Need for Project

The renovation of this pump station is required due to the age (over 30 years) of the pump station and the existing design. The existing design uses a dry well system for the pumps which requires confined space entry and makes routine maintenance very difficult. The proposed design will utilize a submersible pump arrangement will be a more reliable and easily maintained system.

Project Description

The Georgetown Boulevard Sewage Pump Station is located on Georgetown Boulevard just west of the intersection of Georgetown Boulevard and Route 9 in Barnegat Township Ocean County. The Georgetown Boulevard Sewage Pump Station Upgrade will consist of converting the existing wet welldry well type pump station into a submersible type pump station utilizing new submersible pumps installed in the existing wet well. The existing dry well will be abandoned in place. A new valve chamber with bypass connection will be provided adjacent to the wet well. The existing diesel fire generator at the site is in excess of 30 years old. The existing generator will be replaced with a natural gas fired generator. The generator and all electrical including motor control center pump control panel alarm system and automatic transfer switch will be installed within a new decorative block building. In addition a chemical feed system for odor control will be installed within the new generator building.

Sanitary Sewer System Rehabilitation

Priority List Rank

333

County

Ocean

Existing Population

20,065

Service Area

The portion of the sanitary sewer system that the LEHMUA owns and operates is like most Towns in Ocean County and Southern Monmouth County. The owner of the sanitary system is responsible for the conveyance of waste to a connection point with the Ocean County Utilities Authority (OCUA). Undermost conditions the waste is fed down a Township road till it intersects a county road where it ties into the sanitary main owned by the OCUA where it continues to an OCUA plant for treatment. The Authority owns, operates and maintains a sanitary sewer collection system that presently serves 8,614 active residential and 221 commercial customer accounts for a total of 8,835 customer accounts.

Need for Project

The LEHMUA had multiple pipe collapses in the past 8 - 10 years, and emergency repairs were required to fix them. The material and age of the pipes require cautious working skill to avoid further damage when repairs are made. The collapse of the mains cause sewer blockages and backups of the main that could expose the residents to raw sewer inside their properties, of in the roads.

Project Description

Originally, the proposed work included installation of approximately 6,300 LF of new 8-inch diameter PVC sanitary sewer main, 30 LF of new 18-inch diameter PVC sanitary sewer main, approximately 745 LF of new 6-inch diameter ductile iron sanitary sewer force main pipe, 200 lateral sanitary sewer connections, and 41 sanitary sewer manholes. Little Egg Harbor Municipal Utilities Authority now proposes to include approximately 60 LF of additional sewer piping that will run perpendicular to the proposed new water main in Twin Lakes Boulevard and Lake Champlain Drive. Each of the new pipes will extend from the sewer mains approximately 60 LF down each side street. The proposed changes to the sanitary sewer main scope of work includes the installation of approximately 38 additional new manholes, 33 new 8-inch to 18-inch Hymax couplings, approximately 2,700 LF of additional new 8-inch diameter PVC sanitary sewer mains, approximately 1,170 LF of additional new 18-inch diameter PVC sanitary sewer mains, and all associated fittings and appurtenances. The new 18-inch diameter PVC sanitary sewer main mentioned above will replace approximately 930 LF of existing 12-inch diameter PVC piping.

Service Area

The Township of Delran wastewater system serves all of the Township as well as approximately 10 users in Moorestown Township.

Need for Project

Sand Filter Improvements- The Township's Wastewater Treatment Plant includes an existing traveling bridge sand filter installed in 1994 as part of a plant upgrading. The plant staff has indicated that the existing unit is hydraulically inefficient and its rehabilitation or replacement has been identified as a priority project in the Township Sewer Utility Capital Improvement Program. Retrofitting the existing filter unit with similar technology will be considered as will replacement of the unit with a different technology. This improvement will not increase the capacity of the wastewater treatment plant. Fifth Street Pump Station Improvements- An evaluation of the Fifth Street Pump Station found it to be in need of varying degrees of improvement and it has been identified as a priority project in the Township Sewer Utility Capital Improvement Program. These improvements will not increase the capacity of the pump station.

Project Description

The proposed project will involve the improvements to the Fifth Street Pump Station.

Service Area

The station accepts flow from an 18-inch diameter gravity trunk sewer that conveys wastewater flows generally from portions of Delran Township east of Route 130 and south of Chester Avenue. Flow from the Township's Waters Edge and Summerhill Pump Stations are also tributary to the Clay Street Pump Station.

Need for Project

The purpose of the proposed project is to increase the reliability of the sewage pumping station and reduce the level of maintenance required to keep the pump station operational. The removal of the underground dry well will eliminate the extensive confined space safety procedures required to operate and maintain the pump station. The condition of the dry well also creates a potential hazard for maintenance personnel. New submersible pumps will replace existing worn pumps which were installed in 1993. Odor and corrosion control is needed to increase the operational life of equipment and structures.

Project Description

The improvements proposed to the Township's Clay Street Pump Station include converting the existing station to a submersible type station whereby new submersible sewage pumps on rails will be installed in the existing wet well which will be rehabilitated. A hoist will be provided so that the new pumps can be lifted out of the wet well from above. All electrical equipment and controls will be located above ground in an existing fiberglass building. A new precast concrete valve vault, a comminutor to replace the existing screening basket and a Bioxide odor control system will be installed as well. Also, the southwest corner of the pump station site will be stabilized to maintain the existing fence line, rough grading in the gravel driveway area will be performed to eliminate ponding and the existing manhole frame and cover in the driveway will be raised to meet the new grade. In addition, the force main discharge manhole will be replaced.

335

County

Sussex

Existing Population

15,888

Service Area

The Hopatcong Sewer Department provides sanitary sewer service in the Borough of Hopatcong. The customers are primarily residential except for municipal facilities, schools and some small businesses. The sanitary sewer system does not serve the entire Borough. The system presently has approximately 3,000 active accounts. Assuming 3 persons per account, the system supplies approximately 9,000 persons, or 63 percent of the total population. Residents not connected to the municipal sanitary sewer system have septic systems. The homeowners frequently turn to the municipal sanitary sewer system when their septic systems fail.

Need for Project

Wastewater system Asset Management Plans are important for municipalities to drive the inspection, maintenance, repair of and renewal of their infrastructure consistent with regulatory standards. The Asset Management Plan will fully document the overall condition and operation of the wastewater system and identify the priority and budgetary costs of future capital investments. The Asset Management Plan will evaluate the physical, demographic, renewal (replacement or rehabilitation), regulatory, operational efficiency, safety, and security planning drivers to identify capital investment needs into the future (15 years).

Project Description

The Borough of Hopatcong wishes to create and implement a Sanitary Sewer System Asset Management Plan through funding available from the (CW) Asset Management Plan Development; for Small CW Systems; populations <10,000. The Borough of Hopatcong (the Borough) owns, operates, and maintains a sanitary sewerage distribution system which benefits approximately 9,000 residents through approximately 3,000 connections. The Borough's sanitary sewer system consists of transmission mains, force mains, low pressure sewers, lateral connections, and pumping stations. The Borough wishes to report upon sound fundamentals in the planning, operation, maintenance, and reinvestment of its sanitary sewer system to assure a reliable sanitary sewer system to its customers, and potential customers. The Borough proposes to proceed with the following program of activities at this time: 1. Preparation of a Sanitary Sewer System Asset Management Plan 2. Geographic Information System (GIS) Update

Service Area

Service area will be throughout the limits of the Town of Hammonton

Need for Project

The Town of Hammonton Wastewater Treatment Facility is receiving an increase of flow due to infiltration of groundwater, stormwater and gray water into the sanitary sewer pipes. Slip-lining, upgrades, repairs and replacement are needed in order to rehabilitate the aging sewer infrastructure and reduce flow to the wastewater treatments facility.

Project Description

The Sewer Infrastructure project will include three projects at three different locations within the town of Hammonton: Slip-lining/replacement of older sewer lines; Improvements to the Boyer Avenue Pump Station, and Old Forks Road Sanitary Sewer Extension and repairs. The slip-lining of the older sewer lines will reduce infiltration from groundwater/stormwater, which will result in a reduction of flow to the treatment plant, thereby reducing total energy consumption for wastewater treatment.

Need for Project

Replacement of orangeburg sanitary laterals, installation of manholes, and replacement of sanitary main will reduce maintenance costs, ensure that residents have a reliable method for conveying wastewater from their homes, and ensure that the sanitary collection system continues to maintain compliance with necessary regulations. Improvements to the AWWTP Activated Sludge Tank and Influent Pump Station Dry Well ensure that the plant continues to operate and treat wastewater in accordance with State regulations prior to discharge to the Rocky Brook.

Project Description

This project is intended to include two separate contracts: Improvements to Orchard Avenue, Meadow Drive, and Clover Lane Improvements include replacement of existing orangeburg sanitary laterals, installation of new sanitary manholes, and replacement of sanitary sewer main as needed. AWWTP Activated Sludge Tank and Dry Well Improvements include rehabilitation of the existing Activated Sludge Tank and upgrades to the influent pump station dry well. Improvements at the Sludge Tank include replacement of deteriorated mechanical equipment, weirs, scum trough, clarifier drives, and minor electrical improvements. Improvements at the Influent Pump Station Dry Well include replacement of the well floor and replacement of pump stands.

Need for Project

The existing VCP (Clay) sewer transmission lines are experiencing excessive infiltration and inflow. This is increasing the treatment costs at the Wastewater Treatment Plant and causing overflows.

Project Description

The proposed 15-inch sanitary sewer line will help remediate the infiltrationinflow situation by preventing the leakage of groundwater into the collection system and therefore reducing the treatment costs at the plant as well as the transmission lines maintenance costs. This will also increase the capacity of the collection system. The existing deteriorated lines will be capped and abandoned.

Service Area

Borough of Manasquan

Need for Project

The air release valve assemblies are located on an existing 30-inch diameter DIP wastewater force main which conveys an average of 5 MGD. The force main has been in continuous operation for almost 25 years. In accordance with NJDEP requirements to evaluate the integrity of existing wastewater infrastructure the MRRSA conducted inspections of the air release valve assemblies and discovered significant corrosion. If any of these air release valve assemblies were to fail there would be a significant untreated wastewater discharge within the vicinity of an environmentally sensitive area and a commercial corridor. Replacement is necessitated to avoid failure of the force main at these locations. The MRRSA has no other means of conveying wastewater flow from the Upper Manasquan Pump Station.

Project Description

The project involves the replacement of three (3) existing air release valve assemblies on the 30-inch diameter Upper Manasquan Force Main within the Township of Howell. Line stops will be implemented to isolate the force main so that the air release assemblies can be replaced. Inspections of the existing air release assemblies have revealed significant corrosion and replacement is necessary to avoid failure of the force main at these three (3) locations. All work is to be performed within the previously disturbed right-of-way of Casino Drive and NJSH Route 9.

County

Burlington

Existing Population

4,283

Service Area

The service area for this project is the Delanco Sewerage Service area, which generally follows the municipal boundaries of the Township of Delanco with a few areas that are serviced by septic. The project itself will benefit infrastructure which includes <90% of all flow (the trunkline) as well as 100% of the sewerage in the service area (West Avenue Pump Station)

Need for Project

The lining of the trunkline, manholes and lateral connections will serve to "reset" the effective life of the deteriorated system, reduce I&I, and effectively increase the capacity of the main. The replacement of the pumps/controls at the West Ave. PS, the addition of emergency backup pumps and SCADA system will address a number of existing issues in the collection system at the PSs and improve operations. The pumps/controls at West Avenue were effectively obsolete for several years and "work arounds" and used replacement parts are needed to maintain operations. Emergency Backup Pumps will replace the aging and problematic generators which are relied on heavily due to frequent drops and loss of city power. They provide an extra level of redundancy for operations at the stations. SCADA would replace landlines which are unreliable in foul weather events, will reduce response times, and allow the operators to monitor the stations and allow for an informed response to emergencies.

Project Description

The project consists of two sub-projects designed to address the aging infrastructure in the Delanco Sewerage Authority's collection system. The first sub-project includes the CIP lining of the existing sanitary sewer trunkline within Delanco Township. This includes approximately 8,000 LF of 15" and 16" gravity sewer main, constructed of vitrified clay and asbestos cement pipe that was constructed in the 1940s. The trunkline is responsible for conveying over 90% of the Authority's waste to the neighboring Beverly Sewerage Treatment Plant. The proposed work includes the lining of the various sewer mains, rehabilitation of the associated manholes and lateral connections that were found to in need of rehabilitation based on a 2019 CCTV Inspection Project. The second sub-project includes improvements to the Authority's three (3) pumping stations. This work includes the replacement of pumps and controls at the West Avenue Pumping station, which is responsible for 100% of the Authority

Need for Project

The Boroughs sanitary sewer system is subject to excessive amounts of inflow and infiltration causing sewage to overflow in the collection system and at the treatment plant site during wet weather periods.

Project Description

The purpose of the project is to reduce rainfall-induced surcharging of the collection system and sewage treatment plant. The project involves an infiltrationinflow correction program including relining of pipes and removal of stormwater connections.

Somerset

Existing Population

3,500

Service Area

South Bound Brook Borough (West of Cedar Street to border of Borough).

Need for Project

The project is needed to reduce or eliminate sanitary sewer overflows in the Borough. The overflow into the Raritan Delaware Canal occurs periodically.

Project Description

The proposed project includes the construction of a relief sewer line to handle sewage from the overflow problem areas and direct the additional sewage to the regional Sewage Treatment Plant for treatment.

Need for Project

The water quality based need for the project will be satisfied by the replacement of old cracked sewer mains and laterals and the replacement of old manhole with new watertight manhole which will reduce infiltration and increased sewer flows into the conveyance system and eliminate potential groundwater and surface water contamination. In addition new water meters will provide for water conservation.

Project Description

The project consist of the replacement of old deteriorated sewer mains, manholes, sewer laterals, water meters and meter pits located on Curlew Rd., Kingfisher Rd. and Bass Rd. in the Borough of Tuckerton.

Service Area

The project will effect the 118 residential properties located on Heron Rd. The Borough of Tuckerton is located with the Southern Service area for Ocean County Utilities Authority. The Borough is bordered by Little Egg Harbor Twp. to the North, South and West and by the Barnegat Bay to the East. The sewer flows by gravity to the Tuckerton Beach Pump Station located on S. Green St..

Need for Project

The proposed project is to replace old terracotta sewer mains which show signs of cracks, breaks, spalls and settlement and which contributes to the increased cost due to infiltration. The system was cleaned and video inspected to confirm the extent and need for replacement.

Project Description

The project consist of the replacement of the existing sanitary sewer mains, manholes and service laterals located within on Heron Road, which is located in the Tuckerton Beach section of the Borough.

Need for Project

The Boroughs sanitary sewer system is subject to excessive amounts of inflow and infiltration causing sewage to overflow in the collection system and at the treatment plant site during wet weather periods. The Hickory Street Pump Station and the existing trunk sewer are not adequate to handle peak flows causing back-ups and overflows.

Project Description

The project includes replacement or relining of 8000 feet sewer lines construction of 10 new manholes sealing 110 existing manholes and inspection of another 5100 feet of sewer line. The Hickory Street Pump Station will be rehabilitated and upgraded and a new force main constructed to by-pass the existing trunk sewer.

Need for Project

Infiltration/Inflow (I/I) studies conducted have revealed that the Borough Sanitary Sewer System is possibly subject to excessive I/I. Sanitary sewer lines are in excess of 80 years old. The leaking joints have caused sinkhole problems accelerated street deterioration and excessive infiltration/inflow. Additional work is needed on the stormwater sewer system as well.

Project Description

The Borough proposes to replace the existing deteriorated sanitary sewer lines service laterals and storm sewer lines including refurbishing approximately 500 sanitary sewer manholes relining the influent sewer line at the 23rd Street Pump Station replacing sanitary lines on Heron Drive Pelican Drive and the Business District replacing storm lines in the Business District and replacing/relocate 11th Street Pump Station and stormwater outfall.

Need for Project

The sewer distribution system is aging and needs to be replaced. The existing sewer main and services are a combination of Vitrified clay pipe and Asbestos-Cement pipe. Over time this pipe undergoes degradation in the form of corrosion. The clay pipe can collapse due to age and can cause sewer blockages.

Project Description

The project includes the replacement of aging sewer distribution system on various streets in the Borough of Stone Harbor. It includes 7,200 L.F. of sewer main and 148 services. Once the sewer system is replaced the roadway would be reconstructed to provide a proper asphalt thickness for the traffic load.

Sanitary Sewer System Rehabilitation

Priority List Rank

352

County

Essex

Existing Population

37,669

Service Area

The MSA service area (a.k.a. the "planning area") includes all of Montclair Township, Essex County, New Jersey. The Township of Montclair covers a geographic area of 6.16 square miles. The Township is situated on the east-facing slope of the first Watchung Mountain and is bounded to the north by Clifton and Little Falls in Passaic County, to the south by the Township of Orange (Essex County), to the east and northeast by Bloomfield, Glen Ridge and East Orange (all Essex County), and to the south and west-northwest by Verona (Essex County), Cedar Grove (Passaic County), West Orange and Orange (both Essex County).

Need for Project

Manholes of the existing collection system are deteriorated and subject to inflow and infiltration resulting in excess flows in the sewer system due to admission of groundwater to the system. The sewer manholes in the system are largely constructed of brick and most are over one hundred years old. Specific areas have been identified as the target area for the collection system rehabilitation program; the scope of this project is specific to manholes of sewer mains that were recently rehabilitated under projects -03 and 04. These areas have been selected due to the high frequency of repairs, high maintenance requirements and observed infiltration and inflow in the system. These conditions would hazard public and environmental health, and would require greater disruption for emergency repairs than would a planned approach by addressing complete replacement of manhole frame and covers and structural rehabilitation of the manhole itself.

Project Description

The Township of Montclair Sewer Authority (MSA) will rehabilitate sanitary sewer collection Manholes. The scope of this project is to address manholes from the same sanitary sewer segments that were rehabilitated under NJEIFP Project No.s S340837-03 and 04 projects. These manholes are deteriorated and subject to inflow and infiltration (I&I) resulting in excess of groundwater infiltration to the system. MSA has planned for the repair/rehabilitation of the affected manholes to assure that wastewater is safely conveyed through the sewers to the regional wastewater treatment facility and reducing excess flows due to groundwater infiltration.

City of Orange

Need for Project

A sewer system evaluation survey recently performed by Killam Associates for the City of Orange recommended that the combined sanitarystorm sewer systems should be eliminated by internally sealing the overflow weirs in the combination sanitarystorm sewer manholes. In conjunction with sealing the overflows a program of sewer pipe rehabilitation should be undertaken to reduce infiltration and sewer surcharging conditions.

Project Description

A phased program of sewer system rehabilitation to eliminate sanitary sewer overflows to the Wigwam Brook is being undertaken by the City. The first phase of this program will include sealing the overflow weirs in 21 combination sanitarystorm sewer manholes replacement of approximately 250 linear feet of 15 and 18 sewer pipe and sealing underdrain access openings in 20 manholes. The second phase includes replacing approximately 245 linear feet of sewer pipe and slip lining approximately 830 linear feet of pipe. The third phase includes eliminating a bend in the interceptor sewer by constructing a new manhole.

Need for Project

Elimination of infiltration, inflow and exfiltration in and out of sanitary system.

Project Description

Providing for various improvements including repairs, remediation and replacement of the sewer lines and stormwater collection system, including survey of sanitary sewer leaks and stormwater capacity. Pursuant to NJ DEP Violations NJAC 7:19-6.6; 7:19-6.6;7:19-6;7:10-11.6;7:19-11.5(i);7:19-11.2 Collection System Remediation. Orange Twp Waste Water Collection System is made up of a network of 30.6 Miles of pipe divided into a series of 4 major sewer basins. The work will occur at multiple sites, some within the public right-of-way. OWW serves as the collection system for public and commercial centers, as well as residential neighborhoods. The purpose of the OWW Sewer Rehabilitation Project is to upgrade and rehabilitate aging pipes and distribution lines. Cracked sewer pipes and laterals allow outside rainwater and groundwater to flow into the sewer system.

Need for Project

This project is needed because inflowinfiltration of the 75 year old or older sanitary sewer piping systems and interconnection storm water overflows allow sanitary sewer to flow into the Rahway River untreated especially during storm events. The river is the drinking water source downstream for Rahway. This is required to minimize the risk of a system failure to assure proper functioning and to prevent backups.

Project Description

The proposed project includes reduction of inflowinfiltration into the Rahway River through elimination of 1200 linear feet of old 15 sanitary sewer main lining of 1200 linear feet of 8 pipe lining of 100 vertical feet of manhole and removing four storm water sanitary sewer cross connections.

Service Area

The project will serve the City of Pleasantville. Specifically, the sanitary sewer replacement projects are located on Collings Avenue, Decatur Avenue, Ansley Boulevard and Ridgewood Avenue. Also, sewage grinding systems are planned at the California Avenue and the Woodland Avenue pump stations.

Need for Project

The sewer service system in the described areas is old and in need of replacement. If replacement, the chance of leaking and contamination is reduced.

Project Description

This project includes the replacement of sanitary sewer lines on Collins Avenue, Decatur Avenue, Ansley Boulevard and Ridgewood Avenue. In addition it will include the installation of a sewage grinder system. at the Woodland Ave. and California Pump Station.

Need for Project

Malfunctioning sewer system can result in ground water and surface water contamination.

Project Description

Several sewer mains have been identified as needing immediate rehabilitation/reconstruction. The streets identified most in need are Ridgewood Avenue, Bayview Avenue, Decatur Avenue, and Ansley Boulevard. The condition and operating components of a pump station are critical factors affecting their overall function. Improvements include installing a backup generator at the Doughty Road pump station. Pump station improvements are proposed for Doughty Road, California Avenue, Woodland Avenue, and Evan Lane along with various maintenance enhancements.

Project Name, Number

Collingswood Borough
S340291-04
Sanitary Sewer System Rehabilitation

Priority List Rank

359

County

Camden

Existing Population

13,926

Service Area

The Borough of Collingswood is a small municipality (2.0 +/- square miles) located in Camden County, NJ. According to the 2010 United States Census it has a population of 13,926. It shares municipal borders with the City of Camden, Haddon Township, Borough of Oaklyn, Pennsauken Township and the Borough of Woodlynne. Cooper River forms the northerly municipal boundary and Newton Creek forms the southerly boundary. The Highspeed Line (a railroad corridor to Philadelphia, PA) approximately bisects the Borough in the northwest/southeast direction. As designated by the State of New Jersey, the Borough is located within Planning Area (PA) 1, which is the Metropolitan Planning Area.

Need for Project

The Borough is responsible for maintaining the sanitary sewer lines throughout the municipality, and in order to continue sewer service throughout the community, the system requires periodic upgrades and maintenance. These upgrades and maintenance activities are scheduled and planned, in order to maintain the system in good operating condition. Sections of the system are aging and approaching the anticipated lifespan for adequate operation. System upgrades are necessary and must be completed for the Borough to fulfill its obligation of providing sanitary sewer service to its residents and businesses. The municipality has a contractual obligation to provide sanitary sewer services, and to make capital improvements as necessary to fulfill that obligation.

Project Description

In general, the work on this project consists of the rehabilitation and removal and replacement of the existing Harrison Avenue sanitary sewer main for the Borough of Collingswood, Camden County, New Jersey.

City of South Amboy

Need for Project

The sewer systems in the City of South Amboy constructed prior to the use of secondary treatment methods did not set strict limits on the volume of infiltration and inflow within sanitary sewers since treatment costs were not greatly affected by these extraneous flows. However in recent years the construction costs of conveyance facilities coupled with rising treatment costs associated with secondary treatment methods have resulted in efforts to eliminate infiltration and inflow in areas where it is proven to be cost-effective.

Project Description

The proposed project is to provide II correction for South Amboys existing sewer system.

Service Area

The Middlesex County Utilities Authority (MCUA) owns and operates a regional wastewater treatment facility referred to as the Central Treatment Plant (CTP) that serves 36 municipalities within Middlesex County and portions of Somerset and Union Counties in Central New Jersey.

Need for Project

The replacement of the existing mechanically cleaned screens, and the installation a screening conveyor and washer compactor at the Green Brook Pump Station will reduce the screenings load conveyed to the downstream Sayreville Pump Station. Additionally, the proposed floodproofing improvements and permanent generator to be constructed at the pump station will allow for the continued conveyance of wastewater during certain flooding events up to the design flood elevation. The existing Bound Brook Pump Station is in excess of 60 years old and is functionally obsolete. Replacement of the pump station will allow the Authority to continue to provide uninterrupted wastewater conveyance service to the residents and businesses within the Borough of Bound Brook and a portion of Bridgewater Township. The Landfill Gas Booster Pump Improvements project is a part of the Authority's overall wastewater collection and treatment system and failure of the facility will cause disruption to the system.

Project Description

The Authority will be undertaking Pump Station Rehabilitation which consists of two (2) projects: 1) Bound Brook Pump Station (BBPS) Replacement and 2) Landfill Gas Booster Pump Improvements and Relocation. The BBPS includes replacement of the existing 60 years old plus pump station with a new pump station consisting of submersible pumps, solids handling, control valves, an emergency generator, interconnecting pipe and flood protection. The LFG Booster Pump Improvements include the installation of three new blowers and associated electric and controls inside the recently constructed Edison PS floodwalls and abandonment of the existing blowers.

Project Name, Number

Woodbridge Township
S340433-13
Sanitary Sewer System Rehabilitation

Priority List Rank

363

County

Middlesex

Existing Population

0

Service Area

The project is located within the Rahway Valley Sewerage Authority (RVSA) sewer service area. The RVSA service area covers approximately 45 square miles in northeast Middlesex County and central Union County, New Jersey. RVSA currently serves Clark, Cranford, Fanwood, Garwood, Kenilworth, Linden, Mountainside, Rahway, Roselle Park, Scotch Plains, Springfield, Westfield, Winfield, and Woodbridge. RVSA is currently permitted to discharge 40 million gallons per day under NJPDES permit #NJ0024643.

Need for Project

The purpose of the project is to improve effluent quality during peak flow periods, reduce potential environmental contamination, reduce the potential for sewage exfiltration and reduce maintenance and operating problems and costs. The project will reduce inflow and infiltration and need for emergency repairs. In addition to addressing environmental issues associated with sewer backup and overflow, operating and maintenance should be improved. The I/I study and associated collection system improvements along with replacement of existing undersized with larger diameter sewer will reduce the potential for sewer overflows and improve reliability and operations of the system. Installation of grinder pumps for properties along Stafford Road will alleviate sewage backups into homes prior to completion of sewer replacement and system improvement work.

Project Description

Woodbridge Township faces ongoing issues with its sanitary sewer system from the intersection of Stafford Road and Surrey Lane to Ravine Drive, crossing RT 27 and the Amtrak Railroad to the Rahway Valley Sewerage Authority (RVSA) 48" trunkline in Merrill Park. Heavy rain events cause surcharging in the system and sewage backups in Stafford Road homes. Previous investigations by the Township found pipes and manholes to be in satisfactory condition, but some sections lack NJDEP-required conveyance capacity of 4 times average daily flow. Surcharging results from limited downstream capacity and excessive extraneous flow in the tributary drainage basin C-1. The proposed project involves investigating and repairing infiltration/inflow issues, replacing 3,500 linear feet of 10" sewer with larger diameter sewer from Stafford Road to the 48 RVSA trunkline, and installing grinder pumps for 10 Stafford Road homes.

Middlesex

Existing Population

867,708

Service Area

The MCUA collects and treats on average 102 MGD of wastewater from 36 communities and supporting industries in Middlesex County and portions of Somerset and Union Counties. A list of municipalities and a map of the overall service area are included in the Project Report. The Main Trunk Sewer collects wastewater from Dunellen, Middlesex, Piscataway, and South Plainfield in Middlesex County, and Bound Brook, Bridgewater, Franklin, Green Brook, North Plainfield, and South Bound Brook in Somerset Counties.

Need for Project

The MCUA will be rehabilitating a portion of its Main Trunk Sewer through this Project. There will be no impact to surface waters, however, the rehabilitation work will significantly reduce the potential for adverse impacts from the failure of old and deteriorated sanitary sewers.

Project Description

(Carryover SFY2015) - The MCUA is intending to rehabilitate a portion of the existing Main Trunk Sewer (MTS) located in Piscataway New Jersey using trenchless rehabilitation technologies. This is the second of seven (7) phases that are required to address deterioration within portions of the MTS constructed of Corrugated Metal Pipe (CMP) segments. This Phase will rehabilitate the CMP pipe segments that can carry up to 46 million gallons per day (MGD) of raw wastewater. The Project will include segmental sliplining of approximately 5900 feet of 60 CMP sewer pipe installed in the 1950s repair and restoration of manholes bypass of flows environmental protection and site restoration activities.

The Main Trunk Sewer collects wastewater from Dunellen, Middlesex, Piscataway, and South Plainfield in Middlesex County, and Bound Brook, Bridgewater, Franklin, Green Brook, North Plainfield, and South Bound Brook in Somerset Counties.

Need for Project

The MCUA will be replacing and protecting major mechanical and electrical components at the Sayreville Pump Station through these Projects. The work will have no impact to surface waters. The restoration and mitigation measures proposed for these projects will significantly reduce the potential for adverse impacts from future failure of this pump station equipment following a similar storm event.

Project Description

(Carryover SFY2015) - The Project involves the restoration of mechanical HVAC and electrical equipment instrumentation and control equipment and building repairs for both the Sayreville Relief Pump Station and the Original Sayreville Pump Station facilities damaged by flood water from the Hurricane Sandy surge. The Project also involves the construction of a Flood Wall as a mitigation measure to protect the entire site from future flood events which will require the relocation of the present Main Electrical Substation and the Diesel Generator.

Need for Project

The MCUA will be rehabilitating a portion of its Main Trunk Sewer and meter chambers through this Project. There will be minimal impact to surface waters during construction however the rehabilitation work will significantly reduce the potential of adverse impacts from the failure of old and deteriorated sanitary sewers and structures.

Project Description

The project encompasses two separate construction Contracts due to the nature of the work and the specialties of prospective bidders. The MCUA is intending to rehabilitate a portion of the Main Trunk Sewer (MTS) located in the northernmost portion of the service area. This is the third phase in several phases required by the Authority to address deterioration within the pipeline most of which was constructed in the 1950's. The variety of facilities to be rehabilitated are included in an effort to take advantage of costly diversion and bypass pumping of flows around the work areas which otherwise would be required to be performed on multiple occasions. The second Contract is for Meter Chamber Rehabilitation, Phase II consisting of the rehabilitation of eleven chambers and various connected pipes through-out the Authority's system. This is the second of multiple phases required to provide structural rehabilitation and apply protective coatings to prevent further deterioration.

County

Ocean

Existing Population

600,000

Service Area

The service area consists of Point Pleasant Beach Borough and is mainly comprised of single family dwellings located on 1/4 acre lots. The commercial area located along County Route 635 and the Point Pleasant Beach Boardwalk are also served by this interceptor. The service area is almost fully developed and the project area is located within improved rights-of-way.

Need for Project

The proposed rehabilitation work will address potential areas of infiltration along the 7,015 linear feet of interceptor and increase the useful life of the interceptor. Reducing infiltration into the interceptor will improve the quality of the raw wastewater, improve treatment and reduce the treated volume of wastewater.

Project Description

The Point Pleasant Beach Interceptor (NI-13) in the Northern Service Area was inspected in 2011 and found lengths in poor condition with lining and material loss. This project will include the rehabilitation of 1185 linear feet of 24-inch diameter pipe 2364 linear feet of 27-inch diameter pipe and 3466 linear feet of 30-inch diameter pipe for a total of approximately 7015 linear feet from the NI-13 MH 10-8 to NI-12 MH 13-2 utilizing cured-in-place (CIPP) technology and the rehabilitation of sanitary sewer manholes. This work is not anticipated to require any excavation or result in any permanent disturbance.

The OCUA complete

Need for Project

The purpose of this project is to provide additional emergency power generation sources for the Authority in the event of extensive and prolonged commercial power outages to ensure no interruptions in collection system operations are experienced and to minimize the possibility of raw sanitary sewage discharge to the Barnegat Bay.

Project Description

This project involves the procurement of one trailer mounted generator for use as emergency backup power for 38 of the forty (40) Authority pump stations located throughout Ocean County. The Authority is proposing to purchase a 500 kW diesel generator capable of providing electrical power during periods of commercial power outage.

Service Area

The BCUA's Service Area consists of forty-seven municipalities and a portion of five non-member municipalities. The thirty-eight municipalities entirely served by the BCUA WWTP include Bergenfield, Bogota, Carlstadt, Closter, Demarest, Dumont, Emerson, Edgewater, Englewood, Englewood Cliffs, Fairview, Harrington Park, Haworth, Hillsdale, Leonia, Little Ferry, Maywood, Montvale, Moonachie, New Milford, Northvale, Norwood, Old Tappan, Oradell, Palisades Park, Paramus, Park Ridge, Ridgefield, Ridgefield Park, River Edge, River Vale, Rochelle Park, Teaneck, Tenafly, Teterboro, Westwood, Woodcliff Lake and Wood-Ridge. The eight municipalities partially served by the BCUA WWTP include Cliffside Park, East Rutherford, Fort Lee, Hackensack, Hasbrouck Heights, Rutherford, South Hackensack and Washington Township. The five nonmember municipalities partially served by the BCUA WWTP include Alpine, Lodi, Lyndhurst, North Bergen, and Ridgewood. Portions of Cliffside Park, Fort Lee, Hackensack.

Need for Project

The NVFM is comprised of 42-inch diameter prestressed concrete cylinder pipe (PCCP). The force main extends a distance of 22,679 feet from Harrington Park Pumping Station to its connection with the Hackensack Valley Trunk Sewer in the Borough of Oradell. A 2014 condition assessment inspection identified concerns and recommended the replacement of segments of the 42-inch PCCP. BCUA plans to replace approximately 260 linear feet of this 42-inch PCCP section. In addition, the project includes the installation of four air release valves along the Northern Valley Force Main and the installation of one air release valve along the Northvale Force Main. The air release valves are proposed at locations of gas pockets that were detected during the condition assessment of the two force mains.

Project Description

BCUA's Northern Valley Force Main performed a condition assessment of 42-inch prestressed concrete cylinder (PCCP) pipe and identified segments of PCCP that are need of replacement.

Monmouth County Bayshore Outfall Authority
S340325-04
Sanitary Sewer System Rehabilitation

Priority List Rank

368

County

Monmouth

Existing Population

550,000

Service Area

MCBOA serves two customers, the Bayshore Regional Sewerage Authority (BRSA) and the Township of Middletown Sewerage Authority (TOMSA), which collectively serve most of the communities along the Bayshore. These communities include the Boroughs of Atlantic Highlands, Highlands, Keansburg, Keyport, Matawan, and Union Beach, as well as, the Townships of Aberdeen, Hazlet, Holmdel, Middletown and a portion of northern Marlboro that is located in the franchise area of the Western Monmouth Utilities Authority but is served by the BRSA.

Need for Project

MCBOA owns and operates approximately 72,000 LF of force main, which was constructed in the early 1970's out of PCCP ranging in size from 36-inch to 48-inch in diameter. Due to its large diameter and high internal pressure, failure of PCCP can be catastrophic impacting environmentally sensitive areas including shellfish beds, cause significant property damage, and pose a public safety risk. Since the late 1990's MCBOA has experienced several leaks and/or breaks that have resulted in shellfish bed closures and raised concerns with the potential for force main failure.

Project Description

MCBOA's Force Main Rehabilitation Project includes the rehabilitation and/or repair of its existing 14 mile pre-stressed concrete cylinder pipe (PCCP) force main where necessary. Improvements may include internal lining of the existing 36-inch to 48-inch force main, replacement of pipe or joint sections or other miscellaneous improvements.

Need for Project

conveyance of sanitary wastewater from various locations in the County to the Delaware #1 WPCF

Project Description

The CCMUA owns and operates 135 miles of interceptors throughout Camden County. One portion of the system, a force main in Berlin Twp, was found to be leaking on November 21, 2019. During the repair, it was determined the pipe was corroded at bottom which was due to forces from outside the pipe which is irregular for a force main break. During the repair, another section of force main began to leak. This section of pipe was corroded in the same fashion as the first. This section was also replaced. Thereafter, another section of pipe was weeping. This section was not repaired because the Authority did not want to "chase" the pipe down the roadway. The CCMUA declared an emergency and hired a design consultant to ascertain the cause of the corrosion and prepare a design for the rehabilitation or replacement of the damaged force main.

Service Area

The Central Service Area (CSA) provides service to the municipalities of Barnegat, Beachwood, Berkeley, Brick (barrier island portion), Toms River, Island Heights, Lacey, Lakehurst, Lavallette, Manchester, Mantoloking, Ocean, Ocean Gate, Pine Beach, Seaside Heights, Seaside Park, and South Toms River. The Authority's CSA is comprised of the Central Water Pollution Control located on Hickory Lane in Bayville, 19 pump/lift stations, 24 miles of force main, and 52 miles of gravity interceptors. The CWPCF was placed into operation in 1979, provides secondary treatment, and is rated at a capacity of 32 MGD. Effluent is discharged into the Atlantic Ocean through an outfall diffuser located approximately 6,000 feet out from the shore of Seaside Park.

Need for Project

The Federal and State Act require that all wastewater management plans be in conformance with the WQMP and permits issued under the New Jersey Pollutant Discharge Elimination System (NJPDES) must also conform to the plan. None of the proposed projects under this Planning Document Submission will modify the ability to collect and treat sewage in any of the service areas. Therefore, these projects are consistent with the Ocean County Water Quality Management Plan (WQMP). Pursuant to NJAC 7:22-3.11 and 4.11, "A cost-effective analysis of the feasible, conventional, innovative and alternative technologies capable of meeting the applicable effluent, water quality, and public health requirements over the design life of the facility while recognizing environment and other non-monetary considerations" must be performed. This project will ensure that all of the facilities continue to achieve permit conditions, as well as protect the environment from system or equipment failure.

Project Description

Project No. CD2212 CSA Emergency Power Improvements (CPS-2-8-11-12-13-17), includes, the replacement of the existing emergency diesel generators located inside Central Pump Stations CPS-2, 8, 11, 12, 13, and 17 with new generators, include diesel fuel base tanks, to be located outside the pump station on a concrete pad. The Work also includes temporary bypass systems, the replacement of Automatic Transfer Switches at five (5) of the stations.

Need for Project

To eliminate excessive infiltration and inflow and to extend the useful life of the sewer.

Project Description

RVSA operates a 35 mgd secondary sewage treatment facility with a sewer configuration 300 miles in length. The II report indicates that the RVSA's sewer system is susceptible to an excessive II of 3 mgd which may be cost-effectively removed. This will be verified in the upcoming SSES phase. An Infiltration/Inflow correction program will follow thereafter.

Sanitary Sewer System Rehabilitation

Priority List Rank

377

County

Middlesex

Existing Population

107,588

Service Area

The service area for the proposed phased construction contracts is coterminous with the Township boundary limits.

Need for Project

Between 2013 and 2018 the Township of Edison reported over 30 instances of unpermitted discharges of raw sewage from its sanitary sewage infrastructure. As a result the Township is coordinating with the NJDEP and is in the process of being issued an Administrative Consent Order (ACO) to address various deficiencies within their existing gravity and pressure collection system.

Project Description

The proposed project includes assessment and rehabilitation/repair of the Townships existing gravity and pressure sewer collection system based on the criticality of each system component. The existing gravity sewer collection mains and manholes and pressure force main will be internally investigated and/or televised to identify potential defect areas and evaluate their feasibility for rehabilitation or repair based on the quantity of flow through the defect, accessibility to the defect and expected life span. Based on the system evaluation, gravity sewer collection mains and manholes and pressure force mains selected will be rehabilitated or repaired under multiple contracts either using chemical grouting, internal coating systems, Cured-In-Place Pipe (CIPP) lining, sliplining, spiral wound pipe and/or replaced using trenchless or conventional excavation methods. Existing project areas will be regraded and or topsoiled and returned to existing conditions once work is completed.

Need for Project

The Authority treats over 12 million gallons per day of sewage which approximates 4 billion gallons per year. All of the sewage treated by the Authority flows first to the Main Pump Station. The continuous operation of the Main Pump Station is critical to the Authority's ability to protect the environment.

Project Description

The proposed project includes replacement of the main pumping station.

Borough of Dunellen Green Brook Township North Plainfield Borough and a portion of Bridgewater Township

Need for Project

These projects are needed to maintain reliable sewage conveyance. These projects will update existing facilities that are no longer reliable. Failure of the existing facilities will result in a large sewage spill.

Project Description

The Plainfield Area Regional Sewerage Authority proposes to construct a pump station to replace the Rock Avenue siphon in PlainfieldNorth Plainfield and convert one of the existing siphon barrels into a force main. The siphon was constructed circa 1913 and a portion was rebuilt in 1973. The siphon has become problematic and unreliable. The pump station will be sized for a peak flow of 7.0 MGD. One of the existing 20 CIP siphon barrels will be lined with 18 HDPE. The second contract will be to slipline 800 L.F. of 42 diameter RCP with 36 PVC liner. The existing pipe has extensive damage and is in danger of failure.

Sanitary Sewer System Rehabilitation

Priority List Rank

378

County

Middlesex

Existing Population

0

Service Area

The Port Reading Interceptor has experienced odor and corrosion problems for many years. The 36" diameter reinforced concrete gravity sewer receives the majority of the flow from the Borough of Carteret by way of a 15,300 ft long, 27" diameter force main comprised of prestressed concrete cylinder pipe. The condition of this force main has deteriorated. Of the estimated 3.5 MGD dry weather flow in the Port Reading Interceptor, approximately 0.4 MGD of flow is contributed from the Cliff Road Pump Station through 1,200 ft of 12" diameter Ductile Iron force main. Virtually all of the concrete in Port Reading Interceptor above the waterline, as well as the manholes between the discharge of Carteret force main and the Woodbridge siphon are severely corroded due to the presence of hydrogen sulfide (H₂S) and must be rehabilitated or replaced.

Need for Project

NONE

Project Description

The Port Reading Interceptor consists of a 36-inch Reinforced Concrete Pipe (RCP) approximate length of 3,594 ft from manhole M1 just downstream of the Carteret metering chamber to the Woodbridge Pumping Station influent manhole just upstream of the Grit Chamber (MH1). Segment 1 includes 16 gravity pipe sections and 17 MH (Interceptor Sewer System). The gravity line is capable of accommodating a 15.93 MGD peak wet weather flow rate. The Port Reading Interceptor carries 3.5 MGD dry weather flow and 11.0 MGD peak wet weather flow. The Borough of Carteret contributes approximately 86% of the flow and 98% of the sulfide to the interceptor Sewer System. The project seeks to rehabilitate the sewer line and manholes to extend their service life cycle. The intent is: 1) Replace all sections of 36" RCP with direct buried 36" centrifugally cast fiberglass reinforced polymer pipe. 2) Replace 15 MH with PVC lined MH

The existing Segment 5 is 48-inch RCP pipe traveling approximately 5,050 feet from the Route 440 Siphon Outlet Chamber to the Smith Street Siphon Inlet Chamber. Flow from the Perth Amboy Metering Chamber enters the 48-inch Interceptor upstream of Maplewood Avenue.

Need for Project

None

Project Description

The Keasbey Interceptor Segment Five consists of a 48-inch Reinforced Concrete Pipe (RCP) (approximate length of 4,545 feet from the Route 440 Siphon Outlet Chamber to the Smith Street Siphon Inlet Chamber located in the Township of Woodbridge. Segment Five includes 21 gravity pipe sections, (20) manholes, the Route 440 Siphon Outlet Chamber, and the Smith Street Siphon Inlet Chamber (Interceptor Sewer System). Flow from the City of Perth Amboy (C/PA) is pumped to the Perth Amboy Metering Chamber and then flows by gravity to the Segment Five Interceptor sewer system upstream of Maplewood Avenue. The Interceptor Sewer System carries 16.1 MGD dry weather flow and 38.1 MGD peak wet weather flow. Overall, Segment Five was found to be in a highly deteriorated condition due to hydrogen sulfide corrosion. Based on these condition assessments, various alternatives were examined for the rehabilitation and the mitigation of odors and corrosion for the Interceptor Sewer System.

The concrete trunk sewers are over 50 years old and suffer from hydrogen sulfide damage. They will collapse sometime in the next 50 years if not repaired resulting in the overflow of raw sewage into the environment and buildings within Hamilton Township.

Project Description

The proposed project includes rehabilitation of sanitary sewers that are over 50 years old. Most of the pipes involved are concrete trunks 48 inches in diameter or less. All the associated man holes structures and some adjacent contributory pipes will also be refurbished. Total length of pipe involved is about one half mile. The majority will be lined. Some spot repairs or pipe replacement may be needed. The pipes involved are mostly under Newkirk Avenue and Wert Avenue in Hamilton Township.

Service Area

The Toms River Municipal Utilities Authority (TRMUA) serves ~ 43,000 customers throughout Toms River, Ocean County, New Jersey. Toms River has a population of ~90,000 with a density of ~2,300 people/sq. mile of land area (Data from <https://datausa.io/profile/geo/toms-river-nj>). The median household income in 2019 was ~\$77,000 (<https://datausa.io/profile/geo/toms-river-nj>). The TRMUA collects wastewater from the Twp of Toms River and portions of the surrounding communities of Lavallette, Island Heights, Berkeley Township, Manchester Township, Brick Township and Jackson Township, through an infrastructure consisting of: approximately 430 miles of gravity sewer mains and collectors; over 9,600 manholes; 20 pump stations and force mains. The collected wastewater is conveyed to the Ocean County Utilities Authority (OCUA) Central Plant for treatment and subsequent disposal. The TRMUA (fka DSA, DMUA) was established in 1949.

Need for Project

Although the TRMUA has rigorous preventative maintenance programs, regular ongoing studies & inspections have revealed that continuing maintenance and upgrades/rehabilitations are necessary. In this regard the TRMUA has had a Capital Improvement Program (CIP). The goal of the CIP is to ensure that the TRMUA infrastructure is to provide efficient operations while preventing catastrophic failures which could result in a detriment to the surrounding water bodies which are contributory to the Barnegat Bay. The CIP is a result of thorough Infrastructure Inspection and Analysis. Since the TRMUA began aggressive rehabilitation of pipes and manholes beginning in the year 2010, the metered treatment flows have been consistently below the average from previous decades. The reduction has been approximately 400 MG/Yr.

Project Description

Replacement/Supplemental Force Main Installation [Contract FM9-01-20]: Directionally drill installation of replacement/supplemental force main to have backup/redundancy/inspection to existing force main, which was installed >50 yrs ago

Project Description

(Carryover SFY2015) - The design of a permanent gravity sewer connection of the Park section sewers which previously crossed under Route I-287 and connected to the Jersey City Trunk Sewer (JCTS) just upstream of the river crossing. The new gravity sewer will extend the existing sewer along Morris Avenue and connect to the existing JCTS on the west side of Route I-287. The construction of a pumping station located upstream of the washout on Monroe Street will discharge into a 12 force main located along Lincoln Street which will connect to the existing JCTS downstream of the washed out river crossing. In addition gravity sewers will be constructed on Monroe St and Forbush St to provide service to the properties that were discharging into the now abandon portion of the JCTS. The Authority also proposes to rehabilitate approximately 4400 lf of Jersey City Trunk Sewer will remain in service receiving wastewater flow from the new Lincoln Street force main.

Service Area

The three pump stations included in this contract (Melody, Middleton, and Elkton) serve the areas immediately around the sites. These areas are primarily residential and are at or near maximum capacity. No new flow is anticipated at these locations.

Need for Project

The existing Melody and Middleton pump stations have reached their useful life and must be replaced or upgraded. The existing air lift system must be replaced with current technology, the existing structure consists of a steel tube which has likely deteriorated, and the existing wet well is difficult to access due to the structure layout which makes maintenance difficult. Replacing these stations with new wet well submersible systems will allow for continued uninterrupted use, better maintenance and eliminate any potential infiltration that the existing wet wells may be experiencing.

Project Description

The existing Melody and Middleton Pump Stations are air lift stations that were installed approximately 40 and 60 years ago, respectively. The systems have been difficult to maintain and have reached their useful life. The Township proposes the full replacement of both pump stations which shall include removal of the existing stations, installation of a precast concrete drywell, submersible pumping system, comminutor, bypass chamber, davits, electrical service upgrade as needed, meter, and site improvements. Site improvements include modifications to the fence line, driveway paving, water service and yard hydrant installation, and site lighting. Additionally, minor site improvements will be provided at the Elkton Pump Station including a new driveway and water service line with yard hydrant.

Service Area

The Toms River Municipal Utilities Authority (TRMUA) serves approximately 43,000 customers throughout Toms River, Ocean County, New Jersey. Toms River has a population of 90,463 with a density of 2,323 people/sq. mile of land area (2010 Census Data). The median household income in 2018 was \$77,971 (hometownlocator.com). The TRMUA collects wastewater from the Twp of Toms River and portions of the surrounding communities of Lavallette, Island Heights, Berkeley Township, Manchester Township, Brick Township and Jackson Township, through an infrastructure consisting of: approximately 430 miles of gravity sewer mains and collectors; over 9,600 manholes; 20 pump stations and force mains. The collected wastewater is conveyed to the Ocean County Utilities Authority (OCUA) Central Plant for treatment and subsequent disposal. The TRMUA (fka DSA, DMUA) was established in 1949 and has been providing public sanitary sewer service to its patrons for 69 years.

Need for Project

The TRMUA aggressively inspects interior conditions of approximately 430 miles of gravity sewer mains for purposes of determining necessary pipe repairs/replacements, etc. The current TV Inspection Truck has outlived its useful life and a replacement is needed to effectively continue the uninterrupted assessments of the aging infrastructure. PS 10 has an existing natural gas-powered emergency generator that is at, or nearing, the end of its useful life. In recent years, the existing generator has been utilized during significant storms and heavy winds, due to power losses. It has been determined that the existing stationary, standby generator should be replaced soon, in order to maintain uninterrupted sanitary sewer service. PS 16 is TRMUA's largest pump station, processing ~ 1.2 MGD, and it has been determined that the existing influent channel comminutors are nearing the end of their useful lives. New comminutors/grinders are now desired to promote a smoother influent flow.

Project Description

Purchase of (i) One Closed Circuit TV, San Sewer Pipe Inspection Truck, (ii) One NatGas-powered emergency generator (and installation) for PS 10, (iii) Two Comminutors/Dimminutors/Grinders (and installation) for PS 16

Sanitary Sewer System Rehabilitation

Priority List Rank

386

County

Ocean

Existing Population

91,239

Service Area

The Toms River Municipal Utilities Authority (TRMUA) serves ~ 43,000 customers throughout Toms River, Ocean County, New Jersey. Toms River has a population of ~90,000 with a density of ~2,300 people/sq. mile of land area (Data from <https://datausa.io/profile/geo/toms-river-nj>). The median household income in 2019 was ~\$77,000 (<https://datausa.io/profile/geo/toms-river-nj>). The TRMUA collects wastewater from the Twp of Toms River and portions of the surrounding communities of Lavallette, Island Heights, Berkeley Township, Manchester Township, Brick Township and Jackson Township, through an infrastructure consisting of: approximately 430 miles of gravity sewer mains and collectors; over 9,600 manholes; 20 pump stations and force mains. The collected wastewater is conveyed to the Ocean County Utilities Authority (OCUA) Central Plant for treatment and subsequent disposal. The TRMUA (fka DSA, DMUA) was established in 1949.

Need for Project

Although the TRMUA has rigorous preventative maintenance programs, regular ongoing studies & inspections have revealed that continuing maintenance and upgrades/rehabilitations are necessary. In this regard the TRMUA has had a Capital Improvement Program (CIP). The goal of the CIP is to ensure that the TRMUA infrastructure is to provide efficient operations while preventing catastrophic failures which could result in a detriment to the surrounding water bodies which are contributory to the Barnegat Bay. The CIP is a result of thorough Infrastructure Inspection and Analysis. Since the TRMUA began aggressive rehabilitation of pipes and manholes beginning in the year 2010, the metered treatment flows have been consistently below the average from previous decades. The reduction has been approximately 400 MG/Yr.

Project Description

Dig/Replace Pipe [3 Contracts SRDR-01-20a+SRDR-01-20b+SRDR-01-20c]: Rehabilitate via excavation, removal/replacement of approximately 65 separate locations of different Pipe sections, which suffer from sags, offset joints, etc, and are not conducive to trenchless rehabilitation... Foster Rd Pipe Replacement [Contract SRDR-02-20]: Foster Rd: Replace/abandon sagged, 150 LF of sixteen-inch diameter (ACP, circa 1968) gravity pipe with PVC... Sewer/Manhole Rehabilitation [3 Contracts SR-01-20a+SR-01-20b+SR-01-20c]: Rehabilitate several pipes/manholes, via Cured-In-Place Lining...Replacement/Supplemental Force Main Installs [1 Contract FM24-01-20]: Directionally drill installation of replacement/supplemental force mains to have backup/redundancy to existing force mains, which were installed >45 yrs ago

Service Area

The Toms River Municipal Utilities Authority (TRMUA) serves ~ 43,000 customers throughout Toms River, Ocean County, New Jersey. Toms River has a population of ~90,000 with a density of ~2,300 people/sq. mile of land area (Data from <https://datausa.io/profile/geo/toms-river-nj>). The median household income in 2019 was ~\$77,000 (<https://datausa.io/profile/geo/toms-river-nj>). The TRMUA collects wastewater from the Twp of Toms River and portions of the surrounding communities of Lavallette, Island Heights, Berkeley Township, Manchester Township, Brick Township and Jackson Township, through an infrastructure consisting of: approximately 430 miles of gravity sewer mains and collectors; over 9,600 manholes; 20 pump stations and force mains. The collected wastewater is conveyed to the Ocean County Utilities Authority (OCUA) Central Plant for treatment and subsequent disposal. The TRMUA (fka DSA, DMUA) was established in 1949.

Need for Project

The TRMUA aggressively maintains, inspects and repairs conditions of approximately 430 miles of gravity sewer mains and 20 pump stations. The current maintenance work Vehicles and Generators have outlived their useful lives and replacements are needed in order to effectively continue the uninterrupted maintenance of the aging infrastructure. The proposed wetwell-mounted Grinders at four pump stations will be helpful in reducing pump clogs and malfunctions as a result of non-woven fabrics being introduced to the collection system. In effort to ensure the health and safety of the public, the TRMUA plans to install new Grinders at the four pump stations, which have suffered pump malfunctions from cloggings due to fabrics. The wetwell-mounted Grinders shall have a design capable of allowing sufficient flow through the channel while grinding material into fine pieces, small enough to pass through the pumps.

Project Description

Purchase of (i) One replacement Dump Truck Vehicle, (ii) One replacement Utility Truck Vehicle with Crane, (iii) One replacement JetVac Truck Vehicle, (iv) Three replacement portable generators for Pump Stations #14, 15 & 20 and (v) Four new wetwell-mounted grinders for Pump Stations #24, 25, 26 & 30.

Service Area

The Southern Service Area (SSA) is depicted in Figures 1 and 2. The SSA provides service to the municipalities of Barnegat Light, Beach Haven, Eagleswood, Harvey Cedars, Little Egg Harbor, Long Beach, Ship Bottom, Stafford, Surf City, and Tuckerton. The Authority's SSA is comprised of the SWPCF located in Stafford Township, 13 pump/lift stations, 15 miles of force main, and 27 miles of gravity interceptors. The SWPCF was placed into operation in 1977, provides secondary treatment, and is rated at a capacity of 20 MGD. Effluent is discharged into the Atlantic Ocean through an outfall diffuser located approximately 6,000 feet from the shore of Ship Bottom Beach in accordance with NJPDES Permit No. NJ0026018.

Need for Project

The Interceptor Rehabilitation project is intended to provide improved effluent quality through improvements to the structural integrity of the influent conveying system as well as improvements to the reliability of these facilities. All improvements will increase the useful life of the facilities. Failure to implement the improvements could result in a spill of raw wastewater, which is not acceptable.

Project Description

The Manahawkin Interceptor, SI-4 is primarily a 24 inch diameter gravity interceptor located along east bound Rte. 72 in Stafford Township, New Jersey, in the Authority's Southern Service Area. It was installed in 1977 using Pre-stressed Concrete Cylinder Pipe (PCCP). SI-4 conveys wastewater flow from an area beginning at the municipal boundary between Stafford Township and Barnegat Township (west of the Garden State Parkway, Exit 63) and discharges into the SI-2 Interceptor near the intersection of Route 9 and Rt. 72. Cured-in-place pipe technology (CIPP) will be used to rehabilitate approximately 2,139 linear feet of 24-inch diameter PCCP in SI-4 from MH 10-6 to MH 12-2 (See Figure No. 4). This work will also include the rehabilitation of manholes, as required. The CIPP lining will require bypassing of flows while the CIPP liner is installed, and portions of the bypass pipe require minor excavation of existing roads to temporarily bury the bypass pipe.

Sanitary Sewer System Rehabilitation

Priority List Rank

390

County

Monmouth

Existing Population

78,413

Service Area

The service area for Two Rivers Water Reclamation Authority (TRWRA) includes its 6 member communities (Fair Haven, Little Silver, Monmouth Beach, Oceanport, Shrewsbury Borough, and West Long Branch), as well as, 6 customer communities including Rumson, Sea Bright, Shrewsbury Township, Tinton Falls, Eatontown and Red Bank. All communities are located within Monmouth County.

Need for Project

TRWRA's existing infrastructure is in need of rehabilitation and/or replacement. Existing components are nearing their life expectancy and in some cases in danger of imminent failure. Portions of the interceptor system being rehabilitated as part of Contracts 169A and 169B are located in easement areas in forested/vegetative areas and various water bodies. Catastrophic failure of these components may result into spillage onto surrounding communities and environmentally sensitive areas impacting the health and safety of its member and customer communities.

Project Description

TRWRA proposes three separate contracts for improvements to its collection system and pumping infrastructure. Contracts 169A and 169B, Interceptor Rehabilitation, includes cleaning and internal inspection of 16,000 LF of pipe ranging in size from 18 to 42 inches. Other work included in these contracts includes rehabilitation of approximately 2,500 LF of existing pipe using cured in place liners or other trenchless methods, and manhole lining. Contract 155A, Pump Station Rehabilitation, includes various electrical and mechanical upgrades to its existing Pump Station No. 12. Upgrades include new electrical service, new pump station controllers, VFDs, SCADA, odor control and other miscellaneous equipment.

Sanitary Sewer System Rehabilitation

Priority List Rank

391

County

Monmouth

Existing Population

75,570

Service Area

The TRWRA currently services six member towns: Fair Haven, Little Silver, Monmouth Beach, Oceanport, Shrewsbury, West Long Branch, and six customer towns: Red Bank, Eatontown, Rumson, Sea Bright, Shrewsbury Township and Tinton Falls. They service 100% of all towns except Tinton Falls and West Long Branch. The TRWRA services approximately 50% of Tinton Falls and the majority of West Long Branch. US Census Factfinder was utilized to determine the populations for each of the member and customer towns.

Need for Project

The TRWRA conducted an investigation into the 50-year old 48-inch sewer crossing beneath Pleasure Bay which revealed internal corrosion and cracks in the Pleasure Bay Interceptor (PBI). The internal corrosion has impacted the integrity and reliability of the PBI creating an increase risk of failure. The consequences of failure of the PBI would include interruption of service to the communities. The TRWRA has also identified issues with it's 50-year old Main Pump Station (MPS) which receives the wastewater flows conveyed by all of the TRWRA's sanitary sewer system to it's WWTP, making the MPS a critical asset that must operate under all circumstances. MPS experienced significant structural damage to its wet well during Superstorm Sandy. Operationally, it has been noted that under low flow conditions the MPS may intermittently turn off which results in undesirable flow cycling in the TRWRA's WWTP. Also, there are wet well surges , indicating insufficient pumping capacity.

Project Description

Construction of a new 54" Pleasure Bay Interceptor, extending the current 30" Monmouth Beach Interceptor to a new 50 MGD Main Pump Station, installing a new force main to the Headworks/Blower Building, as well as diverting supernatant flow to the new Main Pump Station. Additionally, the project entails demolition of the existing Supernatant Pump Station and Main Pump Station.

Service area consists of Brick Township.

Need for Project

The proposed pump station rehabilitation is required to improve pump station effectiveness and efficiency, standardization of equipment and method of operation, provide better access for maintenance, reduce the need to enter confined spaces and perform upgrades for code compliance.

Project Description

The Project generally consists of the rehabilitation of nine (9) wastewater pump stations; Lanes Mill Wastewater Pump Station, Pine Meadows Wastewater Pump Station, Riviera Drive Wastewater Pump Station, Sloping Hill Wastewater Pump Station, Cape Breton Wastewater Pump Station, Sea View Village Wastewater Pump Station, Burnt Tavern Manor Wastewater Pump Station, Green Briar II Wastewater Pump Station and Laurel Brook Wastewater Pump Station. The rehabilitation includes converting six (6) dry well/wet well type pump station to submersible type pump stations, converting one (1) eject type pump station to submersible type pump station and replacing existing submersible pumps at two (2) pump stations.

Service area consists of Brick Township.

Need for Project

The proposed sanitary sewer manhole rehabilitation and replacement is required to improve structural stability, reduce the need for emergency repairs of manhole failures, alleviate potential clogging of sanitary sewer pipe with debris from the deteriorated manholes and prevent from potential infiltration and inflow into the deteriorated manholes.

Project Description

The project scope will include rehabilitation and replacement of 74 sanitary sewer manholes in various locations of Brick Township. The manholes show signs of deterioration from moderate to severe. Manholes showing signs of severe deterioration are slated to be replaced, and manholes showing signs of moderate deterioration are slated to be lined with cured-in-place liner. A table detailing the proposed sanitary sewer manhole replacement and lining locations, numbers and sizes is included in the Planning Document.

Service Area

The project service area is located within the public right-of-ways with the Township of Brick, along Cartagena Drive, Alhama Drive, Cadiz Drive, Valencia Drive, and Monterey Drive.

Need for Project

The existing water infrastructure is considered under this loan application. The Asset Management Plan (AMP) recommends the replacement of the sanitary sewer mains to meet the public sewer utility standards for the reliable service.

Project Description

The proposed project includes a sanitary sewer main replacement of approximately 6,350 linear feet (LF) along Cartagena Drive, Alhama Drive, Cadiz Drive, Valencia Drive, and Monterey Drive, located within the Baywood Section of the Township of Brick, to reinforce the collection system. This replacement includes the installation of 8 and 10 inch polyvinyl chloride (PVC) pipe that consists of site clearing, service laterals, man hole replacement, site restoration, curb to curb paving and related appurtenances. This project was planned as a direct result of the Township's ongoing Water and Sewer System Asset Management plans and will be bid out as a single CONTRACT to coincide with the water main replacement project in the Baywood Section.

Service Area

The Authority's service area includes 11 municipalities including the Borough's of Allendale, Ho-Ho-Kus, Midland Park, Ramsey and Waldwick. Partially served are the municipalities of Mahwah, Wyckoff, Saddle River, Upper Saddle River, Franklin Lakes and Ridgewood.

Need for Project

The Authority's four main pump stations range in age from 35 to 45 years old. The Pump Station Upgrades, is required as various components of each station are nearing or have surpassed its life expectancy and for improved reliability and parts availability purposes. The building and site upgrades are required to protect critical control and pumping equipment within the pump station buildings from potential water damage. Failure of this infrastructure would cause backups and potential spillage onto adjacent water bodies.

Project Description

The Authority proposes various mechanical, electrical and structural improvements to four existing pumping stations including Midland Park PS, Ho-Ho-Kus PS, Darlington PS, and Goffle Rd PS. Improvements include pump replacement, VFD and electrical equipment replacement, roof and grading modifications, as well as other miscellaneous improvements.

Service Area

The Authority's service area includes 11 municipalities including the Borough's of Allendale, Ho-Ho-Kus, Midland Park, Ramsey and Waldwick. Partially served are the municipalities of Mahwah, Wyckoff, Saddle River, Upper Saddle River, Franklin Lakes and Ridgewood.

Need for Project

The Midland Park Force Main Project, is needed to provide redundancy for the existing 20-inch diameter force main that is over 5,000 feet long. The pump station operates under high head and therefore upstream sections of the force main are subject to high pressure. Any failure of the force main would require pump station shut down for repair of the force main. The Midland Park Pump Station wet well has limited storage capacity and trucking of the sewage during this shutdown would likely not be able to keep up with the high flow coming into the station. As a result, overflows could occur at the pump station which would result in significant environmental impacts due to the stations location adjacent to the Goffle Brook.

Project Description

This project consists of installation of 5,000 feet of 20-inch force main along the same route of the existing force main. This parallel force main will be used as a backup to the existing force main and will be used in the future if the existing force main fails or needs to be shut down for service and/or replacement.

Sanitary Sewer System Rehabilitation

Priority List Rank

393

County

Bergen

Existing Population

75,000

Service Area

The NBCUA provides sanitary sewer service to eleven member municipalities in the northwest section of Bergen County including Allendale, Ho-Ho-Kus, Midland Park, Ramsey and Waldwick, as well as, portions of Mahwah, Wyckoff, Saddle River, Upper Saddle River, Franklin Lakes and Ridgewood.

Need for Project

The majority of the NBCUA's interceptor system was constructed in the late 1960's and 1970's and system components are nearing their life expectancy. In recent years, the NBCUA has experienced some failures in their system. The NBCUA's system traverses throughout 11 municipalities in the northwest section of Bergen County most of which travels through easement areas in forested/vegetative land adjacent to wetlands and various water bodies. A catastrophic failure of the system may result in spillage into adjacent communities and environmentally sensitive areas impacting the health and safety of its member customers.

Project Description

The Authority proposes to rehabilitate two (2) sewer sections of the Trunk Sewer East Interceptor located in an easement area that runs parallel to Franklin Turnpike from Stone Ridge Lane to just south of Rosencrantz Place in the Borough of Ho-Ho-Kus. Work includes cleaning and slip lining approximately 675 lineal feet (LF) of 30" RCP sanitary sewer pipe and miscellaneous site improvements to restore the project site to its original condition. Additionally, as part of the finance application, the Authority proposes to purchase an automated and portable manhole scanner and operating system, the CleverScan Scanning System by EnviroSight; a mobile mounted sewer camera; and a truck mounted combination sewer cleaner to assist in the evaluation and assessment of their existing interceptor mains and manholes.

Service Area

The NBCUA provides sanitary sewer service to eleven member municipalities in the northwest section of Bergen County including Allendale, Ho-Ho-Kus, Midland Park, Ramsey and Waldwick, as well as, portions of Mahwah, Wyckoff, Saddle River, Upper Saddle River, Franklin Lakes and Ridgewood.

Need for Project

The majority of the NBCUA's interceptor system was constructed in the late 1960's and 1970's and system components are nearing their life expectancy. In recent years, the NBCUA has experienced some failures in their system. The NBCUA's system traverses throughout 11 municipalities in the northwest section of Bergen County most of which travels through easement areas in forested/vegetative land adjacent to wetlands and various water bodies. A catastrophic failure of the system may result in spillage into adjacent communities and environmentally sensitive areas impacting the health and safety of its member customers.

Project Description

The proposed project includes assessment and rehabilitation/repair of the Authority's existing interceptor system based on the criticality of each system component. The existing interceptor mains and manholes are being internally investigated and/or televised to identify potential defect areas and evaluate their feasibility for rehabilitation or repair based on the quantity of flow through the defect, accessibility to the defect and expected life span. Based on the system evaluation, interceptor mains and manholes selected will be rehabilitated or repaired under multiple contracts either using chemical grouting, internal coating systems, Cured-In-Place Pipe (CIPP) lining, sliplining, spiral wound pipe and/or replaced using trenchless or conventional methods.

Project Name, Number

Woodbridge Township
S340433-04
Sanitary Sewer System Rehabilitation

Priority List Rank

395

County

Middlesex

Existing Population

69,830

Service Area

Woodbridge Township Sewaren and Keasby sections

Need for Project

The sewer systems in the Sewaren and Keasby sections constructed prior to the use of secondary treatment methods did not set strict limits on the volume of infiltration and inflow within sanitary sewers since treatment costs were not greatly affected by these extraneous flows. In recent years however the construction costs of conveyance facilities coupled with rising treatment costs associated with secondary treatment methods have resulted in efforts to eliminate infiltration and inflow in areas where it is proven to be cost-effective.

Project Description

The proposed project is an Infiltration/Inflow Correction program for Woodbridges existing sewer system within the Sewaren and Keasby sections. The Sewaren sewer system serves Avenel Port Reading Sewaren and Woodbridge proper. Its drainage area encompasses 6090 acres and contains 89.9 miles of sanitary sewer. The Woodbridge Interceptor (approximately parallel to the Woodbridge River) serves a majority of the system. The Keasby sewerage system serves Fords Hopelawn and Keasby. Its drainage area encompasses 2389 acres and contains 30.2 miles of sanitary sewer.

Need for Project

The project is needed to protect the pumping stations and collection system from future storm damage and provide emergency electrical power in the event of a storm.

Project Description

The proposed pump station improvements include reconstruction of one station and installation of generators raising equipment and fuel conversions at others. A portable generator will be purchased and three above grade pipe crossings will be repaired or replaced.

Service Area

This project services a portion of the Franklin Township Sewerage Authority's South Crossing Service Area.

Need for Project

The project is required due to hazardous conditions within the pump station that restrict staff access from performing regular maintenance on the site. In addition, some equipment within the pump station is approaching the end of its useful life and needs to be replaced.

Project Description

This project includes rehabilitation of the existing Commerce Drive Wastewater Pump Station, including the construction of a new electrical building; construction of a canopy over the existing wet well; rehabilitation of the existing wet well; replacement of existing pumps, piping and valves; the installation of a bypass connection and installation of a grinder.

Sanitary Sewer System Rehabilitation

Priority List Rank

398

County

Monmouth

Existing Population

66,000

Service Area

The WMUA provides sewage conveyance and treatment services to the Townships of Manalapan and Marlboro, the Borough of Englishtown and a portion of the Township of Freehold.

Need for Project

The Hawkins Road force main was originally constructed in 1976 and the Mill Ponds force main was originally constructed as an 8" force main in 1974 and replaced in 1994 with a 12" force main. In recent years, these force mains have experienced a number of breaks. It was reported by the WMUA that the outside of the force main pipes showed signs of deterioration in locations where the breaks occurred. The Hawkins Road and Mill Ponds force mains have reached the end of their useful lives and we anticipate that these improvements will decrease potential force main breaks and lower maintenance costs.

Project Description

The project generally consists of the replacement of the Hawkins Road force main, consisting of approximately 5,300 LF of 14" force main and the replacement of the Mill Ponds force main, consisting of approximately 4,555 LF of 12" force main. The project also include air release manholes, connections to existing force mains, back fill and restoration.

Service Area

The WMUA provides sewage disposal services to the Townships of Manalapan and Marlboro, the Borough of Englishtown and a portion of the Township of Freehold.

Need for Project

The existing Pine Brook Interceptor was originally constructed in the 1960's and due to existing capacity and surcharge concerns it is necessary to replace this 16" diameter section with new 24" diameter PVC to match the upstream and downstream pipe sections of the interceptor to minimize service disruption and/or potential failure which may impact area residents.

Project Description

The WMUA proposes to replace approximately 2,000 lineal feet (LF) of 16" diameter gravity sewer main, also known as the Pine Brook Interceptor, located along Tarrytown Road in Manalapan Township with new 24" diameter PVC gravity sewer main, as well as, associated manholes and sanitary lateral connections up to the cleanout at the curb.

399

County

Monmouth

Existing Population

65,923

Service Area

The WMUA provides sewage disposal services to the Townships of Manalapan and Marlboro, the Borough of Englishtown and a portion of the Township of Freehold.

Need for Project

The existing Route 79 Pump Station and force main was originally constructed in 1968 and expanded in 1980. The age of the buried steel cans and equipment is in excess of 30 years and is a concern for potential failure given the facility's proximity to Big Brook. The existing force main is undersized with velocities in excess of 8 feet per second resulting in almost 120 feet of friction head loss.

Project Description

The WMUA proposes to reconstruct the Route 79 Pump Station and replace the station's existing force main discharge piping located along Route 79. The proposed improvements will include demolition of the existing pump station facilities and installation of a new wet well with submersible type pumps, electrical equipment and controls building, valve chamber and emergency generator. Additionally, the existing 8" force main will be replaced with a new 12" force main to be installed along Route 79 from the pump station to its existing discharge location.

Service Area

Service Area is Franklin Township Service Area, specifically in and around Marcy Street.

Need for Project

Reduction of extraneous flow.

Project Description

The Franklin Township Sewerage Authority (FTSA) conducted closed circuit television (CCTV) inspection of the sewerage system located in the Marcy Street area. Results of the CCTV inspection determined that a significant portion of the laterals were made up of Orangeburg pipe and showed substantial deterioration. The mainline piping showed signs of deterioration with sections containing dips that were retaining wastewater. The proposed project will involve the cleaning and television inspection of approximately 13,310 feet of existing sewer pipe, gravity sewer and lateral replacement, CIPP lining, service lateral replacement, excavated spot repairs, manhole to manhole cured in place lining (CIPP), manhole rehabilitation, and milling / paving of the roadways. These changes will significantly improve the structural integrity of the sewerage system and reduce extraneous flows into the sewerage system.

Service Area

The Southern Service Area (SSA) is depicted in Figures 1 and 2. The SSA provides service to the municipalities of Barnegat Light, Beach Haven, Eagleswood, Harvey Cedars, Little Egg Harbor, Long Beach, Ship Bottom, Stafford, Surf City, and Tuckerton. The Authority's SSA is comprised of the SWPCF located in Stafford Township, 13 pump/lift stations, 15 miles of force main, and 27 miles of gravity interceptors. The SWPCF was placed into operation in 1977, provides secondary treatment, and is rated at a capacity of 20 MGD. Effluent is discharged into the Atlantic Ocean through an outfall diffuser located approximately 6,000 feet from the shore of Ship Bottom Beach.

Need for Project

The Interceptor Rehabilitation project is intended to provide long term improvements through rehabilitation which will restore structural integrity and increase in remaining life of the conveying system as well as improving the reliability of these facilities. As this interceptor is the carrier for all wastewater created in Eagleswood, Little Egg harbor and Tuckerton, maintaining carrying capacity and long term life of this pipe will be protection of the marine estuary environments where these municipalities are located.

Project Description

Contract No. SD2114 Little Egg Interceptor SI-5 Rehabilitation MH 5-1 to MH 12-2, the Work, includes, but is not necessarily limited to the rehabilitation of approximately 870 linear feet of 36-inch diameter Reinforced Concrete Pipe (RCP) and 10,750 linear feet of 48-inch diameter RCP interceptor using CIPP liner, bypassing wastewater flows, traffic control, rehabilitation of concrete surfaces in manholes, rehabilitation of Meter Chamber SM-5, and site restoration.

Need for Project

The Authority has an on-going program to eliminate sources of excessive II in their sewer system. The project is needed due to the deterioration of the structural integrity of the sewers. In addition the Rams Field and Farrington Pump Stations are old and need to be rehabilitated and upgraded to ensure proper operation to facilitate routine maintenance and to control odors.

Project Description

The project includes the relining of problem sewer mains throughout the Township and the rehabilitation of two pump stations including the installation of comminutors with submersible motors and carbon filters for odor controls. A new bypass chamber will be installed in one pump station.

Service Area

This project is addressing sanitary sewer pipeline rehabilitation to the sewer main leading to the treatment plant; as such, service area is system wide.

Need for Project

This project will address Infiltration and Inflow for approximately 1-mile of pipe with diameters ranging from 8-inch to 48-inch. Mitigating infiltration reduces treatment costs by controlling total conveyance volumes and further prevents exfiltration of sanitary flows to groundwater.

Project Description

Landis Sewerage Authority (LSA) intends to address Infiltration/Inflow and reinforcing structural integrity of various sanitary sewer pipe throughout the system. Approximately 1-mile of sanitary sewer mains are to be rehabilitated ranging from 8-inch to 48-inch diameter pipe in the vicinity of Mill Road (from Almond Rd to Landis Ave to the treatment plant) and Gheysen Avenue. Additionally, LSA wishes to address electrical upgrades at the treatment plant and consideration of purchase for back-up generator.

The Lake Hiawatha Pump Station largely services the residential area of Parsippany Troy Hills.

Need for Project

The proposed Parsippany-Troy Hills Sewer Utility's 2023 Pump Station Replacement Project is appropriate and necessary to maintain operations, collections and conveyance of wastewater to the wastewater treatment plant.

Project Description

Lake Hiawatha Pump Station Replacement Project, includes the installation of a new pump station to reduce energy consumption and increase operational efficiency due to the aging equipment. This project includes proposed modifications to address operational and maintenance issues, including the replacement of the existing sanitary pump station with a new packaged pump station, influent grinder chamber, sanitary manhole, and two (2) new sanitary doghouse manholes. Also included in this project is the selective demolition of the existing pump station and appurtenances, as well as some site modifications to facilitate operations and maintenance of the facility.

Brookwood III Section of Jackson Township

Need for Project

This project is being undertaken to correct sewer system deficiencies that have led to sanitary sewer overflows.

Project Description

The proposed project includes replacing 988 lf of gravity sewer which is surcharging and periodically has backed up into homes in the Brookwood III Section of the Township. The project also involves extending a force main 1953 lf to correct capacity problems on County Line Road which has caused overflows into a tributary of the Metedeconk River.

Need for Project

The West Branch Interceptor is a major source of SSO discharging into an environmentally sensitive area along Fairway Drive East. Overflows from manholes occur during moderate to heavy rainstorms and discharge sewage into freshwater wetlands and state open waters i.e. West Branch of the Elizabeth River. Sewer backups into residential basements occur along Fairway Drive South and Evergreen Parkway causing a serious public health risk.

Project Description

The project includes replacement of 2350 linear feet of 24-inch sanitary sewer along Fairway Drive East in the Township of Union Union County. The project also includes the elimination of a siphon beneath the West Branch of the Elizabeth River to be replaced with an armored ductile iron pipe installed at the invert of the channel.

Need for Project

A sewer system evaluation survey recently performed by Elson T. Killam Associates for the Passaic Valley Sewerage Commissioners service area found excessive Infiltration/Inflow (II) in this municipalitys sewer system. Raw sewage overflows were reported to have occurred on area streets.

Project Description

This project consists of the removal and replacement of numerous sections of sanitary sewer piping of varying diameters throughout the City Limits. The City maintains an inventory of deficient areas which note deficiencies relating to alignment extraneous inflow through joints and cracked pipe sections broken pipe sections and manholes which have out lived their service life. The City has identified these areas for point repairs in kind replacement and trenchless lining after conducting extensive televising and cleaning operations over the past five-year period as part of their Sewer O & M Contract. The City also desires to acquire a JetVacuum Truck.

Service Area

The Lake Hiawatha service area is served by three pumping stations: Lake Hiawatha Pumping station, Pump Station No.4 (PS4) and New Road Pumping Station. Tributary sub-basins in the service area have developed over the last 50 years, and this growth has created hydraulically sensitive areas.

Need for Project

Pump station and the force main is at the end of useful life. The 24 inch PCCP force main crosses under Rt 46 and routes through wetlands. Failure of this force main would have significant consequences.

Project Description

The Township of Parsippany-Troy Hills (Township) owns and operates a sanitary sewer collection, conveyance and treatment system. The Lake Hiawatha service area is served by Pump Station No. 4. PS4 is the largest wastewater pumping station in the Township's Sewer Service Area, and conveys wastewater to the Township's Wastewater Treatment Plant via 8,900 linear foot, 24-inch diameter, PCCP force main. PS4 and its force main, constructed around 1963, is at the end of its useful life. The force main requires frequent emergency repairs. The pumps station is approaching its flow capacity and needs rehabilitation. Redirecting the flow from this area via a gravity sewer to the existing 72-inch interceptor was identified as the preferred and most feasible alternative. Upon Completion of the proposed gravity sewer connection, PS4 will be taken out of service providing considerable energy savings.

Need for Project

This project is for the minor rehabilitation of the Townships existing sewer system. A sewer system evaluation survey concluded that approximately 1.5 million gallons per day (MGD) of excessive InfiltrationInflow could be removed from the system cost- effectively. This project would ensure the removal of the 1.5 MGD by the accomplishment of this rehabilitation work.

Project Description

The proposed Phase I project (C340393-06) is to rehabilitate portions of the existing sewer system in the area of Pines Lake and Packanack Lake. The work for Phase I includes inversion lining of 3160 linear feet (LF) of sewer pipe replacement of approximately 5130 LF of sewer pipe grouting and air testing and rehabilitation of 11 manholes. Phase II investigations (C340393-07) will be required to eliminate all excessive infiltrationinflow for other portions of the existing sewer system.

49,000

Service Area

The service area for the Authority includes the municipalities of Belmar, Brielle, Lake Como, Manasquan, Sea Girt, Spring Lake, Spring Lake Heights and approximately 70% of the Township of Wall.

Need for Project

During Superstorm Sandy, the existing Belmar Pump Station was damaged structurally, mechanically and electrically and rendered inoperable. Due to its proximity to the Atlantic Ocean and climate change challenges predicted for the Borough of Belmar, the Authority proposes various storm proofing improvements to ensure continued operation of the existing pump station during weather related emergencies.

Project Description

The Authority proposes various mechanical structural and electrical improvements to its existing Belmar Pump Station. Improvements include replacement of the existing pumping equipment with new dry pit submersibles construction of a new below ground grinder chamber and demolition of the existing pump station building as well as installation of internal bracing of the below ground walls. Additionally the Authority proposes to install a mobile enclosure that would house the critical electrical and control equipment required to operate the pump station.

Project Name, Number

South Monmouth Regional Sewer Authority
S340377-03
Sanitary Sewer System Rehabilitation

Priority List Rank

415

County

Monmouth

Existing Population

49,000

Service Area

The service area for the Authority includes the municipalities of Belmar, Brielle, Lake Como, Manasquan, Sea Girt, Spring Lake, Spring Lake Heights and approximately 70 of the Township of Wall.

Need for Project

During Superstorm Sandy, three (3) existing sanitary sewage pump stations were damaged. Improvements are needed to put the pump stations back online and providing sanitary sewer service. The existing stations are running on bypass which increases the potential for sewage backups and or spillage into adjacent water bodies.

Project Description

The Authority proposes various mechanical structural and electrical improvements to its existing Lake Como Station.

Need for Project

As a result of the systems age and deteriorated conditions of the ACP lining the pipes will reduce I&I into the collection sewer system and decrease operations and maintenance costs. Reconstruction of an existing pump station facility will help comply with NJDEPOSHA requirements and facilitate maintenance and increase systems reliability.

Project Description

The proposed project includes rehabilitation of approximately 2900 LF of existing ACP collections sewer by way of lining to provide improved sanitary sewer reliability reduce I&I into the collection sewer system and decrease operations and maintenance costs as a result of the systems age. The project also includes reconstruction of an existing pump station and removal of the existing Welsh Pump Station to convey sewage by way of gravity.

Project Description

(Carryover SFY2015) - The Egg Harbor Township Municipal Utilities Authority (EHTMUA) proposes the construction of a new wet well structure and control building for the FAA Pump Station Reconstruction Project. A new duplex pumping system with control system and motor starters shall be provided. The improvements include approximately 140 linear feet of new eight-inch force main that will connect into the existing force main. The upgrades will also involve the provision of a cellular base remote telemetry system a diesel powered backup pumping unit and redundant control system.

Sanitary Sewer System Rehabilitation

Priority List Rank

423

County

Burlington

Existing Population

41,864

Service Area

The service area of the project includes all of Mount Laurel Township

Need for Project

The various improvements will have the beneficial impacts of greatly reducing the risk of overall system failure and provide modern safer operating conditions for the Mount Laurel Township MUA personnel.

Project Description

Replacement of Briggs Rd and Library Pump Station Force Main Connections, Replacement of Library Pump Station Force Main and Millstream Force Main Connection and Union Mill Farms Pump Station Force Main Replacement including 20" isolation valve replacement

Need for Project

The replacement of the force main, due to its age, would result in benefits to the water quality of the Barnegat Bay by eliminating emergency repair projects due to failure of the force main. The force main is an essential portion of the wastewater conveyance system. An emergency repair project would disrupt service and could be a threat to the public health, safety, and welfare in terms of beach closings due to the presence of pathogens in the raw sewage. Replacement of the force main will also help eliminate / prevent any impact on shellfish bed closings due to pathogens in the raw sewage.

Project Description

Belaire sanitary sewage pumping station #2 is located at the end of Colleran Place and was constructed circa 1968. According to the Authority's maps, it conveys the sewage via a ten inch (10") diameter DIP force main along Colleran Place, Neary Avenue, Brennan Concourse, Bayview Avenue (County Route 617), and discharges into gravity sewer at Evergreen Drive. The length of the force main is approximately 7,400 feet long. Due to the age of the force main (50 years), this project proposes to install a new ten inch force main within the existing rights-of-ways and as closely located to the existing force main service. Manholes for air release valves would also be included.

Service Area

The service area for the proposed project consists of the Township of North Brunswick, the Borough of Milltown, and the City of New Brunswick.

Need for Project

Video inspection of the Mile Run Interceptor in North Brunswick and New Brunswick showed that certain sections of the pipe contain fractures that can lead to collapse. This interceptor has been identified by the Township as critical infrastructure that requires immediate attention. Replacement and rehabilitation of this line are necessary to avoid detriment to the health, safety, and welfare of the residents of North Brunswick Township.

Project Description

Rehabilitation of two sections along the Mile Run Interceptor sewer line which conveys over 90% of the municipality's waste from the township to the MCUA for treatment.

Service Area

Winslow Township is a relatively large municipality (58.19 square miles) which is part of the Camden County Wastewater Management Plan (CCWMP) Area and the proposed rehabilitation projects are all within the boundary limits of the CCWMP existing Sewer Service Area (SSA).

Need for Project

Winslow Township Department of Municipal Utilities has a contractual obligation to provide sanitary sewer service and conveyance services to its service area, and to make capital improvements as necessary to fulfill that obligation. In order to continue to provide sanitary sewer service, the proposed rehabilitation projects (CIPP lining, spot repairs, and manhole replacements) are necessary to keep the system functioning properly and in good working order.

Project Description

This project involves various improvements to the Township's sanitary sewer infrastructure. Improvements include the lining of approximately 2,500 LF of existing sanitary sewer pipe (Asbury Place - 375 LF; Lehigh Manor Drive - 450 LF; Primrose Gate - 1,675 LF), the replacement of approximately 105 LF of existing sanitary sewer pipe (Eastmont Lane - 25 LF; Evergreen Avenue - 80 LF), and the replacement of approximately 2 existing sanitary sewer manholes (South Cedarbrook Road - 1 unit; Thousand Oaks - 1 unit).

Project Name, Number

Montclair Township
S340837-03
Sanitary Sewer System Rehabilitation

Priority List Rank

429

County

Essex

Existing Population

37,669

Service Area

The MSA service area (a.k.a. the "planning area") includes all of Montclair Township, Essex County, New Jersey. The Township of Montclair covers a geographic area of 6.16 square miles. The Township is situated on the east-facing slope of the first Watchung Mountain and is bounded to the north by Clifton and Little Falls in Passaic County, to the south by the Township of Orange (Essex County), to the east and northeast by Bloomfield, Glen Ridge and East Orange (all Essex County), and to the south and west-northwest by Verona (Essex County), Cedar Grove (Passaic County), West Orange and Orange (both Essex County).

Need for Project

Portions of the existing collection system are deteriorated and subject to inflow and infiltration resulting in loss of sewage to the environment and admission of groundwater to the system. The sewer mains in the system are largely constructed of vitrified clay pipe and most are over one hundred years old. Specific areas have been identified as the target area for the collection system rehabilitation program. These areas have been selected due to the high frequency of repairs, high maintenance requirements and observed infiltration and inflow in the system. The VCP sewer piping can further deteriorate and collapse, with near complete occlusion and associated sewage backups disrupting normal flow. These conditions would hazard public and environmental health, and would require greater disruption for emergency excavation and repairs than would a planned approach using CIPP technology.

Project Description

The Township of Montclair Sewer Authority will rehabilitate approximately 16000 linear feet of sanitary sewer collection mains. Portions of the existing collection system are deteriorated and subject to inflow and infiltration (I&I) resulting in loss of sewage to the environment and admission of groundwater and stormwater to the system. The MSA has planned for the repair of the affected sewers to assure that wastewater is safely conveyed through the sewers to the regional wastewater treatment facility.

Project Name, Number

Ocean Township Sewer Authority
S340750-14
Sanitary Sewer System Rehabilitation

Priority List Rank

435

County

Monmouth

Existing Population

29,551

Service Area

The Township of Ocean Sewerage Authority provides sanitary sewage service to the Township of Ocean, the Boroughs of Allenhurst, Deal and Interlaken and the Village of Loch Arbour.

Need for Project

Proposed improvements are necessary at both pump stations (Asbury Avenue and Longview) to maintain the existing facilities in operating condition and resilient against severe storm events that may potentially impact their operation in the future. Both sites are also adjacent to wetland and/or streams and failure would impact these environmentally sensitive areas.

Project Description

The Authority proposes various mechanical, electrical, structural and site improvements to two (2) existing sanitary sewage pumping stations, Asbury Avenue Pump Station and the Longview Pump Station. Improvements include conversion of both of the existing dry well/wet well units to submersible pumping facilities with a new valve chamber and installation of new 10'x12' prefabricated enclosures to house the electrical and control equipment. At the Asbury Avenue Pump Station other improvements include access ladder and hatch replacement, repair to the existing perimeter fencing and upgrade to the existing bypass connection. At the Longview Pump Station other improvements include installation of a bypass connection, replacement of the check valves, and installation of site lighting.

County

Monmouth

Existing Population

29,551

Service Area

The Township of Ocean Sewerage Authority provides sanitary sewage service to the Township of Ocean, the Boroughs of Allenhurst, Deal and Interlaken and the Village of Loch Arbour.

Need for Project

The existing sanitary sewer collection system along Berkeley Avenue, Lincoln Drive and Lakeview Avenue is corroding/deteriorating and in need of rehabilitation and/or replacement where needed. Due to its close proximity to Deal Lake, the potential for failure would be catastrophic to the adjacent water body.

Project Description

The Authority proposes to repair and rehabilitate the existing 8" sanitary sewer collection system along Berkeley Avenue, Lakeview Avenue and Lincoln Drive from Berkeley Avenue to Park Place. Improvements include lining of approximately 3,000 lineal feet (LF) of 8" pipe, lining of 15 manholes, 5 trenchless spot repairs and approximately 50 LF of 8" pipe replacement.

Decentralized Wastewater (or Septic) System Repair/Replacement

Priority List Rank

437

County

Monmouth

Existing Population

27,291

Service Area

The Service Area of the Township of Ocean Sewerage Authority is comprised of the Township of Ocean, and the customer communities of the Borough of Allenhurst, the Borough of Deal, the Borough of Interlaken and the Village of Loch Arbour.

Need for Project

For Project No. 1, the configuration of the existing Logan Road and Rt 35 sanitary sewer causes frequent blockages and the manhole is not accessible because of the Rt 35 travel lane. In the Roseld Avenue area, the Wickapecko pump station force main discharges into shallow manholes along Roseld Avenue that surcharge during high flows. Lastly, in the Wanamassa, West Allenhurst and Deal Park area, existing manholes are extremely old and during heavy rain events result in increased flows to the plant. For Project No. 2, the Township still contains a considerable amount of orangeburg pipe laterals from the property line to the main in the Wanamassa area which is brittle and deteriorating causing sewage backups and spills.

Project Description

(Carryover SFY2015) - The proposed improvement is to install a new sanitary sewer pipe across Route 35. The proposed configuration would remove the sharp bend from the manhole and have manholes moved from the travel lane of Route 35. Roseld Avenue Sanitary Sewer - The proposed improvement is to extend the existing Wickapecko pump station force main so it discharges to the gravity sewer system along Roseld Avenue downstream of the shallow manholes. Interlaken Pump Station - The proposed improvement will include replacing the three existing pumps building upgrades pump control upgrades and replacing 400 lf of the existing force main.

Priority List Rank

437

County

Monmouth

Existing Population

27,291

Service Area

The Authority serves the Township of Ocean, the Boroughs of Allenhurst, Deal and Interlaken and the Village of Loch Arbour.

Need for Project

The Authority proposes the improvements to upgrade the existing pump station to handle actual flows coming into the pump station particularly during storm events. Surcharging of the station could potentially result in sewage backup onto the adjacent Deal Lake. Additionally, improvements are being proposed to improve the resiliency of the pump station, which was impacted by Sandy, against future storm events.

Project Description

(Carryover SFY2015) - The proposed project includes reconstruction of the Interlaken Pump Station to raise the building to prevent future flooding.

County

Monmouth

Existing Population

27,291

Service Area

Township of Ocean

Need for Project

The Township of Ocean Sewerage Authority owns and maintains a siphon that crosses Deal Lake. The Authority's system maps indicate the 6 and 8 pipes are cast iron and are from a manhole on Hetrick Point Road in the Wanamassa section of Ocean Township to a manhole located in the backyard of a residence located along Windermere Avenue in the Borough of Interlaken. As a minimum the Authority checks the flow in the manhole downstream of the siphon weekly to confirm flow across Deal Lake. On Monday morning March 28 the flow through the downstream manhole was greatly reduced. The Authority placed dye in both the 6 and 8 pipes and determined flow was entering the lake. The Authority installed a bypass pump system that is pumping flow to a manhole located on Wickapecko Drive. The bypass system includes three pumps and over 3500 ft of temporary piping installed along narrow streets with houses located close to the road.

Project Description

The proposed project includes replacement of the 6 and 8 siphon pipes that cross Deal Lake.

Bergenfield Borough
S340378-02
Sanitary Sewer System Rehabilitation

Priority List Rank

438

County

Bergen

Existing Population

26,247

Service Area

Borough of Bergenfield

Need for Project

The project is needed to help reduce the Boroughs current II issues. Inflow and Infiltration contribute to sanitary sewer overflow conditions as well as surcharge of the system. Due to the influx of additional unanticipated flow the sanitary sewer system becomes overloaded and fails due to capacity constraints. By repairing the worst section of the system as noted from Borough inspections and maintenance programs this will be a significant first step in reducing II in the Borough of Bergenfield.

Project Description

The Borough in an effort to combat an ever-growing Inflow and Infiltration (II) problem with its sanitary sewer system intends to rehabilitate approximately 10000 to 12000 linear feet of existing vitrified clay sanitary sewer main which is approximately 80 years old. The Borough plans to use trenchless technology specifically Cast-In-Place-Pipe (CIPP) slip-lining to reestablish the integrity of the sanitary sewer main specified. The Borough is comprised of approximately 300000 linear feet of piping and this represents approximately 5 of the total piping deemed most urgent through the Boroughs preventative maintenance and inspection program. In addition to the piping rehabilitation the Borough plans to rehabilitate approximately 30 manhole structures by means of repairing larger cracks with cementitious repair mortars followed by epoxy coating of the interior of the structures. It is assumed that II in the sanitary manholes contribute up to approximately 30 of the II problems faced by the Borough. The final facet of the project includes the furnishing and installing of approximately 30 area velocity flow meters throughout the Borough to implement a flow monitoring program in an effort to continually pinpoint areas throughout the Borough which require addition rehabilitation work.

Service Area

Borough of Carlstadt and portions of Rutherford and East Rutherford

Need for Project

The Bergen County Utilities Authority conducted an Infiltration/Inflow (II) analysis and sewer system evaluation survey which concluded that excessive II existed in the sewer system. The correction of this II will be cost-effective and result in the improved operation of a 13.8 MGD pump station used for the conveyance of sewage from the Joint Meeting STP to the Bergen County Utilities Authority system. Water Quality violations are currently experienced for dissolved oxygen fecal coliform and toxics standards due to the raw discharges of the existing Triboro Joint Meeting Treatment plant into the Hackensack River (SE-2).

Project Description

The project will consist of rehabilitation work to remove a portion of the excessive II. The rehabilitation project may include repair and/or grouting of sewers and joints sealing manholes repair/replacement of defective manhole covers and other standard rehabilitation measures. This project will also eliminate sewerage system overflows.

CI-1A is located in the South Seaside Park portion of Berkeley Township, Ocean County. SI-11 is located in the Holgate Section of Long Beach Township, Ocean County. Use of cured-in-place technology will be used to rehabilitate: for CI-1A, approximately 3,630 linear feet of 18-inch diameter PCCP pipe from MH 19-5 to CPS-3; approximately 4,880 linear feet of 24-inch diameter PCCP pipe from MH 15-5 to MH 12-2; approximately 3,370 linear feet of 30-inch diameter PCCP from MH 12-2 to MH 12-1, MH 10-5 to MH 9-1D, MH I-2 to CPS-2 and CPS-2 to MH 8-3; and for SI-11 approximately 315 linear feet of 16-inch diameter PCCP pipe from MH 25-6 to 25-1; and approximately 465 linear feet of 20-inch diameter PCCP pipe from MH 25-1 to SPS-10. This work will also include the rehabilitation of manholes, as required. The Authority does not anticipate that any excavation work will be required for this project.

Need for Project

The inspections of the CI-1A interceptor were completed in 2000 and 2010 and portions were found to be in poor condition. This project presents the most cost effective alternative and is designed to protect the integrity of the existing collection system for wastewater conveyance. The Authority's intent is to improve the conveyance system reliability and thus improve the operation of collection facilities to continue to meet the discharge limits and prevent system failures that could result in spills. The construction of the interceptor improvements should provide a higher degree of reliability in the Authority's capability collecting and conveying wastewater.

Project Description

The use of Cured-In-Place-Pipe technology to rehabilitate the South Island Beach Interceptor (CI-1A) in the Central Service Area and South Island Interceptor (SI-11) in the Southern Service Area Included in the project for CI-1A is approximately 3,630 linear feet of 18-inch diameter pipe; 4,880 linear feet of 24-inch diameter pipe; and 3,370 linear feet of 30-inch diameter pipe; and for SI-11 is approximately 315 linear feet of 16-inch diameter pipe and 465 linear feet of 20-inch diameter pipe. Total length is of this project is approximately 12,660 linear feet. Rehabilitation of interior surfaces of all manholes within the limit of the project is included.

Need for Project

The proposed project will remove an existing inverted siphon which clogs regularly causing significant sewage backups. The sanitary relining will eliminate inflow and infiltration of groundwater into the system and leakage of sewage out of the system. The project also proposes locking watertight frames and covers to protect the system which is located in the floodplain.

Project Description

The proposed project includes lining of antiquated lines. All sewer manholes inlets services piping and other appurtenances will be replaced to promote full functioning sewer systems. Locking watertight frames and covers will be installed.

Need for Project

An InfiltrationInflow (II) analysis has been completed which documents the existence of excessive II within the service area. Additional studies are under way to further define the quantity of excessive II and to propose an II correction program to mitigate hydraulic overloading of the plant during severe storms.

Project Description

This proposed project will consist of an II correction program to remove a portion of the excessive II. This will include replacement of sections of sanitary sewer pipe grouting of sewer lines grouting and sealing leaking manholes and repair of and adjustments to defective manholes.

Service Area

The tributary area of Raritan Road Pump Station is located in the southwestern portion of Scotch Plains. The drainage area covers approximately 2,160 acres which drains to the Raritan Road Pump Station. The area tributary to Lamberts Mill Road Pump Station is located in the southeastern portion of the Township of Scotch Plains. The drainage area that is tributary to the station within the Township of Scotch Plains is approximately 530 acres. In addition, there are approximately 60 acres within the Town of Westfield that are tributary to this facility.

Need for Project

Existing equipment is at the end of its useful life. Renewal of this pumping asset is critical to maintain sewer service to the municipality to avoid station failure and mitigate the potential for a sewage spill. The need is the same for the electrical, mechanical and piping systems.

Project Description

Rehabilitation of 2 existing raw sewage pump stations to replace pumping equipment, piping, electrical panels, instrumentation and HVAC components that are at the end of their useful life.

Need for Project

The proposed equipment and pipe improvements are necessary to address aging and undersized infrastructure to minimize potential future failures and eliminate surcharging of the system. The Roosevelt Avenue Pump Station and trunkline are adjacent to the Arthur Kill which is classified as a saline estuarine (SE3) waterway and the Noes Creek which would adversely be impacted if the improvements are not undertaken.

Project Description

The proposed project includes upgrades to the existing Roosevelt Avenue Pump Station and trunkline. Upgrades include new pumps new odor and corrosion system control and replacement of approximately 2500 linear feet of 15 inch pipe with 21 inch PVC to increase capacity to handle the periodic high flows and minimize surcharging of the system.

Service Area

The Roosevelt Avenue Pump Station service area is the entire Borough of Carteret, The entire Borough's sewer flow is conveyed through this pump station.

Need for Project

The Roosevelt Avenue Pump Station is vital to maintaining health, safety, and welfare of the community. The RAPS, which was constructed in the early 1990's, is in need of improvements to replace equipment that has either failed and/or has surpassed its useful life expectancy and to upgrade other systems which are antiquated. The Borough currently averages around 3.0 Million gallons per day (MGD) and that the RAPS peak pumping capacity is limited to 13.30 MGD by virtue of Sewer User Agreement with Woodbridge Township. Bergen Street Pump Station is upstream of Roosevelt Avenue Pump Station and conveys sewer flow from a specific area of the borough. Construction improvements are based on the results of failing mechanical equipment and corroded piping at the pump station.

Project Description

The Borough of Carteret depends upon the Roosevelt Avenue Pump Station to receive and convey all wastewater generated within the Borough to downstream conveyance facilities in Woodbridge Township and ultimately to the Middlesex County Utilities Authority for treatment. Roosevelt Avenue Pump Station improvements include the replacement of dry-pit submersible pumps, pump VFDs, pump controls, piping, gate valves, surge valves, building roofing, electrical motor starters, lighting, heating and ventilation, flow meter, and a new station bypass chamber. Bergen Street Pump Station consists of the replacement of pumps, discharge piping and valves within the wet well, flow meter and chart recorder, and the replacement of pump controls and VFDs.

Burlington

Existing Population

22,594

Service Area

The service area affected by this project includes several apartment and condominium complexes, single family residential neighborhoods and numerous commercial businesses, restaurants and a medical facility. The population service by the portion of the system to be rehabilitated is approximately 4500 residents.

Need for Project

The project will be addressing existing water infiltration problems in the sanitary sewer system by sealing leaking service lateral connections and lining sewer manholes. This will also help limit effects of water infiltration into the system during heavy rain/ flooding events.

Project Description

The Township proposes to continue the rehabilitation of existing Asbestos Cement sanitary Sewer Mains in various areas of the Township. Manhole rehabilitation and lateral sealing will also be performed.

Need for Project

The existing sewer is currently located under the athletic field at HCRHS. As part of an artificial turf field renovation project, a video inspection was performed. During a recent video inspection, a significant break was discovered and also it was noted that a section of the cast iron pipe has considerable tuberculation. An effort to repair and rehabilitate this section of sewer would require substantial disturbance to the field's substructure and also when the proposed field renovations are complete this portion of the sewer would be inaccessible.

Project Description

The proposed project includes the relocation of the existing sewer located under the HCRHS Football field. Work includes the installation of 4 manholes and approximately 770 lf of SDR 35 pipe. Also included is the abandonment of two existing manholes and 750 lf of 18 clay pipe.

Existing Population

0

Service Area

The service area is located along Chubb Avenue, Valley Brook Avenue, and Wall Street West and is made up of commercial, industrial and residential uses. The residential properties are multi-story apartment buildings consisting of a total of 738 total units with one to three bedroom units.

Need for Project

To replace the pump station with higher gpm pumps to handle the flow and prevent any sewage spills.

Project Description

The project consists of the replacement of pump station no. 3 which is located within the Chubb Avenue right of way. The pump station replacement is due to increase in flow as well as the change in flow characteristics to include residential waste. The original station was constructed approximately back in the 60's for office and commercial use, however within the last 10-15 years there have been 3 residential buildings constructed with a total of 738 units amongst the three buildings. The township has installed additional temporary external pumps to handle the increase in flow, however the pump station needs to be completely replaced to incorporate upsized submersible pumps, grinder and other measures to address the residential waste products that have caused issues for the station. The project will be designed with more energy efficient pumps and controls as well as incorporate the latest technology in controls.

City of Clifton

Need for Project

The purchase of the above reference equipment is to meet state regulated mandates associated with the Stormwater Management Program as well as provide the borough with the means to clear blockage and back-ups of their existing sanitary and storm sewer areas reducing the potential for adjacent stream and/or water body areas contamination.

Project Description

The Borough of South Plainfield is proposed to purchase of new mobile combination sewer and catch basin cleaning machine. The apparatus will be capable of high pressure water cleaning of sanitary sewer or storm sewer drain lines while simultaneously removing debris from a manhole or catch basin with a Three Stage Fan air compressor vacuum system in order to minimize the adverse impact of stormwater runoff on water quality.

S340947-05
Sanitary Sewer System Rehabilitation

Priority List Rank

453

County

Gloucester

Existing Population

21,677

Service Area

West Deptford Township is located in Gloucester County, New Jersey. The Township was incorporated in 1871 and is a suburban municipality which borders the Delaware River. The Township covers over 17 square miles. Adjacent municipalities include Gloucester City to the north, Westville and Brooklawn Boroughs to the northeast, Deptford Township, Woodbury City, and Woodbury Heights to the east, Mantua and East Greenwich Townships to the south, Paulsboro to the southwest, and National Park Borough to the west.

Need for Project

Replacing these two 40-50 year pump stations will limit possible future failures and prevent discharge to groundwater. The new systems will have emergency generators to make sure they continue to operate during power outages.

Project Description

Replacement of Pump Station #4 (a.k.a. Red Bank) and Pump Station #6 (a.k.a. Queen Street)

Service Area

The service area for this project encompasses the entire Township of Hillside. Improvements to the pump station will benefit the entire sanitary system, and the street sweeper will improve the condition of the overall storm sewers and receiving waters.

Need for Project

The North Avenue Pumping Station has numerous components that are in need of repair to prevent operational failure of the pump station. The operation of this pump station is necessary to convey sanitary flow from Hillside Township to the Joint Meeting of Essex and Union Counties where it is treated. Failure of this pump station would result in significant disruptions in sanitary flow and potential compliance issues. The street sweeping vehicle associated with this project will assist in reducing the amount of sediment, debris, and pollutants entering the Township's storm water system.

Project Description

This project includes improvements to the North Avenue Pump Station, as well as the equipment purchase of one (1) street sweeping vehicle.

Township of Hillside

Need for Project

The existing collection system serving the Township is very old and is subject to an extreme amount of II. Rehabilitation of the entire sanitary sewer system is necessary to remove 650000 gpd of II to prevent overflows from the existing collection system and back-ups into residential and industrial establishments.

Project Description

This proposed project will be for an II correction program to eliminate the portion of II that is excessive and detrimental to the existing collection system. In some cases minor replacement may be necessary. Also proposed is the major rehabilitation of an existing sewage pumping station.

Hazlet Township

Need for Project

The Townships sanitary sewer system is subject to inflow and infiltration causing sewage to back up in the collection system. A 30 year old pump station must be replaced.

Project Description

The proposed project includes an infiltrationinflow correction program and replacement of a pump station.

Roselle Borough
S340332-02
Sanitary Sewer System Rehabilitation

Priority List Rank

457

County

Union

Existing Population

21,085

Service Area

The lining of sanitary sewers will occur in the western portion of Roselle Borough in the vicinity of surface stormwater drainage. It is the experience of the Borough Engineer that lining sanitary sewers located near surface stormwater drainage is effective in reducing I/I.

Need for Project

This project will reduce I/I into the sanitary sewer system and prevent downstream sewer overflows. This will increase water quality by preventing the untreated discharge of sanitary sewerage into stormwater systems.

Project Description

The Borough of Roselle proposes to perform sanitary sewer system improvements to sanitary sewer mains which will include the cleaning television inspection and lining of approximately 3.5 miles of sanitary sewer pipe. The bulk of the sanitary sewer system consists of terra cotta or clay pipe that will be inspected and lined. The Borough of Roselle desires to decrease the amount of I/I that enters the system by utilizing cured-in-place (CIP) lining techniques for the majority of the project where improvements are warranted. Where lining is not an option due to pipe section collapses in-kind sanitary sewer pipe replacement within the existing trench box shall be performed. Sanitary manhole rehabilitation is anticipated in order to stabilize structures where needed.

Carteret Borough
S340939-01
Sanitary Sewer System Rehabilitation

Priority List Rank

459

County

Middlesex

Existing Population

20,709

Service Area

Borough of Carteret

Need for Project

The project is needed to help reduce the Boroughs current II issues. Inflow and Infiltration contribute to sanitary sewer overflow conditions as well as surcharge of the system. Due to the influx of additional unanticipated flow the sanitary sewer system becomes overloaded and fails due to capacity constraints. By repairing the worst section of the system as noted from Borough inspections and maintenance programs this will be a significant first step in reducing II in the Borough.

Project Description

The Borough in an effort to combat an ever-growing Inflow and Infiltration (II) problem with its sanitary sewer system intends to rehabilitate approximately 10000 to 12000 linear feet of existing vitrified clay sanitary sewer main which is approximately 80 years old.

Service Area

West Deptford Township

Need for Project

The three existing pump stations are submarine style stations that were built in the early 1970s. The stations are proposed be replaced with suction lift stations to remove the need for Township workers to enter confined spaces for maintenance work that becomes increasingly necessary as the stations age. The new stations would have backup generators where none currently exist. Currently extended power outages cause failures of the station and create a backup of sewage to the local residents.

Project Description

Replace existing pump station number one located at Grove and Cumberland pump station number six located at the corner of Prince and Linden and pump station ten located on the north side of Crown Point Road west of its intersection with Church Street.

Need for Project

Upgrading the equipment in the pump stations will greatly reduce the chance of a sewage overflow and potential water contamination. In-line storm sewer and sanitary pipe improvements would reduce all types of inflowinfiltration increasing system capacity. Outfall improvements will reduce erosion and stream degradation.

Project Description

This proposed proposed project includes upgrades to two sanitary pumping stations and one storm sewer station. The project also includes storm and sewer pipe rehabilitaion and outfall improvements.

The sanitary sewer replacement and rehabilitation is necessary to reduce infiltration and inflow and to minimize the chance of failure in the system.

Project Description

The project consists of televising and clearing of numerous sections of sanitary sewer piping of various diameter throughout the Borough and then identifying deficient areas for point repairs in kind replacement or trenchless lining.

Project Name, Number

Dumont Borough
S340922-01
Sanitary Sewer System Rehabilitation

Priority List Rank

468

County

Bergen

Existing Population

17,710

Service Area

Dumont

Need for Project

The existing Sanitary Sewer System serves the Borough of Dumont and is approximately 65 years old. Treatment of the wastewater collected is provided by the Bergen County Utilities Authority at the Little Ferry Treatment Plant. Field investigations and existing records available at the Department of Public Works of the Borough of Dumont reveal that the condition of the sanitary sewer system is substandard. There are many sections of this mostly clay pipe system that have been troublesome resulting in frequent blockages and requiring significant efforts and time by the Department of Public Works to clear the lines. These blockages and problems are caused mainly by undersized piping cracking of pipes root intrusion offset joints and inadequate slopes. The purpose of the program to rehabilitate the Sanitary Sewer System is to correct these problem areas and also to decrease the amount of infiltration into the system.

Project Description

The areas of the system requiring rehabilitation were selected based on the problems incurred as recorded in the Department of Public Works files and past field investigations. The proposed scope of work will be carried out in four (4) phases over a 4-year period. The first phase will cover the southwest quadrant of the Borough where the system connects up with Bergen County Utilities Authoritys System the second phase will cover the northwest quadrant the third phase the southwest quadrant and the fourth and final phase the northeast quadrant.

Hopewell Township
S340282-03
Sanitary Sewer System Rehabilitation

Priority List Rank

469

County

Mercer

Existing Population

17,304

Service Area

The Hopewell Township Department of Public Works operates and maintains two (2) small public sanitary sewer conveyance systems which service approximately 1,905 customers within Brandon Farms and Princeton Farms developments. Brandon Farms sewerage system serves 1,686 residential dwellings, one (1) school and seven (7) commercial customers. No treatment is performed within this community and all sewerage is conveyed to Ewing Lawrence Sewerage Authority (ELSA). Princeton Farms sewerage system serves 211 residential dwelling customers. No treatment is performed within this community and all sewerage is conveyed to Stony Brook Regional Sewerage Authority (SBRSA). The Township plans for the repair deteriorated sewers to assure that wastewater is safely conveyed through the sewers to each respective regional wastewater treatment facility. A significant portion of the planning efforts will include the preparation of an Asset Management Plan (AMP) to identify critical areas for repair.

Need for Project

Portions of both existing collection system are deteriorated and subject to I&I resulting in loss of sewage to the environment and admission of groundwater and stormwater to the system. I&I has led to a notice of wet well overflow from the New Jersey Department of Environmental Protection (NJDEP) at the Princeton Farms location.

Project Description

The Hopewell Township Sewer Department operates and maintains two (2) small public sanitary sewer conveyance systems which service the Brandon Farms and Princeton Farms developments. Portions of both existing collection systems are deteriorated and subject to inflow and infiltration (I&I) resulting in loss of sewage to the environment and admission of groundwater and stormwater to the system. I&I has led to a notice of wet well overflow from the New Jersey Department of Environmental Protection (NJDEP) at the Princeton Farms location. The Township plans for the repair of deteriorated sewers to assure that wastewater is safely conveyed through the sewers to each respective regional wastewater treatment facility. As such, in addition to the rehabilitation, a significant portion of the planning efforts represent the creation and preparation of an Asset Management Plan (AMP) which the Township is seeking PF Grant monies to complete.

Service Area

This project's service area is Linden Lane between Nassau Street and Henry Avenue; the entire length of Spruce Street; and Maple Street from Spruce Street to the northern end.

Need for Project

By reducing the wastewater flow conveyed to the SBRSA, the Princetons are helping to reduce the amount of flow treated at the SBRSA's River Road facility. In addition, the new infrastructure helps to prevent wastewater flow from ex-filtrating from the collection system. Overall, the rehabilitation of the collection system provides a water quality benefit to the area.

Project Description

This project provides for roadway, sanitary sewer, storm drainage, and pedestrian improvements on Linden Lane between Nassau Street and Henry Avenue; the entire length of Spruce Street; and Maple Street from Spruce Street to the northern end. The principal items of work consist of the following: 4,085 CY of excavation, unclassified; 11,595 CY of dense graded aggregate base course; 4,579 tons of HMA 19M64 base course; 1,460 tons of HMA 9.5M64 surface course; 655 LF of reinforced concrete storm pipe; 393 LF of PVC storm pipe; 4,804 LF of sanitary sewer pipe lining; 1,206 LF of PVC sanitary sewer pipe replacement; 4,687 LF of sanitary sewer pipe lateral replacement; 3,255 SY of concrete sidewalk ADA curb ramps and driveway aprons; 2,029 LF of concrete vertical curb; traffic markings; permanent signage; tree removal and other related miscellaneous work. The estimated construction cost is \$3,271,398.00 of which \$2,221,574.00 is eligible.

Service Area

This project's service area is the entire length of Bank Street from Nassau Street to Chamber Street.

Need for Project

By reducing the wastewater flow conveyed to the SBRSA, Princeton is helping to reduce the amount of flow treated at the SBRSA's River Road facility. In addition, the new infrastructure helps to prevent wastewater flow from exfiltrating from the collection system. Overall, the rehabilitation of the collection system provides a water quality benefit to the area.

Project Description

Sanitary sewer mains in the road and under sidewalk will be rehabilitated by means of pipe replacement, spot repair, and / or pipe lining. Sewer laterals will be replaced by pipe bursting or open excavation. New laterals may be installed for duplexes currently using a combined lateral. New storm sewer piping will be installed under sidewalks to an existing underground storm sewer, which will be rehabilitated. Sidewalks will be reconstructed with tinted concrete. The 12' x 18' wide road will be reconstructed with new aggregate subbase and full depth pavement, as the sewer construction will damage all existing pavement. Curb will be replaced with granite curb and concrete curb. A tinted concrete raised crosswalk, flanked on both sides by 4" cobbles, will be constructed at the south end of the project. New trees with iron tree grates may be added. Pavement striping and markings and signage will be replaced. The total estimated project cost is \$1,559,668 of which \$988,974 is eligible.

Project Name, Number

Robbinsville Township
S343020-02
Sanitary Sewer System Rehabilitation

Priority List Rank

475

County

Mercer

Existing Population

0

Service Area

The project will serve a large section of the Township of Robbinsville. The Route 130 Pump Station receives sewer flow from multiple developments south of the pump station, all the flow collected from the AAA Pump Station, and flow from the Township's Town Center area. There are at least 100 lots served by the Route 130 Pump Station.

Need for Project

The Township of Robbinsville is still developing as a municipality which results in increasing sewer flows. The Route 130 Pump Station has been in operation since the early 1900s and is not designed to facilitate the increasing sewer demands generated by the Township. Not only will this project increase the pump station's capacity but also replace its aged and deteriorated pumps, electrical equipment, and machinery. The pump station requires much needed upgrades that will ensure it will continue to convey wastewater through the Township to the wastewater treatment plant for treatment while decreasing yearly pump station maintenance costs. In addition, improvements to the Route 130 Pump Station will allow the Township to eliminate the Route 33 Pump Station in the future which will further reduce annual maintenance costs.

Project Description

This project proposes replacement of the Township of Robbinsville's Route 130 Pump Station and installation of new sewer gravity and force mains. Improvements at the pump station will include new and larger pumps, an updated control system, a new wet well, grinder or bar screen, emergency generator, electrical service, and control building. The proposed gravity main will collect wastewater from Railroad Avenue and convey it across Block 1, Lot 56 to U.S. Route 130 to the pump station. The proposed force main will travel from the pump station up Route 130, cross Block 1, Lot 53 to connect to a manhole on Robbinsville-Edinburg Road.

Priority List Rank

476

County

Warren

Existing Population

15,420

Service Area

The Warren County-Lopatcong Creek Sewerage Authority is retaining a spot on the Priority List for rehabilitation of the local collection systems within their 201 Facilities Planning Area. The planning area lies in the Delaware Watershed and includes Alpha Borough and Lopatcong Pohatcong Harmony and Greenwich Townships.

Need for Project

Sanitary collection systems currently serve Alpha Lopatcong and Pohatcong. The existing Phillipsburg plant (NJ0024716) presently treats domestic and industrial waste from the above municipalities. Constructed in 1950 - 1951 with a design capacity of 3.5 MGD the plant provides secondary treatment by means of an activated sludge process. Present flows average slightly over 2.1 MGD but peak conditions can result in flows over 6.0 MGD which lead to a by-pass of the plant and direct discharge of untreated effluent into the Lopatcong Creek FW2-TM (tributary to Delaware River). There also are known cross connection between the storm and sanitary sewerage systems. These raw discharges result in frequent violations of fecal coliform standards and marginal degradation from nutrient and toxic impacts. An II analysis included in the facilities plan concluded infiltration to be non-excessive but recommended a Sewer System Evaluation Survey (SSES \$26000) to study the removal of excessive inflow and the elimination of the system by-passes.

Project Description

The proposed SSES will refine the conclusions of the II analysis and make recommendations for II correction. The project will allow for the construction and implementation of the cost effective rehabilitation measures. This will result in the abatement of the raw sewage by-pass problem presently experienced both in the collection systems and at the plant.

Sewage Treatment Plant (STP) - Improvement/Upgrade

Priority List Rank

479

County

Gloucester

Existing Population

15,217

Service Area

The Township population is 15,217 residents, based on the 2010 census. The sanitary sewer collection system is owned and maintained by the Mantua Township Municipal Utilities Authority (MTMUA). Sanitary sewer generated by the Township is conveyed to the Gloucester County Utility Authority (GCUA) for treatment.

Need for Project

This project is being undertaken in order to protect and enhance existing sanitary sewer infrastructure within the MTMUA service area. Failing to maintain the current infrastructure will only serve to increase the risk of future service interruption. The replacement of existing sanitary sewer infrastructure will serve to protect local water quality from disturbances related to chemical leaching and accidental discharges from aging infrastructure. Overall the proposed work will enable MTMUA to keep the municipal infrastructure in good operating condition, reduce unscheduled maintenance, and improve system monitoring.

Project Description

The Mantua Township Municipal Utilities Authority (MTMUA) has been evaluating the water and sewer infrastructure within the Township in an effort to identify equipment and components that are aging and reaching the end of its life cycle. The Authority is looking to be proactive and has identified three (3) sanitary sewer projects that will lessen maintenance time / costs, improve safety and allow for improved system monitoring. The Austin Street PS Improvements consist of the removal and replacement of the existing pumping station and associated force main as well as upgrades to existing communication / SCADA system for improved monitoring and control.

Phillipsburg Town
S340874-10
Sanitary Sewer System Rehabilitation

Priority List Rank

482

County

Warren

Existing Population

14,238

Service Area

This project will serve the western section of the Town of Phillipsburg in Warren County, in the vicinity of Riverside Way. The Delaware River borders to the west.

Need for Project

The existing pump station has deteriorated over the years and was undersized and must be replaced. Along with replacement of the pump station rehabilitation is required to the gravity sewer and force main associated to the pump station. EPA has issued an Administrative Order to the Town of Phillipsburg to mitigate and eliminate sewer system overflows. EPA cited this pump station as one of the worst they have seen and are mandating a replacement. The pump station is also on the Delaware River bank and subject to flooding. The project will help harden current sewer infrastructure.

Project Description

The station is in a state of advanced deterioration and the force main is old with the bell joints backwards as the pipes once conveyed flows to the river rather than away from the river. The EPA has expressed concerns regarding the condition of the facility in their recent Administrative Order and lists the replacement of the pump station as a high priority project. The project will include the replacement of the Pump Station and associated rehabilitation of the related gravity sewer mains and force main. The replacement pump station will utilize energy efficient pump motors and lighting in the design.

County

Essex

Existing Population

14,150

Service Area

Borough of Verona

Need for Project

An Infiltration/Inflow (I/I) analysis has concluded that the Borough's sewer system exhibits excessive I/I. Additional studies are underway to further define the quantity of excessive I/I and to propose a sewer rehabilitation program to mitigate hydraulic overloading of the plant during severe storm events which affects the performance of the treatment plant.

Project Description

This proposed project will consist of I/I correction to remove a portion of the excessive I/I. Construction of an equalization basin for storage of inflow may be necessary depending upon the conclusions of the additional on-going studies.

Service Area

Highland Park

Need for Project

The Borough of Highland Parks gravity sewers suffer from infiltrationinflow due in part to faulty joints cracked or collapsed pipes and leaky manholes. In addition some of the Boroughs sanitary sewers are located in high groundwater areas further increasing infiltration.

Project Description

The proposed project includes evaluation of the existing sanitary sewer mains through TV inspection. Pipes found to be in good condition shall be cleaned and have the joints grouted. Pipes with minor cracks will be grouted. Deteriorated manholes will be rehabilitated and have watertight covers installed.

S340870-06
Sanitary Sewer System Rehabilitation

Priority List Rank

489

County

Salem

Existing Population

0

Service Area

PSA's sanitary sewer service area service area.

Need for Project

This project is being undertaken in order to protect and enhance existing sanitary sewer system and wastewater treatment plant within the PSA's sewer service area. The Authority has observed that the frequency of repairs within sections of the sanitary sewer system that were constructed of asbestos-cement (transite) during the 1950s and 1960s has increased in recent years, which suggest that the infrastructure is reaching the end of their service life cycle. These improvements will address a need that has been closely monitored for years. Failing to maintain the current infrastructure will only serve to increase the risk of discharging wastewater that has not been adequately treated, increase emergency repairs and undermined roadways as a result of sewer main breaks as well as future service interruption. The replacement of existing sanitary sewer force main will serve to protect local water quality from disturbances related to unapproved discharges.

Project Description

The Pennsville Sewerage Authority (PSA) has been evaluating their sanitary sewer system infrastructure within the Township in an effort to identify equipment and components that are aging, reaching the end of its life cycle or would lessen maintenance time / costs, and improve operations. This phase of the Authoritys capital plan includes the following project: Pumping Station No.4 Force Main Replacement.

Need for Project

An infiltrationinflow (II) analysis has concluded that excessive II exists in the sewer system. Additional studies will define this excess quantity and propose an II correction program to eliminate a portion of the excessive II.

Project Description

This project is for the II correction of the Townships sewer system. The project involves grouting of manholes raising and resetting manhole frames and covers internal pressure grouting of sewer joints excavation and removal of 2 storm sewer connections repair of one service connection and elimination of sump pumps roof leaders and yard drains. This II correction project does not affect the treatment system.

Sanitary Sewer System Rehabilitation

Priority List Rank

492

County

Salem

Existing Population

12,456

Service Area

PSA's sanitary sewer service area service area.

Need for Project

This project is being undertaken in order to protect and enhance existing sanitary sewer system and wastewater treatment plant within the PSA's sewer service area. The Authority has observed that the frequency of repairs within the sanitary sewer system has increased in recent years, which suggest that the infrastructure is reaching the end of their service life cycle. These improvements will address a need that has been closely monitored for years. Failing to maintain the current infrastructure will only serve to increase the risk of discharging wastewater that has not been adequately treated, increase emergency repairs and undermined roadways as a result of sewer main breaks as well as future service interruption. The replacement of existing sanitary sewer force main and wastewater treatment plant improvements will serve to protect local water quality from disturbances related to unapproved discharges.

Project Description

The Pennsville Sewerage Authority (PSA) has been evaluating their sanitary sewer system infrastructure within the Township in an effort to identify equipment and components that are aging, reaching the end of its life cycle or would lessen maintenance time / costs, and improve operations. The first phase of the capital plan includes the following project: Pumping Station No.3 Force Main Replacement.

Sanitary Sewer System Rehabilitation

Priority List Rank

494

County

Morris

Existing Population

12,100

Service Area

Roxbury Township and portions of Mine Hill Mount Arlington and Randolph

Need for Project

To eliminate excessive inflow into the sewer system.

Project Description

The Ajax Terrace sewage treatment plant has a sewer configuration 50 miles in length with a dry weather flow of 0.94 mgd. The infiltration has been determined to be nonexcessive. However excessive inflow does exist since the plant flow records indicated that the wet weather flows were as much as 4 times greater than the dry weather flows. Inflow investigation is presently underway to identify the locations magnitudes and causes of this inflow problem. It is expected that a sewer system evaluation survey and II correction program will follow.

Need for Project

Various water quality-based needs for the projects will be addressed including the removal of several existing potential cross-connections (Tanner St) reducing II (Woodland Ave and Coles Mill Pump Station Phase I) an the elimination of potential pump station overflows that would drain to adjacent waterways (Elm Ave Pump Station).

Project Description

The 2009 Sanitary and Storm Sewer Replacement Project includes the following projects Tanner Street - Replace existing clay sanitary sewer and brick storm sewer to remove cross-connections Woodland Ave - Replace existing clay sanitary sewer and install new storm sewersump pump collector Coles Mill Pump Station Replacement Phase I - install new PVC sanitary sewer connection to regional sewer authority to eliminate one (1) existing sanitary sewer pump station Station Ave - Replace existing damaged clay sanitary sewer and Elm Ave Pump Station - Install an emergency by-pass pump to prevent sanitary sewer overflows.

Township of West Caldwell

Need for Project

While currently operating normally with no support for the pumping controls and software any failure will result in the manual operation of this station and the need for an emergency contract to bring this facility back on line. The installation of the grinder in the wet well headworks will reduce if not eliminate the current matting problem and subsequent pump clogging significantly extending the working life of the submersible pumps and extending the scheduled maintenance intervals of the pumps.

Project Description

The Kirkpatrick Sanitary pumps stations located on Kirkpatrick Drive near the intersection of Bloomfield Avenue and Passaic Avenue initially constructed in 1958 was last rehabilitated in 1990 and conveys approximately 1.3 MGD. The station controls and software installed in 1990 are no longer supported by the company that installed them. The Township needs to upgrade these outdated controls and software. The existing submersible pumps are not as efficient as the newer pump designs are now approaching the end of their design life at 20 years old and obtaining replacement parts is becoming more difficult and costly. The pumps have been rebuilt to various degrees several times since the 1990 rehabilitation work. Recently there have been conditions in the wet wells where the solids have been matting and causing subsequent pump clogs. The Township seeks to install a Muffin Monster grinder at the station headworks to address this matting problem.

County

Passaic

Existing Population

10,855

Service Area

Township of Little Falls

Need for Project

The Little Falls Collection System consists of approximately 120,000 linear feet of pipe in size from six to eighteen inches diameter. Eighty-nine percent of pipe is clay tile, ten percent is asbestos cement, and one percent is cast iron pipe. Interviews with the plant operator indicate that sewers in the western section of Little Falls surcharge and overflow during periods of heavy rain and high Passaic River levels. Overflows also occur at the Hopson Street Pumping Station, which receives sewage flow from the easterly section of Little Falls.

Project Description

This proposed project consists of a sewer system evaluation study utilizing manhole inspection, rainfall simulation, and T.V. inspection and the minor rehabilitation of the Townships existing sewer system to eliminate the portion of the I/I that is excessive.

Need for Project

The Bergen County Utilities Authority Infiltration/Inflow (I/I) Analysis and Sewer System Evaluation Survey identified excessive I/I in this municipality's sewer system.

Project Description

The excessive I/I will be removed by grouting slip lining and other minor rehabilitation methods.

Sanitary Sewer System Rehabilitation

Priority List Rank

503

County

Middlesex

Existing Population

10,500

Service Area

Borough of Sayreville (Morgan and Melrose Sections)

Need for Project

The sewer systems in the Morgan and Melrose sections of Sayreville Borough constructed prior to the use of secondary treatment methods did not set strict limits on the volume of infiltration and inflow within sanitary sewers since treatment costs were not greatly affected by these extraneous flows. However in recent years the construction costs of conveyance facilities coupled with rising treatment costs associated with secondary treatment methods have resulted in efforts to eliminate infiltration and inflow in areas where it is proven to be cost-effective.

Project Description

The proposed project is to provide II correction for Sayrevilles existing system.

Service Area

The Brielle Pump Station services the Borough of Brielle. The Glimmer Glass Pump Station services the Borough of Manasquan

Need for Project

The Brielle and Glimmer Glass Pump Stations are vital to maintaining health, safety, and welfare of the community. The stations, which were constructed in the late 1970's, are in need of improvements to replace equipment and infrastructure that has either failed and/or has surpassed its useful life expectancy and to upgrade other systems which are antiquated. These improvements will help increase the reliability and performance of the stations for years to come. The Brielle Pump Station currently averages around 0.373 Million gallons per day (MGD) and the Glimmer Glass pump station averages around 0.755 MGD. Construction improvements are based on the results of failing mechanical equipment, corroded piping and deteriorating infrastructure at each pump station.

Project Description

The work at the Brielle and Glimmer Glass pump stations shall include, provision and implementation of bypass pumping system; shutdown and isolation of existing sewage pumps wet wells; demolition of existing concrete diversion walls, floors and flow channels within wet wells; and installation of new FRP grating levels as well as the installation of stainless steel or concrete structural support systems. Additional work shall include cleaning and repairing of all interior concrete surfaces within each wet well; cleaning and rehabilitation and coating of metal surfaces to remain in each wet well; installation of epoxy coating system on all existing wet well surfaces; installing new stainless steel trash basket with associated mounting and railing requirements; installation of both davit crane hoists and fall protection/retrieval hoists; and installation of flood protection measures.

Most of the population of Pine Hill Borough has public sanitary sewer service with the exception of those located on Bramau Avenue, Bramau Court, New Freedom Road, Mohawk Avenue, and Weikel Avenue.

Need for Project

N/A

Project Description

This project will consist of two components. The first component is to update an existing aging pump station on Greenwood Avenue. The project includes the excavation and installation of a new wet well including all pumps controls and electrical panels and force main improvements. The proposed pump station will utilize submersible pumps. The existing pump station utilizes a drywell and pumps that are to be abandoned. The second component is the installation of a new force main connection from the Madison Avenue pump station to the recently installed Camden County Municipal Utilities Authority interceptor on Berlin-Cross Keys Road. The existing aging force main will be capped and abandoned.

Lincoln Drive Stormwater Pump Station, Lincoln Drive at Caverly Drive 10. Police/Fire/Emergency Medical Services, 1417 West Brigantine Avenue 11. City Hall, 1417 W Brigantine Avenue

Need for Project

It is critical that stormwater, sewer and water services be maintained during natural hazards. By providing Emergency Generators for these services the systems will be operational during extended storm periods. Natural hazards can result in an emergency condition for many days due to lack of electricity and other factors, and these pumps must continue to operate. . The proposed emergency generators will help the City to provide continued environmental services during and after future natural disasters and during power outages.

Project Description

(Carryover SFY2015) - The City of Brigantine is served by three sanitary sewer lift stations three potable wells and two stormwater pumps which all require Emergency Generators.

Project Name, Number

Edgewater Park Sewerage Authority
S340108-03
Sanitary Sewer System Rehabilitation

Priority List Rank

510

County

Burlington

Existing Population

0

Service Area

The service area for this project is the Township of Edgewater Park. The elimination of one pump station and the rehabilitation of the two other stations will help to ensure that the residents of Edgewater Park have a reliable system to collect and transport their wastewater and eliminate the potential for disruptions in service.

Need for Project

The upgrades to Pump Stations #2 and #3 will ensure that there is no decrease in the current water quality of the areas surrounding the stations or within the Township as a whole. The elimination of Pump Station #1 will help to ensure that the water quality remains the same, as this station is the oldest in the system and has surpassed its useful life.

Project Description

This project is eliminating a pump station and upgrading two other pump stations within Edgewater Park. The Edgewater Park Sewerage Authority owns and operates eleven (11) pump stations within Edgewater Park. The three pump stations being addressed are the oldest in the system, and this project will help to reduce operations and maintenance costs for the system.

Service Area

The existing pump station is serving a large area within the City of Northfield, the current sewer flows area is generated by approximately 1,500,000 SF of commercial facilities and 956 homes at this time this station cant accommodate any additional flows. There is an approved multi family housing development that will add 256 homes to the demand; a portion of the multi housing development's units are designated to be affordable housing.

Need for Project

The pump station is running beyond its capacity, requires daily inspection to insure that it is functioning properly, this station was constructed more than 40 years ago with antiquated equipment and design. The major concern if the station should fail, it will be catastrophic for the residents and businesses in the area, and may affect the public safety and welfare of the residents and general public.

Project Description

The existing pump station is more than 40 years old consisting of a wet well and dry well, it is undersized based on the current flows, and no additional flows could be added at this time. We are proposing to rehab the existing station and eliminate the dry well and upgrade the wet well and eliminate any ground water intrusion; we will also replace the existing pumps with more efficient pumps.

Project Name, Number

Ocean Township, Ocean County
S340112-07
Sanitary Sewer System Rehabilitation

Priority List Rank

518

County

Ocean

Existing Population

8,332

Service Area

Service area for the Utility is the majority of Ocean Township east of the Garden State Parkway and the northeastern corner of the Township of Barnegat. The project will service the southeastern section of Ocean Township.

Need for Project

The existing infrastructure is ACP pipe that is old and deteriorating. Several blockages and leaks have occurred causing sewage backups. Failure of the main could potentially cause a spill that due to its proximity to Barnegat Bay watershed would have an adverse impact.

Project Description

Replacement of approximately 6000 LF of existing sanitary sewer main as well as 1600 LF of drainage improvements along Maplewood Road Teaneck Road Englewood Avenue Dune Lane Stillwater Road and Harborage Place.

Project Name, Number

Carneys Point Sewerage Authority
S340502-08
Sanitary Sewer System Rehabilitation

Priority List Rank

519

County

Salem

Existing Population

8,049

Service Area

CPTSA sewer service area serves approximately 2,123 residences and 134 businesses within Carneys Point Township and Oldmans Township. At an average rate of 2.58 persons per household (U.S. Census Bureau 2012-2016), the estimated residential population served by CPTSA is 5,477 people. The Lafayette pump station serves approximately 100 residences within its capture area. Using the average rate of 2.58 persons per household, the proposed work will serve approximately 258 people. Please refer to the sewer service map in the reports and maps section for further details.

Need for Project

This project is being undertaken in order to protect and enhance existing sanitary sewer infrastructure within the CPTSA service area. Failing to maintain current infrastructure will only serve to increase the risk of future service interruption. The reconstruction of existing sanitary sewer infrastructure will serve to protect local water quality from disturbances related to failure of the existing pump station or sanitary sewer collection mains. Overall the proposed work will enable CPTSA to keep the sanitary sewer infrastructure in good operating condition and to facilitate its continuing efforts to provide sanitary sewer service for its residents, businesses, and industry. The Lafayette pump station is reaching the end of its service life cycle and the proposed project is necessary to maintain uninterrupted sanitary sewer service to the residents. This project could also be considered a green project since it will eliminate the electric and fuel usage of the pump station.

Project Description

This project is being completed to eliminate the need for an existing sanitary sewer lift station on Lafayette Road in Carneys Point Township. New sanitary sewer gravity mains will be constructed in order to redirect sanitary sewer flow downstream and allow the demolition and removal of an existing pumping station. We have estimated that removal of the pumping station will eliminate approximately \$950,000 in electricity, labor, maintenance & repairs over a 50 year period.

Project Name, Number

Glen Ridge Borough
S340861-04
Sanitary Sewer System Rehabilitation

Priority List Rank

523

County

Essex

Existing Population

7,527

Service Area

The proposed project is located within the public right-of-ways of Glen Ridge Borough along various local and county roads. The project area consists of residential and commercial properties.

Need for Project

Portions of the existing collection system are deteriorated and subject to inflow and infiltration resulting in admission of groundwater to the system and loss of sewage to the environment. Specific areas have been identified as the target area for the collection system rehabilitation program. These areas have been selected due to the high frequency of repairs, high maintenance requirements and observed infiltration and inflow in the system.

Project Description

The Borough of Glen Ridge will evaluate and rehabilitate approximately 22,000 LF of sanitary sewer through a phased project approach dependent upon received building costs. Associated manholes will be rehabilitated as well to eliminate any potential hazards and water intrusion into the system. Portions of the existing collection system are deteriorated and subject to inflow and infiltration resulting in admission of groundwater to the system and loss of sewage to the environment. The Borough plans to repair the affected sewers to safely convey wastewater through the sewers to the regional wastewater treatment facility. As such, in addition to the rehabilitation and additional rehabilitation evaluations design phase of this project a significant portion of the planning efforts represent the creation and preparation of an AMP and implementation thereof. The Borough is interested to pursue the Principle Forgiveness that is available for small systems to cover the costs for the AMP.

Service Area

Service area for this project is the areas of the Borough that are serviced by the Lake Street Pump Station. This area is the south eastern part of town and was designated as SubSystem 1 MiniSystem B in the Camden County Municipal Utilities Authority Analysis in November 1979, revised March 1980.

Need for Project

This project helps to eliminate any loss-of-power emergency spillage or overflow of the Lake Street Pump Station.

Project Description

This project includes supplemental pumping equipment for the Lake Street Pump Station to accommodate emergency events such as power outages. This project also includes slip lining of sanitary sewer lines in the vicinity of the Lake Street Pump Station. This project will reduce total energy consumption and recover previously wasted energy in that the existing method of providing power in emergency loss-of-power situations is the use of a mobile generator. The proposed emergency standby pumping equipment would conserve valuable time, manpower, and energy in times of emergency loss-of-power situations.

Service Area

The sanitary sewer pump station services the western portion of the borough with approximately 341 homes that are connected to this pump station.

Need for Project

The updated sanitary sewer pump station will improve the efficiency of the system and will prevent any potential backups in the sanitary system.

Project Description

The project includes upgrades to an existing sanitary sewer pump station. The work includes replacement of the two sanitary sewer pumps with new pumps which are more efficient and reliable. Additionally the controls for the station will be replaced to provide better control of the operation of the system. The existing pump station has met its useful life and these improvements will provide for an updated sanitary sewer pump station.

Need for Project

Based on an infiltration/inflow analysis sponsored by the Somerset County Planning Board the Upper Raritan Watershed Wastewater Facilities Plan recommends a Sewer System Evaluation Survey (SSES) be performed on the Bernardsville sewer system.

Project Description

The SSES will include a physical survey of the Bernardsville sewer system including manhole inspections and flow inspection (measurement of sewage flows in isolated reaches of pipe) rainfall simulation and smoke testing building inspection of units suspected of contributing inflow to the sanitary sewers and television inspection. If correction in accordance with the recommendations of the SSES will follow.

Borough of Dunellen

Need for Project

The majority of the sanitary sewer system of Dunellen was installed around 1915. The system consists of vitrified clay pipe which has been cracking and failing. Over the past four years the Borough has had to replace or reline several thousand feet of trunk line at a cost of almost \$1 million.

Project Description

The proposed project consists of relining or replacing all the trunk lines in the Borough upgrading and repair of Boroughs pump station upgrading and sealing manholes and televising and clean remaining system.

Service Area

Borough of Union Beach

Need for Project

The Boroughs sanitary sewer system is constantly inundated by groundwater and surface flooding due to its proximity to the shore. The Boroughs sanitary sewer study indicates that many sections of sewer pipe and manholes must be rehabilitated to reduce extraneous flows which are costly to treat.

Project Description

The proposed project involves rehabilitation by grouting lining repair and/or replacement of troubled sewer lines which are identified in the Boroughs II study.

Need for Project

The sanitary sewer replacement and rehabilitation is necessary to reduce infiltration and inflow and to minimize the chance of failure in the system.

Project Description

This project consists of the installation of 800 l.f. of 8 sanitary sewer main from the last manhole on Stryck Ave. to the restrooms at the Borough owned Hofstra Park. It also consists of purchasing a JetVacuum Truck. The project also consists of televising and clearing of numerous sections of sanitary sewer piping of various diameter throughout that Borough limits and then identifying on the deficient areas for point repairs in kind replacement and trenchless lining

Lopatcong Township

Need for Project

The southern portion of the Townships sewage system drains to two pump stations. The sewage is then pumped to the Township of Phillipsburg sewage system for treatment. These two pump stations are over 20 years old and require extensive maintenance to keep them operable. The Township is planning to either upgrade these facilities or possibly construct an interceptor sewer to replace them. Also several sanitary sewers throughout the Township are in need of replacement. This project will address these known problem areas and provide the Township with a reliable system.

Project Description

The proposed project includes the construction of gravity sewers and a force main in conjunction with the upgrade or replacement of the Baltimore Street Pump Station. The likely plan is to eliminate the Baltimore Street PS and intercept its flow with a gravity sewer that will lead to the Morris Heights PS. The Morris Heights PS will either be expanded or eliminated and replaced by an interceptor that will connect to the Phillipsburg system. Additionally several pipes in the collection system will be replaced to improve problem areas.

Service Area

Portions of the Borough of North Arlington

Need for Project

The Joint Meeting has conducted an Infiltration/Inflow (I/I) analysis and concluded that excessive I/I exists in the sewer system. A sewer system evaluation survey has evaluated flow conditions and identified the sewer segments which are cost-effective to rehabilitate. Further sewer system evaluation work will propose an I/I correction program to reduce the excessive I/I flows.

Project Description

This proposed project will consist of an I/I correction program to remove a portion of the excessive I/I flows. This may include grouting of sewer joints sealing manholes repairs or replacement of defective manhole covers and other major rehabilitation measures such as removal and replacement of defective sewer pipes and relining of sewer pipes.

Service Area

Rochelle Park Township

Need for Project

The sewer main connecting the Township system to the Bergen County UA interceptor is forty years old and has been experiencing blockages due to deterioration. Two pump stations need to be upgraded to allow them to operate as originally intended.

Project Description

The proposed project includes the installation of a new trunk sewer main from the Townships main pump station to a Bergen County UA interceptor. The existing line will be abandoned in place. The Townships main pump station will have a second comminutor unit a backup sanitary sewer pump and a new pump control system installed. The Sprout Brook Pump Station will be upgraded by replacing the existing pumps motors and control system with new ones.

Project Name, Number

Highlands Borough
S340901-05
Sanitary Sewer System Rehabilitation

Priority List Rank

544

County

Monmouth

Existing Population

5,005

Service Area

This project will serve residents of Highlands Boro in the central business district, community center public beach, and nearby residential areas. Areas to see benefit include Linden Ave, Bay Ave, Waterwich Ave, and all upstream residential roadways in addition to beachgoers at Snug Harbor Beach.

Need for Project

The project aims to reduce infiltration and inflow issues with the existing sanitary sewer system within Bay Avenue. Current I & I levels overburden the sewer system resulting in overflow of contaminated water into the streets. This contaminated water flows into the stormwater conveyance system that discharges into Jones Creek, creating an unsafe swimming condition further downstream at the Sung Harbor Beach at the Borough Community Center. Replacement of the sanitary sewer system is expected to reduce infiltration and inflow, thereby keeping the sanitary sewer system within capacity and eliminating contaminated water in the stormwater system and swimming areas.

Project Description

The existing sanitary sewer system within Waterwich Ave, Linden Ave, Bay Ave, and the surrounding residential area is vitrified clay and has deteriorated and is overburdened due to infiltration and inflow. This project aims to eliminate I&I in this system removal of existing deteriorated clay sanitary sewer main and replacement with PVC sanitary sewer

Sanitary Sewer System Rehabilitation

Priority List Rank

546

County

Essex

Existing Population

4,850

Service Area

Borough of Roseland

Need for Project

The excessive inflow and infiltration condition results in surcharging of the collection system. In addition the excess flow is being directed to the Caldwell STP and these additional volumes result in higher treatment costs to the Borough of Roseland.

Project Description

The Borough has conducted preliminary field investigations and determined that several residential neighborhoods are experiencing significant inflow/infiltration problems. These impacted areas represent approximately twenty (20) percent of the utility users. The Borough will embark upon final studies to determine the exact location and magnitude of the problems. The rehabilitation work will include air testing and chemical grouting of approximately 8000 linear feet of sanitary sewer.

Sanitary Sewer System Rehabilitation

Priority List Rank

547

County

Gloucester

Existing Population

4,720

Service Area

Harrison Township

Need for Project

The sanitary sewer system is approximately 25 to 30 years old and was constructed of terra cotta pipe. A majority of these sewer mains are located in low lying areas adjacent to wetlands or streams. In addition the 11 pump stations are also 25 to 30 years old and are in need of rehabilitation to bring them up to current operational standards. Several of the pump stations do not have back-up emergency generators or other alternate power source.

Project Description

The Township will repair and/or replace those sections of the sewer system which experience problems. Also included is the necessary work to upgrade the existing pump stations to current standards.

Project Name, Number

Buena Borough Municipal Utilities Authority
S340518-06
Sanitary Sewer System Rehabilitation

Priority List Rank

549

County

Atlantic

Existing Population

4,603

Service Area

The project area includes 229 Wheat Road (Pump Station #1), 145 Wheat Road (Pump Station #2), and 421 Plymouth Road (Pump Station #3 and Wastewater Treatment Plant Grit System) in Buena Borough. All sites are on cleared grass lots owned by the Borough. The project will service the entire area of Buena Borough.

Need for Project

Due to aging components of the existing grit chamber, pump stations and pump station sites, improvements and upgrades are necessary to maintain operations and to continue operating within the New Jersey Pollutant Discharge Elimination System permit requirements. The added flow meters will be helpful to identify and quantify extraneous flows.

Project Description

This project consists of the planning, design and construction of various improvements to sanitary sewer pump stations 1, 2 and 3, including structural, mechanical and electrical component upgrades at each pump station; the installation of flow meters at each pump station; grit removal system upgrades at pump station 1; and all work and materials necessary therefor or incidental thereto.. Pump replacements with premium efficiency motors will result in energy savings.

Service Area

Sayreville Borough

Need for Project

The southern and western portions of the Morgan Section of the Borough of Sayreville are presently served by a series of six municipal pump stations and one privately owned pump station which convey the wastewater flow to the Middlesex County Utilities Authority's secondary treatment facility. The gravity collection system downstream of the discharge of a major basin pumping station is subject to surcharge to the point of overflow during dry weather peak flow periods. Anticipated growth in the area will additionally stress the already overloaded conveyance facilities.

Project Description

The proposed project calls for the construction of a gravity interceptor regional pump station and force main and the upgrading of four existing sub-regional pump stations. The wastewater flow will ultimately discharge directly to the Middlesex County Utilities Authority gravity sewer which runs parallel to the New York and Long Branch railroad.

Service Area

Sanitary improvements are proposed along Evergreen, Monmouth, Burlington, Pacific, Madison Avenues including portion of Bradley Boulevard. Stormwater improvements will include all 10 outfall into Sylvan Lake at the following intersections with Bradley Boulevard: Main Street, Pacific Avenue, Atlantic Avenue, Madison Avenue and Monmouth Avenue.

Need for Project

The Borough of Bradley Beach is requesting funding through the New Jersey Environmental Infrastructure Trust Finance Program (Trust) Clean Water State Revolving Fund for the State Fiscal Year 2016 loan program to improve its aged stormwater and sanitary infrastructure.

Project Description

The Borough is currently operating an aged sewer collection system and stormwater system constructed in the early 1900's. It is the Borough's desire to rehabilitate their infrastructure systems over time as funding is available. It is the intent of this application to address about 15% of the sanitary sewer system and approximately 90% of the stormwater infrastructure system to Sylvan Lake. This infrastructure rehabilitation project will address the sanitary sewer system as follows: - 9,500 linear feet of 8 inch diameter vitrified clay sewer mains with 8 inch diameter PVC mains. - Replace 34 brick manholes with precast concrete manholes - Replace 280, 4 inch diameter, sanitary sewer laterals with 4 inch diameter PVC laterals

Project Name, Number

Medford Lakes Borough
S340319-03
Sanitary Sewer System Rehabilitation

Priority List Rank

553

County

Burlington

Existing Population

4,146

Service Area

The Borough provides sanitary sewer service to residents within the Medford Lakes Borough municipal boundary limits, as well as, parts of Medford Township, including the Medford Pines area and along Stokes Road, Chippingwood Court and Medford Lakes Road.

Need for Project

The proposed work is necessary to rehabilitate the existing deteriorating collection system located throughout the Borough's Sewer Service Area. The existing system was originally constructed in the 1930's and last upgraded in the 1960's and 1970's. The rehabilitation and repair work proposed will minimize blockages and eliminate potential sewage spills in order to assure proper functioning of the system and minimize impact to adjacent environmentally sensitive areas including surrounding groundwater and adjacent water bodies.

Project Description

The Borough proposes to rehabilitate and repair its existing sanitary sewage collection system located throughout its service area. Work proposed includes lining of 110,000 lineal feet (LF) of sewer pipe; repair and/or replacement of 5,000 LF of sewer pipe; interior lining of approximately 500 manholes; repair and/or replacement of 20 manholes and testing and sealing of approximately 1,350 lateral connections.

Mendham Borough
S340159-03
Sanitary Sewer System Rehabilitation

Priority List Rank

555

County

Morris

Existing Population

3,915

Service Area

The Mendham Boro Water Reclamation Facility (WRF) and associated sanitary sewer system services the majority of the northern portion of the Borough of Mendham.

Need for Project

CCTV & Sanitary Sewer Rehabilitation - The Borough's WRF has recently experienced I/I related flow variations that have caused the WRF to exceed its permitted capacity. This condition has led the NJDEP to notify the Borough that the WRF has reached 90% of permitted capacity triggering the Capacity Assurance Program regulation requirements. The Capacity Assurance Plan provided to the NJDEP identified how flows would be reduced to alleviate capacity concerns. The plan indicated the Borough was in the planning stages of implementing a CCTV program to identify piping defects in the collection system that could be contributing excessive flow to the WRF. The CCTV and associated rehabilitation are the implementation of that project. WRF Improvements - the various improvements proposed at the WRF are to replace existing equipment that has reached the end of its useful life or to alleviate operational concerns at the plant. This is necessary to maintain operational compliance at the WRF

Project Description

The Borough of Mendham is currently planning to perform closed circuit television (CCTV) inspection to identify areas of I/I and defects within the sewer system. Based on the results of the CCTV work, a collection system rehabilitation project will be designed and bid to repair all identified defects in the collection system.

Sanitary Sewer System Rehabilitation

Priority List Rank

556

County

Hunterdon

Existing Population

3,906

Service Area

The Lambertville Municipal Utilities Authority (LMUA) Wastewater Management Plan (WMP) Planning Area includes portions of the following Hunterdon County municipalities: "§ City of Lambertville "§ Borough of Stockton Pursuant to an Agreement dated July 19, 1965 (amended August 4, 1980 and January 5, 1982, and July 6, 1995), the LMUA also provides service to the BCW&SA which is wholly contained in the State of Pennsylvania.

Need for Project

Water quality will be improved as a result of this project because potential sanitary sewer overflows or discharges will be minimized or eliminated through the use of new flood controls.

Project Description

Construction of new floodwall across the mouth of Swan Creek with floodgates built into the wall. The gates would be designed to be normally open to pass flows from Swan Creek and flows from the Canal spillway, and would close during Delaware River flood events preventing River flood waters from backing into the City via Swan Creek. A stormwater pump station would be constructed to convey residual stormwater flow from Swan Creek into the Delaware River when the gates are closed, while discharges from the Canal would be routed directly to the River. Also, the relocation of LMUA's Swan Street Pumping Station Force Main under the D&R Canal will involve installation of a new sewage force main via microtunneling from a point adjacent to the Swan Creek PS to a point where the new sewage force main will be reconnected to the existing sewage force main located to the south of the proposed floodgate structure. The existing Swan Street Pumping Station force main would be abandoned in place.

Need for Project

The existing sanitary sewers are in need of replacement/repair because of broken/collapsed pipes, failed pipe joints, and major root intrusion, and will minimize infiltration and pipe collapses.

Project Description

The proposed project includes the rehabilitation of existing sanitary sewer lines and manholes.

Hamburg Borough
S340149-03
Sanitary Sewer System Rehabilitation

Priority List Rank

561

County

Sussex

Existing Population

3,277

Service Area

The Hamburg Sewer Department provides sanitary sewer service in the Borough of Hamburg. The customers are primarily residential except for municipal facilities, schools and businesses. The sanitary sewer system serves the entire Borough, which is a population of approximately 3,200 people.

Need for Project

Wastewater system Asset Management Plans are important for municipalities to drive the inspection, maintenance, repair of and renewal of their infrastructure consistent with regulatory standards. The Asset Management Plan will fully document the overall condition and operation of the wastewater system and identify the priority and budgetary costs of future capital investments. The Asset Management Plan will evaluate the physical, demographic, renewal (replacement or rehabilitation), regulatory, operational efficiency, safety, and security planning drivers to identify capital investment needs into the future (15 years).

Project Description

The Borough of Hamburg wishes to create and implement a Sanitary Sewer System Asset Management Plan through funding available from the (CW) Asset Management Plan Development; for Small CW Systems; populations <10,000. The Borough owns, operates and maintains a sanitary sewerage distribution system which benefits approximately 3,000 residents through approximately 1,000 connections. The Borough's sanitary sewer system consists of transmission mains, force mains, lateral connections, and pumping stations. The Borough wishes to report upon sound fundamentals in the planning, operation, maintenance, and reinvestment of its sanitary sewer system to assure a reliable sanitary sewer system to its customers and potential customers. The Borough proposes to proceed with the following program at this time: 1. Preparation of a Sanitary Sewer System Asset Management Plan 2. Condition assessment of collection system (via flow metering & inspection) 3. Geographic Information System (GIS) Update

The Hamburg Sewer Department provides sanitary sewer service in the Borough of Hamburg. The customers are primarily residential except for municipal facilities, schools and businesses. The sanitary sewer system serves the entire Borough, which is a population of approximately 3,200 people.

Need for Project

The maintenance, repair of and renewal of infrastructure consistent with regulatory standards is imperative for preserving water quality. The scope of work of this project is consistent with keeping maintaining and upgrading an existing aging sanitary sewer system.

Project Description

The Borough of Hamburg wishes to rehabilitate & upgrade their existing sanitary sewer system. The Borough owns, operates and maintains a sanitary sewerage distribution system which benefits approximately 3,200 residents through approximately 1,000 connections. The Borough wishes to rehabilitate its sanitary sewer system to assure a reliable sanitary sewer system to its customers and potential customers. The Borough proposes to proceed with the following program at this time: 1. Rehabilitation of the Quarry Road sanitary sewer pump station, including two new pumps, new rail system for pumps & floats in wet well, new hoist system, new control panel, new level control system, and a new back-up generator. 2. Purchase of spare/back-up pumps for all Borough Pump Stations (four other locations include the Gingerbread Castle Pump Station, Heritage Lakes Pump Station, Limekilm Road Pump Station, and Michael Court Pump Station) 3. I/I (Infiltration & Inflow) Correction

Need for Project

Television inspections of the sanitary sewer pipe are being performed for large sections of the waste water system to identify most critical areas. Previously submitted sewer runs were found to have large groundwater infiltrations, breaks, and excessive deterioration.

Project Description

The proposed project includes the removal and replacement (in-kind) of sewer mains with approximately 10000 to 13000 feet of new 8 10 and 12 PVC SDR 26 sanitary sewer mains as well as the replacement of existing sanitary manholes services and cleanouts.

Service Area

Borough of Woodbury Heights

Need for Project

The Boroughs sanitary sewer system is subject to excessive amounts of inflow and infiltration causing sewage to overflow in the collection system during wet weather periods.

Project Description

The purpose of the project is to reduce rainfall-induced surcharging of the collection system. The project involves an infiltrationinflow correction program in conjunction with the replacementrehabilitation of sections of the sewer system.

Service Area

In the vicinity of State Rt. 173 (Old Highway 22) and East Main Street, Town of Clinton

Need for Project

Replacement of aging infrastructure and rehabilitation of existing mains will alleviate Infiltration and Inflow (I/I) which in turn improves water quality throughout the system.

Project Description

The Town of Clinton Sewer Utility is interested to rehabilitate and improve sanitary sewer system components to address aging infrastructure and system resiliency in the vicinity of State Rt. 173 (Old Highway 22) and East Main Street. This project will include but not limited to trenchless rehabilitation, sanitary sewer pipe replacement and manhole rehabilitation. In addition, the utility is interested to complete an asset management plan, intergrade GIS mapping of sewer system components and life valuation of above grade assets to plan capital improvements as needed.

Need for Project

An economic study of flow level with sewer improvements versus Township of Neptune Sewerage Authority current charges for flow indicates that flow levels may be in excess of contractual amounts. The excessive flow results in dilute flow into the treatment plant. This contributes to unwarranted costs and possible penalties for excessive flow. The original sewer system was constructed prior to 1920.

Project Description

The proposed project would reduce infiltration of groundwater into the existing sewer system and includes sleevinglining of the sanitary sewers grouting all connections to the trunk sewers repairing and replacing manholes and the replacement of the deteriorated sewer on Lincoln Lane.

Wenonah Borough
S340531-01
Sanitary Sewer System Rehabilitation

Priority List Rank

572

County

Gloucester

Existing Population

2,278

Service Area

The Borough of Wenonah Department of Public Works operates and maintains five (5) small public sanitary sewer lift stations and 14.22 miles of main which serves 822 connections and approximately 2,278 people. No treatment is performed within this community and all sewerage is conveyed Gloucester County Sewerage Authority. The Borough plans for the repair deteriorated sewers to assure that wastewater is safely conveyed through the sewers to each respective regional wastewater treatment facility. The proposed project is located within the public right-of-ways of Wenonah Borough in addition to Borough-owned land.

Need for Project

Portions of the existing collection system are deteriorated and subject to inflow and infiltration resulting in admission of groundwater to the system and loss of sewage to the environment. Specific areas will be identified as the target area for the collection system rehabilitation program. These areas will be identified in the asset management plan due to high frequency of repairs, high maintenance requirements and observed infiltration and inflow in the system. The Borough is interested to pursue the Principle Forgiveness that is available for small systems to cover the costs for the AMP.

Project Description

The Borough of Wenonah Department of Public Works operates and maintains five (5) small public sanitary sewer lift stations and 14.22 miles of main. Portions of the existing collection systems are deteriorated and subject to inflow and infiltration (I&I) resulting in loss of sewage to the environment and admission of groundwater and stormwater to the system. The Borough plans for the repair of deteriorated sewers to assure that wastewater is safely conveyed through the sewers to each respective regional wastewater treatment facility. Additionally, the Borough anticipates replacing outdated lift stations. As such, in addition to the rehabilitation, a significant portion of the planning efforts represent the creation and preparation of an Asset Management Plan (AMP) which the Borough is seeking PF Grant monies to complete.

Service Area

North Hunterdon Regional High School with future accommodation for campus expansion and 84 affordable residential units.

Need for Project

1. Increasing the pumping capacity to accommodate new affordable housing 2. Replace aging equipment to prevent station failure and raw sewage spillage

Project Description

The CTSA is proposing to replace the NHRHS PS located on the NHRHS campus. The CTSA would like to upgrade this facility to accommodate new development construction with proposed sewer connections to the Beaver Brook Sewer Service Area in Clinton Township. The NHRHS PS is planned to receive, in addition to the existing NHRHS flows, the flows from two new developments: the proposed NHRHS Vo-Tech facility and the proposed Apartments at Clinton residential development. Generally, the pump station upgrades include the construction of a new precast concrete influent manhole, a new precast concrete wet well to house submersible, explosion-proof pumps, a new precast concrete valve chamber including a discharge flow meter, and a precast electrical/equipment storage building. The project also includes installation of a new outdoor standby generator mounted on a new reinforced concrete foundation pad and controls to be housed in the electrical/equipment storage building.

Service Area

There are 38 single family homes on Edgehill Road that will be serviced by the project.

Need for Project

This project is being proposed to assist with the elimination of I and I and to prevent sanitary sewer surcharges that have occurred in the past.

Project Description

Edgehill Road is a residential collector street that services 38 single family dwellings. The roadway contains eleven (11) brick manholes, 2000 linear feet of terra cotta pipe main and 38 service laterals. Approximately 30 of the laterals to do contain cleanouts at the curb line for maintenance. The sewer main has been televised and many spot repairs are required in the 8 diameter main to eliminate severe tree root intrusion, offset joints, lateral protrusions, and broken piping. The Borough proposes to make these isolated repairs to the main and slip line the entire pipe length utilizing the cured in place pipe restoration method. All sanitary sewer manholes will be replaced with new pre-cast manholes and all service laterals will be replaced with schedule 40 PVC pipe with new cleanouts as part of the project.

The sewer force main sections to be repaired are 1,600 feet from station 16 to station 32 along the Sussex County MUA driveway, 200 feet from station 129 to station 131 along NJ State Highway Rt. 23, and 400 feet from station 268 to station 172 along NJ State Highway Rt. 23. Maps of the locations are provided in the attachments section.

Need for Project

The Sewer Force Main project does not involve any changes to the water quality-based need of the system.

Project Description

Sussex Borough can be described as a small mixed use community, both in terms of population and size. The Borough, which consists of .62 square miles, is located in the northeast quadrant of Sussex County New Jersey. With a population of 2,300 people and a median income of \$42,375, Sussex Borough is considered to be a small sewer system with low to moderate income residents. There are 3 force main locations that require constant repairs. They are 1) Along the Sussex County MUA Driveway, 2) Along NJ State Highway Rt. 23, and 3) A Second Location Along NJ State Highway Rt. 23. Maps of the 3 areas are in the attachment section. The purpose of this project is to permanently repair the force mains, reduce maintenance costs, and keep the system fully operational. The total project cost is \$400,000.

Wyckoff Township
S340738-03
Sanitary Sewer System Rehabilitation

Priority List Rank

578

County

Bergen

Existing Population

1,900

Service Area

Township of Wyckoff

Need for Project

The area is served by on-site septic systems. The majority of these systems do not function satisfactorily primarily due to poor soil conditions and the age of the individual systems. Health records along with on-site inspections and surveys indicate failing septic systems are contributing to the degradation of HoHoKus Brook (FW2-NT) consequently impacting fishable non-trout and industrial uses. Water quality in the area does not meet standards for fecal coliform and toxics.

Project Description

Project is currently in the design stage and will involve construction of 71600 linear feet of lateral sewer and interceptors to replace septic systems. This project along with C340739-02 (collection system P.S.) and C340482-02 (pump station force main and interceptor) provides an integrated collection system for the Township. Flows will be conveyed to the Northeast Bergen County Utilities Authority interceptor sewer.

Borough of Allentown

Need for Project

The Boroughs sanitary sewer system is subject to excessive amounts of inflow and infiltration causing sewage to overflow in the collection system and at the treatment plant site during wet weather periods. Allentowns wastewater treatment plant needs upgrades and replacement of deteriorated outdated equipment to improve removal efficacy and reduce the chance of surcharge or overflow.

Project Description

The purpose of the project is to reduce rainfall-induced surcharging of the collection system and sewage treatment plant. The project involves an infiltrationinflow correction program in conjunction with the replacementrehabilitation of sections of the sewer system. Upgrade of the treatment plant would include electrical and control system replacement installation of a comminutor replacement of trickling filter media chemical feed systems modifications RBC reconstruction and other miscellaneous improvements.

Need for Project

The Borough of Island Heights provides sewage collection throughout the Borough. The sewage collection system is comprised of numerous small pump stations. The West End Avenue Pump Station (No. 2) must be renovated to meet the existing wastewater flow demands.

Project Description

This project is a continuation of Island Heights ongoing pump station renovation projects. Pump Station 2 - the West End Avenue Pump Station - is experiencing pumping equipment electrical and control failures requiring extensive maintenance by Borough Public Works personnel to keep operational and to prevent sewage backups and overflows. The project consists of pump and control replacement and electrical upgrades. The Borough is built out and the pump station renovations are for existing conditions and not to expand the service area.

Ocean

Existing Population

1,751

Service Area

Borough of Island Heights

Need for Project

The renovation of a pump station is required due to the age of the pump station and the existing design. The existing pump stations are experiencing pumping equipment electrical and control failures.

Project Description

The proposed project includes pump and control replacement and electrical upgrades.

Project Name, Number

Seaside Park Borough
S340083-04
Sanitary Sewer System Rehabilitation

Priority List Rank

582

County

Ocean

Existing Population

1,579

Service Area

The portion of the sanitary sewer system that the Borough of Seaside Park owns and operates is comparable to other towns in Ocean County. The owner of the sanitary sewer system is responsible for the conveyance of waste to a connection point with the Ocean County Utilities Authority (OCUA). The Borough owned sanitary system consists of gravity lines that ultimately feed into sanitary sewer mains owned and maintained by OCUA. The Borough owns, operates and maintains a sanitary sewer collection system that presently has approximately 1998 service connections

Need for Project

Seaside Park had multiple pipe collapses in the past 10 years, and emergency repairs were required to fix them. The material and age of the ACP/PVC pipes requires cautious working skill to avoid further damage when repairs are made. The collapse of the mains cause sewer blockages and backups of the main that could expose the resident to raw sewage. The area is in a flood zone and in close proximity to open waterways that feed the Barnegat Bay. The water table is high in the project limits which makes the failing sanitary system more susceptible to water infiltration into the system.

Project Description

Seaside Park Phase III A Sanitary Sewer Replacement will be a Phased Sanitary Sewer Replacement Project. This phase will consist of the replacement in kind of a failing sanitary sewer system consisting of approximately 9,400 linear feet of PVC Sanitary Sewer. The project will include the construction of new sanitary sewer manholes, pvc sanitary pipe, and new laterals with clean-outs. This project is located in a flood hazard area which encounters high water tables and is subject to high levels of water infiltration. The sanitary sewer main has reached its useful life and has been repaired in several locations under emergency work.

Service Area

Bay Head Borough

Need for Project

The Borough of Bay Head has an old sewerage collection system consisting of clay pipes and lead joints. Cracked pipes and weak joints lead to excessive infiltrationinflow to the existing sanitary sewers. During wet weather the infiltrationinflow to the system peaks at 0.8 mgd. It is cost effective to perform II correction as compared to transporting and treating these extraneous flows at the Ocean County Utilities Authority Wastewater Treatment Facility.

Project Description

At present the project is in Phase II of SSES. This consists of preparatory cleaning and internal TV inspection of 15281 linear feet and smoke testing of 29005 linear feet of sewer line. Dye water flooding and dye tracing will be done at the conclusion of smoke testing. In addition a pilot grouting program of the worst 10 lines will also be undertaken during this phase and the results so obtained will be used in the subsequent work in Phase 3 which will consist of the II correction of the remaining lines with excessive infiltrationinflow grouting of 17 leaking manholes and utilizing manhole inserts to eliminate inflow in 47 manholes. The II correction program will remove extraneous flow from this sewer system.

Need for Project

Reduction in inflow and infiltration during precipitation events larger than a 2-year frequency and or during seasonal high groundwater elevations experienced from January to April each year. Reduced flows to Readington Lebanon Sewerage Authority Treatment plant.

Project Description

Over a 3 to 5 year period work on the entire LBSA sewer system to reduce infiltration and inflow issues that currently average about 35000 gpd in a system limited to 240000 gpd flow. Similar work in 1997 to 2000 provided for a recapture of over 30000 gpd. Work first to identify the sources of inflow and infiltration and then program a series of bids to respond to the most critical areas first and then to areas with lesser impact.

586

County

Ocean

Existing Population

1,000

Service Area

Project areas to include: Long Beach Blvd (at 18th Street, 23rd thru 25th and Ryerson Lane thru Louisiana Ave)

Need for Project

The existing sewer main piping in the Township of Long Beach is deteriorating allowing the occurrence of leaks and infiltrations. Older sewer pipe is primarily asbestos cement (ACP) and over time begins to break down developing spalls, cracks and breaks. Television inspections of the sanitary sewer pipe are being performed for large sections of the wastewater system, to identify the most critical areas. Previously submitted sewer runs were found to have large groundwater infiltrations, breaks, and excessive deterioration. In an effort to provide a temporary solution, grouting work has been performed in various locations. However, this is not a permanent solution and in order for the Township to maintain effective wastewater treatment, 8 inch, 12 inch, 15 inch and 18 inch new PVC sewer mains are required.

Project Description

The Township of Long Beach proposes to replace existing deteriorated sanitary sewer mains with new 8 inch, 12 inch, 15 inch and 18 inch PVC sewer mains including service laterals and cleanouts within the area between Beach Haven and Ship Bottom. Project areas to include: Long Beach Blvd (at 18th Street, 23rd thru 25th and Ryerson Lane thru Louisiana Ave)

Service Area

System Wide sanitary sewer system rehabilitation

Need for Project

This aging infrastructure has not been properly maintained due to the Authority's financial constraints. There are various areas throughout the system that exhibit high volumes of Infiltration and Inflow and manholes that require rehabilitation throughout the system.

Project Description

Weymouth Township MUA is an Authority that owns and operates the sanitary sewer collection system of Weymouth Township. Weymouth Twp meets the Affordability criteria, and through this funding opportunity, the MUA would like to pursue 100% PF for the creation of an Asset Management Plan, Condition Assessment of sewer system, Capital Project Prioritization efforts, Rate Evaluation and ultimately, a Capital Improvement Project for rehabilitation of sanitary sewer segments identified in the planning efforts above.

Fieldsboro Borough
S340522-01
Sanitary Sewer System Rehabilitation

Priority List Rank

590

County

Burlington

Existing Population

540

Service Area

The project service area is the Borough of Fieldsboro, which is located in Burlington County, New Jersey, is a 0.269 square mile town along the Delaware River, and it shares its borders with Bordentown Township.

Need for Project

An Asset Management Plan is needed in order to create a comprehensive inventory of the system assets, evaluate their condition and prioritize and plan for projects in order to repair, maintain and improve the system to meet level of service goals. This process is essential for sustaining adequate sewer and stormwater systems and service for residents of Fieldsboro. In addition, planning appropriately and prioritizing projects may prevent costly emergency repairs and potential environmental hazards, including raw sewerage leaks.

Project Description

The project scope will include sanitary sewer CCTV and cleaning as needed; sanitary sewer CIPP main lining (approx. 6,700 LF); sanitary sewer lateral lining (to ROW limits, approx. 110 locations); sewer lateral cleanout installation (estimated 55 units); and, manhole rehabilitation (approx. 30 MHs).

The Authority sewer system serves Willingboro and Edgewater Park and Westampton. The Authority water system serves Willingboro and Westampton Township, Mt. Laurel Township and Eveshame (via Mt. Laurel).

Need for Project

To be determined after energy efficiency plan developed.

Project Description

Development of energy efficiency plan (a/k/a Energy Savings Improvement plan) and then implementation of plan for various clean water and drinking water projects. Investment grade energy audit underway. From this audit, energy savings plan will be prepared and submitted to BPU and independent 3rd party for verification. Expected projects include cogen improvements, solar facility re-commissioning, water meter change outs and addition of advanced meter infrastructure, and sludge drying facility improvements,

PVSC serves 48 municipalities in parts of Bergen, Essex, Hudson, Passaic and Union Counties.

Need for Project

PVSC is a regional wastewater treatment plant that accepts non-hazardous liquid wastes by truck, barge and ships. PVSC utilizes its sludge storage tanks to accept municipal wastes by barge and ship for treatment. The tanks are in need of repairs and improvements in order to maintain their integrity and operate properly.

Project Description

The project includes improvements and rehabilitation of PVSC's Sludge Storage Tanks #1 and #2. The work includes, but is not necessarily limited to, recoating and repairing the interior of the tanks, removing the existing lead paint on the exterior of the tanks, recoating them, pump and well improvements and performing miscellaneous structural repairs. The project also includes the installation of new piping, valving and/or pumping as necessary to provide additional connections and process flexibility.

Existing Population

1,509,654

Service Area

PVSC serves 48 municipalities in parts of Bergen, Essex, Hudson, Passaic and Union Counties. In addition to the PVSC district, PVSC accepts non-hazardous liquid wastes from outside its sewer district by truck, ship and barge.

Need for Project

PVSC utilizes thickening centrifuges to thicken our primary and waste activated sludges prior to feeding it into the wet air oxidation (Zimpro) process for stabilization. Currently four centrifuges are utilized to thicken the sludge. Due to increase in sludge production and the age of the equipment, a fifth thickening centrifuge needs to be purchased and installed to reliably process the sludge.

Project Description

PVSC processes, transports and disposes of a daily average of approximately 260 wet tons of sludge. PVSC's Sludge Treatment Process utilizes gravity thickening of combined Waste Activated Sludge (WAS) and primary sludge. The thickened sludge is then processed by PVSC's four existing thickening centrifuges to concentrate the sludge solids further prior to feeding it into the wet air oxidation process (ZIMPRO) for stabilization. The centrifuge facility was designed such that ultimately 5 centrifuges would be installed. To date, four centrifuges have been successfully installed and operating. Recent investigations, and operational concerns due to aging equipment have triggered the need to install a fifth centrifuge. Under this loan, two contracts will be issued. One to purchase the centrifuge through our spare parts contract (Contract B195-1) and the second contract will be to install the centrifuge and ancillary equipment. PVSC has standardized on GEA Westfalia model CA 1036 units.

Service Area

PVSC serves 48 municipalities in portions of Bergen, Essex, Union, Hudson and Passaic Counties.

Need for Project

The Zimpro process is a critical component of PVSC's sludge processing facilities. If the facilities performance is impacted or impeded, this could cause a buildup of biosolids in the wastewater treatment process and lead to a permit excursion. Reliable operations of the Zimpro, OSL&V and Decant Tanks is critical to the entire wastewater treatment process.

Project Description

The Passaic Valley Sewerage Commission (PVSC) utilizes Wet Air Oxidation (WAO/Zimpro) to stabilize the biosolids generated in the wastewater treatment process. The effluent from the Zimpro process is conveyed to six sludge Decant Tanks via Oxidized Sludge and Vapor (OSL&V) lines. PVSC has experienced a buildup of scale within the pipes which has reduced their conveyance capacity. This project will review previously performed pilot studies on ways to reduce the scale buildup, perform additional testing if necessary, provide recommendations for a liner/coating or alternative pipe system, prepare design documents, bid and implement the recommended improvements.

Need for Project

PVSC operates a 230 mgd secondary sewage treatment plant which produces 945000 dry poundsday of sludge which is currently dewatered and shipped to Texas. This interim sludge disposal alternative was implemented by the PVSC in order to enable the PVSC to cease the ocean dumping of sewage sludge as mandated by federal and state legislation. However this practice is costly and its future availability is uncertain.

Project Description

The proposed project would provide a long-term method for the disposal of sewage sludge. A Step 1 grant was awarded in January 1977 for a land-based sludge management study which recommended the implementation of a sludge disposal scheme consisting of a belt filter press for dewatering and incineration. The Sludge Management Plan dated June 1989 recommended a fluidized bed incinerator be constructed as a long-term plan. The PVSC will be required to appropriately update the Sludge Management Plan to ensure that adequate consideration of beneficial reuse alternatives has been included as required by the Departments White Paper on Beneficial Use of Sewage Sludge issued in November 1990.

Need for Project

The Passaic Valley Sewerage Commissioners are investigating improvements to their STP NJPDES No. NJ0021016. The high strength Zimpro sidestream is returned to the activated sludge treatment plant which leads to instability in the activated sludge process. Other improvements are needed to the the sludge processing equipment.

Project Description

The proposed project includes an anaerobic treatment system for the high strength Zimpro sidestream methane gas recovery and electrical generation facility and various improvements to the sludge processing equipment.

Need for Project

Installation of a sludge drying system for the dewatering of digested solids from the anaerobic digesters. The anaerobic digesters coupled with the proposed sludge drying system will take the place of Incinerator Nos. 1 and 2. With implementation of this process and through the use of combined heat and power, the GCUA anticipates being within 20% of net zero energy status.

Project Description

This project consists of the installation of a sludge drying system for the dewatering of digested solids from the anaerobic digesters. The proposed system will be utilized for a reduction in sludge weight and produce a Class A bio-solid, which will allow for beneficial-reuse as daily landfill cover. The anaerobic digesters and the proposed sludge drying system will take the place of Incinerator Nos. 1 and 2. Through the implementation of these processes and through the use of combined heat and power, the GCUA anticipates operating within 20% of net zero energy status.

Service Area

The entire City of Atlantic City

Need for Project

The water quality-based needs for the project are many. The City is adding pump stations in an effort to reduce stormwater impacts on the neighborhoods. This effort requires that trash that is entering the stormwater system be reduced to avoid costly damage to the stormwater pumping systems. Many of the stormwater facilities (catch basins, outlet structure, etc.) need to be retrofitted or replaced to reduce materials from entering the system and from being discharged into the waterways.

Project Description

The City of Atlantic City has successfully implemented a green technology project by building a living shoreline at Gardners Basin. Similar systems will be proposed as part of this study including a living shoreline along Raleigh Avenue in Chelsea Heights. At least twenty percent of this grant will be used for green infrastructure, water and energy efficiency improvements, and other environmental innovative activities.

Need for Project

Long Branch Sewerage Authority is presently disposing of sludge by incineration however this is on a short term basis only. This project is necessary to identify a long term disposal alternative for disposal of the 1235 lbs. of sludge (dry weight basis) produced at the plant each day.

Project Description

The project report for this project is essentially complete and has recommended a long term sludge management plan which calls for in-vessel composting with distribution. After resolution of several minor issues the project report may be approved.

Need for Project

This long-term project will see the evaluation of potential dewatering technologies as well as the full feasibility and planning for the capital improvements and final disposal methods. These improvements may potentially reduce the volume of sludge generated with a primary focus of reducing impact to the environment.

Project Description

The Cumberland County Utilities Authority (CCUA) treatment process utilizes preliminary treatment through the grit and screening process and aerated equalization basin, followed by primary clarifiers for settling and secondary treatment through aeration and the use of fine bubble diffusers and secondary clarifiers and finally disinfection. The CCUA is proposing improvements to their sludge and biosolids management to improve plant efficiencies. The current gravity belt thickeners are capable of producing sludge with 5% to 7% solids and after final digestion transport these biosolids for sub-surface injection at local farms for sod, nurse stock, and feed grains. CCUA is seeking financial assistance for the pilot study, feasibility evaluation and implementation thereof through the Affordability project category.

Millville City
S340921-08
Sewage Treatment Plant (STP) - Improvement/Upgrade

Priority List Rank

604

County

Cumberland

Existing Population

28,400

Service Area

The City of Millville is a community located in the central portion of Cumberland County. The WWTP is the only public owned treatment works within the bounds of the City limits. The City of Millville service area contains all of the area bounded by the official City limits. Of the 44 square miles that make up the City of Millville, approximately 13 square miles are serviced by the wastewater collection system. The collection system consists of approximately 90 miles of sewer mains ranging in size from 8 to 30 inches in diameter and 20 pump stations of varying capacities. The Millville treatment plant is located on an approximate 4 acre portion of Block 546, Lot 36 situated on the eastern side of the Maurice River, approximately 1.3 miles below the New Jersey State Highway Route 49 bridge crossing in the center of this urban area.

Need for Project

Solids handling is a known bottleneck due to aging equipment, mechanical reliability and lack of adequate redundancy. Dewatered sludge produced by the current system often does not meet the minimum % solids required by disposal facilities. This project will improve the biosolids dewatering operation capacity, reliability and performance.

Project Description

Solids handling is a known bottleneck due to aging equipment, mechanical reliability and lack of adequate redundancy. Dewatered sludge produced by the current system often does not meet the minimum % solids required by disposal facilities. This project will improve the dewatering operation capacity, reliability and performance through the following scope: Demolish the existing solid thickening/dewatering equipment - 2 gravity belt thickeners, 2 belt filter presses and associated wash water pumps, sludge pumps, polymer units, air compressors, process piping, concrete curbs and pads, conveyors, grinder, odor control fan and associated duct. Install new thickening and dewatering equipment - 2 sludge thickeners, 2 sludge dewatering presses, thickened sludge pumps, polymer blend units, a blended sludge grinder, air compressors, dewatered cake conveyor, roll-off container handling system, odor control fan, new plug valves for the existing sludge holding tank, associated electrical and I&C.

Deptford Twp., Woodbury City, Woodbury Hgts. Borough, Parts of E. Greenwich Twp., Elk Twp., and Monroe Twp.

Need for Project

The GCUA WWTP is currently permitted to treat 24.10 mgd. The average flow is 19.4 mgd and the maximum value is 25 mgd. This project will not affect the water quality, however is necessary to meet the air quality permit limits for the incinerator.

Project Description

(Carryover SFY2015) - The Authority is proposing to construct an adsorber immediately adjacent to Sewage Sludge Incinerator 2. These upgrades are proposed in order to meet new federal air emission limits. The improvements will provide removal of acid gases (HCl and SO₂) and the removal of mercury dioxins and furans.

Need for Project

The existing system is disintegrating and failing. Odors are being generated that are impacting the neighborhood. New regulations require a change of location, stack raising and a small natural gas line to be added to ensure the flame does not go out and cause odors.

Project Description

The methane gas flare system is failing due to age and degradation. It must be replaced due to its failing and the new requirement that the control system be located an additional 3 feet away from the source flame. The stack also must be raised an additional 6 feet and an new natural gas pilot line must be connected to the flare - also a new requirement so that the flame will not go out due to low BTUs.

The

Need for Project

BCUA operates a 94 mgd secondary sewage treatment plant which produces 35 dry tonsday of anaerobically digested liquid sludge which is currently dewatered by Spectroserv Inc. in the Town of Kearny and shipped to Pennsylvania to be landfilled. This interim sludge disposal alternative was implemented by the BCUA in order to enable the Authority to cease the ocean dumping of sewage sludge as mandated by federal and state legislation. However this practice is costly and its future availability is uncertain.

Project Description

The BCUA has modified its Sludge Management Plan to include beneficial reuse of the sludge. The modified plan calls for the chemical stabilization of the sludge and use of the product as final cover of the landfills in the Meadowlands area. As required by the Judicial Consent Decree the BCUA is required to pursue its original plan of incineration until such time as the beneficial use plan is approved.

Need for Project

JMEUC operates a 75 mgd secondary sewage treatment plant which produces 35 dry tons per day of anaerobically digested sludge which is currently dewatered and shipped to Pennsylvania to be landfilled. This interim sludge disposal alternative was implemented by the JMEUC in order to enable the Authority to cease the ocean dumping of sewage sludge as mandated by federal and state legislation. However this practice is costly and its future availability is uncertain.

Project Description

The proposed project would provide a long-term method for the disposal of sewage sludge. A Step 1 grant was awarded in 1977 for a land-based sludge management study. The Land-Based Sludge Management Facilities Plan Update dated March 1989 recommended construction of a multiple hearth incinerator with a hot water generator Venturi scrubber impingement plate after cooler wet electrostatic precipitator induced draft fan regenerative after burner and a pneumatic dry ash system as the most cost-effective alternative. The JMEUC present plans are to abandon the original idea of sludge incineration and to pursue a beneficial reuse alternative utilizing a sludge drying process.

Need for Project

The Leachate Treatment Plant (LTP) expansion and upgrade is necessary to provide treatment and capacity for the wastewater to be generated through operation of the county co-composting facility. The existing LTP currently treats leachate and sanitary wastewater from the county landfill and associated support facilities at the county Resource Recovery Facilities Complex. In accordance with NJPDES Permit No. NJ0055395 issued October 23 1991 which provides the discharge requirements for the LTP expansion of the hydraulic design capacity of the plant from 50000 gpd to 130000 gpd average daily flow (ADF) on a monthly basis will allow for the treatment of wastewater to be generated from the previously funded co-composting facility operations (approximately 56000 gpd - monthly ADF Project No. S340818-03). Permitted capacity was increased from 28000 gpd to 130000 gpd (monthly ADF) under NJPDES No. NJ0055395.

Project Description

Expansion of the facility includes physical-chemical treatment units biological and physiochemical treatment units rapid sand filtration ultraviolet disinfection and a wastewater heating system.

Service Area

The Central Service Area (CSA) is depicted in Figure 1. The CSA provides service to the municipalities of Barnegat, Beachwood, Berkeley, Brick (barrier island portion), Toms River, Island Heights, Lacey, Lakehurst, Lavallette, Manchester, Mantoloking, Ocean, Ocean Gate, Pine Beach, Seaside Heights, Seaside Park, and South Toms River. The Authority's CSA is comprised of the CWPCF located on Hickory Lane in Bayville, 19 pump/lift stations, 24 miles of force main, and 52 miles of gravity interceptors. The CWPCF was placed into operation in 1979, provides secondary treatment, and is rated at a capacity of 32 MGD. Effluent is discharged into the Atlantic Ocean through an outfall diffuser located approximately 6,000 feet out from the shore of Seaside Park in accordance with NJPDES Permit No. NJ0029408.

Need for Project

The Federal and State Act require that all wastewater management plans be in conformance with the WQMP and permits issued under the New Jersey Pollutant Discharge Elimination System (NJPDES) must also conform to the plan. None of the proposed projects under this Planning Document Submission will modify the ability to collect and treat sewage in any of the service areas. Therefore, these projects are consistent with the Ocean County Water Quality Management Plan (WQMP). Pursuant to NJAC 7:22-3.11 and 4.11, "A cost-effective analysis of the feasible, conventional, innovative and alternative technologies capable of meeting the applicable effluent, water quality, and public health requirements over the design life of the facility while recognizing environment and other non-monetary considerations" must be performed. This project will ensure that all of the facilities continue to achieve permit conditions, as well as protect the environment from system or equipment failure.

Project Description

The Ocean County Utilities Authority owns and operates three wastewater treatment plants. When constructed the CWPCF included three (3) active anaerobic digesters, Primary Digester No. 2, No. 3 and No. 4, a fourth but inactive digester, and two (2) Secondary Digesters, SD-1 and SD-2. In 1988, SD-1, an 85-foot diameter reinforced concrete structure was converted to a storage tank, now identified as the Thickened Sludge Storage and Blend Tank (TSSBT). The TSSBT received thickened digested sludge from all three WPCFs and then pumped this material to Fertilizer Manufacturing Division, where it is dewatered and manufactured into a Class A fertilizer (OceanGro). The TSSBT receives CWPCF and SWPCF thickened sludges and has an aluminum dome. This project involves the removal of the existing mixing system and replacement with a Linear Motion Mixer, repair of the dome, installation of "at grade" entrance into the tank, and interior concrete rehabilitation.

Sludge Treatment/Disposal Facilities

Priority List Rank

619

County

Atlantic

Existing Population

163,667

Service Area

Several Municipalities in Atlantic County and Mercer County

Need for Project

The Authority has several goals for this project. First to diversify the Authoritys method (by providing a back-up for the existing sludge incinerators) and increase capacity for the disposal of municipal wastewater sludge. The second goal relates to the Interdistrict Agreement by which the ACUA is required to accept up to 19000 tons per year of compostable material from Mercer County. Finally to meet the Authoritys recycling goals large source separated generations of food waste within the county will be directed to the proposed facility.

Project Description

The Authority is planning to construct an Enclosed Composting Facility at the Environmental Park Site in Egg Harbor Township. The facility will process the following selective waste streams food waste municipal wastewater sludge vegetative waste and clean wood waste. These selective waste streams will produce a compost which can be used as a soil amendment. The proposed facility has an array of unique features to avoid the pitfalls of other composting facilities which have been forced to close due to mechanical and odor control problems. An integrated building ventilation system including a biofilter for odor control will be constructed. The facility will be totally enclosed and designed to handle 159 wet tons per day.

S340801-08
Sewage Treatment Plant (STP) - Improvement/Upgrade

Priority List Rank

620

County

Somerset

Existing Population

117,000

Service Area

The SRVSA provides service to the Township of Bridgewater, Township of Branchburg, the Township of Hillsborough, the Borough of Manville, the Borough of Raritan, the Borough of Somerville (Somerville), the Township of Warren, and portions of the Township of Green Brook. Combined, all municipalities contribute to a service area of over 67 square miles.

Need for Project

Recent USEPA regulations (40CFR60 subpart M) set strict limits for nine pollutants under section 129 of the clean air act: Cadmium, carbon monoxide, hydrogen chloride, lead, mercury, nitrogen oxides, particulate matter, sulfur dioxide, polychlorinated dibenzo-p-dioxins and polychlorinated dibenzofurans. In order for the SRVSA incinerators to meet these new low emission limits, it is necessary to significantly upgrade the Authority's air pollution control equipment. The proposed upgrade to Incinerator No. 2 is needed to provide continued reliable operation of SRVSA's sludge incinerator facilities, while improving energy efficiency through replacement of antiquated equipment with new energy efficient equipment. The present capacity of SRVSA's wastewater treatment plant will remain unchanged.

Project Description

The proposed rehabilitation of sludge incinerator 2 consists of a new secondary heat exchanger new scrubber system and new associated instrumentation and electrical systems. To meet new Federal air emission performance standards for existing sewage sludge incineration units (40 CFR Part 60 Subpart M) a new mercury control system will be installed which will clean the exhaust from sludge incinerator 2. This proposed project will not involve any changes or an increase to the present wastewater capacity of the WWTP. Additionally no adjustments to the permitted wastewater flow to the treatment plant under the SRVSAs existing NJPDES permit will be necessary.

County

Cape May

Existing Population

97,265

Service Area

WildwoodLower Region and Seven MileMiddle Region

Need for Project

The project is required to provide sludgesseptage treatment and disposal for the Cape May County MUA - WildwoodLower Regional and Seven MileMiddle Regional Wastewater Systems.

Project Description

The project is the second phase of the Cape May County MUA - County-wide enclosed vessel mechanical composting system. This component is planned to service combined primary and secondary belt filter press dewatered sludge from the 14.18 mgd WildwoodLower Regional WWTF and the 7.67 mgd Seven MileMiddle Region WWTF. The septage treatment facilities will be incorporated into the CMCMUA Seven MileMiddle Regional WWTF.

