

Endangered Species

More than 37,400 species are threatened with extinction worldwide, 52 of those are endangered in New Jersey.

Climate change affects temperatures, precipitation and sea level which can alter and eliminate habitats and threaten species.

Species play essential roles in ecosystems. Without species in their natural habitats, food chains become disrupted and more species can become threatened.

Prioritizing nature conservation and lowering your carbon footprint are essential actions needed for reducing the impact of climate change on species.

Participate in the 16th Annual Endangered Species Day on May 21st, 2021. Learn more about Endangered Species Day and this year's virtual activities here:
