and introducing invasive plant seeds, and harming sensitive plants and animals during construction.

SPECIES MANAGEMENT (=TRACS ACTION TARGETS)

Species-Specific Management Actions identified in the SWAP:

Arogos skipper: The SWAP recommends surveying suitable habitats in the Mullica River zone to identify new populations of this skipper. Such survey will have no impact on pine barren riverside savannas or pitch pine reedgrass savannas if sensitive vegetation is not trampled (see guidelines for survey and monitoring). The SWAP also calls for development of a management plan to maintain and enhance habitat for Arogos skipper using controlled burns. Development of this plan must be done in consultation with other experts to avoid impacts to non-target species in the same habitat.

TRACS ACTION #3:

DATA COLLECTION AND ANALYSIS (TRACS Level 1)

Research, Survey, or Monitoring (TRACS Level 2)

Inventory and Long-term Monitoring

Conducting baseline survey and long-term monitoring for all SGCN animals is a conservation priority in all Pinelands landscape zones. In particular, forest passerines (e.g., northern parula) have been mentioned as targets for this work. Plant and animal population monitoring efforts at a site should be coordinated to prevent situations where multiple monitoring initiatives are occurring, potentially creating frequent, extensive, long-term disturbance without sufficient recovery periods. As mentioned previously, it is also recommended that there be a thorough survey and mapping of all rare species found at a site, including population location, status and condition, such that any proposed management can avoid or minimize impacts.

Animal survey and monitoring techniques –minimizing harm to plants:

Breeding bird surveys: Assessing the status of the northern parula warbler or other passerines in these habitats would generally require multiple site visits in May and June

during the breeding season. Surveys for the parula warbler should have minimal impact on rare plants in the savanna as these bird surveys are typically conducted as roadside point counts (S. Petzinger, personal communication, 2013).

Lepidoptera surveys: Moth surveys generally consist of evening visits with light traps throughout the flight season for each species but with minimal vegetation trampling as lights are typically placed at the edge of the wetland (D. Schweitzer, personal communication, 2012). The helicta satyr flies from late June through July in these Pine Barrens locations and would best be surveyed during the day during this flight period. Consult the plant phenology tables in this report and any rare species maps that are prepared for additional guidance when planning the location and timing of helicta satyr survey work.

The SWAP recommends working with qualified groups or citizen scientists to conduct surveys at particular sites, depending on the level of expertise needed. It is important that survey methodology be developed upfront, to be sure that there is no conflict in recommended techniques and that volunteers are made aware of the need to avoid rare plant populations at specific sites.

Mammal surveys: Survey and monitoring of the southern bog lemming may entail extensive walking through the site. If live traps are used, they are typically placed along runways within the habitat, as the animals are faithful to them. Pitfall traps may also be used, however avoid digging up any rare plants when installing traps (M. Valent, personal communication, 2013). As bog lemmings are often difficult to trap, an analysis of owl pellets can be useful in certain locales (Whittaker and Hamilton 1998). In all cases, consult the plant phenology tables in this report and any rare species maps that are prepared for additional guidance when planning the location and timing of survey work.

Rare plant survey and monitoring techniques –minimizing harm to animals:

Plant surveys: Plant surveys and rare plant monitoring activities can occur throughout the growing season as phenology differs among species, and over multiple years since growing conditions vary from year to year. Such activities may include random searches through habitat, use of parallel transects, and/or the establishment of long-term vegetation monitoring plots.

Rare plant populations in savannas are regularly monitored. However, there should be no impact to northern parula warblers or bog lemmings for any transect or other ground plant survey work (S. Petzinger, personal communication, 2013; M. Valent, personal communication, 2013).

Climate Change Vulnerability Assessment

The year 2012 was the warmest on record nation-wide (NOAA 2013) and in the garden state (Robinson 2013), with more changes forecast to come. In New Jersey the effects of climate change are projected to include: an increase in average temperature (minimum 2-6

°F. increase by 2050) and precipitation (although the exact nature of the change in precipitation may vary across the state); more extreme weather events such as storms and droughts; and sea level rise. Generally we can expect more prolonged summer heat waves with temperatures above 90° F., and fewer cold days and nights during the winter, which may be of import for those species requiring cold dormancy. Rainfall, especially in the northern part of the state may increase in amount mainly in the winter months (Faass et al. 2012, NJ Climate Adaptation Alliance 2013a).

Savanna Habitats and Climate Change:

According to Faass et al. (2012) there are a number of stressors that should be looked at to determine whether or not a particular plant community is vulnerable to climate change. These stressors include: 1) exacerbation of other non-climate stressors; 2) specific hydrologic conditions; 3) vulnerability to human response; 4) sensitivity to extreme climate events; 5) intrinsic adaptive capacity; 6) species vulnerability; 7) latitudinal constraints; 8) management feasibility; 9) degree of cold adaptation; and 10) location in geographical range. (For a detailed discussion of each of these stressors, see Faass et al. 2012.)

Pine Barrens savannas are susceptible to a number of these stressors. Riverside savannas are maintained by specific hydrologic conditions that require constant groundwater seepage. The significant alteration to precipitation patterns anticipated with a changing climate (e.g., greater flood events, increased drought the summer months) may alter groundwater flow and seepage. This may be compounded by increased development at the periphery of the Pine Barrens in future years, putting more pressure on underlying aquifers. This in turn will affect plant and animal species composition, favoring species adapted to drier conditions and possibly permitting greater invasive species incursion (non-climate stressor).

Reedgrass savannas are maintained fire. Although some studies in the western U.S. have shown a predicted increase in wildlife fire frequency with changing climate, recent research in New Jersey indicates that fire size and intensity here may not change appreciably in the coming years (Clark et al. in press). In New Jersey, wildfire is currently constrained by habitat fragmentation and ongoing fuel management activities. However, it is difficult to predict future scenarios as there are many additional confounding factors to consider with changing climate, such as the introduction of new forest pests and changes in tree and plant species composition and subsequent effects on fuels. Also, the increase in other disturbances to the landscape such as more storm and wind events may play a role.

Species and Climate Change:

Plants: Using the NatureServe Climate Change Vulnerability Assessment (CCVA) model (NatureServe 2011), state endangered plant species of Pine Barren savannas were assessed for climate vulnerability (see Ring and Spencer 2013). Six species (43%) including Rough Cotton-grass (*Eriophorum tenellum*), Pine Barren Boneset (*Eupatorium resinosum*), New

Jersey Rush (*Juncus caesariensis*), Bog Asphodel (*Narthecium americanum*), Knieskern's Beak-rush (*Rhynchospora knieskernii*), Death Camas (*Zigadenus leimanthoides*), were considered moderately vulnerable to a changing climate. Of these, one (*Eriophorum tenellum*, rough cotton-grass) is at the southern edge of its range while the others are considered vulnerable for specific life history traits. Eight (57%) of the rare plants species were presumed stable, likely because in general core pine barren habitats are largely intact and relatively protected from human disturbance. For more detailed discussion, see Ring and Spencer (2013).

Animals:

Southern Bog Lemming – A CCVA for southern bog lemmings has not been completed in New Jersey as not enough is known about their status and life history in the state to populate the model. However, a CCVA was prepared for Illinois populations that found the lemming to be “presumed stable” in light of climate change based on similar life history factors (Hollingshead 2011). Unless Pine Barrens riverside savanna habitats change significantly with a changing climate, it is likely that lemming populations will remain relatively stable. No additional habitat management actions are proposed to address climate change needs for this species.

The rare **moths and butterfly** depend on the presence of their food plants for survival. Three of the four species rely on Pine Barrens reed grass. Although a CCVA was not conducted for it, reed grass is widespread in the Pine Barrens and the habitat in the core Pine Barrens remains relatively intact, so it may persist. Georgia satyr (= helicta satyr) is a southern species, although New Jersey populations are disjunct from the core southern populations. Depending on how its habitat migrates, this satyr may actually do well with a warming climate. A warmer New Jersey climate may enable them to become bivoltine, completing two life cycles in a summer instead of the single generation it currently completes (D. Schweitzer, personal communication, 2012). Arogos skipper may also benefit for similar reasons. A warming climate could extend the growing season in turn enabling the skipper, which is currently at the extreme northern edge of its range in New Jersey, to produce more generations per season. It is unclear how climate change will affect the other moth species. In any case, no new habitat management practices have been proposed for these Lepidoptera species to account for climate changes impacts.

Northern parula warblers are at the northern edge of their breeding range. Their numbers declined during the early- to mid-1900s in New Jersey, possibly due to the decline of *Usnea* lichen with which they built their nests. However, their numbers have increased in recent years in the state, perhaps due to their ability to use alternate nest materials (Walsh et al. 1999) and habitats (riverside floodplain forest over swamps in other regions) (W. & S. Wander, personal communication, 2012). It is unclear how a changing climate will affect them although the U.S. Forest Service climate bird atlas projections indicate that their numbers will likely increase in New Jersey in future years (Matthews et al. 2007).

Climate Change Summary

There are no specific management recommendations proposed to address climate change for Pine Barrens savannas or any of the savanna species highlighted in this report other than maintaining appropriate ecological processes: site hydrology and wetland connectivity on the landscape for riverside savannas and fire frequency and type of burn (growing season) for reedgrass savannas. For these reasons, no additional habitat management conflicts are anticipated in the near term due to plant and animal species management activities. As riverside savannas have persisted on the landscape for thousands of years and are intimately associated with riverine habitats, they may remain relatively stable in light of future climate change. Although current projections are for wildfire frequency and severity to remain relatively constant (Clark et al. in press), the need for ongoing fire management for fire-dependent habitats remains.

Therefore, the Pine Barren species management actions currently outlined in the SWAP should continue (modified as needed by the recommendations in this report). Addressing existing hydrology and water quality issues, invasive species, recreational overuse, and other threats as necessary to maintain or restore existing habitat will be key to resiliency. The ability of Pine Barrens savannas to withstand change over time while retaining their basic structure and function will enable them to support viable populations of rare plants and wildlife SGCN into the future (Anderson and Ferree 2010).

Overall Conclusions:

Pine Barrens savannas support significant populations of rare plants and SGCN animals. Based on the information presented in the 2008 SWAP, there are few management actions proposed for the SGCN in these habitats that would potentially affect the rare plants also occurring in these habitats. In part, this is a result of the fact that the savannas occur within the Pine Barrens in a relatively well protected and intact matrix landscape. Intensive survey and monitoring of multiple species at individual sites would cause harm, and therefore regular communication among organizations and others working in these habitats is critical to minimize impact.

Integrated Management Guidelines: Coastal Plain Intermittent Pond Habitat

Hirst brothers' panic grass (*Dichanthelium hirstii*); Coastal plain intermittent pond; Pine Barren treefrog (*Hyla andersonii*)

Overview

New Jersey's Coastal Plain Intermittent Ponds (CPIP) are found on the state's Inner and Outer Coastal Plain, and were formed in Wisconsin periglacial depressions. Plant and animal inhabitants of these ponds rely on their seasonal hydrology, typically filling and drying annually. Foremost among these is Hirst brothers' panic grass (*Dichanthelium hirstii* or *Panicum hirstii*), one of the rarest grass species in the world and listed as a federal candidate species (Walz et al. 2006b). The ponds themselves are also considered rare throughout their range. There are 11 different coastal plain intermittent pond ecological community types found in New Jersey, but for the purposes of this report we are addressing these ponds as habitat systems, not focusing just on one particular type.

Coastal plain intermittent ponds are included in the NE Wildlife Habitat Classification System as Northern Atlantic Coastal Plain Pond; in the New Jersey Landscape Map Emergent and Wetland Species-Based Habitat and Vernal Habitat; and mapped in the New Jersey Land Use/Land Cover as Herbaceous Wetlands See Appendix B for more details on habitat classification.

Seventeen (17) state endangered plant species occur in coastal plain intermittent ponds, including Southern Boltonia (*Boltonia asteroides* var. *glaberrima*), Wrinkled Jointgrass (*Coelorachis rugosa*), Marsh Flat Sedge (*Cyperus pseudovegetus*), Hirst Brothers' Panic Grass (*Dichanthelium hirstii* or *Panicum hirstii*), Larger Buttonweed (*Diodia virginiana* var. *virginiana*), Knotted Spike-rush (*Eleocharis equisetoides*), Featherfoil (*Hottonia inflata*), Barton's St. John's-wort (*Hypericum adpressum*), Claspingleaf St. John's-wort (*Hypericum gymnanthum*), Boykin's Lobelia (*Lobelia boykinii*), Narrow-leaf Primrose-willow (*Ludwigia linearis*), Awned Meadow-beauty (*Rhexia aristosa*), Small-head Beaked-rush (*Rhynchospora microcephala*), Slender Arrowhead (*Sagittaria teres*), Torrey's Bulrush (*Schoenoplectus torreyi*), Dwarf White Bladderwort (*Utricularia olivacea*), Reversed Bladderwort (*Utricularia resupinata*). See Appendix A for complete species list with rarity rankings.

Animal Species of Greatest Conservation Need (SGCN) identified in the 2008 State Wildlife Action Plan (SWAP) include Pine Barrens treefrog (*Hyla andersonii*), carpenter frog

(*Lithobates virgatipes*), and two damselflies and one dragonfly (Pine Barrens bluet [*Enallagma recurvatum*], scarlet bluet [*Enallagma pictum*], and golden-winged skimmer [*Libellula auripennis*]). Other SGCN have been documented from coastal plain intermittent ponds (e.g., Fowler's toad (*Anaxyrus fowleri*), southern gray treefrog (*Hyla chrysoscelis*), etc.) (Walz et al. 2006b) but for the purposes of this report they were not included, rather we chose representative species of core Pinelands ponds. The presence of any of these animals at a particular pond depends upon pond hydrology, particularly the length of time ponds retain standing water during the season.

For the purposes of this assessment we are focusing on the CPIP natural community found in the four New Jersey Pine Barrens SWAP zones (Western, Mullica drainage, northern, and southern), although there are other significant coastal plain intermittent ponds found on the inner and outer coastal plain in Cape May, Cumberland, Gloucester, and Salem counties).

Threats

Threats to Coastal Plain Intermittent Ponds range-wide include altered hydrology that modifies the annual cycle of filling and drying, and runoff with nutrients and other pollutants that alter water quality and change the water chemistry of the acid Pine Barrens waters. Changes in pond chemistry have significant impacts to breeding amphibians and to rare plant species. Groundwater depletion due to agricultural use or due to surrounding development also threatens pond hydrology (Walz et al. 2006b), with implications for those species, such as treefrogs that rely on ponds holding water for certain lengths of time during the season.

Ponds are also threatened by Off Road Vehicle (ORV) use that crushes rare plants, compacts soil, alters site hydrology, and causes direct mortality of animals in their path (Switalski and Jones 2012). Invasive species like nonnative fish or bullfrogs (*Lithobates catesbeiana*) outcompete and/or consume native pond amphibians (J. Bunnell, personal communication, 2013) while over-browsing by white-tailed deer in some ponds alters the habitat structure and destroys rare plants. Suppression of natural fire regimes is also a concern in Pine Barrens landscapes that have evolved in the presence of fire. Although most ponds are maintained primarily by site hydrology, some coastal plain intermittent ponds have been and are affected by periodic wildfires especially during times of extreme drought, which helps shape their vegetation and structure (Little 1979, Laidig 2010). Other threats to coastal plain intermittent ponds in New Jersey have included ditching and draining of these wetlands, sand and gravel mining, and past conversion to cranberry bog operations (Walz et al. 2006b).

A summary of CMP Threats to state endangered plants and wildlife SGCN in coastal plain intermittent pond habitat is found in Appendix C.

Species Ecology

Plants:

Rare plants of coastal plain intermittent ponds are well-adapted to the changing hydrology of these ponds. The seeds of grasses and forbs become part of the seed bank, germinating and flowering as conditions become suitable. In fact, some seeds can remain viable for decades. In contrast, during periods of either extended flood or drought, some perennial plants such as grasses and orchids survive by storing energy underground in their rhizomes or tubers (Walz et al. 2006b).

Of the seventeen rare species found in these ponds, nine are at the northern limit of their range, six are mid-range, and two are at the eastern edge of their range (e.g., southern boltonia and marsh flat sedge). See Ring and Spencer (2013) for more detailed information.

The following two tables provide a list of state endangered species that can found in Coastal Plain Intermittent Ponds in New Jersey with their phenology, or timing of vegetative, flowering and fruiting, and comments on their habitat/niche. The phenology and habitat information can be used to help avoid negative impacts to these state endangered plant species during wildlife surveys and management activities.

Coastal Plain Intermittent Pond - Rare Plant Habitat/Niche Comments

SCIENTIFIC NAME	COMMON NAME	Habitat/Niche Comments
<i>Boltonia asteroides</i> var. <i>glastifolia</i>	Southern Boltonia	Herbaceous dominated clay bottomed vernal ponds.
<i>Coelorachis rugosa</i>	Wrinkled Jointgrass	Restricted sedge and grass dominated turfy zones in intermittent Coastal Plain ponds.
<i>Cyperus pseudovegetus</i>	Marsh Flat Sedge	Upper shoreline edge of intermittent Coastal Plain pond.
<i>Dichanthelium hirstii</i> (<i>Panicum hirstii</i>)	Hirst Brothers' Panic Grass	Restricted to dry bottoms or in shallow water of intermittent Coastal Plain ponds.
<i>Diodia virginiana</i> var. <i>virginiana</i>	Larger Buttonweed	Grows in shallow water filled depressions in open areas of wet woods, open, wet, grassy swales, and intermittent pond shores.
<i>Eleocharis equisetoides</i>	Knotted Spike-rush	Grows in shallow water of intermittent Coastal Plain ponds.
<i>Hottonia inflata</i>	Featherfoil	Grows in open, usually shallow, water of intermittent ponds, sluggish streams, and wet depressions in wooded swamps.
<i>Hypericum adpressum</i>	Barton's St. John's-wort	Seasonally saturated to flooded acidic sands and peat of shores/margins of freshwater ponds, swales, wet meadows, and depressions.
<i>Hypericum gymnanthum</i>	Clasping-leaf St. John's-wort	Edge of wet woods, boggy meadows, peaty pond shores, and borrow pits, growing in wet, sandy soil of shallow depressions.
<i>Lobelia boykinii</i>	Boykin's Lobelia	Restricted to Coastal Plain Intermittent Ponds.
<i>Ludwigia linearis</i>	Narrow-leaf Primrose-willow	Typically occurring in intermittantly wet habitats such as pond shores, ditches and inactive sand and gravel pits.
<i>Rhexia aristosa</i>	Awned Meadow-beauty	Grows in sandy bottomed Coastal Plain intermittent ponds and shallow watter of abandoned sand and gravel pits.
<i>Rhynchospora microcephala</i>	Small-head Beaked-rush	Grows in moist to wet sand in powerline ROW's through pitch pine lowland forests and sphagnous hummocks in overgrown boggy borrow pits.
<i>Sagittaria teres</i>	Slender Arrowhead	Restricted to shallow water or exposed sandy or muddy bottoms of Coastal Plain intermittent ponds.
<i>Utricularia olivacea</i>	Dwarf White Bladderwort	Grows in shallow, acid water of a large Coastal Plain intermittent pond in the Pine Barrens.

Animals:

Pine Barrens treefrogs are found from New Jersey south along the coastal plain in three disjunct populations; the New Jersey Pine Barrens, the Carolina Sandhills, and the Florida panhandle. (They have recently been confirmed from southern Alabama near the Florida panhandle [J. Bunnell, personal communication, February 2013.] In New Jersey, treefrogs begin calling in mid-to-late April with peak calling in May and part of June, when ponds still hold sufficient water. Coastal plain intermittent ponds provide important breeding habitat, although treefrogs will use a range of wetlands including other natural and excavated ponds and the edges of some high-quality on-stream impoundments (Zampella and Bunnell 2000). Up to one thousand eggs are scattered on the pond bottom or attached to vegetation. Larvae transform in 80 – 100 days, beginning in late June and disperse into adjacent upland habitat (Bunnell and Ciraolo 2010).

Carpenter frogs are found on the coastal plain from New Jersey south to the Florida/Georgia border in Okefenokee Swamp. Their distribution in New Jersey is somewhat restricted in that they are only found in more forested landscapes in the Pine Barrens. Carpenter frogs use a variety of aquatic habitats including coastal plain intermittent ponds, other natural as well as excavated ponds, and other acidic wetlands (Zampella and Bunnell 2000, Bunnell and Zampella 2008). Usually found in or near water, they rarely venture into upland habitats. Carpenter frogs begin calling in April, their breeding period extending into August. They lay eggs in masses with 200 – 600 eggs/mass and may mate more than once each season. Because the larval period may last up to a year, it is critical that ponds retain sufficient water in at least some sections to ensure tadpole survival.

Major threats to these frog species include altered wetland hydrology and water quality, especially changes to water chemistry that elevate pH. The stocking of nonnative predatory fish such as bluegill, black crappie, and largemouth bass in impoundments is also a concern. Raising the pH of acidic Pinelands waters provides an opportunity for these nonnative species to become established (J. Bunnell, personal communication, 2013).

Similarly, two damselflies, the **scarlet bluet** and the **Pine Barrens bluet** also rely on coastal plain ponds for breeding, if the ponds have deeper sections that retain water throughout the year. (The aquatic larval period for odonates typically lasts longer than a year.) The **Pine Barrens bluet** inhabits shallow acidic coastal plain ponds and has a short, early flight season (May and June). They are endemic to the Northeastern U.S. with a limited range, New Jersey being at the southern edge.

The **scarlet bluet** prefers acidic sand-bottomed coastal plain ponds with floating vegetation. It is most abundant from late June through July. Like the Pine Barrens bluet, it is a regional endemic and ranges from New Jersey up the coast to southern Maine (Barlow et al. 2009).

The **golden-winged skimmer** dragonfly is rare in New Jersey and found in sand bottomed ponds. Adults are active from mid May through early October (most commonly seen in July

and August). It is near the northern limit of its range, which extends from southern Massachusetts along the coastal plain south to Florida and west to Texas (Barlow et al. 2009).

The main threats to the odonates include altered hydrology, pollution, and removal of emergent aquatic vegetation that provides critical oviposition and larval habitat (Barlow et al. 2009).

Integrated Conservation Management Guidelines

An important goal of the SWAP is to protect, maintain, and restore critical wetland habitat for SGCN animals. Due to the fact that there are a number of rare taxa with varying habitat preferences that use coastal plain intermittent pond habitats, there is potential for conflicts between conservation management actions proposed for SGCN animals and rare plants at individual sites. For this reason, it is recommended that there be a thorough survey and mapping of all rare species found at a site, including population location, status and condition such that any proposed management can avoid or minimize impacts. The following integrated conservation management guidelines address broad categories linked to conservation actions identified in the SWAP and correlated with the TRACS ACTIONS Level 1. We have specifically targeted discussion around the actions where there may be potential for management incompatibility between rare plants and SGCN animals.

TRACS ACTIONS

1. Coordination and Administration
- 2. Create, Restore, or Enhance Habitat and Natural Processes**
- 3. Data Collection and Analysis**
4. Education
5. Facilities and Areas/New Construction
6. Facilities and Areas/Major Renovation
7. Facilities and Areas/Operations and Maintenance
8. Land and Water Rights/Acquisition and Protection
9. Law Enforcement
10. Outreach
11. Planning
12. Species Reintroduction and Stocking
13. Technical Assistance

TRACS ACTION #2:

CREATE, RESTORE, OR ENHANCE NATURAL HABITATS OR PROCESSES

Hydrology and Water Quality Management

An over-arching conservation goal in the SWAP is to maintain hydrology and water chemistry of Pine Barrens wetlands and aquatic habitats. Actions proposed in the SWAP are general, and include land protection, work with public and private landowners, and development of sufficient habitat buffers and landscape connectivity (see SWAP zones –

western Pinelands, Mullica river drainage, southern Pine Barrens, northern Pine Barrens). Each of these action items, if implemented, would benefit to rare plants and wildlife SCGN by maintaining site hydrology of coastal plain intermittent ponds.

Vegetation Management

Managing succession: Active vegetation management is a key component of the SWAP, especially for maintaining early successional wetlands and scrub-shrub habitats. Recommended techniques may include manual removal (e.g., selective cutting and tree removal or mowing), targeted use of herbicides, and/or application of prescribed fire (see below). Currently no woody vegetation management for animal SGCN has been proposed for Pine Barren coastal plain intermittent ponds in the core Pine Barrens. However, any future plans for woody vegetation control or management should keep in mind the life history and habitats needs of the rare plants and other animal SGCN that occur at individual sites to avoid non-target impacts.

Manual vegetation removal: Hand-pruning or selective cutting of woody vegetation can be used to set back succession and open the canopy for those plant and animal species that require it. If done in the winter months, there will be little impact to coastal plain intermittent pond vegetation or other animal species that use the habitat.

Use of herbicides: Extreme care must be taken if herbicides are used in coastal plain intermittent ponds, as most are broad spectrum. Only direct hand application (e.g. hand painting stump cuts) should be considered for vegetation control adjacent to rare plant populations.

Silvicultural practices on adjacent uplands: Certain forestry practices on lands adjacent to coastal plain intermittent ponds can have a negative effect on pond water quality by increasing soil erosion. Maintaining sufficient uncut buffer at some distance away from the ponds will prevent erosion into the water (which may affect the rare plant community and larval amphibians and odonates). Such buffer will also protect upland habitats used by amphibians like Pine Barrens treefrogs, which move away from the pond to some distance after the breeding season. For example, a 100-foot “no activity” buffer is recommended for forests adjacent to ponds that support Pine Barrens treefrogs and activities such as drum chopping that disturb soil are recommended against (Bunnell, no date). The SWAP recommends working with landowners to promote ecological forestry practices, which would be of benefit to all plants and SGCN animals using coastal plain intermittent pond habitats.

Utility rights-of-way management: The SWAP recommends the development of BMPs for Rights-of-Way (ROW) management for scrub-shrub and animal species that may use them. As ROWs may cross through coastal plain intermittent pond habitats, the development of management guidelines should be coordinated such that all rare plants as well as wildlife SGCN using ROWs are incorporated into BMPs at the same time. This will assist the

landowner in making appropriate management decisions and avoid potentially conflicting recommendations.

Fire Management: Most New Jersey Pine Barrens habitats have been shaped by and are maintained by fire. For this reason, fire management is an ongoing activity, whether by application of prescribed fire for fuel reduction during the winter months or by suppression of hotter growing season burns or wildfires that might affect surrounding development. The way in which fire is managed has a major effect on the persistence and quality of Pine Barrens habitats, including the coastal plain intermittent ponds and their associated rare plants and wildlife SGCN, particularly during times of extreme drought. When considering the use of fire as a management tool in forested landscapes that contain coastal plain intermittent ponds, it is necessary to thoroughly assess what rare plant and animal SGCN are present in the habitat, their tolerances to fire, and their distribution on the landscape before developing a plan for when and if to burn, what to burn and how intensely, or whether fire prevention is warranted. In short, the needs of all species, plant and animal, at a site must be considered. Although hydrology, not fire, is the dominant force shaping coastal plain intermittent pond communities, a better understanding of the historical role of fire in the formation and maintenance of these ponds and their associated rare vegetation is an important research need. Conducting research on fire and its effects on habitats and SGCN animals is another priority goal of the SWAP.

Invasive, Over-abundant, and Pest Species Management

Invasive plant species: Control of invasive species is a conservation goal for all Pine Barrens SWAP landscapes. To date, few invasive or nonnative plant species have been found in core Pine Barrens ponds, although this is a concern in outer Pine Barrens locations such as Bennett Bogs and other coastal plain intermittent ponds in Cape May and Cumberland counties. Should new populations become established, control should begin with the least harmful process (hand pulling or seedhead removal) before moving toward use of chemicals or other less targeted techniques. Biocontrol may be an option for some invasive species, however consultation with experts, both botanists and zoologists is always warranted when considering the use of chemicals and/or biocontrol. Decisions should be made on a site-by-site basis to prevent (or minimize) negative impacts to non-target rare plant or animal species, or to the habitat.

Insect pests and/or disease pathogens: A number of insect pests may be targeted for control in and around coastal plain intermittent ponds (e.g., mosquitoes, southern pine beetle). Control measures often include application of pesticides, many of which are broad spectrum or are applied at times of the year when other invertebrates are vulnerable or are applied in a manner harmful to the rare plant community (e.g., trampling). In the case of the southern pine beetle (*Dendroctonus frontalis*), removal of infested trees and a 50 – 100 foot buffer of uninfested trees to prevent the spread of the outbreak has been recommended. Skidding of trees during removal may harm rare plants and habitats and may increase the possibility of erosion into pond habitats.

Any proposed control measures should be site-specific and the use of integrated pest management and committed, ongoing coordination among agencies and with CPIP managers to reduce non-target impacts is critical. In all cases, botanists and zoologists should be included in the discussion to avoid any potential harm to rare plants or animal SGCN populations or the habitat.

Deer control: Management of deer populations is an important conservation action identified in the SWAP to promote forest health and biodiversity. Deer may consume rare plants and track invasive weed seeds into new habitats (Côté et al. 2004, Rawinski 2008). Management measures may include increased hunting efforts or fencing of vulnerable habitat against deer. Managing the size of local deer herds would benefit both rare plants and animals, and any trampling of vegetation by hunters would occur when most plants are dormant. To date, deer herbivory has not been identified as a major threat in these core coastal plain intermittent ponds but their presence and browsing activity should be regularly monitored.

Beaver control may be needed on occasion in coastal plain intermittent ponds and has also been identified as a conservation action in the SWAP. Typically this could include trapping and removing beaver from a site to prevent dam construction (or partial dam removal), and/or the installation of a water level control device. Since the rare plants and wildlife SGCN using CIPs all rely on a similar hydrologic regime, beaver control should benefit each. However, keep in mind that beaver impoundments provide good habitat for carpenter frogs. In addition, beaver also maintain the dams when old wooden sluice gates rot away in abandoned cranberry farms that dot the region, also maintaining important habitat for carpenter frogs (J. Bunnell, personal communication, 2013). The need for beaver control should be addressed on a case-by-case basis.

Note: Proper protocols should be put in place for all field biologists to prevent the spread of invasive species propagules and/or disease (e.g., Chytrid fungus, Ranavirus) among wetland sites. It is best to follow these or similar recommendations between site visits: 1) wash boots and field equipment with soap and water; 2) rinse in clean water; and 3) disinfect with a 10% bleach solution and allow to air dry (Dodd 2010; B. Zarate, personal communication, 2013). Note: Pinelands Commission scientists have also adopted a disinfection procedure to use between sites, similar to the above (J. Bunnell, personal communication, 2013). Ranavirus has been confirmed from a number of sites in the Pine Barrens, however to date Chytrid has not been found (K. Monsen, personal communication, 2013).

Recreational Use Management

Regulating ORV and other recreational vehicle use is a goal of the SWAP and ORVs are a threat to some CIPs (Walz et al. 2006b, Pinelands Preservation Alliance 2013) and associated species (MA Endangered Species Program 2008). Implementation of conservation actions to prohibit or restrict this activity to less sensitive areas, coupled with adequate enforcement, would benefit both rare plants and animals.

The SWAP includes conservation actions encouraging public outreach and education with enhanced public access opportunities. This is an important goal. However, if wildlife viewing structures or trails will be planned for placement near coastal plain intermittent ponds, care must be taken to avoid altering site hydrology, permitting unguided access into vulnerable habitat to avoid trampling and introducing invasive plant seeds, and harming sensitive plants and animals during construction.

SPECIES MANAGEMENT (= TRACS ACTION TARGETS)

Species-Specific Management Actions identified in the SWAP:

Pine Barrens treefrog – The SWAP recommends the development of habitat management and a conservation plan for this species. Development of this plan would not conflict with rare plant management. In fact, it could ensure that any actions for the frog would not inadvertently harm rare plants. Other recommendations for amphibians include monitoring amphibian road crossings to breeding ponds. If roads are located adjacent to coastal plain ponds with breeding amphibians, monitoring and managing amphibian road crossings on rainy nights would not conflict with rare plants at the site.

TRACS ACTION #3:

DATA COLLECTION AND ANALYSIS (TRACS ACTIONS Level 1)

***Research, Survey, or Monitoring* (TRACS ACTIONS Level 2)**

Inventory and Long-term Monitoring

Conducting baseline survey and long term monitoring for all SGCN is a conservation priority in all Pinelands landscape zones. In particular, the Pine Barrens treefrog has been mentioned as a target for this work. Individually, these activities should have minimal impact to the rare plant community (see below for details), but survey and monitoring of multiple species at a site should be coordinated to lessen trampling or other impacts to coastal plain intermittent pond species. In addition, a good first step should be a vegetation assessment that maps the locations of rare plants such that future amphibian or other animal surveys can avoid locations of sensitive plant populations.

Animal survey and monitoring techniques –minimizing harm to plants:

Frog surveys: These surveys are typically conducted at the shoreline by counting calling frogs so there is little, if any trampling of pond vegetation. If other more intensive amphibian population monitoring is required at some future time (e.g., egg mass counts, larval dip net sampling) avoid trampling vegetation or uprooting plants during dip net sampling. If cover boards are used to monitor amphibians in adjacent upland habitats, they should be placed to avoid rare plants that may be growing in those forest openings (J. Bunnell, personal communication, 2013). Consult the plant phenology tables in this report and any rare species maps that are prepared for additional guidance when planning the location and timing of survey work.

Odonate surveys: Dragonfly and damselfly survey and monitoring at a pond could include netting of adults for identification in the hand, searching for larvae in the water and/or exuviae along the pond edge, and specimen collection when deemed necessary. Such activities may trample the plant community so care must be taken during survey work to avoid rare plant locations. Consultation with the plant phenology tables in this report and any rare species maps that are prepared will help avoid harm to rare plants and other sensitive species.

Vernal pool habitat surveys: Surveying for vernal pools has been identified in the SWAP as a priority. While this habitat is classified as “Eastern Woodland Vernal Pool Sparse Vegetation” in the National Vegetation Classification, in NJ calcareous sinkhole ponds are considered to be vernal pool habitat by the Division of Fish and Wildlife. “Vernal habitat” is defined in the NJDEP Freshwater Wetlands Protection Act as a wetland or State open water that meets four criteria including 1) confined basin depression without permanent flowing outlet, 2) evidence of breeding by one or more species of obligate and/or facultative fauna adapted to reproduce in ephemeral aquatic conditions, 3) maintains ponded water for at least two continuous months between March and September of a normal rainfall year, and 4) is free of reproducing fish populations throughout the year, or dries up at some time during a normal rainfall year. See Appendix E for more details and a list of vernal habitat obligate and facultative species. More information can also be found at. Much work has already been done with the use of remote sensing, followed by site visits to verify pond presence (see <http://www.nj.gov/dep/fgw/ensp/vernalpool.htm>). Typically, site visits to ground-truth remotely-sensed data are easiest to do in the winter when ponds are full of water (or frozen) and there is no ground cover so generally there would be little or no impact to the rare plant community. Site visits in the spring to confirm the presence of obligate wetland species (e.g., wood frogs, fairy shrimp) should also occur early enough in the season to avoid trampling rare plants.

Rare plant survey and monitoring techniques –minimizing harm to animals:

Plant surveys – Plant surveys and rare plant monitoring activities can occur throughout the growing season as phenology differs among species, and over multiple years since growing conditions vary from year to year. Such activities may include random searches through habitat, use of parallel transects, and/or the establishment of long-term vegetation monitoring plots. Rare plant monitoring is an ongoing activity in many of these coastal plain intermittent ponds. Vegetation surveys should be done in a manner that minimizes impacts to frogs or odonates (e.g., avoid stepping on or silting up egg masses or nymphs).

Climate Change Vulnerability Analysis

The year 2012 was the warmest on record nation-wide (NOAA 2013) and in the garden state (Robinson 2013), with more changes forecast to come. In New Jersey the effects of climate change are projected to include: an increase in average temperature (minimum 2-6 °F. increase by 2050) and precipitation (although the exact nature of the change in precipitation may vary across the state); more extreme weather events such as storms and droughts; and sea level rise. Generally we can expect more prolonged summer heat waves

with temperatures above 90° F., and fewer cold days and nights during the winter, which may be of import for those species requiring cold dormancy. Rainfall, especially in the northern part of the state may increase in amount mainly in the winter months (Faass et al. 2012, NJ Climate Adaptation Alliance 2013a).

Coastal Plain Intermittent Ponds and Climate Change:

According to Faass et al. (2012) there are a number of stressors that should be looked at to determine whether or not a particular plant community is vulnerable to climate change. These stressors include: 1) exacerbation of other non-climate stressors; 2) specific hydrologic conditions; 3) vulnerability to human response; 4) sensitivity to extreme climate events; 5) intrinsic adaptive capacity; 6) species vulnerability; 7) latitudinal constraints; 8) management feasibility; 9) degree of cold adaptation; and 10) location in geographical range. (For a detailed discussion of each of these stressors, see Faass et al. 2012.)

Coastal plain intermittent ponds are susceptible to a number of these stressors. These ponds are maintained by specific hydrologic conditions that require a fairly even distribution of precipitation throughout the year. The significant alteration to precipitation patterns anticipated with a changing climate (e.g., greater flood events, increased drought the summer months) may alter groundwater flow and seepage. This may be compounded by increased development at the periphery of the Pine Barrens in future years, putting more pressure on underlying aquifers. This in turn will affect plant and animal species composition, favoring species adapted to drier conditions and possibly permitting greater invasive species incursion (non-climate stressor). Additionally, some coastal plain ponds are maintained in part by periodic fire. Although recent research indicates that in the New Jersey Pine Barrens, wildlife fire spread and severity are not anticipated to change, there are many other factors not included in the models that may come into play, so some uncertainty remains (Clark et al. in press).

Species and Climate Change

Plants: Rare plants of coastal plain intermittent ponds were also assessed for climate vulnerability (see Ring and Spencer 2013) using the NatureServe Climate Change Vulnerability model (NatureServe 2011). One species, slender arrowhead (*Sagittaria teres*), was considered extremely vulnerable. Four species (24%) including Southern boltonia (*Boltonia asteroides* var. *glastifolia*), Boykin's lobelia (*Lobelia boykinii*), awned meadow beauty (*Rhexia aristosa*), and Torrey's bulrush (*Schoenoplectus torreyi*) were considered highly vulnerable. Slender arrowhead is found only in a few counties in New Jersey, extreme eastern Long Island and a few locations in Massachusetts and Rhode Island, and is highly dependent on these coastal plain pond habitats. The other highly vulnerable plants are considered vulnerable for specific life history traits. Eight species (47%) were considered moderately vulnerable to a changing climate including marsh flat sedge (*Cyperus pseudovegetus*), Hirst brothers' panic grass (*Dichanthelium hirstii*), larger buttonweed (*Diodia virginiana*), knotted spike-rush (*Eleocharis equisetoides*), Barton's St. John's-wort (*Hypericum adpressum*), clasping-leaf St. John's-wort (*Hypericum*

gymnanthum), narrow-leaf primrose-willow (*Ludwigia linearis*), and small-head beaked-rush (*Rhynchospora microcephala*). Four (24%) of the state endangered plant species were presumed stable, likely because core pine barren habitats are largely intact and relatively protected from human disturbance. For a more detailed discussion, see Ring and Spencer (2013).

Animals: No CCVAs were completed for the New Jersey SGCN anurans or odonates of coastal plain intermittent ponds and it is unclear how Pine Barrens wetlands will fare in future years. However, the following are some predictions based on life history and consultation with state species experts.

Pine Barrens treefrogs and carpenter frogs - Pine Barrens treefrog and carpenter frog populations may remain stable into the near future, as they will breed in a variety of wetland habitats so long as water chemistry is suitable and nonnative frogs and/or fish are not present. Treefrogs would be most sensitive to any changes to the annual cycle of filling and drying, or that alter the length of time that ponds retain water. Treefrogs require predator-free habitat, which the annual drying provides, yet need ponds to retain water long enough for larvae to complete metamorphosis.

Dragonflies and damselflies – All three species of odonates are at the southern edge of their range. Depending on changes to precipitation patterns, and whether Pine Barrens aquifers are significantly lowered due to increased development pressure in the coming years, odonates may not continue to use coastal plain intermittent ponds if they do not retain sufficient water to maintain larval habitat. Although they may be lost from these pond communities, there are likely sufficient remaining permanent wetlands and ponds that can still support these odonates into the future.

Climate Change Summary

There are no specific management recommendations currently proposed in the 2008 SWAP to address climate change for the coastal plain intermittent pond wildlife SGCN highlighted in this report other than maintaining appropriate ecological processes, i.e., site hydrology and wetland connectivity on the landscape and current fire regime. For these reasons, no additional habitat management conflicts are anticipated due to plant and animal species management activities. The coastal plain intermittent pond animal species management actions currently outlined in the SWAP should continue (modified as needed by the recommendations in this report). Addressing existing hydrology and water quality issues, invasive species, recreational overuse, and other threats as necessary to maintain or restore existing habitat will be key to resiliency. The ability of coastal plain intermittent ponds to withstand change over time while retaining their basic structure and function will enable them to support viable populations of rare plants and wildlife SGCN into the future (Anderson and Ferree 2010).

Overall Conclusions:

Based on the information presented in the 2008 SWAP and consultation with species biologists, there are few, if any management actions proposed for SGCN animals in these coastal plain intermittent ponds that would potentially affect the rare plants also occurring in these habitats. In part, this is a result of the fact that many of these ponds occur within a matrix of core Pine Barrens and are relatively well-protected and surrounded by an intact landscape with minimal threats. Intensive survey and monitoring of multiple species at individual sites would cause harm to rare species and habitat, and therefore regular communication and coordination of activities among organizations and others working in these habitats is critical.

CONCLUSIONS

In this report, we have provided guidelines for how to comprehensively manage for rare plants and SGCN animals in four rare wetland habitats; Pine Barrens savannas, coastal plain intermittent ponds, calcareous fens, and calcareous sinkhole ponds. These management guidelines are intended to serve as a model for how the needs of both rare plants and animals can be incorporated into more comprehensive management planning. Robust natural habitats (ecological communities) are vital to thriving animal populations hence compatible management is the key to habitat and population resilience. It is important that both plants and animals be considered when developing management plans for wildlife species of conservation concern as the plant community is an integral component of the required habitat.

In many cases, as long as broad threats are addressed such that the systems that shape the habitat type remain in place (hydrologic or fire regimes, for example) then plant and animal management at sites may be compatible as all benefit from actions that maintain the landscape, key features, and ecological processes.

In some cases, the methods of management may need to be modified to meet specific challenges (e.g., not use chemicals near rare plants or sensitive amphibian species), or the timing of activities will need to be modified (e.g., coordinating survey and monitoring activities at a site to avoid tramping of habitat).

Occasionally, decisions will have to be made on case by case basis for what a site will be “best” managed for, where management needs of two or more species are diametrically opposed (e.g., golden-winged warbler and Schweitzer’s buckmoth require shrubby vegetation whereas the bog turtle and queen-of-the-prairie require open habitats). To accomplish this, a thorough assessment (of species and threats) in all rare habitats of a certain type in the state (all calcareous fens, for example) and an understanding of the scope of proposed management activities on both public *and private* lands is recommended.

Climate change adds an extra layer of complexity to the development of long-term management plans. Although no species-specific management actions have been proposed to date for SGCN animals, this may change in the 2015 revision. Ultimately, decisions may need to be made as to how to prioritize and select species for active conservation and management, based on climate change prediction models.

In preparing this report, a number of other issues came to light.

1. For any species and habitats on state-owned property, there is an agency internal management review committee (the Natural and Historic Resources Land Management Review, Policy Directive 2008-1) that coordinates proposed management actions to minimize negative impacts to non-target species. However, some of these habitats (especially calcareous fens) are owned privately and managed by homeowners in consultation with NGOs or agencies such as the NRCS. In such cases, site management may be focused on single species management with

little or no coordination or consultation so that rare plants may be overlooked in the planning process, or conflicts with other animals using the sites may occur (shrub-nesting birds vs. bog turtles, for example). Landowners and other organizations should be strongly encouraged to refer to the SWAP for management guidelines. In addition, for these and other rare habitats it may be beneficial to establish a group of experts to review the status of particular habitats on both public and private land to ensure that the needs of endangered plants and wildlife SGCN are being adequately addressed among all sites.

2. In this report we are only looking at state wildlife species of conservation need or state endangered (S1) plant species. There are other species that although they may not be “rare,” are considered to have exemplary populations or are key elements of a particular natural community (e.g., bog birch and other shrubs in calcareous fens). Ideally, these other species should also be considered with planning for management at sites.
3. It is interesting to note that the most potential conflict was observed in the Skylands region in the calcareous fens, not in the core Pine Barrens habitats. Strong landscape-level protection coupled with the work of watchdog groups over the years has resulted in a relatively natural system with many fewer stresses than in areas without such comprehensive land use policies. Outside the Pine Barrens or core areas of the Highlands Region, most New Jersey habitats are fragmented and/or degraded, and species there face multiple threats, necessitating ongoing site-specific management for population persistence rather than broad landscape level or systems management.
4. Ongoing communication and coordination is critical. The DEP Natural and Historic Resources Land Management Review process is an excellent tool for this within the Department. Extending such collaboration and coordination outside the Department with other agencies and organizations, as noted in the SWAP, is also recommended as is continued collaboration between the New Jersey Endangered and Nongame Species Program and the Natural Heritage Program/Office of Natural Lands Management as the SWAP is revised in the coming months.
5. Development of Best Management Plans for landowners and others as part of the SWAP, should address both wildlife SGCN and rare plants, to the extent possible. This will ensure that conflicting management recommendations are not inadvertently presented.
6. The New Jersey habitat-based approach worked well for incorporating rare plants into WAPs, as well as linking rare plants and wildlife SGCN by habitat for protection and integrated management. Habitat became an essential component of conducting the CCVI for 70 state endangered plant species – many assessments of species could not be done without an understanding of specific habitat responses to projected climate change. This worked mainly because the state endangered species chosen for the study had a high fidelity to the rare habitats chosen (calcareous fen,

calcareous sinkhole pond, coastal plain intermittent pond, Pine Barren savanna). In fact, the habitat focus for integrated management was crucial for more than climate change – it drove the entire assessment in the context of Wildlife CMP Threats and TRACS Actions frameworks (unified lexicon being used in WAPs).

In addition to coordinating management activities at sites with wildlife SGCN animals and rare plants, public education is an important tool. For all the actions included in the SWAP, whether small backyard habitat projects or larger-scale landowner incentive programs enhanced public education about species and habitats is critical. Providing a greater awareness about New Jersey's biodiversity to strengthen environmental literacy would greatly benefit all New Jersey's species. An additional goal should be to also include information about plants in any public outreach. In the same manner that invertebrates have been overlooked, so, too have plants. Public education and outreach about New Jersey's species of greatest conservation need should also include information about the state's unique and rare plants. People often suffer from "plant blindness", where plants are considered just a green backdrop to the landscape rather than accorded the importance they deserve.