Service Area

The BRSA owns and operates a wastewater collection and treatment system that conveys and treats on average 8 million gallon per day (MGD) of wastewater from three (3) member municipalities, including Hazlet Township, Holmdel Township and Union Beach Borough, and five (5) customer municipalities consisting of Aberdeen Township, Keansburg Borough, Keyport Borough, Matawan Borough, and a portion of Marlboro Township known as Morganville. These also include five (5) industrial users and a major hospital in Monmouth County which overall represent a combined current serviced population of over 90,000 people. Plant Effluent flows by gravity to the MCBOA. MCBOA pumps this effluent using three pumps (2-500HP VS Pumps, 1 diesel driven pump as standby) along 14 miles of pipeline to the Atlantic Ocean.

Need for Project

The project would provide BRSA continuous operation of sludge incineration, reducing the risk and need of hauling wastes to the landfill, through the neighborhood. This project does not impact the surrounding water, or water quality.

Project Description

The Dorr Oliver Incinerator System (DOIS) rehabilitation includes replacement of pumps, blowers, compressors, motors, control panels, motor control centers (MCCs), incinerator and heat-exchanger refractory, incinerator refractory dome, power, control and signal wiring, pre-heat gas burner system, HVAC, lighting, SCADA and ancillary equipment necessary for a fully functional incinerator capable in meeting all standards and regulations. Design work shall comply with all FEMA flood protection requirements. All equipment installed outside shall be protected to the 500-year FEMA flood protection standards + 1ft. Design of DOIS Emissions Upgrades to meet the 2016 EPA SSI Regulations. Design Improvements of the DOIS including upgrades to the Primary shell-and-tube heat exchanger which has a history of failing (cracking of heat exchanger tubes) due to cycling temperatures. Review of new and pending regulations and the impacts on the DOIS, and 2019 NJ Energy Master Plan Pathway to 2050.

Existing Population

76,645

Service Area

The service area for this project is approximately 76,645 people. The total population being serviced for this project is based on 2020 Census population data. Municipalities that will be completely served include Allendale, Ho-Ho-Kus, Midland Park, Ramsey, and Waldwick. Municipalities that will be partially served include Mahwah, Wyckoff, Saddle River, Upper Saddle River, Franklin Lakes, and Ridgewood.

Need for Project

The Sludge Cake Receiving Facility is being built in order to optimize operation of the incinerator which will result in improved efficiency of the wastewater treatment plant.

Project Description

The Northwest Bergen County Utilities Authority (NBCUA) has determined that the existing incinerators at the wastewater treatment plant are not operating to their fullest capacity. The NBCUA has decided to construct a cake receiving facility which will allow sludge cake to be accepted from outside facilities. The objective is for the plant to operate the incinerators 24-hours a day, seven days a week, to reduce operation and maintenance costs and achieve optimal efficiency.

Service Area

WMUA provides wastewater treatment service to a significant portion of the towns of Manalapan, Marlboro, and a portion of Englishtown and Freehold Township. The WMUA provides service to over 25,000 customers.

Need for Project

The Western Monmouth Utilities Authority (WMUA) owns and operates the Pine Brook Wastewater Treatment Plant located in Manalapan, New Jersey. The plant is permitted for an average daily flow of 8.8 million gallons per day and is approximately 45 years old. One of the major processes within the treatment plant is the anaerobic digestion facility. This system is integral to the wastewater treatment system and is required to maintain compliance with the facilities NJPDES permit. The WMUA desires to upgrade the components and supporting systems of this process to replace aging equipment, comply with latest code requirements, address safety concerns, and improve upon the performance of the anaerobic digestion system.

Project Description

The WMUA is desirous of upgrading the anaerobic digestion facility at their Pine Brook WWTP to replace aging equipment, comply with latest code requirements, address safety concerns, and improve upon the performance of the anaerobic digestion system. The improvements will include: application of a concrete corrosion coatings system for exposed portion of the structures, new gas holder floating covers for the primary and secondary digesters, thermal insulation systems for the new floating covers, new mixing system for the secondary digester, modifications to the existing mixing system for the primary digester, new sludge heat exchangers, new digester gas conveyance piping system. Additionally, it is anticipated that upgrades to the existing anaerobic digestion system will result in an increase in digester gas production. Digester gas can be used as a fuel for a future cogeneration system to produce both electric and thermal power which will offset the WMUA's electric usage and costs.

Service Area

Mount Holly, Eastampton, Lumberton, Hainesport, part of Westampton

Need for Project

This is a sludge management project. The Mount Holly Sewerage Authority Wastewater Treatment Plant has been expanded and upgraded from 2.0 mgd to 5.0 mgd flow under USEPA/State project no. C340251 grant. The (201) Facilities Plan recommended that ultimate sludge disposal would be to a licensed landfill. Subsequent to the completion of this original facilities plan and the initiation of construction of the plant expansion, the State of New Jersey enacted new laws relative to the treatment and disposal of sludge. Accordingly, the Mount Holly Sewerage Authority was required to prepare a sludge management plan in accordance with the current state guidelines for the preparation of sludge management plans.

Project Description

The project consists of construction of sludge management facilities at the existing Mount Holly SA Sewage Treatment Plant site. This is a short term solution only. The ultimate sludge disposal will be incorporated into the on-going county-wide sludge and septage management plan recommendations. Mt. Holly will subsequently become a contingency back-up facility for sludge/septage treatment.

Existing Population

6,100

Service Area

Milford Borough Holland Township

Need for Project

There is serious II existing in the sanitary sewer lines in Holland Township which is causing noncompliance with the suspended solids limitations of the NJPDES permit during periods of excessive rain. In addition the Milford Borough Sewer Utility which is classified as a Category D facility does not have the capability of handling septage and must plan for accepting the septage generated in its service area. Furthermore alternatives to the treatment plants current method of disposing of liquid sludge at a Pennsylvania landfill must be evaluated since it is on a short term basis.

Project Description

This project will be classified as a complete wastewater treatment system which includes Holland Township and Milford Borough. The Facilities Plan will develop alternatives for sludge disposal and evaluate a septic management district. Also an II and cost effectiveness analysis will be performed to determine the extent of excessive II in the system.

Project Name, Number

Milltown Borough
S340102-05
Stormwater Management - Gray Infrastructure

Priority List Rank

629

County

Middlesex

Existing Population

6,893

Service Area

The Service Area for the Milltown Municipal Facility is the entire Borough of Milltown. The Borough of Milltown is located in the center of Middlesex County, NJ and is bordered by North Brunswick Township to the north and west, the Township of East Brunswick to the south and the Borough of South River to the east.

Need for Project

The project is required in order to mitigate flooding of the existing Municipal Public Works Garage by removing it from the flood plain. Given the fact that flood levels have reached historic highs at this location twice within five years, there is a concern that the same are being influenced by changes in upstream conditions resulting in increased flood levels and flood frequency in the area of the Borough. In order for the Borough Municipal Facility to be fully utilized and protected from physical and financial damages it is necessary to relocate the facility to an alternate location at a higher elevation. The proposed location for the new Municipal Facility is at an elevation approximately 18 feet higher than the existing Municipal Facility and is approximately 14 feet higher than the 500 year flood plain elevation and the measured flood elevation from Hurricane Irene, which will reduce the risk of flooding.

Project Description

The existing Municipal Public Works Garage is situated in the 100-year floodplain of the Lawrence Brook. Severe flooding of the Lawrence Brook during a storm in April 2007 and during Hurricane Irene in August 2011 inundated the area surrounding the facility and flooded the interior of the building with several feet of water, resulting in the need for repetitive replacement of equipment and materials as well as physical damage to the building that required mitigation. The purpose of this project is to relocate the Milltown Municipal Facilities for flood mitigation. The proposed improvements consist of reconstructing the Municipal Facility outside of the flood plain. The new Municipal Facility will include a Department of Public Works Building, a Salt House and other Borough offices including Operations and Emergency Management. It is anticipated that the Borough's Firehouse will also be relocated to the new site.

West Milford Township
S340701-10
Decentralized Wastewater (or Septic) System Repair/Replacement

Priority List Rank

631

County

Passaic

Existing Population

25,850

Service Area

West Milford Township

Need for Project

The Township of West Milford utilizes individual subsurface sewage disposal systems and individual wells (95 on wells and septic) for their wastewater disposal and potable water supply. There is approximately 8517 (85.2 of residences) subsurface sewage disposal systems within the Township of West Milford. Taking a very conservative approach not counting commercial establishments each of these 8517 systems generate approximately 500 gallons of contaminated waste water per day that's a total of 4258500 gallons of contaminated water that enters into the water shed of West Milford. There is 4647 residences in LR zone (4663 w Class 15) 6463 residences in Highlands Open Water Protection Zone (300(tm) open water buffer) and 3319 residences within 300ft of water (2002lulc) (does not include wetlands streams). Many of these existing systems have malfunctioned even when the systems have been designed constructed and sited in accordance with applicable NJDEP standards largely due to lack of proper system management or improper operation poor soil conditions and maintenance. These malfunctions have been shown to adversely affect public health and welfare and the environment.

Project Description

The proposed project includes helping provide loans to families who are not able to pay for repair of there failing septic.

Project Name, Number

Manasquan Borough
S340450-02
Stormwater Management - Green Infrastructure

Priority List Rank

632

County

Monmouth

Existing Population

5,897

Service Area

The population served by the project is the Borough of Manasquan, a 1.38 square mile coastal town in Monmouth County, New Jersey. The planning area consists of the entire borough, which will benefit from the project as measures will be implemented to improve water quality and replace ageing infrastructure. The project is located at Borough-owned property known as Axel Carlson Park, which is bordered by Stockton Lake. Axel Carlson Park is a linear waterfront passive recreation area with shade trees, picnic tables, benches, trash receptacles, a park sign, and an asphalt path that abuts the bulkhead with Stockton Lake.

Need for Project

The purpose of the project is to improve the water quality of stormwater runoff being discharged into Stockton Lake that eventually leads to Barnegat Bay through the Glimmer Glass, Manasquan River, and Point Pleasant Canal. The water quality need for this project is to remove total suspended solids and float-able pollutants from the stormwater system prior to discharging runoff into Stockton Lake in an effort to improve the water quality of Barnegat Bay. Stormwater runoff is the most common way that nonpoint source pollution reaches local rivers, creeks and other waterways including Barnegat Bay. If the runoff is not absorbed by soil and vegetation or by other measures, rainwater carries chemicals, nutrients, sediments and other forms of nonpoint source pollution into surface waters. The existing bulkhead condition is also causing sediment to enter Stockton Lake. Holes in the bulkhead result in erosion behind the bulkhead causing sinkholes to form and sediment to spill freely.

Project Description

This is a Stormwater Management – Green Infrastructure project that impacts the Barnegat Bay Watershed. There is also a resiliency component. The proposed project includes stormwater management and conveyance improvements to include the creation of a longitudinal bioretention swale with rain garden areas, installation of overflow bubbler inlets on outfall pipes to discharge the runoff into the bioretention swale, installation of structural and/or non-structural water quality treatment devices and measures on existing outfall pipes for surface water conveyance, installation of new outfall pipes as needed for positive drainage of the bioretention swale, and grading of the park property as needed. Also included is the reconstruction and elevation of approximately 1,400 linear feet of bulkhead and installation of a pervious pedestrian walkway and safety railing at the new bulkhead.

Salem

Existing Population

3,100

Service Area

Sections of both Alloway and Quinton Townships

Need for Project

The on-site septic systems in the proposed service area are malfunctioning and causing groundwater degradation. The area borders Elkington Lake and Laurel Lake as well as Alloway Lake and Alloway Creek. The existing systems are impacting fishable (non-trout) recreational industrial and agricultural uses of these waterbodies.

Project Description

The proposed project consists of the construction of force mains gravity sewers and pumping stations. The collected wastewater either will be conveyed to the Salem treatment plant or to a newly erected treatment plant within the service area which will be a part of this project.

Service Area

Vones Lane Section of Raritan Borough

Need for Project

The Vones Lane Section of Raritan Borough is experiencing a high degree of septic tank failures (70%) overflows due to poor soil and high groundwater. This has resulted in septage flowing onto yards and streets.

Project Description

The proposed project will eliminate the septic systems through the construction of a collection system and conveyance facilities.

Sanitary Sewer System - New

Priority List Rank

639

County

Atlantic

Existing Population

14,791

Service Area

SouthwestSoutheast portions of Hammonton

Need for Project

Residents in the area have expressed problems with failing septic systems and individual potable water supply well contamination. This project will also assist residents who have lost the use of their land due to the septic nitrate regulations of the Pinelands Commission. The increased amount of customers will assist the sewer user base and help to reduce the overall user cost for everyone on line.

Project Description

The project consists of replacement of existing sewer interceptors and the construction of new interceptors pump station force mains and sewer collection mains. Although the projects are not contiguous the type of work and benefits derived will be similar. The Southeast Hammonton area will consist of the placement of a 12 sanitary sewer trunk line within the rights-of-way of Thirteenth Street Egg Harbor Road and Fourteenth Street. Eight (8) inch collector sewer lines will be installed within the remaining roadways of this project area. The Southeast Hammonton area will consist of the placement of a 12 inch sanitary sewer trunk line within Park Avenue easement areas Grand Street and through a portion of the Fox Chase Development. A 10 line will be installed along Ninth Street and a portion of Tenth Street. The remaining streets in this area will be serviced with an 8 inch sanitary sewer. It is also anticipated that an upgrade of the existing pump station located on Park Avenue will have to be completed or a new station installed on Grand Street at the low point to service this area.

Project Name, Number

Woodbine Borough
S340370-02
Sanitary Sewer System - New

Priority List Rank

641

County

Cape May

Existing Population

2,472

Service Area

The sewerable areas for the Borough (which is a designated Pinelands Town Center) are shown on a map prepared by the County of Cape May as part of their overall Water Quality Management Plan titled "Future Wastewater Service Area Map-Borough of Woodbine" dated January 7, 2013 and include all areas of the Borough except for the southwesterly area along Washington Avenue and Tyler Road being the Forest Agricultural/Residential (FAR) Zoning District and the area east of Dennisville-Petersburg Road (CR610) being a portion of the Planned Development (PD) Zoning District. Both of these excluded areas are designated as Septic Areas (<2,000 gpd) on the County map.

Need for Project

The primary purpose of the sewer project is to provide a public sewer system that will eliminate inadequate and, in some cases, failing onsite wastewater systems ("cesspools") as well as an aging wastewater treatment plant for the State owned WDC facility, both of which contribute to groundwater degradation affecting the health, safety and welfare of the public. Construction of a new public sewer collection system with an interconnection to the CMCMUA Regional Wastewater Treatment system will eliminate the WDC treatment plant and provide the ability to begin the process of eliminating cesspools, which is anticipated to improve groundwater quality in the area.

Project Description

Construction of Phase 1 of a multi-phased public sanitary sewer collection system to service the sewerable areas of the Borough. Phase 1 will service the easterly end of the Borough including the State-owned Woodbine Developmental Center (WDC), the County Route 550 corridor and the Municipal Airport/Business Park. This new Borough sewer system will be connected to a proposed Cape May County MUA force main that will convey the wastewater to the Middle Township/Seven Mile Beach Regional Wastewater system for treatment.

Need for Project

The Project will be a distribution system for the reuse of treated wastewater to end users within the MCUA Service Area. All treated wastewater conveyed to end user locations, which following its intended use requires disposal, will be redirected to the sanitary sewer for ultimate treatment by the MCUA. The Project will divert treated wastewater from being conveyed to receiving waters.

Project Description

The Project will involve the construction of a 15 MGD Pumping Station and appurtenances to convey treated wastewater from the Edward J. Patten Water Reclamation Center in Sayreville NJ to end user locations. The pumping station will be located at the wastewater treatment facility site. End users will construct and connect their conveyance piping to the pumping stations discharge pipe for transmission of the treated effluent to end use sites. Two electric power generation facilities have approached the MCUA for the use of treated wastewater for cooling purposes at their facilities.

Service Area

This project will serve various areas throughout the Township such as Ludlum Road Arbor Road Riverlawn Drive Riverdale Drive and Hoffman Grove area.

Need for Project

Many areas of the Township presently served by on-site systems have exhibited problems and/or malfunctions as evidenced by foul odors and numerous homeowner complaints thus causing a public nuisance. As determined by the soil conservation service these areas correspond to soils with severe limitations for on-site disposal.

Project Description

This project is for the construction of a sanitary sewer collection system within problem areas of the Township. All of the areas will tie into existing transmission lines for ultimate disposal at the Mountain View treatment plant.

County

Atlantic

Existing Population

31,209

Service Area

South Egg Harbor City

Need for Project

The present disposal system for the area is a septic system which is failing and may pose a threat to health and may also contaminate surface and groundwaters. The Pinelands Commission has recently adopted a new ordinance that affects this area. The zoning of the South Egg Harbor City Section of the Township reflects this change and conforms to the Pinelands comprehensive management plan.

Project Description

The proposed sanitary sewer extension project consists of approximately 60000 linear feet of 8-inch 10-inch or 12-inch diameter gravity sanitary sewer lines to service the existing population of the area. The system is designed to consist of 231 unsewered dwelling units (3.5 persons per dwelling unit). Two pumping stations will also be necessary. One is planned to be located along Pittsburg Avenue the other along Bella Donna Street. The wastewater flow from this area will be conveyed via the ACUA Pomona Pump Station to the ACUA Coastal Plant for secondary treatment with effluent discharge to the Atlantic Ocean.

Sanitary Sewer System Rehabilitation

Priority List Rank

656

County

Middlesex

Existing Population

22,360

Service Area

This project will serve existing and new development along the Major Road area of the Township.

Need for Project

Approximately 36 homes are served by on-site systems a significant portion of which have exhibited problems and/or malfunctions thus causing a public nuisance. The Soil Conservation Service has determined that the Major Road area corresponds to soils with severe limitations for on-site disposal systems. South Brunswick Township will apply under the Public Health Hazard Bypass provisions of the priority system.

Project Description

The proposed project is for the construction of approximately 4500 feet of ten inch sewer line and 1450 feet of eight inch sewer line. The project also calls for the reconstruction of approximately 834 feet of the existing Town Center Sewer. Approximately 31 of the existing properties could make gravity connection to the sewer line and the other 5 homes would have to utilize small grinder pumps to tie into the proposed project.

Need for Project

Certain areas of the Township have malfunctioning septic systems which have been creating a potential health hazard situation and public nuisance.

Project Description

It is anticipated that this project will be for a collection system or other alternative system in White Meadow Lake and remaining unsewered areas of the Township. This project will alleviate the potential health hazard caused by malfunctioning septic systems.

Need for Project

An expansion of the collection system is needed to replace inadequate on-site systems which are malfunctioning and pose a potential health hazard to local residents by adversely impacting well waters.

Project Description

The proposed project involves the construction of lateral sewers and a pumping station to relieve malfunctioning septic systems. This project will provide a collection system for the remaining areas of the Township. These areas include areas 7 8 9 14 and 15-5 as identified in the amendment to the 1981 facilities plan (dated June 1 1990). Wastewater will be conveyed to the Parsippany-Troy Hills STP for treatment.

Montville Township
S340931-04
Decentralized Wastewater (or Septic) System Repair/Replacement

Priority List Rank

659

County

Morris

Existing Population

16,200

Service Area

The Township of Montville has 135 miles of sanitary sewer mains carry 750 million gallons of sewage annually to the Parsippany-Troy Hills Wastewater Treatment Plant (Montville Township, n.d.). The Township is planning to expand its sanitary sewer system in the Old Lane and Mulbrook Area to connect residential homes currently on septic with approximately 9,000 linear feet of new mains, manholes, and laterals with cleanouts. The project service area in Montville Township is categorized as a residential area (Zone R-27A). The proposed collection system will be connected to the existing sewer systems on Valhalla road, Old Lane road and W Serafin way, and convey flow to the Parsippany-Troy Hills Wastewater Treatment Plant that is located 7.3 miles south of the project area.

Need for Project

The proposed sewer systems will improve the groundwater quality thus the water quality of nearby Lake Valhalla and surface water. The septic systems of the proposed project area are poorly managed and failing. The poor condition of the septic systems results a critical groundwater and surface water contamination, therefore, poses a significant threat to drinking water and human health.

Project Description

The proposed project consists of the connection of 95 existing homes to the existing Montville's sanitary sewer system. The properties are currently served by septic systems. The total length of 8" PVC pipe associated with the project is approximately 9,000 LF. The project also includes the 95 service laterals up to the property boundary and the road trench restoration.

Need for Project

The tremendous rate of growth in the planning area coupled with an increasing number of septic tanks has placed a severe strain on the very permeable sandy soils to adequately treat the domestic wastes. Because of a generally high groundwater table and the high percentage of septic system failures pollution of the groundwater is suspected. The pollution to surface water in the planning area has already been documented in the Ocean County Areawide Water Quality Management Plan. The continuation of current septic tank problems poses a potential threat to the groundwater in the region. Therefore a proper sewage disposal system is necessary.

Project Description

Based upon economic environmental and engineering aspects the construction of the following collection system has been recommended Summit Park 13282 feet of gravity sewers Savannah Acres Low pressure grinder pump system with 17085 feet of 2 PVC low-pressure piping Cedar Glen Homes 16000 feet of gravity sewers Richard and Whitney Estates 112 and 2 low-pressure sewers Cedar Glen West 3900 feet of 8 and 15 gravity sewers a pumping station and 8700 feet of 6 force main. The flow from the area will be conveyed to the Ocean County Utilities Authoritys Central Plant for treatment and disposal.

Need for Project

The project area in Franklin Township consists of Franklinville Malaga and Newfield which are existing developments served by individual on-lot systems. There is public nuisance associated with these on-site disposal systems in the area.

Project Description

The selected plan of the GCUA Facilities Plan calls for the complete regionalization of the proposed sewer collection systems for Franklin Township and the Borough of Newfield with an interceptor system to convey wastewater to the Landis Sewerage Authority Plant for treatment and ultimate disposal. The selected plan basically involves the construction of three pump stations interceptors and force mains to convey the wastewater to the Landis SA plant.

S340745-02
Sanitary Sewer System - New

Priority List Rank

665

County

Sussex

Existing Population

11,080

Service Area

The

Need for Project

Vernon Township is comprised of clusters of lakeside communities (including Barry Lakes) that have developed from seasonal vacation homes to year-round dwellings. This fact coupled with the restrictions of small undersized lots located on soils with severe limitations for on-site systems has resulted in an overburdening of the soil stratum. This has led to an increasing number of septic system failures which previously had functioned satisfactorily. In addition a number of existing systems are known to be inadequate through design and/or installation deficiencies. This situation poses public health as well as nuisance problems to the Township. The needs of Vernon Township as identified under the Sussex County Step I Study (C340503-01) are to be resolved on a local level through this project.

Project Description

This project would implement the wastewater management recommendations of the Sussex County-Pochuck Facilities Plan on a local level. Collection low pressure and/or cluster systems may be involved in this project. On-site rehabilitation in conjunction with the establishment of a septic management district(s) may also be a viable alternative. The construction of this project should satisfy the wastewater needs of Vernon Township as well as maintaining water quality and safeguarding the public health.

Wanaque Borough

Need for Project

This project is necessary for the construction of a sewer extension. This is the second phase of the Boroughs collection system project. The first phase (75130 l.f.) has already been constructed. In several instances septic systems have been malfunctioning creating potential health hazard situations and a public nuisance.

Project Description

This project involves the construction of 4251 linear feet of collector and interceptor sewer and a pump station which will convey wastewater to the proposed Wanaque Valley Regional Sewerage Authority treatment plant (0.68 MGD capacity). The planning work for the collection system needs to be addressed.

Service Area

Township of Mahwah (Portion)

Need for Project

The area is currently served by septic systems failures appear to be contributing to the pollution of groundwater a potable water source. This could result in health problems in the community. The project would also convey wastewater from package plants in the Township. The water quality in the area marginally meets standards for fecal coliform and nutrients.

Project Description

The project involves construction of a collection system and interceptor to serve the Fardale Section of Mahwah Township. The wastewater will be conveyed through the Northwest Bergen County Utilities Authority interceptors and then to the treatment plant in Walldwick. The project report has not been submitted by the Township.

Portions of Green Village Road and Britten Road in Chatham Township

Need for Project

The Green Village service area is the last major area in Chatham Township that remains unsewered. The existing water table is high and most of the service area is adjacent to the Great Swamp National Wildlife Refuge. Several existing septic systems have failed and several more are projected to fail within the next 2 years.

Project Description

The proposed project includes installation of community and individual mound type treatment systems for those portions of Green Village Road that have failing or failed septic systems.

Project Name, Number

Upper Saddle River Borough
S340909-01
Sanitary Sewer System - New

Priority List Rank

671

County

Bergen

Existing Population

7,840

Service Area

Southwest portion of Upper Saddle River

Need for Project

Sanitary sewers from the commercial buildings in the southwest portion of Upper Saddle River drain into the Ramsey Brook Interceptor. The Ramsey Brook Interceptor was not originally designed to handle flow from the southwest portion of Upper Saddle River. As a result the line runs near capacity with some surcharging. Continuing commercial development in this area necessitates an alternate drainage source. Construction of a sanitary sewer collection system which would drain into the northwest Bergen Interceptor to serve both the expanding commercial and residential (currently served by septic system) communities in the southwest portion of Upper Saddle River has been proposed.

Project Description

Construction of a sanitary sewer collection system and interceptor. The sewer system would contain 9800 linear feet of 8-inch and 1000 linear feet of 10-inch diameter sanitary sewers.

County

Ocean

Existing Population

6,460

Service Area

Pine Lake Park area of Manchester Township

Need for Project

The tremendous rate of growth in the area coupled with an increasing number of septic tanks has placed a severe strain on the very permeable sandy soils to adequately treat the domestic wastewater. Because of a generally high groundwater table and the high percentage of septic system failures pollution of the groundwater and surface water is suspected. Also the current septic tank problems pose a potential threat to the health of local residents. Therefore a proper sewage disposal system is necessary.

Project Description

The project is for the construction of three pump stations and approximately 35 miles of force mains and gravity sewers with diameters ranging from 8 inches to 24 inches. The wastewater will be conveyed to the existing 42-inch diameter Union Branch Interceptor owned and operated by the Ocean County Utilities Authority (OCUA). The wastewater will be treated at the OCUA's Central Plant located in Bayville for secondary treatment with effluent disposal to the Atlantic Ocean.

Need for Project

The Gould town center area to be serviced relies on the discharge to groundwater through individual onsite septic systems that are close to 30 years old. As a result of aging and failing septic systems the project will provide a sanitary sewer extension to address groundwater quality standards.

Project Description

The proposed project includes the installation of 18000 linear feet of gravity sewer ranging in size from 8 to 12 inches and the upgrade or replacement of an existing pump station to eliminate the onsite systems.

Carlstadt Sewerage Authority
S340705-03
Sanitary Sewer System - New

Priority List Rank

675

County

Bergen

Existing Population

6,120

Service Area

Borough of Carlstadt

Need for Project

There are malfunctioning and inadequate on-site systems which cause a public nuisance in unsewered areas of Carlstadt. Additionally a portion of Carlstadts sewered flows are currently conveyed to the RutherfordCarlstadts Joint Meeting STP for treatment prior to discharge to Berrys Creek (FW2-NTSE-2). This plant has been under a court order on consent to be abandoned in favor of regional treatment by the Bergen County Utilities Authority (BCUA). Existing water quality violates standards for dissolved oxygen fecal coliform and toxics.

Project Description

The facilities plan has evaluated alternative methods for the diversion of all or part of the flow from the Joint Meeting plant to the BCUA regional treatment facilities. The plan also identifies additional sanitary facilities needed to collect sewage in developed and developing areas of Carlstadt.

Decentralized Wastewater (or Septic) System Repair/Replacement

Priority List Rank

676

County

Bergen

Existing Population

6,000

Service Area

Mahwah Township (unsewered portion)

Need for Project

Facilities planning in Mahwah Township has identified areas of low density development which will remain unsewered for the planning period. However areas of soils with limitations to on-site disposal exist and on-site systems continue to fail in these areas. These malfunctions are considered to be public nuisances and must be addressed. It is therefore necessary to create a management program to address the correction of malfunctioning systems in unsewered areas.

Project Description

This project is still in the planning stages and the specifics of the septic management program to be adopted by the Township have not yet been determined. However at a minimum the program must provide for inspections of systems every three years.

Service Area

Branchville Borough and sections of Frankford Township.

Need for Project

The service area is a clustered community which currently relies on on-site septic disposal systems for the treatment of wastewater. Many of these systems appear inadequate and are a public nuisance to the community. An on-going planning study was conducted under the Sussex County-Paulinskill planning grant (C340449-01) to determine the nature severity and extent of the wastewater disposal problems for the impacted areas.

Project Description

The proposed project includes the construction of a pump station and force main to convey flow to the wastewater treatment plant site construction of a treatment plant with the ability to treat effluent to Class II A groundwater standards with subsurface disposal of the treated effluent.

Sanitary Sewer System Rehabilitation

Priority List Rank

679

County

Camden

Existing Population

5,550

Service Area

Berlin Township

Need for Project

At present there is no sewer service to the residents of Berlin Township. Well-drained sandy soils and a shallow groundwater table increase the possibility of contamination to ground waters by individual septic tank disposal systems. In addition contamination of the head waters of the Great Egg Harbor River (PL and FW2-NT) and nitrogen contamination of wells has been attributed to septic tank sources in Berlin Township. The systems are also creating a public nuisance.

Project Description

The proposed project consists of the construction of a new collection system of approximately 138774 linear feet and four pumping stations. The collection system will connect to the regional CCMUA pumping station.

Need for Project

The lots in the project area are very small and most have cess pools. A ground-water problem is causing many of the on-site systems to fail.

Project Description

The proposed project includes the construction of approximately 550 feet of eight-inch sanitary sewer line with manholes and service connections to 12 properties.

Service Area

Highly dispersed areas of Evesham Township including the Marlton Lakes area.

Need for Project

The Marlton Lakes area of Evesham Township has experienced on-site disposal problems for the past seven years. Monitoring of potable water wells has shown high nitrate readings and the lake has shown indications of eutrophication from elevated nitrate levels. Approximately 850 developed properties exist in the southern two thirds of the Township with about 40 concentrated in the Marlton Lakes area. A review of the more concentrated areas of development shows that on-site systems are located on Lakewood and Evesboro soils that have severe limitations for septic systems due to high permeability. Many homes in the highly dispersed areas of the Township have also experienced on-site disposal problems. In the northern portions of the Township outside of the existing sewer service areas many homes experiencing problems are located on Kresson and Marlton soils having severe limitation for on-site disposal due to poor permeability.

Project Description

The recommended plan for wastewater management for southern Evesham Township has been divided into two regions based primarily on the need for wastewater management and population density o Marlton Lakes Community Small DiameterSTEP sewer system with centralized wastewater treatment utilizing the Carrousel process followed by effluent disposal in a series of Rapid Infiltration basins. o Remainder of Southern Evesham Township Privately owned publicly managed septic system management district entailing periodic septic tank pump-out and septic system inspection. Pump-out and maintenancerepair costs would be the responsibility of the owner.

Service Area

A portion of the Borough of Kinnelon

Need for Project

The Borough has proposed the construction of a collection system for a small area of the Borough where on-site disposal systems have been experiencing problems and have malfunctioned. Water quality standards are currently marginally meeting fecal coliform and nutrients.

Project Description

It is anticipated that this project will be for the construction of one pump station force main and approximately 48000 L.F. of gravity sewer. The Borough of Kinnelon has become a member of the Pequannock River Basin Regional Sewerage Authority (PRBRSA) (January 1 1991). The project would connect to a PRBRSA interceptor at the ButlerKinnelon boundary and all wastewater would be discharged to the Pequannock-Lincoln Park-Fairfield Sewerage Authority for treatment.

Sanitary Sewer System - New

Priority List Rank

688

County

Warren

Existing Population

1,660

Service Area

The study area for this project consists of Hope Township within the Pequest Basin.

Need for Project

The majority of the township is currently using cesspools as a means of on-site wastewater disposal. Failures of these systems have created potential health hazards. In the Silver Lake area the water table is high and wells are shallow. Cesspools and septic systems have been a public nuisance through surface failures and groundwater pollution. The septic malfunctions have been threatening the health and welfare of the local residents. Because of the existing small lot size soil limitations and lack of adequate planning for runoff management there is significant potential for future environmental and health problems within the community as well as problems of the degradation of water quality in Silver Lake.

Project Description

This project is still in early stage of planning and proposes small diameter gravity system connected to a community-based leaching field as an alternative solution to malfunctioning septic systems. Also included is a sub-surface drainage system to be installed to collect and divert high seasonal groundwater and run-off to protect the disposal bed from flooding.

Pequannock Township

Need for Project

The project is needed to improve existing wastewater treatment practices through the elimination of approximately 490 on-site disposal systems in a residentialcommercial area and replacing them with a sanitary sewer system. The soils in this service area are classified by the Soil Conservation Service as severely limiting for on-site disposal. The average housing stock in this area is in excess of 35 years and health surveys have indicated an incidence of septic system malfunctions and shallow aquifer contamination. The proposed sewer system will provide the transmission facilities to convey the wastewater to the Pequannock Lincoln Park and Fairfield Park Sewerage Authority (TBSA) facilities for ultimate treatment.

Project Description

This Phase IV project will be an extension of the Phase III sanitary sewer system and will include the residential area known as the Village and the commercial areas on Route 23.

Washington Township

Need for Project

Failure of on-site sewage disposal systems within the Gardendale and Grenloch areas of Washington Township have created a public nuisance. Project is necessary to eliminate failing septic systems and to construct a sanitary sewer collection system to service several of the older developments within Washington Township.

Project Description

Construction of extensions to the existing sanitary sewer collection system. The extension to the Grenloch area collection system will consist of approximately 9895 linear feet (L.F.) of gravity main 1750 LF of 4 force main 1 pump station and all appurtenances along Park Avenue Lake Avenue Central Avenue Edgewater Avenue Milburn Avenue Arbutus Avenue and Woodbury-Turnersville Road. The extension to the East Gardendale area collection system will consist of approximately 10940 LF of 8 gravity main and all other appurtenances. The extension will include McKinley Avenue Garfield Avenue Myrtle Avenue Spruce Street Chestnut Street Lucust Street Pine Street Copper Street Hilbert Drive and Forrest Street. The extension to the Wilson Road area collection system will consist of approximately 2890 LF of 8 gravity main and all appurtenances. The Wilson Road area extension will include West End Avenue Salem Avenue Glen Avenue Wilson Road and Woodbury-Turnersville Road. All new flows are to be conveyed to and treated at the Gloucester County Utilities Treatment Plant.

Service Area

Holly OaksKnollwoods area of the Manchester Township

Need for Project

The tremendous rate of growth in the area coupled with an increasing number of septic tanks has placed a severe strain on the very permeable sandy soils to adequately treat the domestic wastewater. Because of a generally high groundwater table and the high percentage of septic system failures pollution of the groundwater and surface water is suspected. Also the current septic tank problems pose a potential threat to the health of local residents. Therefore a proper sewage disposal system is necessary.

Project Description

The project is for the construction of two pump stations and approximately 8 miles of force mains and gravity sewers with diameters ranging from 6 inches to 12 inches. The wastewater will be conveyed to the existing 42-inch diameter Union Branch Interceptor owned and operated by the Ocean County Utilities Authority (OCUA). The wastewater will be treated at the OCUA's Central Plant located in Bayville for secondary treatment with effluent disposal to the Atlantic Ocean.

Strathmere Section of Upper Township

Need for Project

This project is proposed for the elimination of public nuisance associated with ground and surface water pollution possibly resulting from malfunctioning individual on-site wastewater treatment systems. The Strathmere section of Upper Township is a recreational island community characterized by high summer population densities and high groundwater levels.

Project Description

Upper Township proposes the planning design and construction of a new sanitary sewage collection and interceptor system for the elimination of the existing improperly operating on-site systems. Wastes collected in this system will be pumped into the Avalon system for transmission to the proposed 7.67 mgd Seven MileMiddle regional treatment facility. The collection and treatment of wastes generated by the Strathmere section of Upper Township were included in the Seven MileMiddle regional plans.

Service Area

Branchville

Need for Project

The Branchville area is currently relying on on-site septic disposal systems for the treatment of wastewater. Many of these existing systems appear inadequate and are becoming a public nuisance.

Project Description

This project is part of a wastewater treatment system to be developed by the Sussex County Municipal Utilities Authority and consists of a proposed regional sewage treatment plant which will serve Frankford Township along with Branchville Borough. It includes the construction of a collection and interceptor system for the Branchville Borough area.

Village of Vincentown

Need for Project

The Village of Vincentown is primarily a residential area currently using individual on-site wastewater treatment disposal systems. A survey report was made by the Burlington County Health Department which showed that many of the systems are having serious problems.

Project Description

The topography of the area to be served (Village of Vincentown) is not steep sloped but with gently sloping grades. The major obstacles are three small streams which will be crossed by hanging insulated pipes on the existing bridges. 11200 L.F. 8 inch san. sewer pipe and 3800 L.F. force main will be installed. The project also entails 230 laterals 44 manholes and pavement restoration.

Bartons Lake and Fawn Lake Villages in Shamong Township

Need for Project

The Fawn Lake and Bartons Lake areas of Shamong Township have been experiencing on-site disposal problems for the past ten years. Bartons Lake Village is a development of 77 homes adjacent to Indian Mills Lake. This development is experiencing failures due to high groundwater and soil constraints. The Fawn Lake Village is a mobile home park with approximately 114 units served by combined septic systems. Problems experienced in the development appear to be associated with undersized systems and soil constraints. The Fawn Lake Village is adjacent to Springers Brook a tributary of the Mullica River.

Project Description

The facilities plan indicates that two septic tank effluent collection systems which will convey partially treated wastewater to two community leachfields will be the most cost-effective solutions for the two problem areas.

Need for Project

A high water table and poor soil conditions contribute to the failure of the existing on-site systems. Continued reliance on inadequate systems may degrade groundwater quality in the area. In addition the potential for ponding septage and other problems associated with system failure may create a public health problem.

Project Description

The project report will evaluate all feasible collection and on-site treatment alternatives in order to determine the most cost-effective and environmentally acceptable alternative to treat wastewater in those areas of Buena which are presently unsewered.

Sanitary Sewer System Rehabilitation

Priority List Rank

702

County

Morris

Existing Population

180

Service Area

Pequannock Township - Pequannock Avenue from Newark-Pompton Turnpike to Route 23 and a portion of Madison Street

Need for Project

The project is needed to improve existing wastewater treatment practices through the elimination of on-site disposal systems which serve a residential area of 61 units and replacing them with a sanitary sewer system. The soils in this service area are classified by the Soil Conservation Service as severely limiting for on-site disposal. The average housing stock in this area is in excess of 50 years and health surveys have indicated an incidence of septic system malfunctions and shallow aquifer contamination.

Project Description

The proposed project includes the construction of approximately 320 linear feet of 8-inch diameter PVC sewer main and 2825 linear feet of 10-inch diameter sewer main and all necessary appurtenances to serve 61 properties. Also included in the project is a culvert crossing and the crossing of the City of Newark's twin water supply aqueducts. The proposed sewer system will provide the transmission facilities to convey the wastewater to the Pequannock Lincoln Park and Fairfield Park Sewerage Authority (TBSA) facilities for treatment.

There are approximately 67 homes within the proposed service area (Jacksonville Road) which have experienced problems and/or failures with their individual disposal systems. This has created a public nuisance.

Project Description

This project is for the construction of a pump station force main interceptor and collector sewers for this service area. These facilities will convey the Borough's wastewater to an existing interceptor of the Pequannock Fairfield and Lincoln Park Sewerage Authority (TBSA) for ultimate disposal at the existing TBSA's treatment plant. This project is presently in the facilities planning stage.

Service Area

The project service area is in Elizabeth, NJ consisting of predominantly single-family residential streets of Melrose Terrace, Decker Avenue, Wilson Terrace, Lincoln Avenue (from Melrose Terrace to Cherry Street) and a few multi-unit residential buildings on Cherry Street (from Lincoln Avenue to Trotters Lane). The area is served by separate storm sewers. The existing storm system discharges to an unnamed tributary of the Elizabeth River in Phil Rizzuto Park. The unnamed tributary transitions to a box culvert across Morris Avenue, along Trotters Lane, and finally discharges to the Elizabeth River. In the proposed plan, drainage from the service area will be redirected to a new storm sewer along Lincoln Ave and Cherry Street, which will discharge to a proposed new connection to the Trotters Lane box culvert (about 350 feet downstream of the existing outlet in Phil Rizzuto Park). The project is necessary to provide adequate flood relief and surface drainage to the residents of this area.

Need for Project

The project is needed by the community to relieve periodic, localized street flooding on Melrose Terrace, Decker Avenue and Wilson Terrace caused by the existing limitations in the storm sewer capacity due to pipe alignment and size. This flooding interferes with residents' ability to access their homes and causes nuisances for motorists. The installation of the rerouted and upsized storm sewers aims to reduce the incidence of this flooding. The project will not reduce flood storage volume or increase flood flow because all construction will be below ground with restoration to existing grade, and the project will not create or drain any new impervious area to the storm sewer system.

Project Description

The proposed project involves the replacement and rerouting of storm sewers within existing street rights of way along Melrose Terrace, Decker Avenue, Wilson Terrace, Lincoln Avenue and Cherry Street in the City of Elizabeth, Union County, New Jersey. The objective is to mitigate reported periodic, localized flooding along these residential streets, which has also been confirmed with hydraulic/hydrologic modelling in a previously completed feasibility study. In order to provide additional conveyance through the storm sewer system, the sewers along these streets will be upsized, with flow re-directed away from the existing outlet at Phil Rizzuto Park, and conveyed further downstream to an existing stormwater culvert at Trotters Lane to the outfall to the Elizabeth River. This portion of the project involves engineering design and construction phase services for sewer installation.

Project Name, Number

Woolwich Township
S340432-01
Sanitary Sewer System - New

Priority List Rank

707

County

Gloucester

Existing Population

10,200

Service Area

Woolwich Township is located in northwestern Gloucester County and is bounded by the Townships of Logan, Greenwich and East Greenwich on the north, Township of Harrison on the east, Township of South Harrison and Piles grove on the south, Township of Oldmans on the west and the Borough of Swedesboro in the center. The Township of Woolwich has an approved Wastewater Management Plan that includes the area to be served by this project within the sewer service area. Sanitary sewer service in Woolwich Township is provided by Aqua NJ. The Weatherby area of the Township has a sanitary sewer system that flows to LTMUA. There is also a small section of the Township that is serviced by Swedesboro.

Need for Project

The project will serve the TDR receiving area along Route 322. The area is currently serviced by septic systems. The new sewer force main and pump station will ensure future development is not serviced by septic. Otherwise development could result in negative impacts to water quality. Although the project impacts the TDR receiving area, the sending area will now be protected from future development and water quality issues that may have resulted from development in the sending area.

Project Description

The project serves a smart growth regional center and a TDR receiving area. This project consists of the extension of sanitary sewer service to residential and commercial properties within the TDR receiving area designated along Route 322 and commercial and industrial properties along Route 322. A gravity sewer extension will be installed within the Route 322 rights-of-ways and a sanitary pumping station will be located at the border of Woolwich and Logan Townships. A force main will extend along Route 322 and through an easement to convey the flows from the proposed Woolwich pump station to an existing LTMUA pump station which will convey the flow to the Water Reclamation Facility.

Need for Project

Excessive nutrients have led to the Newton Creek to become eutrophic which has manifested itself in algae blooms and algae mats. The algae blooms and mats have affected the dissolved oxygen levels in the creek. This project will address watershed and stormwater practices to positively affect external nutrient loading.

Project Description

The project consists of the dredging of the Newton Lake from Cuthbert Boulevard to the Black Horse Pike in Oaklyn including the Peter's Creek tributary, Pond 2 and Nichols Pond. Dredging will improve the water quality of the Creek.

Need for Project

Stormwater runoff is the most common way that nonpoint source pollution reaches local rivers creeks and lakes. Rainwater carries chemicals nutrients sediments and other forms of nonpoint source pollution into local streams if the water is not absorbed by soil and vegetation. The Townships goal with its stormwater management plan is to increase absorption of rainwater by soil and vegetation using mechanisms that reduce the velocity of flow and retain the water in natural areas. This will reduce the amount of pollutants being carried off to nearby watercourses and reduce flooding.

Project Description

The proposed project includes replacement of existing compacted gravel roads that currently have no stormwater management controls with pavement and specific stormwater controls both structural and nonstructural to properly control stormwater runoff and reduce nonpoint source pollution. Nonstructural management will include practices such as allowing stormwater to runoff roadways into vegetated areas as sheet flow where feasible directing runoff into vegetated swales where feasible and allowing stormwater that must be collected to bubble up through outlets and spread out as sheet flow runoff through vegetated filter strips and forested riparian buffers. Where it is not practical to utilize those nonstrucural practices stormwater will be collected and directed into an underground stormwater recharge system.

Service Area

The Fisherman's Park Flood Gates provides an outlet for the Baltic Avenue Canal which drains an 815 acre area of Atlantic City that stretches from just south of the Atlantic City Expressway to the Absecon Inlet and the Bungalow Park Neighborhoods in Atlantic City. The planned Fisherman's Park Flood Gates are located at the intersection of Melrose Avenue and N. Rhode Island Avenue.

Need for Project

This system is designed to improve flood and storm water control in much of the City of Atlantic City. The project includes removal of existing flood walls and construction of 542 linear feet of new flood walls; construction of closed drainage culvert to replace open drainage culvert; construction of storm water control gates; and construction of new storm water pumping structure and piping.

Project Description

(Carryover SFY2015) - The proposed project involves repair and installation of floodwalls and floodgates. The project also includes reconstruction and elevation of roadway. These improvements will reduce flood damage to the City's infrastructure. This system is designed to improve and protect groundwater by providing well-designed stormwater systems. Hence this project will provide adequate environmental infrastructure to improve resiliency of Sandy damaged systems in future natural disasters.

Need for Project

This system is designed to improve and protect groundwater by capping historic fill and providing well-designed stormwater wastewater and water supply systems. This site will support a new business park and marina when completed.

Project Description

This project includes installing a fill material shore protection structure stormwater management site work sewer and water supply systems and soil erosion and sedimentation control systems at the planned Riverside Business Park. This project is designed to make the stormwater system more resilient and to protect public infrastructure and private investments in the area. This system is designed to improve and protect groundwater by capping historic fill and providing well-designed stormwater systems.

Need for Project

The proposed improvements will address existing roadway flooding and potential pavement deterioration soil erosion and also improve water quality in the Pine Lake via reduction in TSS and phosphorus removal.

Project Description

The project involves installation of six (6) subsurface recharge systems approximately 1600 linear feet of 36 perforated HDPE pipe within the Pine Lake Park area of the Town. The project also includes installation of 50 new inlet structures. The Town will also collect runoff from four dead end areas and redirect them into proposed treatment units prior to discharging into Pine Lake.

Need for Project

This project seeks to correct the ecological imbalances of the site through ecologically designed water management practices resulting in increased infiltration into the ground of clean water cleaner water throughout the site that is naturally cleansed through plant processes without the use of chemicals and a healthier minimized and controlled return of water to the Dead River. This project also seeks to create clean water from waste water through the use of constructed wetlands. Water exiting the system is recreational quality water before it is returned to the ecosystem therefore reducing site pollution. This project is in the planning area of the Highlands and as such seeks to contribute clean water to the ecosystem.