Because New Jersey's landscapes have been so significantly altered and protected habitats are limited, for the most part we must meet the conservation needs of plants and animals (in fact, all biodiversity) at the same locations. While recognizing that there may be individual species management actions that must be undertaken, depending on the species, managing for habitat resilience is the most important management action we can take. To succeed, we need to take into consideration all habitat components; the ecological processes that create and maintain the habitat and the plants and animals that occur there. Managing for one apart from the whole will not work in today's New Jersey.

List of Selected State Endangered Plant Species with Protection Status and Rarity Rank

SCIENTIFIC NAME	COMMON NAME	Fed Status	State Prot Status	Global Rarity Rank	State Rarity Rank
<i>Alisma triviale</i>	Large Water-plantain		E	G5	S1
<i>Andromeda glaucophylla</i>	Bog Rosemary		E	G5T5	S1
<i>Aster borealis</i>	Rush Aster		E	G5	S1
<i>Boltonia asteroides</i> var. <i>glastifolia</i>	Southern Boltonia		E	G5TNR	S1
<i>Boltonia montana</i>	Appalachian Mountain Boltonia			G1G2	S1S2
<i>Calamagrostis pickeringii</i>	Pickering's Reed Grass		E	G4	S1
<i>Carex alopecoidea</i>	Foxtail Sedge		E	G5	S1
<i>Carex aquatilis</i>	Water Sedge		E	G5	S1
<i>Carex diandra</i>	Lesser Panicle Sedge			G5	S1
<i>Carex formosa</i>	Handsome Sedge		E	G4	S1.1
<i>Carex haydenii</i>	Cloud Sedge		E	G5	S1
<i>Carex lupuliformis</i>	Hop-like Sedge		E	G4	S1
<i>Carex pseudocyperus</i>	Cyperus-like Sedge		E	G5	S1
<i>Carex tuckermanii</i>	Tuckerman's Sedge		E	G4	S1
<i>Carex woodii</i>	Wood's Sedge			G4	S1.1
<i>Cleistes divaricata</i>	Spreading Pogonia		E	G4	S1
<i>Coelorachis rugosa</i>	Wrinkled Jointgrass		E	G5	S1
<i>Comarum palustre</i>	Marsh Cinquefoil		E	G5	SH
<i>Conioselinum chinense</i>	Hemlock-parsley		E	G5	S1
<i>Cyperus pseudovegetus</i>	Marsh Flat Sedge		E	G5	S1
<i>Cypripedium candidum</i>	Small White Lady's-slipper		E	G4	S1
<i>Cypripedium reginae</i>	Showy Lady's-slipper		E	G4	S1
<i>Diodia virginiana</i>	Larger Buttonweed		E	G5T5	S1
<i>Eleocharis equisetoides</i>	Knotted Spike-rush		E	G4	S1
<i>Eleocharis quinquefolia</i>	Few-flower Spike-rush		E	G5	S1
<i>Equisetum variegatum</i>	Variegated Horsetail		E	G5T5	S1
<i>Eriophorum tenellum</i>	Rough Cotton-grass		E	G5	S1
<i>Eupatorium resinosum</i>	Pine Barren Boneset		E	G3	S2
<i>Filipendula rubra</i>	Queen-of-the-prairie		E	G4G5	SX
<i>Galium labradoricum</i>	Labrador Marsh Bedstraw		E	G5	S1
<i>Galium trifidum</i>	Small Bedstraw		E	G5T5	S2
<i>Glyceria borealis</i>	Small Floating Manna Grass		E	G5	SH.1
<i>Hottonia inflata</i>	Featherfoil		E	G4	S1
<i>Hypericum adpressum</i>	Barton's St. John's-wort		E	G3	S2
<i>Hypericum gymnanthum</i>	Clasping-leaf St. John's-wort			G4	S1
<i>Hypericum majus</i>	Larger Canadian St. John's Wort		E	G5	S1
<i>Juncus caesariensis</i>	New Jersey Rush		E	G2	S2
<i>Lobelia boykinii</i>	Boykin's Lobelia		E	G2G3	S1
<i>Ludwigia linearis</i>	Narrow-leaf Primrose-willow			G5	S1

SCIENTIFIC NAME	COMMON NAME	Fed Status	State Prot Status	Global Rarity Rank	State Rarity Rank
<i>Megalodonta beckii</i>	Water-marigold		E	G4G5	S1
<i>Narthecium americanum</i>	Bog Asphodel	C	E	G2	S2
<i>Neobeckia lacustris</i>	Lake Water-cress		E	G4?	SH
<i>Panicum boreale</i>	Northern Panic Grass		E	G5	S1
<i>Panicum flexile</i>	Wiry Panic Grass		E	G5	S1
<i>Panicum hirstii</i>	Hirst Brothers' Panic Grass	C	E	G1	S1
<i>Platanthera integra</i>	Yellow Fringeless Orchid		E	G3G4	S1
<i>Rhexia aristosa</i>	Awed Meadow-beauty		E	G3	S1
<i>Rhynchospora capillacea</i>	Capillary Beaked-rush		E	G4	S1
<i>Rhynchospora knieskernii</i>	Knieskern's Beaked-rush	LT	E	G2	S2
<i>Rhynchospora microcephala</i>	Small-head Beaked-rush		E	G5T5	S1
<i>Rudbeckia fulgida</i>	Orange Coneflower		E	G5T4?	S1
<i>Sagittaria cuneata</i>	Arum-leaf Arrowhead		E	G5	S1
<i>Sagittaria teres</i>	Slender Arrowhead		E	G3	S1
<i>Salix lucida ssp. lucida</i>	Shining Willow			G5T5	S1
<i>Salix pedicellaris</i>	Bog Willow		E	G5	S1
<i>Schoenoplectus torreyi</i>	Torrey's Bulrush		E	G5?	S1
<i>Scirpus longii</i>	Long's Woolgrass		E	G2G3	S2
<i>Sisyrinchium montanum</i>	Strict Blue-eyed Grass		E	G5T4T5	S2
<i>Sparganium natans</i>	Small Burr-reed		E	G5	S1
<i>Spiranthes laciniata</i>	Lace-lip Ladies'-tresses		E	G4G5	S1
<i>Thuja occidentalis</i>	Arborvitae		E	G5	S1
<i>Tofieldia racemosa</i>	False Asphodel		E	G5	S1
<i>Triglochin maritima</i>	Seaside Arrow-grass		E	G5	S1
<i>Trollius laxus ssp. laxus</i>	Spreading Globe Flower		E	G4T3	S1
<i>Utricularia minor</i>	Lesser Bladderwort		E	G5	S1
<i>Utricularia olivacea</i>	Dwarf White Bladderwort		E	G4	S1.1
<i>Utricularia resupinata</i>	Reversed Bladderwort		E	G4	S1
<i>Veronica catenata</i>	Sessile Water-speedwell		E	G5	S1
<i>Xyris fimbriata</i>	Fringed Yellow-eyed-grass		E	G5	S1
<i>Zigadenus leimanthoides</i>	Death-camus		E	G4Q	S1

Special Plants of NJ - - Categories & Definitions

http://www.nj.gov/dep/parksandforests/natural/heritage/spplant_ap1.html

Plants:

Plant taxa listed as endangered are from New Jersey's official Endangered Plant Species List (N.J.A.C. 7:5C – 5.1).

E Native New Jersey plant species whose survival in the State or nation is in jeopardy.

REGIONAL STATUS CODES FOR PLANTS AND ECOLOGICAL COMMUNITIES

LP Indicates taxa listed by the Pinelands Commission as endangered or threatened within their legal jurisdiction. Not all species currently tracked by the Pinelands Commission are tracked by the Natural Heritage Program. A complete list of endangered and threatened Pineland species is included in the New Jersey Pinelands Comprehensive Management Plan.

HL Indicates taxa or ecological communities protected by the Highlands Water Protection and Planning Act within the jurisdiction of the Highlands Preservation Area.

EXPLANATION OF GLOBAL AND STATE ELEMENT RANKS

The Nature Conservancy developed a ranking system for use in identifying elements (rare species and ecological communities) of natural diversity most endangered with extinction. Each element is ranked according to its global, national, and state (or subnational in other countries) rarity. These ranks are used to prioritize conservation work so that the most endangered elements receive attention first. Definitions for element ranks are after The Nature Conservancy (1982: Chapter 4, 4.1-1 through 4.4.1.3-3).

GLOBAL ELEMENT RANKS

G1 Critically imperiled globally because of extreme rarity (5 or fewer occurrences or very few remaining individuals or acres) or because of some factor(s) making it especially vulnerable to extinction.

G2 Imperiled globally because of rarity (6 to 20 occurrences or few remaining individuals or acres) or because of some factor(s) making it very vulnerable to extinction throughout its range.

G3 Either very rare and local throughout its range or found locally (even abundantly at some of its locations) in a restricted range (e.g., a single western state, a physiographic region in the East) or because of other factors making it vulnerable to extinction throughout its range; with the number of occurrences in the range of 21 to 100.

G4 Apparently secure globally; although it may be quite rare in parts of its range, especially at the periphery.

G5 Demonstrably secure globally; although it may be quite rare in parts of its range, especially at the periphery.

GH Of historical occurrence throughout its range i.e., formerly part of the established biota, with the expectation that it may be rediscovered.

GU Possibly in peril range-wide but status uncertain; more information needed.

GX Believed to be extinct throughout range (e.g., passenger pigeon) with virtually no likelihood that it will be rediscovered.

G? Species has not yet been ranked.

GNR Species has not yet been ranked.

STATE ELEMENT RANKS

S1 Critically imperiled in New Jersey because of extreme rarity (5 or fewer occurrences or very few remaining individuals or acres). Elements so ranked are often restricted to very specialized conditions or habitats and/or restricted to an extremely small geographical area of the state. Also included are elements which were formerly more abundant, but because of habitat destruction or some other critical factor of its biology, they have been demonstrably reduced in abundance. In essence, these are elements for which, even with intensive searching, sizable additional occurrences are unlikely to be discovered.

S2 Imperiled in New Jersey because of rarity (6 to 20 occurrences). Historically many of these elements may have been more frequent but are now known from very few extant occurrences, primarily because of habitat destruction. Diligent searching may yield additional occurrences.

S3 Rare in state with 21 to 100 occurrences (plant species and ecological communities in this category have only 21 to 50 occurrences). Includes elements which are widely distributed in the state but with small populations/acreage or elements with restricted distribution, but locally abundant. Not yet imperiled in state but may soon be if current trends continue. Searching often yields additional occurrences.

S4 Apparently secure in state, with many occurrences.

S5 Demonstrably secure in state and essentially ineradicable under present conditions.

SA Accidental in state, including species (usually birds or butterflies) recorded once or twice or only at very great intervals, hundreds or even thousands of miles outside their usual range; a few of these species may even have bred on the one or two occasions they were recorded; examples include European strays or western birds on the East Coast and vice-versa.

SE Elements that are clearly exotic in New Jersey including those taxa not native to North America (introduced taxa) or taxa deliberately or accidentally introduced into the State from other parts of North America (adventive taxa). Taxa ranked SE are not a conservation priority (viable introduced occurrences of G1 or G2 elements may be exceptions).

SH Elements of historical occurrence in New Jersey. Despite some searching of historical occurrences and/or potential habitat, no extant occurrences are known. Since not all of the historical occurrences have been field surveyed, and unsearched potential habitat remains,

historically ranked taxa are considered possibly extant, and remain a conservation priority for continued field work with the expectation they may be rediscovered.

SP Element has potential to occur in New Jersey, but no occurrences have been reported.

SR Elements reported from New Jersey, but without per-suasive documentation which would provide a basis for either accepting or rejecting the report. In some instances documentation may exist, but as of yet, its source or location has not been determined.