Project Description

Mine Brook Road is an ecologically designed and agriculturally integrated residential development with 12 homes on Minebrook Road in Bernards Township in the Highlands Planning Area. The property is bounded by RT 287 to the north and west and the Dead River to the east. The entire property was design to be sustainable and water was a primary focus. The current conditions include high levels of runoff and low water infiltration to the soil. This is being addressed through a site-wide ecologically driven stormwater system that includes new constructed wetlands a habitat pond and vegetated swails throughout that cleanse water as it travels through the site so that all water returned to the ecosystem is clean water. We are also working with DEP to permit a new constructed wetland for the treatment of wastewater on the site. This system is similar to a constructed wetland wastewater treatment system that we built for the Willow School in Gladstone and we believe it will be the first one to serve a residential community in the state of NJ. Aside from water agriculture energy and other sustainability concerns are also featured very heavily in this project. Organic berries and fruits will be grown on site. Because this project is so forward thinking it helps to create green jobs that will push the green economy forward - these jobs are green design green construction organic farming (there will be farmers employed) and peripheral jobs for material creation.

Hiohela Pond; Block 33 Lot 1.021

Need for Project

This pond was constructed in the 1930s with minimal maintenance on record. Currently the pond is in need of dredging, where sediment has accumulated to an extent where excessive vegetation has limited the function of the pond and related storage volume. Removal and disposal of the spoils will improve stormwater management and aquatic habitat which will in turn facilitate adequate detention time of stormwater and improved water quality on site and downstream of the pond.

Project Description

Pond Dredging for Hiohela (Pennytown) Pond

Need for Project

Replacement of existing impervious concrete with pervious concrete will allow the College to divert stormwater from Lake Fred to the underground aquifer. The project will enable the College to reclaim more water.

Project Description

The proposed project includes replacement of existing impervious concrete with pervious concrete.

Woodbine Borough

Need for Project

The existing residences are served by individual on-site septic systems which are suspected to contribute to groundwater pollution. The State Department of Human Services owns and operates the only treatment facility in the Borough and it is located at and serves only the Woodbine Development Center.

Project Description

The proposed project involves the acquisition of the Woodbine Development Centers STP and the upgrade and expansion of the treatment facility from 0.16 MGD to 0.5 MGD. The upgrade will employ the sequential batch reactor process and denitrification. In addition the project includes pump stations force mains and approximately 60000 linear feet of gravity sewers to collect and transport wastewater to the upgraded STP.

Portions of Cranbury Township

Need for Project

Cranbury Township Planning Board recently changed their zoning on the east of Route 130 to permit 100 warehouse development. This has caused a dramatic increase in growth on the east side of Route 130 during the past year. The installation of the proposed sanitary system would benefit future development in the area east of 130. By diverting all flows presently directed to the Village Area Pump Station from the east side of Route 130 the Village Area Pump Station and force mains will have sufficient capacity for all projected flows west 130.

Project Description

The proposed project includes installation two new pump stations one at 1.75 MGD with 1700 LF of 12 force main the second at 3.75 MGD with 4000 LF of 16 force main.

Sanitary Sewer System - New

Priority List Rank

726

County

Warren

Existing Population

5,712

Service Area

The proposed service area is located in the hamlet of Stewartsville, Greenwich Township ant the intersection of two county roads and a municipal road. The hamlet primarily consists of d single family and multi-family dwellings, commercial buildings and institutional buildings. Many of the lots are approximately one quarter acre in size. The community is served by a public waster supply.

Need for Project

Failing septic systems on small lots and the proximity to local streams

Project Description

The Township of Greenwich proposes to install a collector sewer in the vicinity of the Village of Stewartsville. The project area is located in an existing approved sewer service area designated in the Township's Wastewater Management Plan (WMP). Dwellings and commercial establishments in the village are currently served by onsite sewage disposal system, many of which are cesspools. The proposed sewer extension is anticipated to be primarily a gravity system to be constructed within existing road right-of-ways and other easements as required. The gravity system would be routed to a proposed pump station adjacent to the Greenwich Township Middle School located on South Main Street. The proposed sewers would be located in the following streets and right-of-ways: Greenwich Street (County Route 638) North Main Street (County Route 637) South Main Street (County Route 637) Willow Grove Road Washington Street Water Tower Road

Service Area

Several Municipalities in New Jersey

Need for Project

The State of New Jersey has mandated that all septic tank wastes (septage) be banned from disposal in unlined landfills as of March 15 1985. Subsequently as there are no adequate landfills in the County an agreement has been reached between Burlington County and the Mount Holly Sewerage Authority in which the latter would act as the lead agency to dispose of the Countys septage on an interim basis. However the Authoritys facility is not designed to accept septage and the septage management plan concluded that treatment plant modifications are necessary. Since there are no adequate means of septage disposal in the County initial investigations indicate that septage is being dumped illegally and in all likelihood is resulting in localized surface and ground water degradation.

Project Description

The proposed project will treat and dispose of all the septage generated in the County on a short term basis at relatively minor costs. The county-wide sludgeseptage study (C340818-01) will plan for septage disposal on a long-term basis. The latter study may conclude that the Authority should dispose of septage also for the long-term. The plans and specifications recently submitted will provide for the following 1. Screening and Grit Removal Equipment 2. Comminutor 3. Aerated Holding Tanks 4. Chlorination Equipment 5. Pumps 6. Odor Control 7. Prefabricated Structure

Need for Project

The Gloucester County Utilities Authority (GCUA) is presently disposing of sludge by incineration. The design capacity of the GCUA incinerator is inadequate to handle the 15 tons of sludge (dry weight basis) produced at the GCUA Regional Plant. As a result the Authority proposes to add another fluidized bed to the existing incinerator in order to increase its design capacity. The approved (201) Facilities Plan for the GCUA consolidated region calls for static pile composing as a long term sludge management alternative. Therefore the Authority may be required to amend the facilities plan should they intend to employ incineration as the most cost effective environmentally sound and implementable long term sludge management alternative.

Project Description

The project will consist of the addition of a fluidized bed to the existing incinerator of the GCUA Regional Plant for disposal of all the sludges produced in the GCUA-consolidated region.

Need for Project

Disposing of septage in unlined landfills was banned on March 15 1985 pursuant to amendments of the Solid Waste Management Act to prevent the danger of groundwater contamination. An alternative disposal method is the utilization of existing treatment facilities. Therefore the municipalities indicated above have been assigned to the Somerset-Raritan Valley SA treatment plant as designated in Appendix A of the Statewide Septage Management Plan. The present facilities at SRVSA for handling septage wastes are inadequate to handle the quantity and quality of wastes proposed to be accepted. This project is necessary to ensure that septage disposal for existing and future development is in conformance with said plan.

Project Description

This project is for the construction of septage facilities at the SRVSA plant so that it may dispose of the septage generated in Somerset County. The septage management plan recommends that the design capacity of the septage receiving station at the SRVSA plant be 28000 gallons per day. In addition the plan is addressing management and implementation considerations. The septage plan will provide SRVSA with a septage treatment and disposal method that will enable the Authority to accept all the wastes from its designated areas while also meeting its discharge requirements.

Need for Project

Construction of a new 18 PVC sanitary sewer pipe will greatly reduce the amount of infiltrationinflow from this area will increase the flow capacity and will remove an environmental concern that presently exists within the nature preserve.

Project Description

Project consists of the construction of a new 18 PVC sanitary sewer by relocating it along the northerly boundary of the Bonsal Nature Preserve. The existing pipe is undercapacity due to excess I&I and root intrusion and it presently within the Township of Montclair which traverses along the center of the nature preserve. The existing pipe would be abandoned with flowable fill and eliminates a potential environmental liability.

Need for Project

Approximately 30 percent of County residents employ on-lot individual septic systems to treat their wastewater. Currently numerous problems exist with these systems as a result of their installation in inappropriate soils and due to inadequate design. This situation leads to nuisance conditions possibility of public health problems and localized groundwater quality degradation. The problems in Salem County are further aggravated by the lack of adequate facilities to accept and properly dispose of septage pumpouts. The State of New Jersey mandated that septage be banned from all but lined landfills with leachate control effective March 15 1985. There are no such facilities in the planning area. It is presumed that a good deal of illegal septage dumping is occurring in the County and that surface and groundwater quality degradation may result.

Project Description

The planning for this project is to provide two basic responses to the problem outlined above. The first response is to plan for the adequate treatment and disposal for all the septage generated within the County. The second is to develop an overall management system of the County where on-lot systems currently exist. These solutions would involve the application and innovation of advanced technologies to resolve these problems. The facilities plan will consist of the following components 1. County-wide Septage Disposal Plan 2. On-lot Septic Tank Management Plan 3. Environmental Analysis 4. Full-scale Public Participation Program. Implementation of the selected plan will resolve the problem indicated above in a cost-effective environmentally sound manner.

Need for Project

Disposal of septage in unlined landfills was prohibited effective March 15 1985 to prevent the danger of groundwater contamination. An alternative disposal method is to use existing treatment facilities. Therefore the municipalities indicated above have been assigned to the Parsippany-Troy Hills treatment plant as designated in Appendix A of the Statewide Septage Management Plan. The project is necessary to insure that septage disposal for existing and future development is in conformance with said plan. The Township of Parsippany-Troy Hills is in the last stages of completing the construction of a 16 mgd advanced wastewater treatment facility. The present septage handling facilities were adequate to handle the flows from just the immediate service area but they are not adequate to handle the quantity and quality of wastes directed to this facility by the Department. It is the intent of this project to develop and implement a comprehensive plan to evaluate the capability of the treatment facility to accept additional septage wastes and to recommend necessary modifications be constructed.

Project Description

Parsippany-Troy Hills Wastewater Treatment Plant will have responsibility of treating an estimated 54000 GPD of septage. In order to handle these wastes Parsippany-Troy Hills has completed an NJDEP approved septage management plan which recommends construction of facilities that include the truck receiving area gravel trap coarse bar screens holding tank and associated appurtenances.

Need for Project

Although the unsewered areas are included in the Planning Area for Northwest Bergen County Utilities Authority there is presently no formal provision to treat septage from these areas. Septage from NWBCUA is presently being taken by informal agreement to Bergen County Utilities Authority treatment plant. The distance to this facility creates a climate for illegal dumping. The lack of a long term formal arrangement with Bergen County is unacceptable and the lack of quality assurance is unacceptable.

Project Description

This project will provide for the construction of septage handling facilities to receive all septage generated within the planning area for treatment at the Northwest Bergen treatment plant. The septage facilities will provide for quality assurance to prevent treatment plant upset and will provide odor control. The construction of septage facilities in conjunction with the initiation of a voucher system for tracking septage from cradle to grave will assure control collection disposal and treatment of septage wastes from approximately 50000 people in the planning area thereby eliminating present unacceptable trucking and disposal of septage.

Need for Project

The existing septic systems serving the single family dwellings and commercial businesses in the project area are failing.

Project Description

The EHTMUA proposes to extend a gravity collection system to service twenty-seven (27) existing homes and four (4) commercial establishments located on Doughty Road Oak Avenue Blue Spruce Road Woodland Avenue and Marlborough Road in the Farmington section of Egg Harbor Township. The flow will be conveyed via gravity mains to the Washington Avenue trunk line. The flow then is conveyed by gravity to the ACUA Pleasantville pump station which is then pumped to the ACUA City Island Treatment Plant. The project also proposes the removal and replacement of an existing manhole and removal and replacement of 359 linear feet of PVC sanitary sewer main within the municipality of Pleasantville City in order to connect to the existing trunk line in Washington Avenue.

Service Area

The sanitary sewer system will serve the Marlboro Township Harbor Rd. Water Treatment Plant.

Need for Project

The sewer system is needed to provide for the ability to dispose of the process waste and domestic waste from the water treatment plant. The project will allow the process waste to enter the sanitary sewer system for disposal as opposed to the current discharge to surface water NJPDES Permit method utilized presently.

Project Description

The project consists of the construction of a submersible pumping station to convey process and domestic wastewater generated at the Harbor Rd., Water Treatment Plant. The work consists of the following: construction of a pre-cast wet well, valve chamber, submersible pumps, controls and associated gravity sewer and force main

County

Essex

Existing Population

39,110

Service Area

West Orange Township

Need for Project

The existing sewerage system in West Orange has inadequate capacity to allow for future growth potential. New interceptors and appurtenances are required to provide the needed reserve capacity for both planned and proposed sewer connections. The Township of West Orange is included within the sewer service area of the Essex/Union Joint Meeting. Since this project will have no direct impact upon existing water quality, only discharge category points for new systems can be justified.

Project Description

Proposed is the construction of new interceptors consisting of both gravity sewers and pump station/force main and appurtenances to provide additional capacity for the First and Second Mountain areas of West Orange and Livingston. An old interceptor line (PS/FM and Gravity) is also proposed for replacement as part of a major sewer system rehabilitation effort.

Project Name, Number

Galloway Township
S340892-09
Sanitary Sewer System - New

Priority List Rank

745

County

Atlantic

Existing Population

37,349

Service Area

The proposed project location is the Smithville section of Galloway Township. The project is located within the Township's CC Community Commercial zoning district. The proposed pump station will be located on Lot 1.03 in Block 1173.02

Need for Project

The intent of the State Plan for Suburban Planning Areas is to promote growth in Centers and other compact forms, to protect the character of existing stable communities, to protect natural resources, redesign areas of sprawl, to reverse the current trend towards further sprawl and to revitalize cities and towns. The State Plan indicates that these goals can be met by upgrading or replacing aging infrastructure systems to eliminate deficiencies and provide capacity for sustainable development and redevelopment in the region. This project would eliminate aging systems and redirect flow to upgraded more environmentally sound infrastructure.

Project Description

This project involves the construction of a new pump station on Lot 1.03 in Block 1173.02 and the construction of approximately 850 linear feet gravity main and 800 linear feet force main. The proposed gravity main will redirect existing flow to the proposed pump station. The project also consists of the lining of 1000 linear feet of 14 main. The other improvements proposed as part of the pump station construction include wet wells duplex submersible pumps a control building standby generator for power and a cellular based alarm system.

Cherry Hill Township

Need for Project

To remove aging septic systems and replace them with sanitary sewer extensions and to rehabilitate aging pump stations.

Project Description

The Township of Cherry Hill plans to extend their sanitary sewers to reach several remaining unsewered sections of the Township. The various extensions are spread throughout the Township. The project will consist of gravity sewer mains several force mains house connections all restorations and appurtenances. Also the Peppermill Pump Station and Batesville Pump Station will be rehabilitated. The project may include the elimination of the School Lane Pump Station and connection by gravity sewer to an existing Camden County MUA interceptor. The Peppermill Pump Station has an existing peak flow rate of 0.13 mgd and the Batesville Pump Station has an existing flow rate of 0.52 mgd. Each pump station will have their wetwells and pumps replaced along with related electrical services.

Sewage Treatment Plant (STP) - Improvement/Upgrade

Priority List Rank

747

County

Burlington

Existing Population

31,340

Service Area

Portions of Pemberton Township including areas designated as regional growth within the Pinelands

Need for Project

The implementation of the upgrading of the Pemberton Township Municipal Utilities Authority Wastewater Treatment System will serve to enhance the groundwater quality in those area which are presently serviced by on-site septic systems. The properly planned expansion of the system will protect the environment from improper discharges to the groundwater and surface water. The upgrading of the existing facilities at the Authoritys STP will be necessary to maintain the high level of treatment required for discharge into the North Branch of the Rancocas Creek in accordance with NJPDES permit No. NJ0024821. The existing plant is over twenty (20) years old is in need of rehabilitation and replacement of equipment. In the event that the collection system is enlarged the treatment plant capacity will have to expand to meet the demand.

Project Description

The proposed project includes the construction of a regional collection system and repairreplacement of various treatment units to improve treatment capabilities at the Pemberton Township MUAs STP.

Need for Project

The RCA sewer-pumping station is a 35-year-old Can station. Failure of the station may cause contamination of the Alomonesson Creek and the Delaware River. The station conveys wastewater from the busiest section of the Township to a Gloucester County UA pump station and ultimately to GCUA for treatment. Upgrades and expansion will assure proper operation.

Project Description

The proposed project includes construction of a new larger wet well with 3 submersible variable speed pumps. The controls for the new facility will be above ground in a secure building to do away with the Can station. New instrumentation pumps alarm system and a natural gas generator for emergency supply will be installed. Upon completion of the project the existing pump station shall be abandoned the property graded and a new fence installed to secure the area.

Project Name, Number

Aberdeen Township
S340869-02
Sanitary Sewer System - New

Priority List Rank

758

County

Monmouth

Existing Population

18,210

Service Area

The project area is located in the Woodfield area of the Township of Aberdeen, bounded by Matawan Borough. A portion of the proposed force main to be installed as part of this Project will be located with Matawan Borough.

Need for Project

The Woodfield area of Aberdeen Township consists primarily of residential homes that are serviced by individual sewage treatment systems (septic). The septic systems have been susceptible to failure throughout the years. Failure of these systems has become a substantial burden and health concern to the affected residents within the community and has resulted in costly repairs for the homeowners and has impacted their quality of life. As a result of the failed systems, the stormwater quality has been negatively impacted as the septic discharge does not adequately percolate into the soils and has remained near the surface, ultimately draining into the stormwater facility and discharging into Lake Lefferts. The Township desires to install a sanitary collection system within the Woodfield area to eliminate the poor septic conditions and improve the stormwater quality and quality of life for the affected residents of the municipality.

Project Description

Install sanitary sewerage facilities (gravity sewer pump station force main) to eliminate failing septic systems for 81 residents within the Woodfield Area of the Township.

Montclair State University

Need for Project

The project is required to upgrade the sanitary sewer infrastructure for the University in order to meet the sewer demands of the proposed University expansion. The project will involve construction of 8200 ft of new sanitary sewer infrastructure and upgrades to existing sewage pump stations force mains and gravity mains. The project intended to reduce the downstream capacity problems that the Montclair Township sanitary sewer infrastructure is facing and allowing the University to expand in the next few years.

Project Description

The project area is located with the Montclair State University (Montclair and Little Falls Townships) and within Montclair Township and involves construction of approximately 8200 ft of new sanitary sewer that will convey sanitary sewer flows from the Montclair University campus to the Montclair Township sewer. The project also involves upgrading the existing sanitary sewer infrastructure within the Montclair State University Campus including upgrading pump stations and force mains upsizing gravity mains and lining gravity mains within to handle the additional sewer flows that will be generated by the proposed University Expansion and construction of new campus buildings.

Project Name, Number

Mantua Township MUA
S340514-02
Sanitary Sewer System - New

Priority List Rank

763

County

Gloucester

Existing Population

15,217

Service Area

The Township population is 15,217 residents, based on the 2010 census. The sanitary sewer collection system is owned and maintained by the Mantua Township Municipal Utilities Authority (MTMUA). Sanitary sewer generated by the Township is conveyed to the Gloucester County Utility Authority (GCUA) for treatment.

Need for Project

This project is being undertaken in order to protect and enhance existing sanitary sewer infrastructure within the MTMUA service area. Failing to maintain the current infrastructure will only serve to increase the risk of future service interruption. The replacement of existing sanitary sewer infrastructure will serve to protect local water quality from disturbances related to chemical leaching and accidental discharges from aging infrastructure. Overall the proposed work will enable MTMUA to keep the municipal infrastructure in good operating condition, reduce unscheduled maintenance, and improve system monitoring.

Project Description

The Mantua Township Municipal Utilities Authority (MTMUA) has been evaluating the water and sewer infrastructure within the Township in an effort to identify equipment and components that are aging and reaching the end of its life cycle. The Authority is looking to be proactive and has identified three (3) sanitary sewer projects that will lessen maintenance time / costs, improve safety and allow for improved system monitoring. The Barnsboro PS project consist of the construction of a new construct a gravity collection system, duplex pumping station, and force main to support existing properties along Barnsboro Road (County Route 609) and Breakneck Road (County Route 603) in Mantua Township, New Jersey. This need has been identified as a result of aging septic systems, where approximately 80% of the properties were constructed prior to 1980. The proposed pump station will be located on Block 276.01, Lot 7. The existing property is owned by Gloucester County, easements will be obtained

Service Area

Hackettstown Town Independence Township

Need for Project

Disposing of septage in unlined landfills was prohibited as of March 15 1985 to prevent degradation of groundwater quality. An alternative disposal method is the utilization of existing treatment facilities. Therefore the municipalities indicated above have been assigned to the Hackettstown Municipal Utilities Authority treatment plant as designated in Appendix A of the Statewide Septage Management Plan. This project is necessary to ensure that septage disposal for existing and future development is in conformance with said plan. It should also be noted that the present facilities for handling septage wastes generated within the above service area are inadequate to handle the quantity and quality of wastes proposed to be accepted.

Project Description

A septage management plan has already been approved by the NJDEP. The facility plan recommends the construction of additional septage handling facilities at the HMUA wastewater treatment plant. The proposed facilities consist of a receiving station receiving chamber holding tank pumping station piping valves and miscellaneous equipment to provide the capability of diverting septage at a controlled rate to the primary digester or the division box upstream of the primary clarifier.

Service Area

The project area is located within the western portion of Zone 4 of the Town in an irregularly-shaped area that will disturb 1.17 acres

Need for Project

The Town of Boonton is upgrading inadequate wastewater infrastructure decreasing the likelihood of leakage and spills due to inadequate capacity.

Project Description

This project will increase the capacity of this critical sewer main that conveys sewer flows from the northwestern part of the Town to the Rockaway Valley Regional Sewerage Authority (RVRSA). The northwestern region is experiencing a significant amount of planned or anticipated redevelopment. To convey these sewage flows, this project will install approximately 1,009 linear feet (LF) of new 10-inch sewer main and 9 new manholes. Additionally, it will increase the size of 952 LF of 12-inch sewer main, and replace 30 service laterals.

770

County

Gloucester

Existing Population

8,788

Service Area

Harrison Township

Need for Project

Although the Township has an existing wastewater treatment facility it does not service the area of the proposed development requiring construction of the entirely new Richard WRF. The proposed Richwood WRF will still utilize a membrane bioreactor (MBR) for biochemical oxygen demand (BOD) and total suspended solids (TSS) removal and nitrificationdenitrification. Influent will be screened prior to entering the MBR system via two (2) parallel rotary drum screens. MBR permeate will be treated by UV disinfection and disposed of sub-surface via groundwater recharge. The new wastewater facility will be designed for a maximum month flow of 0.98 MGD although the first phase will be for a maximum month flow of 0.375 MGD.

Project Description

The Richwood Sewer Service Area is approved for a wastewater treatment and disposal facility of 980000 gallons per day. (Currently there are no such facilities in the Richwood Sewer Service Area.) A new treatment plant will be constructed on Township-owned property and will be owned operated and maintained by the Township once completed. The facilities as designed will have a total capacity of 690000 gallons per day (gpd) and will be built in two phases. Phase 1 of the facility is projected to cost approximately \$15250000 (\$14000000 for treatment and disposal \$1250000 for conveyance systems). Phase 2 is projected to cost approximately \$4000000 for treatment and disposal.

Sanitary Sewer System - New

Priority List Rank

771

County

Camden

Existing Population

8,468

Service Area

Service area includes approximately 94 residencies in immediate proximity to Davis Road, Evergreen Road, Sunnybrook Road, and Sunset Road within the Borough of Runnemede.

Need for Project

The proposed sanitary sewer system is required to provide wastewater conveyance from approximately 94 residencies within the project area that currently rely on septic systems, many of which are nearing the end of their useful service lives. Improvements will primarily consist of conveyance to the existing Municipal sanitary sewer system, and ultimately to the Camden County Wastewater Treatment Plant (Delaware #1 Water Pollution Control Facility, NJ0026182) for treatment. Wastewater treatment is required to protect the health, safety, and welfare of the surrounding community.

Project Description

This project will consist of the construction of a new sanitary sewer system on Davis Road, Evergreen Road, Sunnybrook Road, and Sunset Road within the Borough of Runnemede. All of the properties on these roadways currently utilize septic systems and are not connected to the Municipal sanitary sewer system. Improvements shall include sanitary sewer mains, manholes, force mains, a pump station, and appurtenances. Roadway resurfacing will follow construction of the proposed sanitary sewer system.

Service Area

Moore's Brook is directly downstream from the Town of Newton's Memory Park recreational area

Need for Project

Currently the area is inundated with inadequate stormwater measures and the Brook is not functioning as intended with years of silt accumulation diminishing its capacity to receive stormwater discharge. Dredging the brook will restore the ability to serve as storage and adequate conveyance of stormwater runoff.

Project Description

Town desires to remove accumulated sediment from Moores Brook. Over the last several years, the brook has lost capacity due to the accumulation of sediment over time causing excessive flooding in the upstream areas, specifically Memory Park. It is the Town's intention to restore the capacity of this brook to function as intended for resiliency measures and prevent oversaturated conditions in the area.

Need for Project

The purchase of the EDC wastewater system will ensure continuing efficient service to the existing customers at reasonable rates. The existing system includes a 2.10 MGD wastewater treatment plant that discharges to the North Branch of the Raritan River. The purchase is intended to maintain water quality through an efficient municipal operation and controlled growth in the service area.

Project Description

The proposed project includes the purchase of the entire EDC wastewater collection system within the utilities franchise area in Bernards and Bedminster along with the companys 2.1 MGD central wastewater treatment plant located in Bedminster.

Service Area

City of Cape May Borough of West Cape May Borough of Cape May Point portion of Lower Township and Coast Guard Base

Need for Project

The Cohansey Aquifer from which the Cape May Water Utility draws its potable water is experiencing salt water intrusion. To prolong the life of the Cohansey Aquifer and to meet summer water needs the City is proposing to derive 1.4 MGD of brackish water from the Atlantic City 800-feet deep sand aquifer and build a desalination facility employing a reverse osmosis process.

Project Description

The desalination facility will generate 1.0 MGD of potable water 0.4 MGD of concentrate and 1000 gpd of sanitary wastewater. The conveyance facilities is included in this project and involves the construction of two force mains. One force main will be 2-inch diameter 2300 feet long and will carry sanitary waste membrane wash water and water from floor drains to the West Cape May Boroughs sewer system where it will flow to the Cape May County MUAs STP for treatment and disposal in the Atlantic Ocean. The second force main will be 6-inch diameter 2700 feet long and will be designed to carry 0.4 MGD of desalination concentrate to the Cape Island Creek.

Cresse Avenue to 26th Street Beaches City of Wildwood

Need for Project

The sand on the Wildwood beach has accreted approximately 1700 feet since 1950 creating a beach front that is over a quarter mile from the Boardwalk to the waters edge. The existing outfall lines no longer extend far enough out into the ocean. Storm drain runoff containing animal and bird excrement washes back onto our bathing beaches. High fecal coliform counts detected in the weekly sampling conducted by the Cape May County Health Department each summer has confirmed unsafe condition and has resulted in beach closing. Ponding of this contaminated water occurs at the terminus of the outfall lines after each rain and the area must be plowed and leveled. The health and safety of the beach bathers have been imperiled and the beach closings produce a tremendous negative impact on tourism for many weeks thereafter.

Project Description

The ten (10) outfall lines will be retrenched and pilings and cross-beams will be installed to support and contain the lines with 1400 foot extensions. Trenches for the extensions will be dug during the low tide and the entire line will be re-covered with the accumulated sand.

North Wildwood City

Need for Project

The City's stormwater system needs to be reconfigured with the addition of a stormwater pump station to alleviate backups that could cause the sanitary sewer in the area to become overburdened allowing individual sanitary sewer laterals to overflow and eventually discharge to coastal waters.

Project Description

The proposed project includes stormwater sewer and bulkhead rehabilitation and construction of a new storm sewer pump station.

Service Area

The project is located in the Northeast section of North Wildwood. The project is bounded on the East by the Hereford Inlet of the Atlantic Ocean, on the Northwest by New York Avenue, on the Southwest by Second Avenue, on the South and Southwest by Central Avenue.

Need for Project

To improve the water quality of the storm water discharge into the Hereford Inlet/Atlantic Ocean.

Project Description

The project is the improvements to our storm sewer system in order to improve the water quality of the storm water discharge into the Hereford Inlet/Atlantic Ocean and to provide for a safer evacuation route out of our city in the case of an approaching hurricane. The project area is subjected to frequent flooding due to rain events and minor tidal flooding. During an approaching hurricane our City will experience heavy rain and increasing tide levels. The project area is included in our evacuation route. In order to keep our evacuation route open as long as possible we are proposing a storm water pump station. The pump station will keep the area from flooding in order to allow a longer period of time to evacuate the city. During normal rain events our project will enhance the quality of the storm water discharge.

Buena Borough

Need for Project

The Borough of Buena Wastewater Treatment Plant currently discharges effluent to the surface waters of Deep Run. The BBMUA WWTP is located within the New Jersey Pinelands jurisdiction as well is the outfall. Under the New Jersey Pinelands Comprehensive Management Plan discharging to surface waters within the Pinelands is prohibited. The BBBMA Buena Vista Township and Pinelands Commission has entered into a MOA mandating the BBMUA WWTP. The BBMUA WWTP NJPDES is NJ0021717. The design flow for the WWTP is 0.4 MGD and the actual flow is approximately

Project Description

Construct an Effluent Disposal Facility to facilitate the discharge of wastewater effluent to ground water. Additionally a pump station will be constructed along with force main transmit the effluent to the Effluent Disposal Facility. The pump station will be constructed at the Borough of Buena Municipal Utilities Authority Waste Water Treatment Plant (BBMUA WWTP) and the Effluent Disposal Facility will be constructed on Block 106 Lot 6 within the Borough of Buena. The force main will extend from the BBMUA WWTP to the Effluent Disposal Facility along Plymouth Road North Boulevard and Weymouth - Malaga Road.

Service Area

System wide stormwater infrastructure asset inventory and condition assessment and stormwater management improvements in the vicinity of Chestnut Street and McMullen Street.

Need for Project

Currently the Borough does not have a complete inventory of their stormwater infrastructure assets. It is a lake community bordering Lake Musconetcong and the existing infrastructure does not provide adequate capacity to store and delay stormwater discharges during typical rain events. Evaluating the condition of the assets will enable the Borough to proactively address Capital Improvements, and further the hydraulic analysis will facilitate appropriate mitigation measures along Chestnut and McMullen Streets. Adequately sized culverts, will add horizontal storage in the subject area, with appropriate water quality devices which will improve water quality that reaches the lake.

Project Description

The Borough is interested to conduct a storm water system asset inventory and condition assessment to prioritize Capital Improvement efforts. Additionally, the Borough is interested to address storm water system resiliency and flood mitigation in the vicinity of Chestnut Street and McMullen Street. This area is heavily impacted during rain events and there is inadequate capacity in the existing infrastructure. A hydraulic analysis will be required to properly evaluate water quality measures and repairs.

Service Area

Pemberton Township

Need for Project

Pemberton is developing a program to correct failing septic systems to improve the communitys groundwater and surface water quality and protect residents from exposure to septage.

Project Description

The proposed project includes the creation of a septic management district.

Sanitary Sewer System - New

Priority List Rank

790

County

Atlantic

Existing Population

96

Service Area

9 acres of uplands surrounded by 39 acres of water and wetlands. Designated as a sewer service area by the 201 Planning Area of NJDEP

Need for Project

Elimination of sewerage disposal from the 29 (1,000 gallons each) septic tanks, which are all more than 60 years old and failing. Currently, the sewerage disposal truck pumps out over 12,000 gallons of sewerage on average per week. As the septic system deteriorates, the risk of contamination of surrounding water and wetlands increases.

Project Description

Installation of in-ground gravity sewer to replace malfunctioning septic system for 56 residential units

Priority List Rank

791

County

Ocean

Existing Population

22,007

Service Area

The drainage improvements proposed impact the Mystic Island section of the Township.

Need for Project

The proposed work is necessary to improve the existing storm drainage infrastructure that is mostly comprised of corrugated metal pipe approximately 40 to 50 years old that is deteriorating and undersized to handle the contributing drainage flow. Water quality will be impacted through the potential reduction of sediment and other particulates that would normally accumulate in area properties and roadways after storm events and then drain into the existing collection system, which would ultimately be discharged into uncoded tributaries that feed Big Creek, a Category 1 waterbody according to NJDEP's Digital GeoWeb Data. Bid Creek flows into the Great Bay, which is part of the Mullica Watershed Management Area, and is adjacent to the Barnegat Bay Watershed Management Area.

Project Description

The Township proposes to replace approximately 2,300 lineal feet of existing drainage pipe and various inlets with new drainage piping and inlets, as well as install up to 2,735 lineal feet of new drainage pipe and inlets along West Potomac Drive, East Potomac Drive, West Susquehanna Drive, East Susquehanna Drive, West Raritan Drive, East Raritan Drive, West Shrewsbury Drive, East Shrewsbury Drive and through approximately 13 easement areas located within this project area. Work also includes easement and road pavement restoration curb to curb once the installation work is completed.

Need for Project

Stormwater runoff in the area discharges shallow concentrated flow over existing residential septic systems. Stream testing has confirmed high levels of coliform as a result of the existing drainage patterns. The project will eliminate concentrated stormwater flow over the existing septic systems.

Project Description

The proposed project includes the installation of a new stormwater conveyance system to control erosion and divert stormwater away from septic systems.

Need for Project

The existing riverwall has deteriorated due to age resulting in erosion from wave action along the shore which allows top soil debris and other non-point source pollution to enter the Delaware River.

Project Description

The proposed project includes repairreplacement of riverwall to halt the introduction of pollutants into the Delaware River.

Stormwater Management - Gray Infrastructure

Priority List Rank

799

County

Mercer

Existing Population

5,494

Service Area

The entire Borough of Hightstown is the service area affected by the proposed improvements.

Need for Project

The sixteen existing stormwater outfall headwalls have been in continuous use without any major repair or replacement. The headwalls are beyond repair and must be replaced in order to maintain compliance with all NJDEP and Soil Erosion and Sediment Control Standards.

Project Description

The Borough is planning to remove and replace the 16 existing stormwater outlet headwalls with concrete headwalls with the outfall structures designed to the present standards for outlet protection at the headwalls. The replacement will reduce flow velocities at the pipe outlets and the deterioration of the area around the headwalls thus reducing siltation in the waterways. Disturbance will only be within the vicinity of the existing outfall structures.

Project Name, Number

Wildwood City
S340664-05
Stormwater Management - Gray Infrastructure

Priority List Rank

800

County

Cape May

Existing Population

5,325

Service Area

The project is located in the City of Wildwood, Cape May County. It is bounded by Pacific Avenue on the west, the Wildwood Boardwalk on the east, Cresse Avenue on south and Montgomery Avenue on the north. The project will include installation of storm drains along portions of Pacific Avenue, Hildreth Avenue, Bennett Avenue, Leaming Avenue, Hand Avenue, Taylor Avenue, Andrews Avenue, Burk Avenue, Davis Avenue, Montgomery Avenue, Cresse Avenue, Atlantic Avenue and Ocean Avenue. These storm drains will convey surface runoff to a proposed storm water pump station located at the boardwalk street end of Leaming Avenue.

Need for Project

This project will not increase the quantity of storm water flow, this project is designed to remediate storm sewer water to make its conveyance more efficient. By installing storm drains along portions of the roadways within the project area and installing a storm water pump station, it will be possible to create roadways that will remain passable during storm and high tide events. The same amount of storm water discharge will occur, but it will now occur at a larger gallon per minute rate.

Project Description

The City of Wildwood will address stormwater issues along Pacific Avenue, from Creese Avenue to Davis Avenue. The project will include installation of storm drains to convey surface runoff to a proposed storm water pump station. The runoff will be pumped, via force main, into the Atlantic Ocean thus allowing elimination of five (5) existing malfunctioning ocean outfalls. The existing outfall sewers at the project location are approximately 440 linear feet from the mean high water level. Therefore, the City must dig out the existing outfalls each day to allow water to rise to the surface of the beach and flow over the beach to the ocean. This consumes many hours of labor and equipment costs (fuel). The proposed project, when complete, will include the removal of the five (5) existing outfalls, thus providing maintenance cost savings to the City.

Service Area

The Borough of Tuckerton's Waterways including, Thompson's Creek, Tuckerton Creek , Paradise Cove Lagoons (various) and Tuckerton Beach Lagoons (various).

Need for Project

The water quality-based need for the project will be satisfied by the removal of excess sediment which has built up in the waterways. The contaminate soils removal will improve water quality in the creeks, lagoons and Barnegat Bay by increasing tidal flow by eliminating stagnant water and also by exposing silted over stormwater outfall pipes. In addition to the dredging, tide valves will be installed with the stormwater conveyance system to remove tidal flow from street contaminants which will also improve water quality. The tide valves will also improve clean water by providing resiliency to the sanitary sewer system from tidal flooding. Excessively high sediment loads can smother submerged aquatic vegetation, cover shellfish beds and contribute to increased levels of nutrients. Dredge material will be used for beneficial use projects.

Project Description

The project proposal is for the dredging and removal of sediment from within the Borough Tuckerton's waterways which will improve stormwater system outfall pipe flow and reduce stagnant water from within the Tuckerton's waterways. In addition to the dredging, tide valves will be installed within the stormwater conveyance system to improve clean water flow to the bay by removing tidal flow from street contaminants. The tide valves will also improve clean water by providing resiliency to the sanitary sewer system from tidal flooding. Excessively high sediment loads can smother submerged aquatic vegetation, cover shellfish beds and contribute to increased levels of nutrients. Dredge material will be used for beneficial use projects.

Project Name, Number

West Wildwood Borough
S340626-05
Stormwater Management - Gray Infrastructure

Priority List Rank

802

County

Cape May

Existing Population

603

Service Area

The project is located on an island Borough in Cape May County. The Borough only has one bridge to allow residents and first responders access to the area. The Boroughs plan for the area is to raise all the roadway elevations and create a better flowing storm sewer system so that travelling becomes less hazardous during storm events.

Need for Project

This project will not increase quantity of storm sewer flow, this project is designed to make storm water conveyance more efficient. By regrading existing topography and adjusting slope on existing storm sewers it will be possible to create roadways that can remain passable during storm and hi tide events. The same amount of storm water discharge will occur, ultimately it will just occur at a larger gallon per minute.

Project Description

West Wildwood proposes to address the issue of standing water during abnormally hi tides and strong storm events with a multi-step program of raising the street elevations and improving storm water collection and conveyance via improved roadway pitch and an upgraded inlet configuration throughout the Borough. This project will be the first of many of this nature and will address the streets based on the priority principle. The streets for this project has had the greatest standing water in comparison to the rest of the Boroughs roadways. The project will consist of installing new inlets, storm sewer pipes, curb and their corresponding sidewalks to higher elevations and then will pave the street to match the proposed upgrades.

Need for Project

This is a de-silting project at a 180 degree bend of the Rahway River. This project will reduce the river bank soil erosion along the westerly banks that abut the residential homes. Approximately 250 cubic yards of silt along a 500 linear foot stretch of the river will be tested and removed. This program will also help in cleaning the Rahway River of sediment and potential toxins. The Rahway River is a potable water source for the downstream community of Rahway and a very active recreational river for Cranford other adjoining communities.

Project Description

This is a de-silting project at a 180 degree bend of the Rahway River located between the two Eastman Street bridges. The project is located along the Rahway River in McConnell Park which is located along Eastman street between Hampton and Holly Streets. This project will reduce the river bank soil erosion along the westerly banks that abut the residential homes. Approximately 250 cubic yards of silt along a 500 linear foot stretch of the river will be tested and removed. This program will help in cleaning the Rahway River of sediment and potential toxins.

Service Area

Borough of Matawan

Need for Project

The Borough of Matawan is located in a relatively low lying area surrounding Lake Lefferts and Matawan Lake. Periodically the Boroughs storm sewers collect debris and contaminants which eventually pass through the storm sewer system and into the lakes and surrounding waterways. The Borough is concerned with the non-point source pollution problem and believes this problem can be reduced through better maintenance which will be enhanced by the use of Jet Vac equipment and certain specific improvements to the existing stormwater facilities.

Project Description

The proposed project involves the purchase of a Jet-Vac Truck to clean debris from the storm sewers and minimize adverse impacts on Lake Lefferts.

Borough of Matawan

Need for Project

The Boroughs Lake Lefferts has accumulated sediment its banks are significantly eroded and its storage capacity has decreased. The spillway of the Dam is inoperable and inadequate in keeping solidsfloatables out of the lake.

Project Description

The proposed project includes several measures to reduce erosion and control solidsfloatables. Also included are measures to restore the Lake to its original storage capacity.

Project Name, Number

Dunellen Borough
S340916-03
Stormwater Management - Gray Infrastructure

Priority List Rank

807

County

Middlesex

Existing Population

7,227

Service Area

The service area for the Supplementary Railroad Culvert is the south side of the Borough of Dunellen. The Borough of Dunellen is located in Middlesex County and is bordered by the Borough of Middlesex to the southwest, Piscataway Township to the southeast, the City of Plainfield in Union County to the northeast and Green Brook Township in Somerset County to the northwest.

Need for Project

The Borough of Dunellen has a prolonged history of flood related issues on the southerly side of the Borough. The Bonygut Brook, which traverses the Borough from east to west, conveys flows through the Borough of Dunellen from Piscataway Township and ultimately discharges into the Green Brook in the Borough of Middlesex. The primary cause of flooding in the Borough has been the inadequate size of the culverts along the brook that convey flows under several roadways as well as the culverts that exist under the NJ Transit Railroad embankment on the westerly side of town. The County of Middlesex is presently advancing the design and construction of several culverts along the brook; however, the flooding will persist due to the inadequacy of the aforementioned existing railroad culverts which restrict the flows leaving the Borough. This project will supplement the existing railroad culverts in an effort to improve the flood conditions on the south side of the Borough.

Project Description

The Supplementary Railroad Culvert project is proposed as an initial flood improvement measure to address the severe and frequent flooding in the Borough of Dunellen. The project has previously been fully designed and all necessary permits have been obtained. The project generally consists of the construction of supplementary twin 72" diameter storm drainage culverts crossing the NJTRANSIT Raritan Valley Line including reinforced concrete headwalls, a reinforced concrete junction chamber with 72" flexible flanged end check valves, the installation of a precast 12 foot by 4 foot box culvert, storm drainage improvements, excavation, backfill, grading, pavement and turf restoration, riprap slope stabilization, landscape restoration and offsite riparian mitigation plantings.

County

Somerset

Existing Population

1,500,000

Service Area

The D&R Canal extends from the Delaware River at Bulls Island to the Raritan River in New Brunswick for a distance of approximately 60 miles. The 10.5 mile segment of the Canal to be dredged is located in the Delaware and Raritan Canal State Park and the project area extends from Lincoln Highway - Route 27 (Station 1862+00) to Amwell Road (Station 2406+50) in Franklin Township, Somerset County.

Need for Project

The purpose of this project is to improve water quality and maintain hydraulic capacity by removing accumulated sediment, aquatic vegetation growth and debris. With dredging the velocity in the canal will be reduced thereby reducing sediment resuspension and raw water turbidity. The reduced solids loading will allow for lower coagulant dosage at the water treatment plants. The in situ sediments also contain organics and their removal would help to control the total organic carbon concentration of the raw water. Removal of the submerged aquatic vegetation (SAV) will reduce disinfection byproduct precursors in the finished water of downstream users. Additionally, decaying SAV could result in anaerobic conditions with resulting taste and odors and possible dissolved metals (iron and manganese) released into the water column.

Project Description

Remove by dredging approximately 240,000 cubic yards of sediment from a 10 mile segment of the D&R Canal between Route 27 and Amwell Road in Franklin Township, Somerset County.

Need for Project

Sediment build up in many of the lakes and ponds in the County has lead to poor water quality algae growth mosquito breeding odors and low oxygen levels. Many beach closings are attributable to stormwater runoff from coastal lakes. Deepening the lakes will improve habitat and increase assimilative capacity for nutrients and other pollutants.

Project Description

The proposed project includes establishment of a silt removal program including purchase of dredging equipment and implementation of other measures to restore lakes and ponds to their original storage capacity.

Need for Project

These projects will reduce sedimentation and nutrients from entering Newton Lake from severely eroding streambanks as well as ecological benefits to these aquatic resources and stream corridors and will also reduce future dredging needs within Newton Lake.

Project Description

Stormwater management and ecological restoration of 1) an unnamed tributary through Sadler's Woods Conservation area and 2) a stream and ecological restoration along Peters Creek, both projects to limit the sediment deposition in Newton Lake. The project will occur in two (2) separate locations and under two (2) separate construction contracts. The ecological restoration of the unnamed tributary to Newton Creek within Saddler's Wood Conservation area will restore three unnamed tributaries totaling approximately 3,300 linear feet of stream corridor restoration, stabilize four stormwater outfalls, and repair two culvert crossings underneath a community pedestrian trail. The stream and ecological restoration along Peters Creek will restore approximately 2,100 linear feet of Peters Creek and stabilize three stormwater outfalls. The first construction project will occur at Sadler's Woods Conservation area and the second construction project will occur at Peter's Creek near the Oaklyn Coug

Heros Island in PennsuakenCherry Hill

Need for Project

Veterans Island in the Cooper River is suffering serious erosion with its banks being washed away at a rapid rate causing silt build-up elsewhere in the river and effecting the overall quality of the river. The Island also acts as a natural barrier to erosion along a sensitive area of Cooper River Park. The Islands banks need to be restored and stabilized to stem erosion and reduce solids transportation.

Project Description

The proposed project includes a bank restoration and stabilization through the use of crib walls and vegetative plantings to provide for safe embankments and prevent further soil erosion.

Need for Project

Existing water quality of Haddon Lake has been degraded by undetained stormwater runoff from urbanized upstream drainage and runoff of nonpoint organic pollutants from the shoreline. Bank stabilization will create an in-line sedimentation basin for filtration of stormwater runoff and banks planted with wetland vegetation will filter nonpoint pollutant sources around the lake perimeter.

Project Description

The proposed project includes dredging of sediment from the lakebed coupled with rip rap stabilization of existing stormpipe outfalls and stabilization of eroded banks using a combination of bioengineering and structural improvements.

Trotters Lane Branch Drainage Area

Need for Project

The project is needed to relieve flooding in Morris Avenue and in the Kean College Dormitory area and to screen out debris from the stormwater prior to discharge in the Trotters Lane Branch of the Elizabeth River. The existing brick storm drain from the west side of Morris Avenue to the Elizabeth River is too small and needs to be replaced.

Project Description

The proposed project involves the replacement of the storm drain with an adequately sized concrete box culvert. The upstream end of the culvert will be equipped with a screen to collect debris.

Need for Project

The project is being undertaken to 1. Improve storm water conveyance and stream morphology 2. Generally reduce local bank erosion around obstructions 3. Lessen the risk of damage to bridges 4. Improve recreation amenity 5. Reduce flooding impacts locally specifically for lower flow events.

Project Description

The Rancocas Creek Obstruction Removal/Desnagging project includes the removal of obstruction fields and sediment dams along 8 Rancocas Creek miles extending from Landing Street in Southampton Township to Main Street in Lumberton Township and from the Flying W Airport to Bridge Road in Lumberton Township. Overall it includes the removal of 126 obstruction fields and sediment dams. The project is being undertaken to 1. Improve water conveyance and stream morphology 2. Generally reduce local bank erosion around obstructions 3. Lessen the risk of damage to bridges 4. Improve recreation amenity 5. Reduce flooding impacts locally specifically for lower flow events.

Priority List Rank

814

County

Monmouth

Existing Population

300,000

Service Area

The New Jersey Water Supply Authority (NJWSA) owns and operates the Manasquan Reservoir as part of the Manasquan Water Supply System, which provides a raw water supply for more than 300,000 people. Located in Howell Township, Monmouth County, the reservoir was created by constructing an earthen dam and dike across Timber Swamp Brook, a tributary of the Manasquan River. The reservoir is a raw water source for the Manasquan Water Treatment Plant (operated by NJWSA) and the Oak Glen Water Treatment Plant (owned and operated by New Jersey American Water). The Manasquan Water Treatment Plant currently provides about 60% of the potable water consumed by the communities of Brielle, Sea Girt, Spring Lake, Spring Lake Heights, and Wall Township. In addition to its water supply function, the reservoir is a valuable recreational resource, offering fishing, boating, kayaking, and other outdoor activities to over 1,000,000 visitors each year.