SRF Elements erroneously reported from New Jersey, but this error persists in the literature.

SU Elements believed to be in peril but the degree of rarity uncertain. Also included are rare taxa of uncertain taxonomical standing. More information is needed to resolve rank.

SX Elements that have been determined or are presumed to be extirpated from New Jersey. All historical occurrences have been searched and a reasonable search of potential habitat has been completed. Extirpated taxa are not a current conservation priority.

SXC Elements presumed extirpated from New Jersey, but native populations collected from the wild exist in cultivation.

SZ Not of practical conservation concern in New Jersey, because there are no definable occurrences, although the taxon is native and appears regularly in the state. An SZ rank will generally be used for long distance migrants whose occurrences during their migrations are too irregular (in terms of repeated visitation to the same locations), transitory, and dispersed to be reliably identified, mapped and protected. In other words, the migrant regularly passes through the state, but enduring, mappable element occurrences cannot be defined.

Typically, the SZ rank applies to a non-breeding population (N) in the state - for example, birds on migration. An SZ rank may in a few instances also apply to a breeding population (B), for example certain lepidoptera which regularly die out every year with no significant return migration.

Although the SZ rank typically applies to migrants, it should not be used indiscriminately. Just because a species is on migration does not mean it receives an SZ rank. SZ will only apply when the migrants occur in an irregular, transitory and dispersed manner.

B Refers to the breeding population of the element in the state.

N Refers to the non-breeding population of the element in the state.

T Element ranks containing a "T" indicate that the infraspecific taxon is being ranked differently than the full species. For example *Stachys palustris* var. *homotricha* is ranked

"G5T? SH" meaning the full species is globally secure but the global rarity of the var. homotricha has not been determined; in New Jersey the variety is ranked historic.

Q Elements containing a "Q" in the global portion of its rank indicates that the taxon is of questionable, or uncertain taxonomical standing, e.g., some authors regard it as a full species, while others treat it at the subspecific level.

.1 Elements only, ever documented from a single location.

Note: To express uncertainty, the most likely rank is assigned and a question mark added (e.g., G2?). A range is indicated by combining two ranks (e.g., G1G2, S1S3).

IDENTIFICATION CODES

These codes refer to whether the identification of the species or community has been checked by a reliable individual and is indicative of significant habitat. These codes are not included on all Natural Heritage Reports.

Y Identification has been verified and is indicative of significant habitat.

BLANK Identification has not been verified but there is no reason to believe it is not indicative of significant habitat.

? Either it has not been determined if the record is indicative of significant habitat or the identification of the species or community may be confusing or disputed.

List of selected Wildlife Species of Conservation Need with Protection Status and Rarity Rank

Animal Type	Common name	Scientific name	Fed Status	State Status (ENSP)	Global Rarity Rank	State Rarity Rank

SOURCE: Endangered Non-Game Species Program. T= Threatened; E = Endangered; SC = Special Concern

NJ Endangered and Nongame Species Program Special Concern Species Status Listing

Status Definitions:

Endangered: Applies to a species whose prospects for survival within the state are in immediate danger due to one or several factors, such as loss or degradation of habitat, over-exploitation, predation, competition, disease or environmental pollution, etc. An endangered species likely requires immediate action to avoid extinction within NJ.

Threatened: Applies to species that may become Endangered if conditions surrounding it begin to or continue to deteriorate. Thus, a Threatened species is one that is already vulnerable as a result of, for example, small population size, restricted range, narrow habitat affinities, significant population decline, etc.

Special Concern: Applies to species that warrant special attention because of inherent vulnerability to environmental deterioration or habitat modification that would result in its becoming threatened if conditions surrounding the species begin or continue to deteriorate. Factors that can lead to classification as special concern include, but are not limited to, species rarity in the State, highly specialized food and/or habitat requirements, low reproductive rate, isolated populations of the species within the State and/or other characteristics that make the species particularly susceptible to environmental or habitat changes. This category includes a species that meets the foregoing criteria and for which there is little understanding of its current population status in the state.

Stable: Applies to species that appear to be secure in NJ and not in danger of falling into any of the preceding the categories in the near future.

Undetermined: A species about which there is not enough information available to determine the status.

The lists of New Jersey's endangered and nongame wildlife species are maintained by the DEP's Division of Fish and Wildlife's Endangered and Nongame Species Program. These lists are used to determine protection and management actions necessary to ensure the survival of the state's endangered and nongame wildlife.

This work is made possible through voluntary contributions received through check-off donations to the Endangered Wildlife Conservation Fund on the New Jersey State Income Tax Form, the sale of Conserve Wildlife License Plates, and donations. For more information about the Endangered and Nongame Species Program or to report a sighting of endangered or threatened wildlife, contact the Endangered and Nongame Species, NJ Division of Fish and Wildlife, Mail Code 501-03, PO Box 420, Trenton, NJ 08625-0420.

1. CALCAREOUS FEN CLASSIFICATION

NORTHEAST TERRESTRIAL WILDLIFE HABITAT/ECOLOGICAL SYSTEM:

North-Central Appalachian Seepage Fen

“This rare small-patch system occurs in scattered locations in the central Appalachians and eastern Great Lakes regions. Mostly non-forested, these open fens develop on shallow to deep peat over a sloping substrate, where seepage waters provide nutrients. Conditions are often circumneutral to alkaline. Sedges are the major dominants. Skunk cabbage is a characteristic forb. Some of these areas are kept open by grazing, and succession to shrublands may occur in the absence of disturbance.” (Gawler 2008)

NATIONAL VEGETATION CLASSIFICATION SYSTEM (USNVC 2012):

Class: Shrubland & Grassland
Formation: Temperate & Boreal Bog & Fen
Division: North American Bog & Fen
MacroGroup: Appalachian, Interior Plateau & Prairie Fen
Group: North-Central Appalachian, Interior & Prairie Fen Group

NJ Associations / Ecological Community Types:

Calcareous Shrub Fen
Intermediate Graminoid Fen
Northern Piedmont Rich Fen
Pasture Fen
Prairie Fen
Rich Shrub Carr
Twig-rush Fen
Lakeshore Marl Fen (note that this type of fen occurs on pond and lakeshores and is therefore included in the calcareous sinkhole pond classification below)

LANDSCAPE MAP HABITAT CLASSIFICATION (NJDFW 2010)

Emergent Habitat
Forest Habitat
Wetland Habitat

LAND USE / LAND COVER TYPES (NJDEP 2010, NJDFW 2012)

Herbaceous Wetlands
Deciduous Scrub/Shrub Wetlands
Coniferous Scrub/Shrub Wetlands
Mixed Scrub/Shrub Wetlands (Deciduous Dominant)
Mixed Scrub/Shrub Wetlands (Coniferous Dominant)

2. CALCAREOUS SINKHOLE POND CLASSIFICATION

NORTHEAST TERRESTRIAL WILDLIFE HABITAT/ECOLOGICAL SYSTEM:

Central Interior Highlands and Appalachian Sinkhole and Depression Pond

“This system of ponds and wetlands ranges from the Ozarks east to the northern Piedmont of Pennsylvania and New Jersey. It is found in basins of sinkholes or other isolated depressions on uplands. Soils are very poorly drained, and surface water may be present for extended periods of time, rarely becoming dry. Water depth may vary greatly on a seasonal basis and may be a meter deep or more in the winter. Some examples become dry in the summer. Soils may be deep (1 m or more), consisting of peat or muck, with parent material of peat, muck or alluvium. Ponds vary from open water to herb-, shrub-, or tree-dominated. Tree-dominated examples typically contain oaks, sycamore, green ash, silver maple, and/or black gum. Buttonbush is a typical shrub component.” (Gawler, 2008)

NATIONAL VEGETATION CLASSIFICATION SYSTEM (USNVC 2012):

Class: Shrubland & Grassland
Formation: Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland
Division: Eastern North American Freshwater Wet Meadow, Riparian & Marsh
MacroGroup: Eastern North American Wet Meadow & Marsh
Group: Eastern North American Wet Meadow Group
NJ Associations / Ecological Community Types:
Calcareous Sinkhole Boltonia Pondshore
Calcareous Sinkhole Mote Marsh

NATIONAL VEGETATION CLASSIFICATION SYSTEM (USNVC 2012):

Class: Shrubland & Grassland
Formation: Temperate & Boreal Bog & Fen
Division: North American Bog & Fen
MacroGroup: Appalachian, Interior Plateau & Prairie Fen
Group: North-Central Appalachian, Interior & Prairie Fen
NJ Associations / Ecological Community Types:
Lakeshore Marl Fen (note that this is a calcareous fen that occurs on pond and lakeshores and is therefore included in the calcareous sinkhole pond classification section)

NATIONAL VEGETATION CLASSIFICATION SYSTEM (USNVC 2012):

Class: Forest to Open Woodland
Formation: Temperate Flooded & Swamp Forest
Division: Eastern North American Flooded & Swamp Forest
MacroGroup: Northern & Central Floodplain Forest & Scrub
Group: Silver Maple - Green Ash - Sycamore - Hackberry Floodplain Forest
NJ Associations / Ecological Community Types:
Sinkhole Pond Floodplain Forest
Pond or Lakeside Ash - Maple Swamp
Northeastern Maple - Ash Swamp

LANDSCAPE MAP HABITAT CLASSIFICATION (NJDFW 2010)

Forest Habitat
Wetland Habitat
Vernal Habitat

LAND USE / LAND COVER TYPES (NJDEP 2010, NJDFW 2012)

Herbaceous Wetlands
Deciduous Wooded Wetlands
Mixed Forested Wetlands (Deciduous Dominant)

3. PINE BARREN SAVANNA CLASSIFICATION

NORTHEAST TERRESTRIAL WILDLIFE HABITAT/ECOLOGICAL SYSTEM:

Northern Atlantic Coastal Plain Stream and River

“This system is found throughout the northern Atlantic Coastal Plain from Virginia to New Jersey along low-gradient small streams and rivers with little to moderate floodplain development. This system is influenced by overbank flooding, groundwater seepage and occasional beaver impoundments. The vegetation is a mosaic of forests, woodlands, shrublands, and herbaceous communities. Canopy composition and cover can vary within examples of this system, but typical tree species may include bottomland oaks, Atlantic white cedar, red maple, green ash, black gum, black birch, sweetgum, and sycamore. Shrubs and herbaceous layers can vary in richness and cover. Some characteristic shrubs include alder, musclemwood, and spicebush. Seepage forests dominated by red maple sweet bay can often be found within this system, especially at the headwaters and terraces of streams.” (Gawler, 2008)

NATIONAL VEGETATION CLASSIFICATION SYSTEM (USNVC 2012):

Class: Forest to Open Woodland
Formation: Temperate Flooded & Swamp Forest
Division: Eastern North American Flooded & Swamp Forest
MacroGroup: Northern & Central Swamp Forest
Group: Northern Atlantic White-cedar-(Pitch Pine) Swamp Group

NJ Associations / Ecological Community Types:

Pine Barren Riverside Bog Asphodel Savanna
Pine Barren Riverside Muhly Savanna
Pine Barren Riverside Sedge Savanna
Pine Barren Riverside Shrub Savanna
Pine Barren Riverside Wet Depression Savanna

NORTHEAST TERRESTRIAL WILDLIFE HABITAT/ECOLOGICAL SYSTEM:

Northern Atlantic Coastal Plain Pitch Pine Lowland

“This system is comprised of wetland pine barrens, best developed in the New Jersey Pine Barrens. Although it can be extensive, components often co-occur as a mosaic with upland pine barrens vegetation as well. Substrates range from saturated deep peats to seasonally saturated mineral soils. The range of hydroperiods is reflected in the vegetation, which ranges from wet grasslands dominated by pine barren sandreed to seasonally saturated pine forests. Fire frequency also has a profound influence on the vegetation. Where fire frequency is high, woody vegetation is impeded, favoring the development of large wet grasslands.” (Gawler, 2008)