Need for Project

Increasingly intense HABs have become a recurring issue at Manasquan Reservoir; exacerbated by climate change, as warmer temperatures induce stronger thermal stratification and flashier storms introduce more nutrients into the system. HAB surface scums impede recreational activity, and the presence of cyanotoxins is deleterious to water quality, public health, and ecological health. The water quality impacts of HABs complicate reservoir operations and increase the costs of water treatment. An aeration system is sought as a proactive means to mitigate/reduce HAB impacts. By ensuring sufficient dissolved oxygen throughout the water column, the system will keep phosphorus bound in the reservoir sediments and unavailable for algal growth. In addition, this would reduce the release of iron and manganese from sediments and improve deep water quality. This management strategy will also reduce/eliminate the need for chemical algaecides (e.g. copper sulfate) which can have ecological impacts.

Project Description

Design and construction of an aeration system at the Manasquan Reservoir to reduce/mitigate Harmful Algal Blooms (HABs) and associated water quality impacts. The system will consist of both in-reservoir equipment and land-based appurtenances, which together will function to add air and/or oxygen to the reservoir's hypolimnion. This proven approach prevents the deep water from becoming anoxic during the thermal stratification season (spring to fall), thereby preventing the release of nutrients from the bottom sediments. Previous studies at the reservoir have shown that internal nutrient loading, fostered by anoxia at the sediment-water interface, is the primary source of phosphorus for algal growth. Thus, this project will mitigate HAB occurrence by eliminating the conditions that Cyanobacteria need to thrive.

Need for Project

A former chemical site requires remedial measures to support brownfield development and provide significant environmental benefits. Placement of an impermeable cap along with installation of stormwater controls will ensure that rain water will not mobilize contaminants and pollute groundwater or the adjacent waterways.

Project Description

The proposed project includes demolition of existing buildings installation of an impermeable cap and cover system installation of stormwater controls. The project also includes installation of sanitary sewerage collection infrastructure to collect sewage generated from the proposed redevelopment.

Township of Toms River

Need for Project

The proposed improvements will remove accumulated sediment and vegetation overgrowth and minimize ponding onto existing residential roadways reducing potential health and safety concerns via eroded roadways and standing water (mosquito breeding). The purchase of the equipment will reduce the amount of solids and floatables entering the Townships waterways.

Project Description

Drainage improvements to 5 existing areas throughout the Township to address accumulated sediment vegetation overgrowth and substandard drainage infrastructure. Locations include the Blue Sea cul-de-sac Parkside and Coolidge Avenues intersection Heritage Way Yvonne Drive and Shasta Drive intersection and the Parkside Ave and Gilford Place. The project will include drainage pipe replacement installation of additional catch basins and cleaning of existing pipes and structures in order to address pavement deterioration road hazards and health concerns associated with standing waters. The Township proposes to purchase equipment (i.e. street sweepers brush hogs jet vac truck and new ECO inlet heads) to assist in the removal of floatables and solids from the Township streets and infrastructure.

Project Name, Number

Gloucester Township
S340364-19
Stormwater Management - Gray Infrastructure

Priority List Rank

820

County

Camden

Existing Population

66,760

Service Area

Project serves township residential areas through out the township. Gloucester Township is located in western portion of Camden County and is bounded by the Borough of Runnemede on the north, the Borough of Lindenwold, Stratford and Pine Hill on the east, Winslow Township on the south, and Deptford Township on the west. The Township consists of 23.3 square miles. Based on 2020 US Census the Township has a population of 66,034 persons and 23,248 households. The stormwater project in this round of funding is located in a specific area of the township but also help upstream and downstream areas.

Need for Project

No significant adverse impacts on water quality or hydrology are expected as a result of the proposed projects. It is anticipated that water quality and hydrology will be improved since the projects proposed to repair/reconstruct aging infrastructure. A better collection system within an existing drainage easement will result in a reduction of sediment transport.

Project Description

Gloucester Township proposes to complete improvements to an existing stormwater collection system that services and impacts many users throughout the municipality. The proposed improvements include repairs and augmentation of the existing surface water collection system and underground infrastructure piping. Grading modifications will be made to the roadway to allow for positive drainage in areas that have minimal slope and settlement causing stormwater to collect and pond on the roadway surface. The purpose of this project is address aging infrastructure.

Service Area

Township of Middletown

Need for Project

Shadow Lake provides both natural and recreational resource to Township residents and is designated for trout production or maintenance by the NJ Water Quality Standards (N.J.A.C. 7:9B). A study by the NJ Division of Fish, Game, and Wildlife in 1994 documented 15 different fish species within the lake. In 1996 trout were reintroduced to the lake and are now regularly stocked. As a result of residential and commercial development over the past twenty years the lake has been subjected to excessive sedimentation. This sedimentation has deteriorated the lake's water quality, reduced fish populations, choked the lake banks with aquatic plants, and limited navigable areas to even small boats. Additionally, since Shadow Lake discharges into the upper reaches of the Navesink River dredging of the lake will inherently improve water quality in the Navesink River. Dredging will also reduce the frequency, or possibly eliminate the Township's need to continue using chemical herbicides to

Project Description

(Carryover SFY2015) - The proposed project includes dredging to remove approximately 150000 cubic yards of sediment from the upper portion of Shadow Lake. This will restore the lake to its original depth eliminate the swamp like conditions and lower the phosphorous concentration.

Middletown Township

Need for Project

The proposed project will address health and safety concerns associated with the frequent backup of the drainage systems as well as potential hazards associated with standing waters. The addition of new inlets will also minimize erosion via the conveyance of stormwater away from the landward limits of the beach.

Project Description

The Township proposes improvements to its existing stormwater system located within the rights-of-way along North Leonard Avenue Burlington Avenue and Roop Avenue and between residential properties located on Burlington Avenue and within an earthen berm located along the landward limit of the beach adjacent to Sandy Hook Bay. Presently stormwater drains to an existing outfall pipe that is situated perpendicular to the shoreline of Sandy Hook Bay. A section of the existing 36-inch RCP pipe was destroyed during storm events in early 1990. A temporary repair to the outfall was made in 1991 by replacing the damaged section with a 24-inch diameter plastic pipe. The proposed project will permanently repair and improve the overall function of the entire system. The existing pipe will be replaced with a 48-inch RCCP outfall and timber pile bent. The outfall pipe will extend below the Mean High Water line of Sandy Hook Bay. The pipes within the rights-of-way and properties noted above will also be replaced and new manholes and inlets will be installed.

Service Area

The immediate service area is a small community is the southwest corner of the township. However, the consequences of flooding events have a financial impact on the entire township

Need for Project

This is a flood control project. Control of flooding will reduce the amount of sediment entering the stream.

Project Description

(Carryover SFY2015) - The purpose is to provide stormwater management along a stream that frequently floods Redwood Street. This flooding not only isolates a small community in the southwest portion of the township it also causes erosion which results in downstream water quality deterioration. The project involves a significant increase in the size of the culvert crossing, revisions to the profile of the roadway in order to raise the street above the new culvert, and improvements to the channel. All permitting has been received.

Project Name, Number

Gloucester Township
S340364-15
Stormwater Management - Gray Infrastructure

Priority List Rank

823

County

Camden

Existing Population

64,634

Service Area

Project serves township residential areas through out the township. Gloucester Township is located in western portion of Camden County and is bounded by the Borough of Runnemede on the north, the Borough of Lindenwold, Stratford and Pine Hill on the east, Winslow Township on the south, and Deptford Township on the west. The Township consists of 23.3 square miles. Based on 2010 US Census the Township has a population of 64,634 persons and 23,566 households. The stormwater projects are within different areas of the township but also help upstream and downstream areas.

Need for Project

No significant adverse impacts on water quality or hydrology are expected as a result of the proposed projects. It is anticipated that water quality and hydrology will be improved since the projects propose to repair/reconstruct failing stormwater outfall structures and stabilize eroded areas. The reconstruction of the failing stormwater outfalls is anticipated to reduce the current erosion concerns, thereby improving surface water quality.

Project Description

Gloucester Township proposes to rehabilitate portions of the existing stormwater collection system that services many users throughout the municipality. The proposed improvements include repairs to existing stormwater outfalls leading to streams, stormwater infrastructure piping, and bank stabilization. The purpose of these projects is to replace/repair aging infrastructure, and maintain the stability of the soil near these stormwater outfalls.

Citywide stormwater infrastructure improvements

Need for Project

Currently the City of Vineland wishes to replace non-compliant stormwater inlets in support of non-point source pollution control and preventing solid debris from entering the system. Replacing failing piping will reduce the introduction of soils into the network and reduce adverse impact to groundwater.

Project Description

Reconstruction and rehabilitation of existing stormwater infrastructure including, but not limited to, non-compliant inlets, failing pipe as well as citywide stormwater asset management planning. This loan application will be part of three (3) construction projects focusing on areas that align with Citywide improvement plan.

Union

Existing Population

49,808

Service Area

City of Plainfield. Other customer communities of the facility include Linden, Fanwood, Scotch Plains, South Plainfield, North Plainfield and Green Brook.

Need for Project

The proposed improvements will improve the site conditions and will provide better storm water management. These activities will improve the runoff quality and will mitigate the impact on surface water.

Project Description

The project generally consists of the construction of Material Recovery Facility (MRF) at the existing Rock Avenue Transfer Station, owned and operated by the PMUA. The Material Recovery Facility will processes construction and demolition solid waste and segregates recyclable commodity materials from the waste stream. The commodity materials will be transferred to be recycled. The operation of the MRF will reduces the amount to waste disposed at landfills or processed at waste incinerators. The construction of the facility will redevelop an existing waste/soil pile to be part of the footprint of the MRF. The proposed improvements will improve the site conditions and will provide better storm water management. These activities will improve the runoff quality and will mitigate the impact on surface water. The project includes the construction of a building to house the solid waste processing equipment and operation, procurement and installation of the sorting equipment, truck scales

Service Area

The area this project will affect is the Holiday City development, along Sunken Branch, downstream to the northern branch of Toms River, and minor benefits to Barnegat Bay.

Need for Project

The inverts of the culvert are failing and the supporting soils beneath are eroding. The replacement of these culverts will improve water quality by reducing stormwater turbidity, reduce sedimentation downstream and reduce suspended solids.

Project Description

The removal and replacement of two stormwater culverts, to reduce erosion of underlying soils and sedimentation further downstream.

Need for Project

Stormwater runoff is the most common way that nonpoint source pollution reaches local rivers creeks and lakes. Rainwater carries chemicals nutrients sediments and other forms of nonpoint source pollution into local streams if the water is not absorbed by soil and vegetation. The Townships goal with its stormwater management plan is to increase absorption of rainwater by soil and vegetation using mechanisms that reduce the velocity of flow and retain the water in natural areas.

Project Description

The proposed project includes repairs to three culverts and purchase of two pure vacuum street sweepers with broom assist.

Need for Project

Three lakes within the Township suffer from excessive sediment deposits. Water quality will improve from removing sediment. The lakes do not settle out as they used to based on the limited volume to allow this to happen prior to discharge. There is limited if any water quality from the outfall from these lakes due to the nature of its capacity and material.

Project Description

This project consists of the dredging of all three (3) lakes within the Township. Lake Alberta which is located along Neptune Boulevard east of Highway 33 at the border with Neptune City Fletcher Lake which is located at the south end of Ocean Grove along the border of Bradley Beach and Wesley Lake which is located at the north end of Ocean Grove on the border of Asbury Park.

Need for Project

The existing bulkhead is severely compromised. In certain areas it is to the point that it is no longer stabilizing in some areas. Due to the current state of the bulkhead sand and soil are entering the Shark River through the bulkhead. The storm drain pipes behind the bulkhead are compromised and broken in some areas. These pipes need to be replaced and retrofitted with stormwater devices. By limiting the siltation and the runoff the nonpoint source pollution of the Shark River will be greatly decreased.

Project Description

The Shark River Marina is located adjacent to South Riverside Drive in the Shark River Hills Section of Neptune. The proposed project includes replacement of the bulkhead dredging of the channel rehabilitation of storm drainage and installation of tide flex valves and cofferdam around the existing underground storage tank.

Need for Project

The existing salt storage on the Public Works site is only encapsulated on three (3) sides. As part of our Stormwater Management Permit from the State a contained Salt Storage facility is required. The proposed facility will reduce runoff and siltation to the on-site stormwater system and also reduce siltation and non point source runoff to Wesley Lake. Wesley Lake is in need of maintenance dredging and construction of the salt dome will help to alleviate the ongoing need of dredging the lake by minimizing the siltation in the runoff to the lake.

Project Description

The project consists of the construction of a prefabricated salt dome at our Public Works Garage located on Heck Avenue. The proposed structure is to be sixty-one(61) feet in diameter on a ten (10) foot tall concrete base wall.

Service Area

Ewing Township

Need for Project

The Township needs to reduce flooding and reduce solids transportation. The project would reduce the sediment load to prevent creation of sediment islands and minimize the scour effect on stream banks.

Project Description

The proposed project will address the degradation of the water quality in a tributary to the Gold Run by stabilizing its banks and restoring the bed to its original configuration. The stream has many areas of severe erosion that are causing significant property damage. The stabilization is approximately 1300 feet in length and will restore the conveyance area to reduce erosive velocities.

The Bayshore Estates area on either side of Roseann Avenue is included in the service area. It is estimated that the existing contributory watershed to Roseann Avenue is over 145 acres in size.

Need for Project

NA

Project Description

The Roseann Avenue stormwater trunk line is 50 to 60 percent filled with debris, which undermines its ability to drain. Phase 1 and 2 of this project consists of replacement of the stormwater system from Clearwater in an east direction. Phase 3, the topic of this application, will complete this project with the replacement of 1,000 ft. of stormwater pipe and roadway reconstruction to Bayshore Road.

Service Area

The service area for the Borough of Carteret is the entire municipality

Need for Project

The proposed improvements are needed to reduce non-point source pollution resulting in an overtaxed infrastructure system adjacent to Noes Creek and the Arthur Kill areas, as well as, providing resiliency against future storm events in an area that was impacted by Superstorm Sandy.

Project Description

(Carryover SFY2015) - The project consists of construction of a new stormwater pump station and detention basin in the Noe Street drainage area. The project includes replacement of stormwater collection piping and inlets a force main an outfall and tide gates.

Need for Project

Currently the open ditch stormwater conveyances are overgrown with vegetation and silt buildup and have not been adequately maintained. The removal of vegetation and silt build up will result in higher quantity storms being conveyed downstream to ultimate discharge point reduce stagnant water conditions prevent upstream flooding and provide overall better aesthetics in residential and commercial area.

Project Description

The project includes storm sewer rehabilitation in commercial/industrial area of Milik Street including new regional basin rehabilitation of open ditch stormwater conveyance and tv inspection and repair of existing storm sewer piping.

Need for Project

The Birchwood Lakes and Blue Lake are essential to Medfords storm drainage system and flood control. Sediment needs to be removed to restore proper storm drainage. The bulkhead reduces the amount of sediment that builds up in the lakes and without it sediment and debris is flowing into the lakes and downstream.

Project Description

The proposed project includes removal of sediment and debris from the lakes and replacement/repair of bulkheads to reduce erosion and control solids/floatables.

Need for Project

Various flood control improvements within the White Beeches Berkeley Place and Roosevelt Avenue sections of the Borough that discharge into the Oradell Reservoir and Hirschfeld Brook drainage basins. Proposed improvements include replacement of undersized piping and inlets cleaning of existing piping and structures cleaning and re-profiling of existing ponds and culverts at an existing Golf Course and installation of additional piping and inlets.

Project Description

The existing drainage systems are severely undersized and silted causing frequent flooding resulting in an eroding drainage system and stormwater pollution that discharges into the Oradell Reservoir and Hirschfeld Brook.

Project Name, Number

The Municipality of Princeton
S340656-10
Stormwater Management - Gray Infrastructure

Priority List Rank

845

County

Mercer

Existing Population

16,265

Service Area

This project will serve the population of Princeton. It will also serve the population of Montgomery Township, which is not taken into account in the above provided borrower population served by the project.

Need for Project

This project is a stormwater project, which will potentially improve the water quality of the adjacent stream, Cherry Run.

Project Description

Princeton and Montgomery Twp are jointly proposing stormwater improvements on a 2,400' section of Cherry Valley Road from west of Cherry Hill Road to the Mercer County Bridge. The existing roadway drainage system consists of undersized roadside ditches, which pose hazards to the motorists and significant barriers to pedestrians. Two existing outfalls carry stormwater under Cherry Valley Road to Cherry Run stream located on the south side of the road. The outfalls lack proper outlet protection to reduce the exit velocity. A new drainage system will replace the roadside ditches and safely convey stormwater to Cherry Run utilizing existing outfall locations. New outlet protections are proposed for the outfalls. A new manufactured treatment device is proposed for water quality purposes. In addition, roadway improvements will include widening the pavement from 20' to 34'; new curbing on both sides; new retaining walls; and new 6' wide porous asphalt walking path on south side of the road.

Need for Project

The Borough plans to inspect and map the storm sewer system to identify sensitive areas affected by the discharge of storm sewer flows and to locate any existing cross connections. This will enable the Borough to respond better to potential future hazardous material spills. In addition storm sewer system cleaning and rehabilitation will improve water quality and reduce localized flooding.

Project Description

This project proposes to clean TV inspect and map the existing storm sewer system. Deteriorated catch basins and manholes will be rehabilitated broken pipes replaced or repaired and any cross connections eliminated.

Existing Population

13,183

Service Area

The project area consists entirely of residential neighborhoods, connected with both municipal and County roadways.

Need for Project

Constructing the proposed stormwater improvements would provide a drainage network that can accommodate a 25-year design storm. This would ensure that all stormwater within the subject 140-acres study area would be safely conveyed within the streams and pipes, as opposed to running overland, eroding acres of properties along the way. This would therefore reduce the soil deposition and thereby enhance the water quality of the Forest Avenue Brook and Passaic River.

Project Description

The West Side Drainage Project was conceived to address flooding conditions that are experienced in several residential neighborhoods. Approximately 140 acres of the Township drain to one reach of the Forest Avenue Brook through a combination of piped and open channel conveyances. The drainage systems have a variety of deficiencies and problems which result in significant overland flooding, which adversely affects private properties and public rights-of-way. Additionally, all of the uncontrolled overland flow promotes significant soil erosion and sediment transport into the various creeks and streams, eventually into the Forest Avenue Brook, and ultimately into the Passaic River. Continued erosion and sediment deposition lead to increased turbidity within the downstream receiving watercourses.

Need for Project

The need for the new vac truck is to clean all storm inlets pipes easements etc. This is required so the drainage facilities are in proper working condition. It is also required by the new stormwater regulations. The need for the new street sweeper is to sweep all municipal streets of winter road grits and materials leaves and other miscellaneous debris. This will help prevent sediment build up in our lakes and streams.

Project Description

The proposed project includes the purchase a new vac truck to assist in cleaning storm inlets piping easements etc. Also included is purchase a new street sweeper to sweep winter products leaves debris etc from all municipal streets.

Need for Project

During rainstorms with moderate precipitation the system is overloaded with the amount of water that it receives and flooding occurs causing contaminants to collect and deposit.

Project Description

The proposed project for stormwater improvements along Bethel Road includes replacement of undersized stormwater main installation of an outfall and installation of a stormwater pump station.

This project includes installation of thirty-six check valves on various locations along the back-bay section of the City. This project is designed to make the stormwater system more resilient, do reduce tidal flooding and to protect public infrastructure and private investments in the area. Without properly functioning check valves tidal water can back up into the City, complicating the impacts of a high tide, storm event.

Need for Project

This system is designed to protect public infrastructure and private investments from impacts caused by stormwater flooding and mitigate against future damage to streets, homes, sewer systems, water systems, and other utilities. This project sites consist of well-established neighborhoods that has witnessed frequent flooding and significant impacts from Superstorm Sandy.

Project Description

(Carryover SFY2015) - This project includes installation of flood walls in various locations along the back-bay section of the City. This project is designed to make the stormwater system more resilient and to protect public infrastructure and private investments in the area. The flood walls are currently in poor condition complicating the impacts of a high tide storm event. New flood walls are planned for Winchester Avenue (Lily Park) between Little Rock Avenue & Victoria Avenue - 235 LF. \$364240 Winchester Avenue between Marion Avenue & Austin Avenue - 145 LF. \$224750 Ventnor Gardens Plaza at Wissahickon Avenue - 165 LF. \$255750 Sacramento Avenue street end off Monmouth Avenue - 50 LF. \$77500 Derby Avenue street end at Winchester Avenue - 50 LF. \$77500

Service Area

1. New Lighthouse Circle Stormwater Pump Station - 34th Street and Bayshore Avenue. This pump will serve a drainage area that includes portions of Brigantine Boulevard, the only access route off of the island. 2. New Hackney Place Stormwater Pump Station - to be located off of West Shore Drive in the Golf Course Section of the City. 3. New Pump Station at Jenkins Parkway, 12th Street North.

Need for Project

This system is designed to protect public infrastructure and private investments from impacts caused by stormwater flooding and mitigate against future damage to streets, homes, sewer systems, water systems, and other utilities. This project sites are well-established neighborhood that has witnessed frequent flooding and significant impacts from Superstorm Sandy

Project Description

(Carryover SFY2015) - Three additional stormwater management projects are proposed in this application. Each of the pump stations described below will include an Emergency Generator to insure operation during electric power outages 1. New Lighthouse Circle Stormwater Pump Station - 34th Street and Bayshore Avenue. This pump will serve a drainage area that includes portions of Brigantine Boulevard the only access route off of the island. 2. New Hackney Place Stormwater Pump Station - to be located off of West Shore Drive in the Golf Course Section of the City. 3. New Pump Station at Jenkins Parkway 12th Street North. This project is designed to improve and protect groundwater as well as providing for a functional stormwater systems. The project includes a pump station and emergency generator to service the stormwater needs of this area along with water proofing the boat ramp which is at elevation 7 ft. Flood gates will provide this protection. Also planned is the elevation of the boat ramp apron and Bayshore Avenue to reduce flooding. Currently the outlet structure that serves the Ocean Drive and Lagoon Boulevard section of the Inlet area of the City is totally clogged and non-functional. The current 60 outfall pipe is buried and the system no longer functions as designed. It is estimated that the current system operates at or near 25 capacity resulting in localized flooding. This project calls for a new outlet system to be designed that will reroute stormwater within the Seaport Area Drainage Basin to a new outfall. This project includes 1. 12th Street North Stormwater Project - Located on the far northern section of the City. The plan includes raise 12th Street North. The elevation of 12th Street North is specifically included in the County AHMP. 2. Evans Boulevard Stormwater Project - E Evans Boulevard intersects 12th Street North at a 90 degree angle. The improvements on this street include installing 1800 LF of piping along E Evans Boulevard to 12 Street North. The planned pipe system is specifically included in the County AHMP.

Service Area

This system is designed to improve flood and stormwater control throughout the northern section of Brigantine.

Need for Project

By having a properly functioning stormwater system, the silt traps within the catch basins will capture materials that should not be discharged from the system resulting in water quality improvements.

Project Description

(Carryover SFY2015) - This project will provide for the removal of accumulated sand from municipal drainage basins in the Golf Course Section of the City of Brigantine. The Golf Course Section of the City was significantly flooded by Superstorm Sandy and silts and sand washed into the underground drainage system. This project is designed to improve and protect groundwater as well as providing for a functional stormwater systems.

Service Area

Township of River Vale

Need for Project

The Township of River Vale is situated within an area which is critical to public drinking water supply. The Township borders on two reservoirs - Lake Tappan and Oradell Reservoir and has several class one rivers and tributaries within its boundaries (Hackensack River Pascack Brook). The Townships storm sewer system discharges directly into these critical waterbodies. The installation of these compliant castings will greatly reduce the volume of trash and floatables entering the public drinking water systems.

Project Description

The proposed project includes the replacement of the existing salt storage facility with a new upgraded facility sized to store 300 to 350 ton capacity. The project also includes minor site restoration as needed around the new facility and replacement of storm water inlet head pieces non-compliant Phase II Stormwater regulation.

Service Area

Millstone Township

Need for Project

To comply with the good housekeeping section of the Millstone Township Stormwater Pollution Prevention Plan and to eliminate nonpoint source pollution Millstone proposes to build a truck washing facility designed to allow 100 recycling of water runoff. This process will eliminate truck detergents that contain phosphates from discharging into the local watershed.

Project Description

The proposed project includes construction of a truck washing facility for the Department of Public Works.

Township of Byram

Need for Project

Several of Byram Townships settled lakes are regularly subjected to herbicide treatments to control nuisance weeds. Extensive herbicide use is likely to be affecting wells in the Cranberry neighborhood especially along the shoreline.

Project Description

The proposed project is for the purchase of a weed harvester to mechanically harvest nuisance weeds in the shallower areas of the lakes thereby reducing the need for the use of herbicides.

Township of Byram

Need for Project

The Township of Byram is pursuing the construction of this wash facility to allow for the washing of municipal trucks police vehicles and equipment in a manner that will eliminate runoff into environmentally sensitive areas (wetlands and a Category 1 stream) located in close proximity to the municipal complex. This facility will also provide measures that will ensure that highly corrosive salt materials do not enter into the existing sanitary sewer system during winter months when de-icing activities occur. When completed this facility will provide the Township with a project which truly promotes water quality and meets the requirements of the Townships Tier A Municipal Stormwater General Permit.

Project Description

The project will consist of the construction of a vehicle washing facility at the Byram Township municipal complex. The facility will include the construction of an enclosed wash structure a concrete floor with floor drains an underground oilgritwater separator and piping to connect into existing water and sewer systems. Valve controls will also be an integral part of the project to eliminate flows into the existing sewer system during the winter months when highly corrosive salt material is present.

Service Area

Both pieces of equipment will be used throughout the entirety of the City of Northfield and will benefit all residents and businesses equally.

Need for Project

Currently the Municipality does not have the manpower to efficiently maintain the storm water and sanitary sewer systems with the available equipment, nor in a timely manner. This purchase will help the Municipality in maintaining the storm water and sanitary sewer systems more efficiently and preventing inflow and infiltration, and will ensure compliance with the the NJDEP's MSRP rules and regulations.

Project Description

The City of Northfield has more than 40 miles of municipal roadways. Under current conditions, the Public Works Department staff utilizes two pieces of equipment (water jetter and vacuum) plus two trucks and 4 employees to clean the storm water system, which requires approximately 32 man hours to clean approximately 500' of storm pipe. With the proposed purchase of a complete system it will take one piece of equipment and 8 man hours to perform the same task.

Need for Project

The Borough of Bogota is bordered by the Hackensack River a Class One waterway on its entire western boundary. The Boroughs topography is such that its entire storm water collection system discharges directly into the Hackensack River. This project will greatly reduce the amount of debris and floatables which currently enter the system through the non-compliant inlets.

Project Description

The project includes the purchase of a combined sewer vacuum and jet truck.

Need for Project

The existing drainage system is silted and undersized causing frequent flooding resulting in stormwater pollution. The Hackensack River is adjacent to the area of concern and receives all drainage and sediment pollution caused by the ineffective drainage system.

Project Description

Construction of a stormwater pump station on a property located off of River Road to alleviate flooding and soil erosion problems. Other improvements also include installation of a force main discharging into the Hackensack River cleaning and stabilization of an existing ditch cleaning of drainage piping and inlets repair of the River Road culvert and installation of additional piping and inlets.

Need for Project

The existing spillways control the water levels in Upper Lake and Cedick Run Lake located upstream of Lake Fred. These lakes provide habitat for threatened and endangered species. The loss of spillways will degrade the delicate ecosystem and possibly the necessary habitat for many species of plants animals and aquatic life.

Project Description

The proposed project includes reconstruction of three concrete spillways two timber overflow structures and one corrugated metal culvert.

Service Area

Wood-Ridge Borough

Need for Project

Water quality is improved by the project by efficiently directing storm water (gutter flow) to the existing storm drainage system. Under existing conditions the isolated catch basins are subject to fetid conditions that promote mosquito breeding. The Borough routinely vacuums the isolated catch basins. On-Street water pooling will be addressed by installing catch basins at points that have chronic standing water.

Project Description

The Borough of Wood-Ridge seeks to install and/or attach catch basins to the existing storm drainage system at various locations. The six (6) locations have been identified by the Borough as poorly drained.

Service Area

Borough of Keyport

Need for Project

The Borough needs to remediate certain areas which experience flooding and properly maintain its stormwater sewers. The existing facilities adversely impact water quality in the Raritan Bay.

Project Description

The proposed project involves the construction of approximately 200 feet of reinforced concrete pipe (RCP) and two doghouse drainage structures to create a bypass system to divert stormwater runoff to a separate outfall on Broad Street. Also included in the project is the construction of approximately 800 feet of RCP to replace an existing storm system on Second Street Waverly Street and Third Street and the purchase of a Scavenge-Vac to properly maintain the system.

Township of Westampton

Need for Project

Runoff from streets carries debris and contaminants which eventually pass through the storm sewer system and into the surrounding waterways. The Township is concerned with the non-point source pollution problem and believes this problem can be reduced through increased streetsweeping.

Project Description

The proposed project involves the purchase of a street sweeper to clean debris and contaminants from roadways to minimize adverse impacts on local waterways.

Service Area

City of Linwood

Need for Project

Over time sediment and suspended solids discharge into water bodies lead to the water body becoming shallow. When this occurs it has negative affects on the health of the water body by leaving it susceptible to algae growth which effects other species of the plant and animal life in the water body. The proposed project is essential to the long term future health of three ponds which in turn has a positive net impact on the health and well being of the general public specifically to those residents and business in the immediate vicinity of the ponds one of which is located partially on a school site.

Project Description

This water quality project includes the construction and installation of storm water sediment removal devices upstream of six outfall structures at the three different ponds in the City of Linwood. The filters will remove sediment and suspended solids from stormwater runoff prior to it entering the water bodies. The project is designed and will be built in accordance with current New Jersey Storm water Regulations. The intent of the project is to eliminate sediment and suspended solids from entering the ponds from the City streets. The project will also include the retrofitting and or reconstruction of all storm water catch basinsinlets (which ultimately discharge to the ponds) to meet current NJ stormwater regulations.

Service Area

The storm sewer systems within the Borough of Paulsboro collect storm water for areas within the Borough and in general discharge storm water flows to Mantua Creek, the Delaware River, or tributaries to Clonmell Creek. The storm sewer systems along Thomson Avenue discharge to both Mantua Creek and an unnamed tributary of Clonmell Creek.

Need for Project

This project is being undertaken to mitigate regular flooding that occurs during nearly all moderate to intense precipitation events, regardless of duration. In some locations, due to the saw-toothed nature of the mains, the water has to back up several feet in a manhole before it can even start to flow downstream toward Mantua Creek. The roadway flooding causes unsafe driving conditions, extensive icing of the roads in the winter, premature wear of the roadways, and in severe storms can backup enough to flood into basements and crawl spaces of adjacent residences through basement window wells. In addition the saw-toothed profile of the storm sewer main causes material to collect in the manholes and pipes, which in turn reduces the capacity of the storm sewer even more and increases the cost and effort to keep the system free of blockages. BMPs will also be evaluated to determine what else can be done to lessen the flow that the new mains must convey.

Project Description

This project will replace a malfunctioning storm sewer system along Thomson Ave. and Wood St. in Paulsboro. The system regularly backs up and causes flooding of entire intersections during nearly all precipitation events that have any periods of moderate to intense rainfall. The ex. 18-in storm sewer mains are undersized and incorrectly built in a saw-tooth fashion.

The outfall structure will be constructed to provide relief from flooding conditions in Lake Como. Excessive nutrients from a major storm event will be removed from the lake.

Project Description

This project consists of the construction of a forcemain outfall connection from Lake Como to the Atlantic Ocean to provide relief from potential for flooding into the neighboring residential properties. The outfall structure will be located at the east end of Lake Como and cross under Ocean Avenue to terminate in the ocean. This forcemain will be connected to a portable hydraulic pump during major storm events. Currently the Lake and surrounding properties flood during a major rain event coupled with a high tide situation.

Need for Project

Inadequate facilities to convey and manage stormwater have caused problems such as ponding in certain areas of the Township during storm events. The Township also stores its road maintenance salt and sand in an open uncovered area with the potential for runoff to convey salt and sand to the nearby wetland.

Project Description

The proposed project involves construction of storm drainage systems including storm pipes inlets and basins to address the areas impacted adversely by stormwater build up. The proposed project also includes construction of a salt dome.

Service Area

Borough of Somerdale

Need for Project

Extreme stormwater runoff in the Borough cannot be handled by existing ditches resulting in soil erosion and loss of trees. Soil erosion contributes to silt deposits in Otter Brook and degrades local wetlands and streams.

Project Description

The proposed project involves creating a stormwater detention basin by modifying an existing culvert to restrict flow. Improvements to existing ditches will also be made.

Borough of Englewood Cliffs

Need for Project

The purpose of this project is to alleviate flooding and restore the pond volume for water retention. The purpose of the purchase of the Jetvacuum truck is to assist the DPW in maintaining the integrity of the sewer system. The Pershing Road Pond is subject to storm water runoff from nearby collector streets which creates an overwhelming accumulation of silt and debris. As a result the pond has formed large shoals and is heavily silted in certain areas. This sediment accumulation reduces the drainage capacity of the watercourse raising the ponds water level with each season storm event. The purpose of this project is to alleviate flooding and restore the pond volume for water retention.

Project Description

The proposed project includes the equipment purchase of a JetVacuum Sewer Truck to assist the DPW to maintain the integrity of the sewer system.

Project Name, Number

Highlands Borough
S340901-03
Stormwater Management - Gray Infrastructure

Priority List Rank

881

County

Monmouth

Existing Population

5,005

Service Area

The service area includes the entire Borough of Highlands; however, due to the high elevations and steep slopes, runoff flow from adjacent areas of Middletown Township and Atlantic Highlands Borough also drain into the Borough drainage system.

Need for Project

The existing drainage system, which drains into the Shrewsbury River, a C1 waterway, is undersized to handle contributing drainage flow and runoff sediment from upland areas. Drainage facilities in low lying areas are inundated by floodwaters originating from NJ Rt. 36 corridor and adjacent upgradient areas of the Borough, Middletown Township and Atlantic Highlands. High intensity rainfall events, coupled with high tides, high stormwater velocities and head conditions result in system back ups and extensive flooding of the low lying areas from Bay Avenue northward.

Project Description

(Carryover SFY2015) - Proposed improvements include construction of a new stormwater pump station in Jones Creek, replacement of the existing outfall from the Valley Street Pump Station, the replacement/upgrade of portions of the existing stormwater infrastructure and the installation of additional drainage infrastructure in various portions of the Borough. Merged Carryover and Supplemental Applications into one project for SFY2016

Need for Project

The Borough has a known nonpoint source pollution problem which needs to be corrected. The downtown area of the Borough frequently floods during periods of rain or high tides and Jones Creek cuts through the middle of this area. The floods damage property and collect debris and contaminants which are passed through the system to Raritan Bay.

Project Description

The proposed project involves the installation of a stormwater pump station.

Project Name, Number

Egg Harbor Township
S340856-01
Stormwater Management - Gray Infrastructure

Priority List Rank

886

County

Atlantic

Existing Population

4,545

Service Area

West Atlantic City section of Egg Harbor Township

Need for Project

The existing stormwater collection system in West Atlantic City is physically deteriorating and is inadequate to collect and discharge runoff to Lakes Bay. Under normal conditions tidal flooding often surcharges the system and discharges tidal water back through stormwater inlets due to a lack of back flow prevention devices. This increased flooding increases the amount of sediment and other pollutants that enter the collection system and are discharged to Lakes Bay. A new stormwater system will reduce the amount and frequency of flooding which will decrease the concentration of solids nutrients and fecal coliform in the Bay.

Project Description

The proposed project includes construction of a stormwater management system that will handle runoff from a 100-year storm event. This will include replacing all existing inlets and piping eliminating numerous bay discharge points and installing new outfalls.

Project Name, Number

Bradley Beach Borough
S340472-02
Sanitary Sewer System Rehabilitation

Priority List Rank

889

County

Monmouth

Existing Population

4,298

Service Area

Sanitary improvements are proposed along Evergreen, Monmouth, Burlington, Pacific, Madison Avenues including portion of Bradley Boulevard. Stormwater improvements will include all 10 outfall into Sylvan Lake at the following intersections with Bradley Boulevard: Main Street, Pacific Avenue, Atlantic Avenue, Madison Avenue and Monmouth Avenue.

Need for Project

The Borough of Bradley Beach is requesting funding through the New Jersey Environmental Infrastructure Trust Finance Program (Trust) Clean Water State Revolving Fund for the State Fiscal Year 2016 loan program to improve its aged stormwater and sanitary infrastructure.

Project Description

The Borough is currently operating an aged sewer collection system and stormwater system constructed in the early 1900's. It is the Borough's desire to rehabilitate their infrastructure systems over time as funding is available. It is the intent of this application to address about 15% of the sanitary sewer system and approximately 90% of the stormwater infrastructure system to Sylvan Lake. It will address the stormwater sewer system along Bradley Boulevard as follows: - Replace 1,700 feet of storm drain with 18 inch diameter Reinforced Concrete Pipe - Replace 30 drainage inlets - Replace 14 drainage Manholes

Need for Project

Currently several DPW vehicles and pieces of equipment are stored outside in the maintenance yard. Storing the vehicles and equipment within the rehabilitated building will eliminate contamination of the storm water runoff and extend the useful life of the equipment.

Project Description

Rehabilitation of an existing equipment storage building that is currently in disrepair and inefficiently sectioned for proper storage of DPW maintenance vehicles. The layout of the building will be changed to provide additional storage bays so equipment can be housed within the structure which is located on the DPW property at 405 Mine Road within the Township. Proper drainage and water quality treatment devices will be installed within the building.

Need for Project

The NJDEP has mandated that all discharges of equipment and vehicle wash wastewater from maintenance yard operations be eliminated by 022909. Under the current procedures the wastewater is discharged to the ground surface and enters nearby streamsgroundwater. The facility will capture all water used in the cleaning of equipment and vehicles for proper disposal which will greatly improve the water quality in the area.

Project Description

Construction of a facility designed to collect equipment and vehicle wash wastewater from maintenance yard operations. Bethlehem Township is coordinating construction of the facility with the local New Jersey Department of Transportation maintenance yard located on State Highway Route 173 in order to share services and reduce costs.

Borough of Riverdale

Need for Project

Periodically the Boroughs storm sewers collect debris and contaminants which eventually pass through the storm sewer system and into the lakes and surrounding waterways. The Borough is concerned with the non-point source pollution problem and believes this problem can be reduced through better maintenance which will be enhanced by the use of Jet Vac equipment and certain specific improvements to the existing stormwater facilities.

Project Description

The proposed project involves the purchase of a Jet-Vac Truck to clean debris from the storm sewers and minimize adverse impacts on local waterways.

Sylvan Lake is a coastal lake located between Avon-by-the-Sea and Bradley Beach. The Lake is fed by a small unnamed tributary to the northwest and thirty stormwater outfalls from a highly urbanized watershed that includes both residential and highway/commercial land uses spanning the municipalities of Avon-by-the-Sea, Bradley Beach, Neptune City and Neptune Township. Stormwater is then temporarily detained in the lake prior to directly discharging into the Atlantic Ocean just offshore of Avon's bathing beaches.

Need for Project

The proposed rehabilitation of the Sylvan Lake Stormwater Management capacity and infrastructure will address known water quality problems within the lake and ultimately, the proximate Atlantic Ocean bathing beaches. Presently, the lake is subject to pathogen contamination, algal blooms, aquatic weed overgrowth and eutrophication that are primarily related to inputs of stormwater and runoff from the surrounding watershed. These contaminated waters chronically persist, and the contaminated waters are continuously discharged to the Atlantic Ocean via an ocean outfall that discharges onto the bathing beach areas. The discharges are acutely worse during rainfall events when the lake discharges to the ocean at increased rates. Lastly, the outfall structure is structurally compromised, causing leakage of the contaminated lake water into the beach groundwater and limiting the ability of local authorities to control the discharge during storm events.

Project Description

The Sylvan Lake Water Quality Project aims to increase the lake's capacity to store stormwater. In order to do this, dredging of the lake is required. In addition, the proposed project will address known water quality issues within the lake that result from stormwater runoff from the surrounding watershed. Also, the outfall structure that discharges this water to the Atlantic Ocean is structurally compromised and needs replacement.

Need for Project

The health safety and welfare of the residents are in jeopardy due to deterioration of existing bulkheads and stormwater management measures that have been damaged from recent and significant storm event.

Project Description

The project includes bulkhead repair beach replenishment and jetty construction.

County

Hunterdon

Existing Population

1,401

Service Area

The planning area for this project consists of the entire Borough of Hampton in Hunterdon County, New Jersey. Hampton encompasses approximately 1.5 square miles. The Township has a total population of 1,253 and 506 total housing units. Hampton is bordered by Lebanon Township to the northeast, by Glen Gardner Borough to the east, by Bethlehem Township to the south, and by Washington Township (Warren County) to the northwest.

Need for Project

The purpose of this project is to provide the DPW with a means of more efficiently and effectively retrieving leaves from the side of the road. Leaves piled on the road have the potential to enter into the storm sewer system and negatively impact water quality.

Project Description

The project will result in the purchase of a leaf vacuum to be used by the Borough Department of Public Works (DPW); the DPW provides leaf pickup services throughout the Borough. The selected equipment is a Tarco Hurricane 1000 Series leaf loader, with a 17 cubic yard box capacities and a dual tire dual axle 18,000 lb. axle rating trailer.

Need for Project

When the free flow of tidal waters in and among the multiple tidal creeks and salt marsh is hindered by shoaling the natural flushing and cleansing effect of the tides is hindered. This results in the trapping or slowing of waters within certain areas and accompanying loss of water quality. When shoaling is left unaddressed the problem is compounded and water quality continues to decrease. Detrimental effects of the poor water quality in the back bays includes increased risk of bacteriological contamination and the concentration of other contaminants (metals etc.) in shoaled areas where water velocity is slowed and the contaminants drop to the bay floor rather than continue to disperse throughout the system.

Project Description

The project includes dredging of several back bays and water ways impacted by Sandy.

Need for Project

The existing pump station was built in 1950 to assist two smaller pump houses which date back to 1917. Currently all three pumps are in operation and the system is in need of repair.

Project Description

The proposed project is to extend the two existing 60-inch diameter storm trunk mains to a new pump house constructed with an emergency generator and a variable speed pumping system. Also included is the abandonment and demolition of the two 1917 pump houses and alterations associated with the riser ditch and bulkhead.

Service Area

City of Newark

Need for Project

A former industrial facility requires remedial measures to support brownfield development and provide significant environmental benefits. Placement of an impermeable cap along with installation of stormwater controls will ensure that rain water will not mobilize contaminants and pollute groundwater or the adjacent waterways.

Project Description

This is a proposed redevelopment of a brownfield site located in the City of Newark in Essex County in the Third Industrial District and the Industrial River Urban Renewal Plan Area adjacent to the Route 1&9 Interchange on Delancy Street. The project will consists of remediation requirements included in an approved Remedial Action Work Plan as well as additional environmental and clean water improvements necessary as part of the overall redevelopment. The project consists of a warehouseindustrial facility that includes two (2) buildings of 705000 square feet and 105775 square feet with 20000 square feet of office space and 5000 square feet of office space respectively. The project site is currently a vacant former industrial site from which the structures have been removed. Piersons Creek bisects the project site which is to be enhanced and improved. It is anticipated the project will be occupied by a combination of warehouse distribution and industrial uses.

Jersey City

Need for Project

The City plans to purchase land for water quality protection. The preservation and conservation of land is important to help protect and maintain water quality in the project area. In general the loss of open space is known to have adverse water quality impacts that result from increases in impervious cover loss of recharge areas or buffer zones and undesirable changes in historic stormwater drainage patterns.

Project Description

The proposed project includes the purchase 6.2 acres along the PRR Harimus Branch Embankment to preserve open space and to protect water quality.

Hoboken City
S343078-01
Open Space Land Acquisition and Conservation

Priority List Rank

913

County

Hudson

Existing Population

38,577

Service Area

City of Hoboken

Need for Project

The project will acquire and develop passive recreational open space for the enjoyment of Hoboken residents and visitors but will also help retain stormwater runoff and reduce flooding. Situated along the Hudson River the City of Hoboken is prone to severe flooding when heavy rains combine with high tide. This is particularly an issue in Hoboken's southwest which is one of the more densely populated areas of the City and currently has no open space or parkland. As a result of the creation and preservation of open space stormwater will be retained naturally which will help to alleviate flooding reduce volume flowing into the City's combined stormwater sewer system and prevent sewage discharges into the Hudson River as a result of overflow to the combined sewer system.

Project Description

The City of Hoboken will acquire and develop parkland in the Southwest portion of the City. The new park will provide open space access in a congested neighborhood of town will help retain stormwater runoff and will reduce overflows to the combined sewer stormwater management system.

County

Somerset

Existing Population

0

Service Area

The Borough is part of the watershed management area 9 (WMA9) or Lower Raritan, South River and Lawrence watershed management area.

Need for Project

Heavy Metals and Petroleum Hydrocarbons

Project Description

Watchung borough is located on the eastern and mountain side of the somerset county. Watchung has two scenic lakes which attract visitors and wildlife alike. The eastern branch of Stony Brook discharges into Best Lake from the east. Best Lake was dredged in 1996 by the Borough for the last time. Best Lake is one of the natural low points of the area and the volume of the lakes expanded over time in order to manage flood events and for recreational purposes. Because of the steep slope of the contributory streams and lack of watershed management, a large volume of sediment flows and accumulates in Best Lake. This has led to a large active volume reduction in the lake. The reduction of the lake volume caused a rise in the lakes water surface and, as a result, some parts of the Lake have been washed off or eroded over time. Therefore, after almost 27 years, the Watchung Borough intends to dredge Best Lake.

Water Efficiency / Water Meters

Priority List Rank

916

County

Hunterdon

Existing Population

2,719

Service Area

This is a system-wide replacement project that covers sections of Clinton Town, Lebanon Borough, Clinton Township, Franklin Township and Union Township.

Need for Project

Installation of these meters will increase the level of accuracy on the quantities measured for billing. It is anticipated that the existing aged meters at these locations are not fully capturing actual usage by the customer. In turn, the new meters will yield more accurate reading, which will impose water conservation measures by each customer, and a decrease in waste water returns.

Project Description

Pursuant to the Capital Improvement Plan derived from the Asset Management Plan (AMP) for the system, the Town of Clinton is continuing efforts to implement the AMP to resume the conversion of customer service meters to radio read in order to improve billing accuracy, further reduce the percentage of non-revenue water in the water system and in part minimize the wastewater return to the sanitary sewer collection system. Approximately 750 meters remain for replacement. The preferred course of action would be for the procurement of the meters to be through the co-op and advertise publicly for the installation of the meters. The preparation of the asset management plan, evaluation of the system wide meter inventory and incorporating these assets in GIS as well as ongoing analysis of financing options and rate analysis are part of the extensive planning efforts to identify the scope and priority of this capital improvement project.

Service Area

Services Hudson, Essex, Passaic Bergen and parts of Union County.

Need for Project

As part of PVSCs Energy Roadmap, we are looking to develop, commission, operate and maintain a Renewable Power Generation System (RPGS) that would allow to operate in island mode in the event that a similar event such as Superstorm Sandy would occur. The RPGS would allow PVSC to continue to operate our wastewater treatment facility and ensure compliance with our NJPDES permit during power outages. The power generated from the PV system will be utilized to offset the power from the utility.

Project Description

PVSC as part of it's Energy Road Map, has identified solar generation as a dominant renewable energy source. PVSC solicited proposals and a consultant has developed a photovoltaic program that will utilize roofs, floodwall and canopies for the installation of a PV System that will generate approximately 5 MW of power. The power generated will be utilized to offset the power utilized from utility power.

Project Description

The proposed project includes the purchase of a 2.5-acre parcel adjacent to the beachfront in the southern portion of the island to prevent ponding of stormwater runoff and to maintain or improve existing drainage patterns.

Township of Brick

Need for Project

The uncapped landfill is the source for groundwater contamination documented at the site. A contamination plume emanates from the landfill encompassing approximately 470 acres. As a result of contamination (volatile organic compounds) a Groundwater Use Restriction Area and Classification Exception Area were established and a maintained private water and irrigation wells were closed and residents within the affected area were required to connect to water service. Although the impacted Kirkwood-Cohansey aquifer system is hydraulically connected to Barnegat Bay it is not expected that elevated contamination levels can be traced to the landfill site.