NATIONAL VEGETATION CLASSIFICATION SYSTEM (USNVC 2012):

Class: Forest to Open Woodland
Formation: Temperate Flooded & Swamp Forest
Division: Eastern North American Flooded & Swamp Forest
MacroGroup: Northern Swamp Forest
Group: Northern Atlantic Coastal Conifer Swamp
NJ Associations / Ecological Community Types:
Pitch Pine / Sandreed Savanna

LANDSCAPE MAP HABITAT CLASSIFICATION (NJDFW 2010)

Emergent Habitat
Forest Habitat
Wetland Habitat

LAND USE / LAND COVER TYPES (NJDEP 2010, NJDFW 2012)

Herbaceous Wetlands
Coniferous Scrub/Shrub Wetlands
Mixed Scrub/Shrub Wetlands (Coniferous Dominant)
Coniferous Wooded Wetlands

4. COASTAL PLAIN INTERMITTENT POND CLASSIFICATION

NORTHEAST TERRESTRIAL WILDLIFE HABITAT/ECOLOGICAL SYSTEM:

Northern Atlantic Coastal Plain Pond

'This system includes groundwater-flooded depressions characterized by a flora characteristic of the coastal plain from the Delmarva Peninsula to Cape Cod. It occurs on sandy deposits such as outwash plains of the glaciated region (Long Island and Cape Cod), on the deep sands of the New Jersey Pine Barrens, or on finer sediments of the Coastal Plain of Cape May, the Delmarva peninsula, and the Chesapeake Bay region. Ponds may contain permanent water, such as the deep glacial kettleholes of Cape Cod and Long Island, or may be shallow basins where groundwater drops below the surface late in the growing season. The vegetation is characterized by strong zonation, with a border of tall shrubs, such as highbush blueberry, and several essentially concentric bands dominated by progressively lower vegetation with strong coastal plain affinities. In shallower basins, such strong zonation is generally lacking but still remains evident in some cases. On Cape Cod, Long Island, and New Jersey, this system most often occurs within the pitch pine barrens. From Cape May and south, it occurs within an upland matrix of mixed hardwood forests and generally supports a seasonally flooded swamp forest characterized by sweet gum, red maple, and wetland oaks such as willow oak. Buttonbush often occurs as scattered individuals or forms a shrub swamp in areas with lower diversity and cover of coastal plain flora. (Gawler, 2008)

NATIONAL VEGETATION CLASSIFICATION SYSTEM (USNVC 2012):

Class: Shrubland & Grassland
Formation: Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland
Division: Eastern North American Freshwater Wet Meadow, Riparian & Marsh
MacroGroup: Atlantic & Gulf Coastal Plain Pondshore and Wet Meadow
Group: Atlantic & Gulf Coastal Plain Pondshore & Wet Prairie Group

NJ Associations / Ecological Community Types:

Bulblet Flatsedge Coastal Plain Sandy Pondshore
Buttonbush Coastal Plain Pond
Cape May - Delmarva Depression Meadow
Coastal Plain Horsetail Spikerush Peatland
Coastal Plain Muck Pondshore
Coastal Plain Pondshore
Deep Muck Coastal Plain Pond
Delmarva Bay Tall Grassland
Northern Peatland Sedge Coastal Plain Pond
Panicgrass Pondshore
Swamp-loosestrife Coastal Plain Pond

Appendix D

Sample Sidebars and Information Boxes for SWAP 2015

Inventory and Monitoring

Goal: Inventory and monitor SGCN animals

Methods: Survey methods can range from a single site visit to multiple site visits; from counting from the edge of the habitat to walking transects through the habitat.
Differing plant and animal phenology means that surveying (and related disturbances) could potentially occur throughout the growing season, depending on what species are being monitored.

Impacts: Typical impacts to plant and animal species include trampling of vegetation, possible harm to larval invertebrates and nests of ground-nesting birds, disturbance to nesting birds during breeding season, transmission of invasive weed seeds into new habitat.

Challenge: How to monitor multiple species at a site without harm to species and/or habitat.

Recommendations:

- Develop a base map with locations of particularly rare or sensitive plant and animal species noted, before developing and implementing a monitoring plan.
- Stagger monitoring activities over several years. Do not survey all taxa at a site (e.g., birds, Lepidoptera, turtles, plants) in the same year if possible, and not year after year. Give the habitat a rest.
- Practice good field hygiene. Clean boots and other survey equipment between visits to different sites to prevent spread of weed seeds and/or disease.

Calcareous Fens – Vegetation Management

Conservation Action: Managing woody vegetation

Methods: May include manual removal (e.g., selective cutting and tree removal, mowing or brush-hogging), targeted use of herbicides, and/or use of grazing animals such as goats.

Impacts: Managing for one species may inadvertently harm others. Using goats to manage habitat for bog turtles, for example, will remove critical shrub habitat for scrub-shrub nesting birds and may result in the loss of rare plant populations grazed by goats and/or critical food plants required by rare Lepidoptera. Use of herbicides can harm non-target species.

Challenge: How best to manage fen vegetation for all fen-dependent species (e.g., scrub-shrub birds, rare plants, rare Lepidoptera, bog turtles, rare odonates)?

Recommendations:

- Where possible, manage fens holistically – protecting areas that meet the needs of scrub-shrub birds and rare Lepidoptera while also maintaining the more open areas needed by bog turtles and providing critical microclimates needed by rare plants.
- In some cases, individual sites may best be managed for a single species (e.g., bog turtles) whereas other sites can be managed for multiple species (e.g., rare plants and Lepidoptera).

Fire Management in New Jersey Pine Barrens Savannas

Challenge: Fire management, whether prescription burns or wildfire suppression, has a major effect on the persistence and quality of Pine Barrens habitats, including savannas and their associated rare plants and SGCN wildlife.

Recommendations:

- Thoroughly assess what rare plant and SGCN animals are present in the habitat, their tolerances to fire, and their distribution on the landscape
 - Develop a plan for when and if to burn, what to burn, and how intensely. Consider the needs of all species, plant and animal, occurring at a site.
 - Leave unburned refugia for plant and animal species. Do not burn entire sites in a season.
 - Use care when locating firebreaks.
 - Other vegetation management techniques such as mowing are sometimes used in place of fire. The ecological and species-specific effects of such management practices must be assessed for each rare species as to whether the results are beneficial, harmful, or benign.
 - Research on fire and its effects on plants, habitats and wildlife SGCN will provide a better understanding of landscape effects of fire in Pine Barrens habitats.
-

Guidelines for Cleaning Field Equipment

To prevent the spread of invasive species propagules and/or disease pathogens (e.g. Chytrid fungus, Ranavirus) among wetland sites follow these recommendations between site visits: 1) wash boots and field equipment with soap and water; 2) rinse in clean water; and 3) disinfect with a 10% bleach solution and allow to air dry.

Did You Know?

Orchids can live underground for 20 or more years and reappear aboveground to flower when environmental conditions are just right.

APPENDIX E

**N.J.A.C. 7:7A
Freshwater Wetlands Protection Act Rules
Statutory authority: N.J.S.A. 13:9B-1 et seq.
Date last amended: December 7, 2009**

"Vernal habitat" means a wetland as identified at N.J.A.C. 7:7A-2.3, or State open water, as defined at N.J.A.C. 7:7A-1.4 above that meets all of the criteria at 1 through 4 below. Evidence of breeding by an obligate species under 2i below creates a rebuttable presumption that the criteria at 3 and 4 below are met:

1. Occurs in or contains a confined basin depression without a permanent flowing outlet;
2. Features evidence of breeding by one or more species of fauna adapted to reproduce in ephemeral aquatic conditions, identified in N.J.A.C. 7:7A, Appendix 1, incorporated herein by reference. The following shall constitute evidence of breeding by such a species:
 - i. One or more obligate species listed in Appendix 1, or evidence of such a species, is found in or immediately adjacent to the area of ponded water; or
 - ii. Two or more facultative species listed in Appendix 1, or evidence of the presence of such a species, are found in or immediately adjacent to the area of ponded water;
3. Maintains ponded water for at least two continuous months between March and September of a normal rainfall year; and
4. Is free of reproducing fish populations throughout the year, or dries up at some time during a normal rainfall year.

APPENDIX 1

OBLIGATE AND FACULTATIVE FAUNA SPECIES FOUND IN VERNAL HABITATS

Obligate Species

Marbled Salamander
Blue-spotted Salamander*
Jefferson Salamander
Eastern Tiger Salamander*
Wood Frog
Spotted Salamander
Eastern Spadefoot Toad
Jefferson x Blue-spotted Salamander*
Fairy shrimp (order Anostraca)

Facultative Species

Snapping Turtle
Eastern Mud Turtle

Spotted Turtle
Eastern Painted Turtle
Red-spotted Newt
American Toad
Fowler's Toad
Pine Barrens Treefrog*
Northern Gray Treefrog
Southern Gray Treefrog*
Upland Chorus Frog
Northern Cricket Frog
New Jersey Chorus Frog
Bull Frog
Green Frog
Southern Leopard Frog
Four-toed Salamander
Northern Spring Peeper
Long-tailed Salamander**
Wood Turtle**

*Listed as a New Jersey State endangered species

** Listed as a New Jersey State threatened species

Part 2: Distribution of Rare Plants and Natural Communities within New Jersey

Distribution of Rare Plants and Natural Communities within New Jersey

The following table provides information on the status and distribution of rare plants and natural communities, including the New Jersey landscape region in which they occur, and broad habitat associations. The habitat categories are the same 18 used to characterize the Conservation Focal Areas. An explanation of codes used by the NJDEP's Natural Heritage Program to characterize rare plants and natural communities follows this table.

Pear Hawthorn	Crataegus calpodendron		E	G5	S1						X			X	X	X	X		X	X	X	X	X		X	X		X	X
Fireberry Hawthorn	Crataegus chrysocarpa var. chrysocarpa			G5T5	S2						X			X	X	X			X	X	X	X	X			X		X	
Dodge's Hawthorn	Crataegus dodgei			G4	S2						X			X	X	X			X	X		X	X			X		X	
Holmes' Hawthorne	Crataegus holmesiana		E	G5	S1						X			X	X	X				X	X	X	X			X		X	
Scarlet Hawthorn	Crataegus pedicellata			G5	S1S2						X					X				X									
Pennsylvania Hawthorn	Crataegus pennsylvanica			G3Q	S1.1						X					X				X						X			
Dotted Hawthorn	Crataegus punctata			G5	S2				X		X				X	X				X		X	X			X		X	
Fleshy Hawthorn	Crataegus succulenta		E	G5	S1				X		X			X	X					X		X	X					X	
Elliptical Rushfoil	Croton willdenowii			G5	S2		X		X	X		X		X	X	X	X		X	X	X	X	X			X	X	X	X
Slender Rockbrake	Cryptogramma stelleri		E	G5	SH.1				X						X					X			X						
Blue Waxweed	Cuphea viscosissima			G5?	S3				X		X	X		X	X	X	X		X	X	X	X	X		X	X		X	X
Buttonbush Dodder	Cuscuta cephalanthi		E	G5	S1				X		X	X		X	X	X				X	X	X	X			X		X	
Hazel Dodder	Cuscuta coryli			G5?	S2		X		X	X				X	X	X				X			X			X		X	X
Collared Dodder	Cuscuta indecora var. indecora		E	G5T2T4	S1.1	X										X		X				X		X	X				
Smartweed Dodder	Cuscuta polygonorum			G5	S2	X	X		X		X	X	X	X	X	X	X	X	X	X	X	X	X	X		X		X	
Northern Wild Comfrey	Cynoglossum virginianum var. boreale		E	G5T4T5	SH.1						X																		
Wild Comfrey	Cynoglossum virginianum var. virginianum			G5T5	S2				X		X	X		X	X	X	X			X	X	X	X			X		X	
Engelmann's Flat Sedge	Cyperus engelmannii			G4Q	S2		X		X					X	X	X	X	X		X		X	X	X	X	X		X	
Bristly Flat Sedge	Cyperus hystricinus		E	G4	SH					X		X				X			X										
Lancaster Flat Sedge	Cyperus lancastriensis		E	G5	S1				X	X		X				X	X			X	X	X			X		X	X	X
Plukenet's Flat Sedge	Cyperus plukenetii		E	G5	SH				X			X				X				X									
Coast Flat Sedge	Cyperus polystachyos var. texensis		E	G5T5	S1	X	X		X	X		X		X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X
Marsh Flat Sedge	Cyperus pseudovegetus		E	G5	S1	X				X						X	X					X		X					X
Reflexed Flat Sedge	Cyperus refractus		E	G5	SH		X																						
Rough Flatsedge	Cyperus retrofractus		E	G5	SH		X	X	X			X	X	X	X	X	X			X	X		X	X				X	
Schweinitz's Flat Sedge	Cyperus schweinitzii		E	G5	S1				X	X						X						X							
Small White Lady's-slipper	Cypripedium candidum		E	G4	S1						X						X											X	
Fen Small Yellow Lady's-slipper	Cypripedium parviflorum var. makasin			G5T4T5	S2						X			X			X		X	X	X	X	X		X	X		X	X
Showy Lady's-slipper	Cypripedium reginae		E	G4	S1						X			X	X	X	X			X	X	X	X			X		X	
Lowland Fragile Fern	Cystopteris protrusa			G5	S2				X		X			X	X	X				X	X	X	X					X	
Robin-run-away	Dalibarda repens		E	G5	SH.1				X											X									
Tufted Hair Grass	Deschampsia caespitosa			G5	S3						X			X	X	X	X		X	X	X	X	X			X	X	X	X
Toothed Tick-trefoil	Desmodium cuspidatum var. cuspidatum			G5T5?	S2				X		X			X	X	X	X	X	X	X	X	X	X	X		X		X	
Trailing Tick-trefoil	Desmodium humifusum		E	G1G2Q	S1		X		X					X	X	X	X			X	X	X					X

EXPLANATIONS OF CODES USED IN NATURAL HERITAGE REPORTS

FEDERAL STATUS CODES

The following U.S. Fish and Wildlife Service categories and their definitions of endangered and threatened plants and animals have been modified from the U.S. Fish and Wildlife Service (F.R. Vol. 50 No. 188; Vol. 61, No. 40; F.R. 50 CFR Part 17). Federal Status codes reported for species follow the most recent listing.

LE	Taxa formally listed as endangered.
LT	Taxa formally listed as threatened.
PE	Taxa already proposed to be formally listed as endangered.
PT	Taxa already proposed to be formally listed as threatened.
C	Candidate taxa for which the Service currently has on file sufficient information on biological vulnerability and threat(s) to support proposals to list them as endangered or threatened species.
S/A	Similarity of appearance species.

STATE STATUS CODES

Two animal lists provide state status codes after the Endangered and Nongame Species Conservation Act of 1973 (NSSA 23:2A-13 et. seq.): the list of endangered species (N.J.A.C. 7:25-4.13) and the list defining status of indigenous, nongame wildlife species of New Jersey (N.J.A.C. 7:25-4.17(a)). The status of animal species is determined by the Nongame and Endangered Species Program (ENSP). The state status codes and definitions provided reflect the most recent lists that were revised in the New Jersey Register, Monday, June 3, 1991.

D	Declining species—a species which has exhibited a continued decline in population numbers over the years.
E	Endangered species—an endangered species is one whose prospects for survival within the state are in immediate danger due to one or many factors – a loss of habitat, over exploitation, predation, competition, disease. An endangered species requires immediate assistance or extinction will probably follow.
EX	Extirpated species—a species that formerly occurred in New Jersey, but is not now known to exist within the state.
I	Introduced species—a species not native to New Jersey that could not have established itself here without the assistance of man.
INC	Increasing species—a species whose population has exhibited a significant increase, beyond the normal range of its life cycle, over a long term period.
T	Threatened species—a species that may become endangered if conditions surrounding the species begin to or continue to deteriorate.
P	Peripheral species—a species whose occurrence in New Jersey is at the extreme edge of its present natural range.
S	Stable species—a species whose population is not undergoing any long-term increase/decrease within its natural cycle.
U	Undetermined species—a species about which there is not enough information available to determine the status.

Status for animals separated by a slash(/) indicate a dual status. First status refers to the state breeding population, and the second status refers to the migratory or winter population.

SC Special Concern – applies to animal species that warrant special attention because of some evidence of decline, inherent vulnerability to environmental deterioration, or habitat modification that would result in their becoming a Threatened species. This category would also be applied to species that meet the foregoing criteria and for which there is little understanding of their current population status in the state.

Plant taxa listed as endangered are from New Jersey's official Endangered Plant Species List N.J.S.A. 131B-15.151 et seq.

E Native New Jersey plant species whose survival in the State or nation is in jeopardy.

REGIONAL STATUS CODES FOR PLANTS AND ECOLOGICAL COMMUNITIES

LP Indicates taxa listed by the Pinelands Commission as endangered or threatened within their legal jurisdiction. Not all species currently tracked by the Pinelands Commission are tracked by the Natural Heritage Program. A complete list of endangered and threatened Pineland species is included in the New Jersey Pinelands Comprehensive Management Plan.

HL Indicates taxa or ecological communities protected by the Highlands Water Protection and Planning Act within the jurisdiction of the Highlands Preservation Area.

EXPLANATION OF GLOBAL AND STATE ELEMENT RANKS

The Nature Conservancy developed a ranking system for use in identifying elements (rare species and ecological communities) of natural diversity most endangered with extinction. Each element is ranked according to its global, national, and state (or subnational in other countries) rarity. These ranks are used to prioritize conservation work so that the most endangered elements receive attention first. Definitions for element ranks are after The Nature Conservancy (1982: Chapter 4, 4.1-1 through 4.4.1.3-3).

GLOBAL ELEMENT RANKS

G1 Critically imperiled globally because of extreme rarity (5 or fewer occurrences or very few remaining individuals or acres) or because of some factor(s) making it especially vulnerable to extinction.

G2 Imperiled globally because of rarity (6 to 20 occurrences or few remaining individuals or acres) or because of some factor(s) making it very vulnerable to extinction throughout its range.

G3 Either very rare and local throughout its range or found locally (even abundantly at some of its locations) in a restricted range (e.g., a single western state, a physiographic region in the East) or because of other factors making it vulnerable to extinction throughout its range; with the number of occurrences in the range of 21 to 100.

G4 Apparently secure globally; although it may be quite rare in parts of its range, especially at the periphery.

G5 Demonstrably secure globally; although it may be quite rare in parts of its range, especially at the periphery.

GH Of historical occurrence throughout its range i.e., formerly part of the established biota, with the expectation that it may be rediscovered.

GU Possibly in peril range-wide but status uncertain; more information needed.

GX Believed to be extinct throughout range (e.g., passenger pigeon) with virtually no likelihood that it will be rediscovered.

G? Species has not yet been ranked.

GNR Species has not yet been ranked.

STATE ELEMENT RANKS

- S1** Critically imperiled in New Jersey because of extreme rarity (5 or fewer occurrences or very few remaining individuals or acres). Elements so ranked are often restricted to very specialized conditions or habitats and/or restricted to an extremely small geographical area of the state. Also included are elements which were formerly more abundant, but because of habitat destruction or some other critical factor of its biology, they have been demonstrably reduced in abundance. In essence, these are elements for which, even with intensive searching, sizable additional occurrences are unlikely to be discovered.
- S2** Imperiled in New Jersey because of rarity (6 to 20 occurrences). Historically many of these elements may have been more frequent but are now known from very few extant occurrences, primarily because of habitat destruction. Diligent searching may yield additional occurrences.
- S3** Rare in state with 21 to 100 occurrences (plant species and ecological communities in this category have only 21 to 50 occurrences). Includes elements which are widely distributed in the state but with small populations/acreage or elements with restricted distribution, but locally abundant. Not yet imperiled in state but may soon be if current trends continue. Searching often yields additional occurrences.
- S4** Apparently secure in state, with many occurrences.
- S5** Demonstrably secure in state and essentially ineradicable under present conditions.
- SA** Accidental in state, including species (usually birds or butterflies) recorded once or twice or only at very great intervals, hundreds or even thousands of miles outside their usual range; a few of these species may even have bred on the one or two occasions they were recorded; examples include European strays or western birds on the East Coast and vice-versa.
- SE** Elements that are clearly exotic in New Jersey including those taxa not native to North America (introduced taxa) or taxa deliberately or accidentally introduced into the State from other parts of North America (adventive taxa). Taxa ranked SE are not a conservation priority (viable introduced occurrences of G1 or G2 elements may be exceptions).
- SH** Elements of historical occurrence in New Jersey. Despite some searching of historical occurrences and/or potential habitat, no extant occurrences are known. Since not all of the historical occurrences have been field surveyed, and unsearched potential habitat remains, historically ranked taxa are considered possibly extant, and remain a conservation priority for continued field work with the expectation they may be rediscovered.
- SP** Element has potential to occur in New Jersey, but no occurrences have been reported.
- SR** Elements reported from New Jersey, but without persuasive documentation which would provide a basis for either accepting or rejecting the report. In some instances documentation may exist, but as of yet, its source or location has not been determined.
- SRF** Elements erroneously reported from New Jersey, but this error persists in the literature.
- SU** Elements believed to be in peril but the degree of rarity uncertain. Also included are rare taxa of uncertain taxonomical standing. More information is needed to resolve rank.
- SX** Elements that have been determined or are presumed to be extirpated from New Jersey. All historical occurrences have been searched and a reasonable search of potential habitat has been completed. Extirpated taxa are not a current conservation priority.

- SXC** Elements presumed extirpated from New Jersey, but native populations collected from the wild exist in cultivation.
- SZ** Not of practical conservation concern in New Jersey, because there are no definable occurrences, although the taxon is native and appears regularly in the state. An SZ rank will generally be used for long distance migrants whose occurrences during their migrations are too irregular (in terms of repeated visitation to the same locations), transitory, and dispersed to be reliably identified, mapped and protected. In other words, the migrant regularly passes through the state, but enduring, mappable element occurrences cannot be defined.
- Typically, the SZ rank applies to a non-breeding population (N) in the state – for example, birds on migration. An SZ rank may in a few instances also apply to a breeding population (B), for example certain lepidoptera which regularly die out every year with no significant return migration.
- Although the SZ rank typically applies to migrants, it should not be used indiscriminately. Just because a species is on migration does not mean it receives an SZ rank. SZ will only apply when the migrants occur in an irregular, transitory and dispersed manner.
- B** Refers to the breeding population of the element in the state.
- N** Refers to the non-breeding population of the element in the state.
- T** Element ranks containing a "T" indicate that the infraspecific taxon is being ranked differently than the full species. For example *Stachys palustris* var. *homotricha* is ranked "G5T? SH" meaning the full species is globally secure but the global rarity of the var. *homotricha* has not been determined; in New Jersey the variety is ranked historic.
- Q** Elements containing a "Q" in the global portion of its rank indicates that the taxon is of questionable, or uncertain taxonomical standing, e.g., some authors regard it as a full species, while others treat it at the subspecific level.
- .1** Elements only, ever documented from a single location.

Note: To express uncertainty, the most likely rank is assigned and a question mark added (e.g., G2?). A range is indicated by combining two ranks (e.g., G1G2, S1S3).

IDENTIFICATION CODES

These codes refer to whether the identification of the species or community has been checked by a reliable individual and is indicative of significant habitat.

These codes are not included on all Natural Heritage Reports.

- Y** Identification has been verified and is indicative of significant habitat.
- BLANK** Identification has not been verified but there is no reason to believe it is not indicative of significant habitat.
- ?** Either it has not been determined if the record is indicative of significant habitat or the identification of the species or community may be confusing or disputed.