Project Description

The remedial action consists of the re-grading of the landfill installation of a cap including gas vents and construction of a stormwater management system.

Project Name, Number

Buena Vista Township
S342023-01
Landfill Closure

Priority List Rank

923

County

Atlantic

Existing Population

7,570

Service Area

Former Buena Vista Solid Waste Landfill ceased operation between 1979 and 1982; is now currently known as Buena Vista Township Department of Public Works bounded by agricultural land (farm fields) on the North and West, by a residential property to the South, and Union Road to the East. On the other side of Union is agricultural land with a residence and other out buildings. The nearest residence is adjacent to the Buena Vista Township Public works Yard. There are 31 impacted wells located to the south and southwest and down gradient of the Buena Vista Public Works Yard. The affected homes/wells are being provided with point of entry treatment systems (POETS) through the NJDEP Spill Fund. The highest level of contamination occurs on the southwest corner of the Public Works yard created by commercial agricultural activities (cultivation of produce for human consumption)

Need for Project

Task 1: Project Planning \$30,000 detailed review of project files, site inspections, meetings with client and regulatory agencies and development of a conceptual model that will assist in understanding the project details and become the basis for the required remedial investigation; Task 2: Ground Water Investigation \$235,000 Monitoring Well Installation, traffic control, road opening, cost for sampling the monitoring well network twice, and associated data management; Task 3 Landfill investigation \$100,000; Task 4 Prepare Remedial Investigation report and action plan \$50,000; Task 5 Preparation for Landfill closure \$60,000; Task 6 Project Management \$40,000; Task 7-9 Implement ground remediation, construct recommended landfill closure plan, submit remedial action report \$40,000; Task 10 submission post closure plan report and file deed notice \$40,000 Task 11 Long term monitoring of well. Task 8,11 will be developed at a later date based on the findings of prior tasks.

Project Description

In a letter dated September 24, 2015, the New Jersey Department of Environmental Protection's (NJDEP) Site Remediation Program notified Buena Vista Township that the NJDEP has documented the release of hazardous substances at the former Buena Vista Solid Waste landfill, which ceased operations between 1977 and 1982. The property is currently the Township's Public Works Yard. The NJDEP conducted a ground water investigation at the former Buena Vista landfill and the ground water sample results showed that contamination was present on site. Based on this, the NJDEP stated that Buena Vista Township may have responsibility under the New Jersey Spill Compensation and Control Act for the investigation and remediation of contamination at the subject site. The Township was required to retain a License Site Remediation Professional (LSRP) and conduct the required remedial investigation and remedial action for landfill closure and groundwater contamination.

County of Mercer

Need for Project

The County plans to purchase land for water quality protection. Preservation and conservation of land is important to help protect and maintain water quality in the project area. In general the loss of open space is known to have adverse water quality impacts that result from increases in impervious cover loss of recharge areas or buffer zones and undesirable changes in historic stormwater drainage patterns.

Project Description

The proposed project is for the purchase of land adjacent to the Delaware and Raritan Canal within one mile of both Baldpate Mountain preserve and Mercer County Howell Living History Farm to preserve open space and to protect water quality.

Need for Project

The planned improvements will protect ground water by ensuring that landfill leachate is removed from the landfill in a timely manner and transported for disposal through a secure conveyance system.

Project Description

The proposed project includes the rehabilitaion of six leachate lift stations and the replacement of approximately 1300 feet of single wall leachate force main with double wall pipe. Included will be new pumps electrical instrumentation and other appurtenances.

County

Atlantic

Existing Population

265,429

Service Area

The Atlantic County Utilities Authority Landfill receives all solid waste generated within the 23 municipalities of Atlantic County. Atlantic County is approximately 672 square miles in area. Note: The population data provided is an estimate for 2018.

Need for Project

The Atlantic County Utilities Authority (ACUA) Landfill is a doubled-lined landfill. All leachate generated from the landfill is monitored and pumped into the ACUA's wastewater collection system. The wastewater then flows to ACUA's Wastewater Treatment Plant in Atlantic City. Disposal of solid waste within lined landfills is required by law in New Jersey. Disposal of waste in unlined landfills is a direct threat to groundwater resources, therefore appropriate disposal is achieved through this project.

Project Description

In an effort to maximize the existing permitted capacity of the ACUA landfill, the ACUA has planned to construct a mechanically stabilized earth (MSE) berm around a portion of the perimeter of the landfill. Construction of the MSE berm will allow Atlantic County residents and businesses to continue to dispose of waste within Atlantic County. Construction of Phase 1 of the MSE berm, which was funded by the ACUA, is currently nearing completion. The ACUA is now seeking funding through the I-Bank for the construction of Phases 2 and 3. Phase 2 includes the construction of approx. 1,825 linear feet of MSE Berm and also includes modifications to an existing on-site stormwater basin. Phase 3 includes the construction of approx. 2,250 linear feet of MSE Berm. The ACUA has retained the services of an engineering consulting firm, ARM Group Inc., to provide engineering design services for the proposed construction of Phases 2 and 3 of the MSE Berm.

Service Area

N/A - only involves leachate and sanitary flow from SCMUA Solid Waste facility

Need for Project

Provide for long-term transmission of leachate for treatment at the SCMUA Upper Wallkill WPCF

Project Description

This project includes a pumping station and force main to convey landfill leachate to the Upper Wallkill Water Pollution Control Facility (WPCF) rather than continuing the practice of trucking leachate for treatment and disposal. Currently, leachate generated from the landfill is collected and stored at the SCMUA Solid Waste Facility in a 1.1 million gallon tank. The leachate is then hauled by SCMUA via tanker truck approximately 6 miles to its Upper Wallkill WPCF in Hardyston, New Jersey, for treatment. The current leachate treatment and disposal scheme is regulated by the New Jersey Department of Environmental Protection (NJDEP) under NJPDES/SIU Permit No. NJ0103811, which provides for the disposal of 35,000 gallons per day (annual average) of leachate at the SCMUA's Upper Wallkill WPCF.

Service Area

Edison Landfill is a former 35 acre municipal landfill, disused since 1991, has no defined service area as a result of its continuing inactive status since that time. More details are provided in the uploaded/attached Edison Landfill History.

Need for Project

The Edison Landfill Closure Project will eliminate subsurface leachate migration into the adjacent Raritan River and contiguous properties. This will be achieved primarily through the capping of the Edison Landfill and an engineered leachate containment and pumping system for proper leachate conveyance to the MCUA.

Project Description

(Carryover SFY2015) - The closure of the Edison Landfill will include the following activities Landfill plateau capped with geomembrane geosynthetic clay liner reinforcement textile soil cover and vegetative layer. Sides capped with ordinary soil cover and vegetative layer. Landfill plateau and sides capping shall also utilize waste-derived material such as stabilized sludge. Stormwater channels shall utilize waste-derived materials such as glass cullet or crushed concrete in cover materials. Leachate collection pumping and disposal systems to MCUA via a siphon crossing the Raritan River shall be designed fabricated installed commissioned and operated on a continuing basis. A methane gas extraction system shall also be designed fabricated installed commissioned and operated on a continuing basis. A surface-mounted ballasted 100kWh PVSE system shall be installed as well as an extension of an existing walkway adjacent to the Raritan River under a disruption/restoration component.

Need for Project

The Township plans to purchase parcels of land for water quality protection. The preservation and conservation of land is important to help protect and maintain water quality in the project area. In general the loss of open space is known to have adverse water quality impacts that result from increases in impervious cover loss of recharge areas or buffer zones and undesirable changes in historic stormwater drainage patterns.

Project Description

The proposed project is for the purchase of land including the Raritan River Ravine Silver Lake Glendale Avenue Martins Dock and other lands to preserve open space to protect water quality and to safeguard wildlife habitats.

Need for Project

The Township plans to purchase of property to protect water quality by preserving land that encompasses an unnamed tributary of Pond Run located in the Delaware River Watershed. Since water drains from the parcel into Veterans Park preservation of the parcel also prevents nonpoint source pollution from entering Martins Lake. The preservation and conservation of land is important to help protect and maintain water quality in the project area. In general the loss of open space is known to have adverse water quality impacts that result from increases in impervious cover loss of recharge areas or buffer zones and undesirable changes in historic stormwater drainage patterns.

Project Description

The proposed project includes the acquisition of Klockner Woods property to preserve open space and to protect water quality.

Sayreville Borough
S343075-01
Open Space Land Acquisition and Conservation

Priority List Rank

948

County

Middlesex

Existing Population

40,377

Service Area

Borough of Sayreville

Need for Project

The ownerdeveloper of a currently vacant property has proposed building 207 single-family homes as well as some warehousing. Development of this tract would have adverse impacts on the stormwater management in the Borough and on the Raritan River and Raritan Bay. Preservation and conservation of land is important to help protect and maintain water quality in the project area. In general the loss of open space is known to have adverse water quality impacts that result from increases in impervious cover loss of recharge areas or buffer zones and undesirable changes in historic stormwater drainage patterns.

Project Description

The proposed project is for the purchase of a parcel of land within the Borough to preserve open space and to protect water quality.

Need for Project

The Townships former landfill is generating leachate, which is causing surface and groundwater impacts in an area containing the headwaters of two drainage basins. A capping system is needed to reduce infiltration, which will subsequently minimize further leachate generation and migration.

Project Description

The proposed project will include the construction of a capping system consisting of an impervious clay cap, a sand drainage layer, a vegetative layer, a ground/surface water monitoring system, and drainage improvements. The entire landfill will be re-contoured to remove waste around the perimeter and to establish appropriate cross slope grades.

FINAL FEDERAL FISCAL YEAR 2023 (SFY 2024) CLEAN WATER - PROJECT DESCRIPTIONS (NARRATIVES)

Project Name, Number

Randolph Township
S343007-01
Open Space Land Acquisition and Conservation

Priority List Rank

958

County

Morris

Existing Population

19,974

Service Area

Township of Randolph

Need for Project

The Township plans to purchase the Clyde Potts Reservoir and the surrounding drainage basin for water quality protection. The preservation and conservation of land is important to help protect and maintain water quality in the project area. In general the loss of open space is known to have adverse water quality impacts that result from increases in impervious cover loss of recharge areas or buffer zones and undesirable changes in historic stormwater drainage patterns.

Project Description

The proposed project includes the purchase of the Clyde Potts Reservoir and the surrounding drainage basin to preserve open space and to protect water quality.

STATE OF NEW JERSEY
FINAL FEDERAL FISCAL YEAR 2023 (SFY 2024) CLEAN WATER - PROJECT DESCRIPTIONS (NARRATIVES)

Project Name, Number

River Vale Township
S343064-01
Open Space Land Acquisition and Conservation

Priority List Rank

968

County

Bergen

Existing Population

9,449

Service Area

Township OF River Vale

Need for Project

The Township plans to purchase land to preserve the water quality. The preservation and conservation of land is important to help protect and maintain water quality in the project area. In general the loss of open space is known to have adverse water quality impacts that result from increases in impervious cover loss of recharge areas or buffer zones and undesirable changes in historic stormwater drainage patterns.

Project Description

The proposed project includes purchase of a wooded leased portion of the Bergen Hills Country Club to preserve open space and to protect water quality.

S343047-01
Open Space Land Acquisition and Conservation

Priority List Rank

972

County

Sussex

Existing Population

8,254

Service Area

Township of Byram

Need for Project

The Township plans to purchase land for water quality protection. Preservation of the Lubbers Run Greenway will preserve and protect the stream corridor wetlands and watershed of Lubbers Run a trout maintenance stream and the largest tributary to the Musconetcong River. Byram is under extreme development pressure and the geological resources conducive to groundwater supplies are limited. Areas of high recharge like Lubbers Run Greenway need to be protected to maintain groundwater supplies in the Township.

Project Description

The proposed project is for the purchase of an easement on land adjacent to Lubbers Run Greenway. Purchase of this land will limit development and sprawl and will preserve open space and protect water quality.

Project Name, Number

Fairfield Township
S342004-01
Landfill Closure

Priority List Rank

978

County

Cumberland

Existing Population

5,699

Service Area

Township of Fairfield

Need for Project

The municipal landfill in Fairfield is generating leachate which is impacting surface and ground water. The site adjoins a waterway known as Rattlesnake Gut which flows directly into the Cohansey River. A capping system is needed to prevent further leachate impacts.

Project Description

The proposed project includes construction of fill and an impervious cap to prevent infiltration. Since the site adjoins an intermittent waterway it may be necessary to remove some of the landfill adjacent to the stream for wetlands reclamation and buffering.

Ocean

Existing Population

5,314

Service Area

Borough of Point Pleasant

Need for Project

The Borough plans to purchase land to preserve protect and maintain the native dune vegetation saltwater wetlands along the beach front and certain wildlife habitats. Acquisition of the properties will also assist the Borough in controlling development which result in the reduction of stormwater runoff that could have adverse impacts on the area. The preservation and conservation of land is important to help protect and maintain water quality in the project area. In general the loss of open space is known to have adverse water quality impacts that result from increases in impervious cover loss of recharge areas or buffer zones and undesirable changes in historic stormwater drainage patterns.

Project Description

The proposed project includes the purchase of land to preserve open space and to protect water quality.

City of Cape May

Need for Project

The City plans to purchase land for water quality protection. The preservation and conservation of land is important to help protect and maintain water quality in the project area. This project is less than 2000 feet from the Atlantic Ocean and 1000 feet from a Green Acres conservation area which protects the southern shoreline of Cape May Harbor. In general the loss of open space is known to have adverse water quality impacts that result from increases in impervious cover loss of recharge areas or buffer zones and undesirable changes in historic stormwater drainage patterns.

Project Description

The proposed project includes the purchase of Sewell Point Tract which consists of approximately 90 palustrine wetlands that are stated to be of exceptional resource value. The parcel currently exists as a wildlife sanctuary with the threat of residential development on 10 of the parcel. The proposed project will not only preserve open space and protect water quality but will also protect several species of threatened and endangered birds that have been identified on the parcel.

National Park Borough

Need for Project

The Borough of National Park is required by the State Regulations to implement the closure of the landfill site in accordance with the applicable Solid Waste Rules. The implementation of the closure and preparing the site for development is a priority for the Borough of National Park. This sizable contaminated property is situated in the center of the Borough with no prospects for development. The Borough is very much interested in getting the property to be put to a productive use. The Borough has two alternatives implementation of closure only or implementation of closure and development of the site for the installation of PV Solar system. Therefore the implementation of the landfill closure is needed for both alternatives.

Project Description

It is the intent of the Borough of National Park to implement an NJDEP approved environmentally sound closure of the landfill and prepare the site for future use. The Borough has solicited bids for the installation of a Photo Voltaic solar system on the site and has faced a difficulty in getting the site closed and developed due to the high cost of implementing proper closure.

Service Area

Borough of Peapack & Gladstone

Need for Project

The Township plans to purchase land for water quality protection. The preservation and conservation of land is important to help protect and maintain water quality in the project area. In general the loss of open space is known to have adverse water quality impacts that result from increases in impervious cover loss of recharge areas or buffer zones and undesirable changes in historic stormwater drainage patterns.

Project Description

The proposed project includes the purchase of land to preserve open space and to protect water quality.

Penninsula at Bayonne Harbor

Need for Project

Existing conditions on the site allow for stormwater to collect within the exposed basement of the former industrial building and stagnatemix with the demolition debris. These conditions contribute to water stagnation and unknown water quality consequences of standing water in demolition debris. The proposed project will 1) result in removal fo the debris 2) bring the site to grade so that basement water collection cannot occur and 3) facilitate the collection of stormwater into the existing on-site system. The project will also serve to prepare the site for DEP-approved redevelopment of the site which includes substantial water quality and flood control measures.

Project Description

The project is located on the Peninsula at Bayonne Harbor which is the site of the former Military Ocean Terminal - Bayonne (MOTBY). The proposed work consists of completing the US Armys unfinished demolition of a former warehouse structure and preparing the demolished footprint for collection of stormwater into the existing system. Under existing conditions the unfinished demolition has created a hole in the ground which collects stormwater that stagnates and mixes with the debris. The proposed work will complete the demolition and removal of concrete from the basement hole fill in the hole with material and prepare the surface for routing of stormwater to the existing system that surrounds the former building. The project is fully permitted with the exception of soil erosion and sediment control permit application that is currently being prepared.

Service Area

Peninsula at Bayonne Harbor

Need for Project

Existing conditions on the site allow for stormwater to fall on 90 acres of unstabilized soil that has been placed on the Peninsula to raise the site out of the floodplain. These conditions contribute suspended sediment into the stormwater via both 1) sheetflow and 2) wind-blown sand that deposits on the street system. The proposed project will substantially reduce soil erosion and the introduction of suspended sediment into the adjoining New York Harbor.

Project Description

The project is located on the Peninsula at Bayonne Harbor site of the former Military Ocean Terminal - Bayonne (MOTBY). The proposed work consists of stabilizing approximately 90 acres of unstabilized soil that has been deposited on the site to raise it out of the floodplain. Specifically the work consists of final grading and the placement of topsoil & hydroseed to stabilize the 90 acre area. Upon completion stormwater across the stabilized area will be collected in a stormwater collection and treatment system that is currently under construction (using NJEIT funding). The project is fully permitted and shovel ready.

Service Area

Penninsula at Bayonne Harbor

Need for Project

Existing conditions on the site allow for stormwater to sheetflow across the site and directly over the collapsed bulkhead and into New York Harbor. These conditions contribute to poor water quality and sedimentation of the Harbor. The proposed project will 1) prevent additional erosion and associated Harbor siltation from occurring 2) facilitate stormwater collection and discharge and 3) serve as the basis for the DEP-approved redevelopment of the site which includes substantial water quality and flood control measures.

Project Description

The project is located on the Peninsula at Bayonne Harbor site of the former Military Ocean Terminal - Bayonne (MOTBY). The proposed work consists of reconstructing a shoreline area where approximately 1800 feet of bulkhead has completely collapsed and the associated upland stormwater collection system is no longer functional. The existing conditions allow unfettered stormwater sheetflow to enter directly into New York Harbor. The proposed project would reconstruct the 1800 foot section of failed bulkhead stormwater outfalls and associated upland stormwater collection infrastructure for purposes of remedying the existing uncontrolled condition. The project is fully permitted (NJDEP and Army Corps) with the exception of a soil erosion and sediment control permit for which a permit application is presently being prepared.

Service Area

This project is proposed at the 24-acre Gunnel Oval Recreational Complex which services the entire populous of the Town of Kearny that participates in active or passive recreation. It is a multi-sport facility whose existing and proposed facilities include various regulation sized fields for baseball, softball, soccer, and football as well as a skate park and proposed basketball courts. This project proposes to mitigate exposure to existing historic fill materials through design of an engineered cap which incorporates the artificial turf and underdrain cross-section, for which the Town has submitted to the State's Hazardous Discharge Site Remediation Fund (HDSRF). This project will also positively impact the surrounding residential and industrial neighborhoods through construction of improved stormwater management controls to mitigate the impact of flooding in connection with the tidal influence of the Kearny Marsh ecosystem.

Need for Project

This project will also positively impact the surrounding residential and industrial neighborhoods through construction of improved stormwater management controls to mitigate the impact of flooding in connection with the tidal influence of the Kearny Marsh ecosystem. The proposed stormwater management controls include direct collection of runoff through the artificial turf underdrain system, establishing on-site detention systems for volume control, potential extended detention systems for NJDEP water quality compliance, and improved discharge capabilities through construction of new outfalls with backflow preventors within the tidal Kearny Marsh ecosystem.

Project Description

This project has both a Remedial Action Contaminated Site Cleanup (Brownfield) component as well as a Stormwater Management (Clean Water) initiative component. The primary objective of this project is redevelopment of the Gunnel Oval Recreational Complex as a modern artificial turf sports complex including the environmental component of an engineered cap to minimize potential exposure to historic fill materials present on-site while implementing stormwater management controls that minimize the impact of frequent flooding at this complex and surrounding residential and industrial neighborhoods due to the influence of the tidal Kearny Marsh.

Service Area

This proposed project will enhance the water quality for the Kearny Point Industrial Park located on the southern most tip of the Kearny peninsula.

Need for Project

The general condition of the Water Facilities is very poor. The differential soil settlement on the Project Service Area has caused negative drainage slopes and damage to the underground piping, which requires constant repairs in order to keep the existing Water Facilities in just a minimally functional capacity. The paved areas of the Project Service Area are primarily uncurbed and have poor positive drainage, which results in water being improperly channeled and draining directly into adjacent waterways. Due to the obsolete and ineffective underground Water Facilities, stormwater on the site is not cleaned of impurities, as required by current water quality standards.

Project Description

The proposed water quality improvement project at Kearny Point Industrial Park will provide necessary and substantial improvements and enhancements to the water stormwater and sanitary sewer infrastructure systems at Kearny Point. The Project components include the demolition of existing substandard buildings and infrastructure removal and replacement of the deteriorating Water Facilities implementation of a necessary ground improvement program on soils on the site to minimize settlement that would damage the reconstructed Water Facilities and construction of an impervious cap through appropriate building foundations and asphalt-paved roadways that will mitigate and prevent any further contamination of the site the surrounding areas and the Hackensack River.

Sanitary Sewer System - New

Priority List Rank

994

County

Hudson

Existing Population

265,549

Service Area

Jersey City is the second largest city in the State of New Jersey with a population of approximately 265,000 persons. The sanitary sewer collection system will provide a reliable sewer facilities for the residents of the Bayfront Redevelopment Project.

Need for Project

This project is necessary to provide a reliable sanitary sewer collection system and storm water collection system to the Bayfront Redevelopment Site. The new gravity sanitary sewer mains will be used to service both residential and commercial buildings. The storm sewer will be used for on-site drainage and stormwater management.

Project Description

The project generally consists of onsite infrastructure improvements for Phase 1A of the Bayfront Redevelopment to be located on a former brownfield in Jersey City. The project site is located in Jersey City off of Route 440, between Culver Avenue and Kellogg Street, on the east side of the Hackensack River and approximately 1.5 miles north of the I-78 Newark Bay Bridge. The sanitary sewer improvements consist of approximately 3,150 LF of new 10", 12", 15" and 18" gravity sewer and manholes to service the development. The storm sewer improvements consist of storm water management and collection systems.

Remedial Action/Contaminated Site Cleanups (Brownfields)

Priority List Rank

997

County

Hudson

Existing Population

677,983

Service Area

The Site has been divided based on previous plant processes, physical characteristics and remedial measures into the following three areas: 1. Eastern Area: the location of former coal tar plant and coke plant and gas processing areas, and the location of the interim dense non-aqueous phase liquid (DNAPL) recovery system. The Eastern Area also includes the former parking lot and office area, which is located south of the NJ Transit rail line (also designated as the Southern Area). 2. Central Area: the location of the former coke/coal storage east area and former cyanide/sulfuric acid plant area. It is characterized by the previous remedial activities (e.g., waste removal) and placement of gravel cover; and 3. Western Area: the location of former light oil residue, oxide waste, and west coke/coal storage areas, which is characterized by waste piles, surficial tar, chromium deposits and wetlands. This area also includes the 13-acre parcel included in the SCCC Superfund site.

Need for Project

The site was once used for industrial operations resulting in extensive contamination. The construction of Spine Road acts as a cap and the development includes the installation of an extensive stormwater management system to replace the existing four detention basins on Site. In the new stormwater management system, stormwater runoff will be collected and conveyed via roof drains, catch basins and associated piping and discharged to the Hackensack River. The stormwater collected from the parking lots will be collected and treated via an underground treatment system to remove sediment and fines and trap hydrocarbons (e.g., Vortechs hydrodynamic separator) prior to discharge to the river. The stormwater conveyance system will be designed to minimize the barrier wall penetrations and contact with contaminated soil and groundwater. Based on the proposed Site grading plan, stormwater lines are expected to be located at depths above historical contamination.

Project Description

The proposed plan for the Site includes four warehouse buildings (Building 1 through Building 4). Building 1 will be approximately 746,700 square feet (SF), Building 2 approximately 490,750 SF, Building 3 approximately 386,700 SF, and Building 4 approximately 405,000 SF. Each building will have adjacent parking lots for trucks, cars and trailers. An access road is proposed along the southern border of the Site, with entrances to the Site at the southeastern corner of Building 1 and through the neighboring SCCC site to the west. The MKA portion of the Site is planned for near-term redevelopment.

79,904

Service Area

City of Camden

Need for Project

A redevelopment project in Camden will eliminate the potential for the discharge of contaminants to surrounding water bodies and groundwater that could adversely impact water quality in the project area.

Project Description

The proposed project includes remediation of the former RCA Building No. 8 in the City of Camden. This project includes the removal of contaminated debris and the clean up of PCBs lead asbestos and dioxins.

The project will replace meters for both the Crystal Springs development and Indian Fields public water systems. Indian Fields includes 360 residential customers consisting of townhomes and single family detached units. Crystal Springs includes 1017 residential customers. Units include condos, townhomes and single family units and a resort hotel and conference center.

Need for Project

Install lead free water meters helps create better water use conversation practices resulting in less sewer discharge and improving overall water quality

Project Description

Replace approximately 1,000 meters within the Crystal Springs and Indian Fields water systems with radio-read meters in order to enable the HTMUA to transition from flat-rate billing to consumption based billing helping to better influence consumption behaviors and therefore reduce sewer discharge.

County

Essex

Existing Population

64,270

Service Area

The Project will enhance the water quality of a western portion of the City of East Orange for a population of approximately 1,800 current and new users.

Need for Project

The Water Facilities in and around the project site are substandard and in need of reconstruction or rehabilitation. The site is also currently designated as a Brownfield site. The Project will include the construction of an impervious cap, through appropriate building foundations and asphalt-paved roadways, that will mitigate and prevent any further contamination of the site and the surrounding areas as well as the implementation of a necessary ground water remediation program. Additionally, existing sanitary and stormwater infrastructure will be improved as part of the project along with the installation of new sanitary and stormwater systems associated with the new users.

Project Description

The proposed water quality improvement project (the "Project") at the Crossings at Brick Church will provide necessary and substantial improvements and enhancements to the stormwater and sanitary sewer infrastructure systems (the "Water Facilities") in the area. The Project includes the demolition of existing building and substandard infrastructure, replacement and rehabilitation of the Water Facilities, implementation of a necessary ground water remediation program and construction of the impervious cap, through appropriate building foundations and asphalt-paved roadways, that will mitigate and prevent any further contamination of the site and the surrounding areas.

Need for Project

This project will remediate Contaminated Ground Water entering the Raritan River

Project Description

Somerville Green Seam Construction Phase II - Ground Water Remediation Note: This application is not a new request for funding, but a request for a further release of EIT funds based on the already approved \$3.9 million from project #S342013-1. A contract has been awarded for \$8.2 million leaving a balance of funds available from the approved amount of \$1.85 million of which the estimated \$627,665 would be applied against when this element is approved and the bid awarded. This amount represents 25% of the total estimate of \$2,510,662 of which 75% is being funded through the DEP HDSRF program.

Service Area

These improvements shall be available to service all recreational boaters and fisherman along the Arthur Kill, between Perth Amboy and Elizabeth by providing a marina with approximately 200 slips, as well as those from outside the immediate area who wish to store their vessels in the marina. The marina will also service boaters from outside of this area who are passing through the Arthur Kill.

Need for Project

Water quality will be enhanced by the removal and amendment of existing contaminated materials within the existing cove, totaling approximately 130,000 cubic yards. Many of these contaminants are due to industrial processes and dumping which occurred along the Arthur Kill throughout the twentieth century. Guided by multiple soil boring throughout the existing cove, this project proposes the complete removal all contaminated sediment with appropriate bulkheads and slope stabilization to prevent further migration of contaminants into the Arthur Kill to improve the overall quality of the waterway for native species and recreational users.

Project Description

The project generally consists of the dredging of approximately 130,000 cubic yards of contaminated sediment from the Carteret Marina, and the construction of a bulkhead, wetlands mudflat enhancements, and bio-engineered slope stabilization. The sediment contains a number of contaminants, including arsenic and semi-volatile organic compounds. Contaminated sediment will be dredged and disposed of in accordance with all applicable NJDEP requirements.

Service Area

The Pennsauken Sanitary Landfill (PSL) owned and operated by the Pollution Financing Control Authority of Camden County (PCFACC) provides waste management services for the residents and businesses of Camden County. On a multi-year annual average, the PSL receives about 80,000 tons of type 10, 13, 13C, 23, 25, and 27 waste for disposal. At this tipping rate, the PSL has spare capacity for seven (7) years. The PCFACC is pro-actively engaged in long-term planning to continue serving the rate payers. For operational purposes, early construction of the proposed capital improvement will facilitate more effective site operations. The PCFACC is applying for financing assistance for the design and construction of the Phase VI Expansion.

Need for Project

The construction of the MSE berm in conjunction with the extension of the baseliner key-in trench will eliminate a pathway for leachate entering the storm- and groundwater resources. The interior side of the MSE berm will include a baseliner, keyed into the existing liner system creating a continuous barrier. Furthermore the MSE berm will incorporate stormwater management features and improve drainage adjacent to the proposed berm.

Project Description

The Project consists of the construction of a Mechanically Stabilized Earthen (MSE) berm along a 1,700 FT segment of the eastern boundary of the landfill and a baseliner key-in extension. In conjunction with an increased final elevation from 114 FT to 160 FT, the berm will increase the capacity of the Site E landfill by 819,000 CY. The berm and elevation increase are subject to a major modification of the solid waste facility permit. The MSE berm height will vary from approximately 0 to 50 feet above existing ground and will have a length of approximately 1,700 FT. The objective of the baseliner key-in extension is to raise the anchor trench above grade level, eliminating a potential pathway for leachate into the subsurface.

Service Area

The Gloucester Solid Waste Complex receives solid waste from both Gloucester County and outside the County.

Need for Project

A dual leachate collection system will be constructed to intercept, treat, and properly dispose much of the precipitation falling. Use of a double-liner system will prevent leachate leakage and protect the groundwater quality. In order to prevent Non-Point Source Pollution from the GCSWC, the new construction will include a Soil Erosion & Sediment Control Plan that will include stormwater run-on and run-off controls and sedimentation/detention basins to mitigate adverse impacts associated with site hydrology.

Project Description

The proposed project includes the construction of new landfill Cell 14 within the existing Gloucester County Solid Waste Complex (GCSWC). On April 20, 2012, NJDEP issued the Solid Waste Facility Permit for the Phase VII expansion, which included Cell 14. Cell 14 as approved by the NJDEP is about 13.75 acres in extent and will be constructed at the southern end of the landfill adjacent to the newly constructed Cell 13. The landfill was expanded in a phased manner and in its present configuration occupies about 112 acres (Cells 1 through 13). GCIA has utilized all the available permitted space in Cells 1 through 12. Landfilling operations are currently underway in Cell 13. Cell 13 construction was completed in April 2017.

Project Name, Number

Gloucester County Improvement Authority
S342024-01
Landfill Construction

Priority List Rank

1019

County

Gloucester

Existing Population

288,288

Service Area

The Gloucester Solid Waste Complex receives solid waste from both Gloucester County and outside the County.

Need for Project

In order to prevent Non-Point Source Pollution from the GCSWC, the new construction will include a Soil Erosion & Sediment Control Plan that will include stormwater run-on and run-off controls and sedimentation/detection basins to mitigate adverse impacts to site hydrology. A dual leachate collection system will be constructed to intercept, treat, and properly dispose much of the precipitation. Use of temporary rain covers also will direct precipitation to stormwater basins to be discharged to groundwater. Use of a double-liner system will prevent leachate leakage and preserve the integrity of the groundwater.

Project Description

The proposed project includes the construction of new landfill Cell 13 within the existing Gloucester County Solid Waste Complex (GCSWC). The landfill was expanded in a phased manner and in its present configuration occupies about 101.4 acres (Cells 1 through 12). GCIA has utilized all the available permitted space in Cells 1 through 11. Landfilling operations are currently underway in Cell 12. Cell 12 construction was completed in January 2015. On April 20, 2012, NJDEP issued the Solid Waste Facility Permit for the Phase VII expansion, which included Cell 13. Cell 13 as approved by the NJDEP is about 10.5 acres in extent and will be constructed at the southern end of the landfill adjacent to the newly constructed Cell 12.

Need for Project

This project is for the construction of a new dual composite lined landfill cell at the Gloucester County Solid Waste Complex that will protect the ground water resources of the State.

Project Description

The proposed project includes the construction of an approximately 10 acre landfill cell at the Gloucester County Solid Waste Complex in South Harrison Township. The approved cell design includes a dual containment liner system and leachate collection. Completion of this project will allow for the uninterrupted disposal of solid waste in an environmentally sound manner that is protective of the regions ground water resources.

Service Area

The Cumberland County Landfill receives solid waste from both Cumberland County and outside the County.

Need for Project

The following improvements to the landfill will be implemented at the Cumberland County Solid Waste Complex. i.) Side Slope Restoration mainly consists of restoration of existing stormwater management features to effectively manage contact and non-contact water, as well as minimize leachate generation. The management of non-contact water will include rain cover, diversion swale/downchute, perimeter waterways, and detention basins that will ultimately discharge to groundwater. ii.) The installation of the LFG main header pipe will increase capacity of the LFG extraction system. Leachate condensate generated within the main header pipe will be collected and safely disposed of. iii.) The installation of new rain cover prevents precipitation from infiltrating the landfill, which reduces leachate generation. iv.) The Bio-Tank Feed Pip and Pumps system will be improved with secondary containment which will contain any accidental spills of leachate. v.) Drainage and pavement improvements

Project Description

CCIA intends to implement a series of improvements at the Cumberland County Landfill located at 169 Jesse Bridge Road, Deerfield Township, New Jersey, including I) Side Slope Restoration; II) Landfill Gas (LFG) Main Header Pipe Installation; III) Rain Cover Replacement; IV) Secondary Containment for Bio-Tank Feed Pipe and Pumps System; V) Pavement Improvements.

Service Area

SCMUA provides Solid Waste Disposal and Recycling Services to the County of Sussex

Need for Project

Provide for the proper disposal of solid waste, thereby preventing non-point source water quality impacts.

Project Description

The construction of a Mechanically Stabilized Earthen (MSE) perimeter berm is proposed as part of this Stage 1 Landfill Expansion application. The MSE berm will enable the vertical expansion of the landfill to be established and maintained within the existing facility boundary and enable excavation work to be done within the existing landfill footprint. For Stage 1, the berm will be constructed at the north side of the existing landfill cells 2A/2B and progress west to cell 3B. The north berm is likely to be constructed with a "step" berm on the outside to allow for utilities and SCMUA personnel and access. The berm will transition from the step design to a single berm as it wraps around and continues south along the west side of cell 3B. The MSE berm height will vary from approximately 10 to 17 feet above existing ground surface elevations.

Project Name, Number

Two Rivers Water Reclamation Authority
S340117-06
Sanitary Sewer System - New

Priority List Rank

1026

County

Monmouth

Existing Population

100,000

Service Area

The Two Rivers Water Reclamation Authority (TRWRA) collects and treats the wastewater from six Member Communities (Boroughs of Monmouth Beach, Oceanport, West Long Branch, Fair Haven, Little Silver, and Shrewsbury), six Customer Communities (Red Bank, Rumson, Sea Bright, Tinton Falls, Eatontown, Shrewsbury Township), and two portions of Fort Monmouth in Monmouth County, NJ under its NJPDES permit number NJ0026735. Service areas contain both residential and commercial properties. The population served by TRWRA totals 85,570, including both Member and Customer Communities. The project will affect the Oceanport Section of the former Fort Monmouth property that is served by TRWRA; the property is planned to be reused and redeveloped as a result of the base closing. The population of Oceanport is 5,832.

Need for Project

The project is needed because the existing pump stations and sanitary sewer lines have been determined to be in disrepair and improperly designed. There are no re-usable sections of the existing sanitary sewer system without replacement of a significant portion of the system and replacement of existing pump stations that are not needed if the system is designed properly.

Project Description

The Sanitary Sewer Conveyance System Installation project will result in a new and improved sanitary sewer system in the Oceanport Section of what was formerly known as Fort Monmouth in Monmouth County New Jersey to provide sanitary sewer service for future developers to connect to and for the existing buildings to remain. The project will provide the main components of the sewer system including the North Interceptor Southwest Interceptor New East Area Pump Station and Gravity Sewer Extensions to the existing pump stations to be abandoned.

Need for Project

This project will reduce green house gas emissions in several manners This project fueled by scrubbed landfill gas will destroy methane produced by the landfill. The generator fuel will be scrubbed of sulfur compounds siloxane compounds particulate matter and moisture thereby reducing these constituents to de minimis amounts. By generating two (2) megawatts of electricity the CMCMUA is supplying the need for two (2) megawatts of electricity that would otherwise be generated by fossil fueled plants. This project will result in benefits other than direct reductions of greenhouse gas emissions The engines will reduce atmospheric discharge by over 61000 metric tons of CO2 equivalents. Two (2) less megawatts of power will be necessary for other plants to generate. Sulfur compounds siloxane compounds and particulate matter will be also reduced from landfill emissions. Jobs are always maintained or created by construction expenditures. This project also provides added benefits As this project will not be eligible for net metering andor net metering criteria projects no other funding is currently available. This project can be easily replicated. We have had many visitors to our site to see how we have constructed our first electrical generating plant for their own plans for construction. All gas is metered and tested which will result in measurable data. The project is not only ready to proceed but has already completed the required feasibility studies by PJM and ACE. The CMCMUA has the experience and the capacity to complete this project as we have already constructed a three (3) engine 450 kw electrical generating plant which has been in operation since March 2007.

Project Description

This project will be to construct a two (2) megawatt generating plant at the Cape May County Municipal Utilities Authoritys (CMCMUA) Landfill and Recycling Complex. Landfill gas a renewable energy will be used as fuel for the engines. Since the landfill site is already generating enough electricity to be self sufficient there is no need for net metering and this additional generation will be sold back to the grid.

The service area is the entire County of Salem, New Jersey.

Need for Project

The landfill cell construction is needed to provide for the environmentally sound disposal of Salem County's solid waste in accordance with the County and State solid waste management policies and regulations. The landfill cell will include a double-composite liner system designed and constructed in accordance with NJDEP regulations and the SCIA solid waste facility permit to protect ground water and surface water quality.

Project Description

The project includes a 8.0 +/- acre landfill cell, which is one phase of a 31-acre landfill expansion. The landfill design includes a double composite liner system designed and permitted in accordance with NJDEP regulations.

Need for Project

A 105.4-acre site in Perth Amboy is contaminated as a result of widespread distribution of slag fill. The contaminants of concern are primarily arsenic antimony and lead.

Project Description

The proposed project includes soil and groundwater remediation of a 105.4-acre site. Remediation will consist of excavation and removal of select areas of slag materials in direct contact with groundwater targeted soil remediation for select areas with petroleum-related and PCB contaminants a reduction in groundwater flow through the site treatment of groundwater to reduce contaminant loading to Cranes Creek and implementation of site-wide engineering controls to minimize stormwater infiltration as well as direct contact with contaminated material.

Need for Project

The removal of silt from Colonial Lake improved the water quality of the lake provided rehabilitation of the overall stormwater management capability re-established fish habitation in the lake and enhanced the dissolved oxygen levels and increased the amount of aquatic biota. The silt was stockpiled on a 28.3 acre site. Environmental investigations of the stockpiled material have revealed the presence of polynuclear aromatic hydrocarbons at concentrations above the soil cleanup criteria requiring either removal or capping.

Project Description

The proposed project includes either the removal and off-site disposal of contaminated spoils or the capping of the spoils on-site or a combination of remedial activities.

Service Area

Residential and commercial properties which Lakewood Township Municipal Authorities provides water supply - eastern portion of Lakewood Township.

Need for Project

New meters will provide a more accurate measurement of water use for the residential and commercial properties, incentivizing conservation by users. It will also allow for real-time detection of water leaks, allowing faster response time and minimizing discharges of lost water.

Project Description

Lakewood Township Municipal Utilities Authority is looking to replace approximately 9044 water meters that supply residential and commercial properties within he MUA's service area. The new meters will provide a more accurate of reading of the water being used in the accounts, incentivizing water efficiency and water conservation efforts from users, and allow for centralized, real-time detection of leaks and unusual water use that allow for more rapid response, reducing water lost.

Salem

Existing Population

5,146

Service Area

The planning area consists of the entire City of Salem, located in the western part of Salem County. The City provides potable water to approximately 4,931 residential and commercial metered public customers.

Need for Project

The existing meters are approaching the end of their useful life and require replacement. The meters become less accurate with age and generally run slower. New meters will also enable the City to easily detect leaks within the distribution system and reduce labor costs for meter reads.

Project Description

The project involves the replacement of the existing water meters with an automatic meter read system. The existing meters are approaching the end of their useful life and require replacement. The meters become less accurate with age and generally run slower. The City is experiencing lost revenue as a result. New meters will also enable the City to easily detect leaks within the distribution system and reduce labor costs for meter reads. As part of this project, all commercial water meters will be replaced, in addition to a large portion of the residential water meters.

Need for Project

Stormwater Management - The proposed stormwater collection system collects and conveys the stormwater runoff from the site to four new outfalls discharging to Mill Pond. The proposed stormwater collection and conveyance system consists of approximately 4,000 linear feet of 15-inch high-density polyethylene (HDPE) pipe, 900 linear feet of 18-inch HDPE, 1,200 linear feet of 24-inch HDPE and 100 linear feet of 30-inch HDPE, as well as associated catch basins, manholes, scour holes and water quality treatment units (Vortechs by Contech, for 50% TSS removal) which are necessary to provide adequate stormwater management for the proposed project. In addition, approximately 13,700 linear feet of concrete curb and 31,200 square yards of asphalt pavement are required to convey stormwater runoff throughout the site. Stormwater Treatment - The project site is located on Mill Pond, upstream of Lake Farrington, which is drinking water supply source. Prior to discharge, the runoff is treated via stru

Project Description

(Carryover SFY2015) - This project proposes a mixed use of the old Michelin Tire Company site along Ford Avenue. The project will consist of 350 residential midrise apartments and townhouse units a restaurant 2000 square feet of retail space a residential club facility and leasing office including a town square and waterside pathways. The existing 12-inch sewer system on-site will be abandoned in-place and replaced with a new 12-inch PVC sanitary sewer main which will provide service to the buildings.

Water Efficiency / Water Meters

Priority List Rank

1039

County

Middlesex

Existing Population

50,814

Service Area

Service area is limited to the area within City limits only.

Need for Project

There is no water quality related with this project. This is to replace the existing water meters that are over 15 years old and have found many that are providing inaccurate reading. Additionally, the existing meters can very easily be tampered with. Both of this issues contribute to an inaccurate percent for unaccounted for water. The replacement of these meters will reduce the percent of unaccounted for water.

Project Description

The majority of the water meters installed in Perth Amboy have been in the system for at least 15 years. There has been complaints of high bill where the city has investigated the possible reason of the high bill and on many occasions has discovered that the meter is not registering accurately resulting in an adjustment to the customer's water bill. Additionally, it has been observed that the existing meters can be very easily tampered with allowing the customer use water that is not been registered by the meter and therefore increasing the percentage of unaccounted for water. To stop or at least reduce the stilling of water by tampering the meters, the city has decided to replace all of the meters with a meter that will prevent tampering with. The City will use the existing meter routes to divide the system and replace the water meters. The first section will be the south east section of town where most of the tampered meters have been found.

Service Area

The service area for the proposed project is coterminous with the Township boundary.

Need for Project

The proposed project is intended to replace aging meters with current technology that is in compliance with AWWA standards, as well as, assist the Township in tracking water usage and enhancing leak detection.

Project Description

The Township of Bloomfield proposes to replace their existing distribution system water meters that have exceeded their useful life with new water service meters. The proposed project will include disposal of the existing meters, installation of approximately 11,000 new water service meters throughout the Township, and installation of an Advanced Metering Infrastructure Network (AMI) system.

Water Efficiency / Water Meters

Priority List Rank

1041

County

Essex

Existing Population

38,509

Service Area

Various large users, primarily commercial district and medical facilities as well as interconnections

Need for Project

Montclair Water Bureau is a water purveyor for a population of 38,977 and over 10,000 customers. The efficiency of water meter readings is crucial to probably account for diverted water, peak usage and overall system performance. The accuracy of the water meters will facilitate accurate measure of usage and will incentivize user to implement water conservation measures. Further, water conservation will result in less waste and treatment. Finally, consideration of installation of meter pits close to the curb stop will further incentivize user to correct any service leaks occurring along their service line through the entire reach of the service line from the curb stop to the dwelling / business.

Project Description

Township of Montclair Water Bureau is interested to procure new water meters and bid installation for large users and interconnections. Pending location of meters, the Water Bureau may proceed with meter pit installation near the curb stop.

Need for Project

In order to leverage the investment in this technology, and harness the value drivers, it is critical to understand current and future utility operations, not just meter reading and billing. A key differentiation in our approach to this project is that we will perform both an operational assessment to determine functional objectives as well as a cultural assessment to ensure that the operational changes required to leverage and disseminate interval data through the enterprise will be possible. This will enable our OWW TEAM to begin with the end in mind.

Project Description

Providing for the replacement of water meters throughout the City with an advanced smart metering system consisting of communications network and data management systems. Pursuant to NJ DEP Violations NJAC 7:19-6.6; 7 The City of Orange Township current has (4,743) residential, commercial and industrial connections within the Municipal boundaries. OWW (Orange Water/SUEZ) intends to employ a comprehensive client-centric approach to the development of an AMR/AMI program based on leading industry knowledge and current operational insight (SUEZ Environmental). OWW will craft suitable program models using the industry's real-time technical knowledge regarding communication networks, system functionality, and device-specific capabilities. Working with our partners to determine the specific functional objectives for AMR/AMI, our goal will be to determine which technical solutions are feasible, specific performance criteria for procurement documentation, and redundancy.

Project Name, Number

South Orange Village
S340103-02
Water Efficiency / Water Meters

Priority List Rank

1045

County

Essex

Existing Population

16,316

Service Area

All customers serviced by the South Orange Water Utility. Area includes Seton Hall University (SHU) that has a daily population increase of five thousand and full time student residents of five thousand.

Need for Project

Project includes identification of lead service lines and planning for their replacement.

Project Description

The Township of South Orange Village installed water meters and transmitters need to be replaced as they are at the end of their useful life. As water meters age and mechanical parts wear, accurate accounting of water consumption diminishes. Over time, meters tend to slow down from wear and fail to transmit the consumption data due to transmitter battery failure. The impacts are lost revenue and providing manual reads. The majority of the South Orange meter inventory is approaching or at many locations past their useful life (average meter age is approximately 16.5 years). This situation avails South Orange the opportunity to implement AML a more efficient technology that collects intraday water consumption data. Water Utilities face mounting pressure to operate efficiently. This pressure is coupled with consumer expectations for accurate and timely bills, as well as data and insights to the customers' water usage helpful in water conservation and system management.

Service Area

The service area for the proposed phased construction contracts is coterminous with the Township boundary limits.

Need for Project

The proposed project is intended to replace aging meters with current technology that is in compliance with AWWA standards, as well as, assist the Township in tracking water usage and enhancing leak detection.

Project Description

The Township of Edison proposes to replace their existing distribution system water meters that have exceeded their useful life with new water service meters. The proposed replacement work will be divided into several phased construction contracts and will include disposal of the existing meters, installation of approximately 12,000 new water service meters throughout the Township, and installation of an Advanced Metering Infrastructure Network (AMI) system.

County

Ocean

Existing Population

100,000

Service Area

BTMUA provides approximately 100,000 residential, commercial, and light industrial customers in Brick Township and the Ramtown section of Howell Township with water service. This population also includes customers that are serviced via bulk sales to Point Pleasant Beach Borough, Point Pleasant Borough, and Lakewood Township. BTMUA serves all of Point Pleasant Beach Borough. BTMUA does not provide water service to the population located in the Barrier Island section of Brick Township. The planning area for the project includes BTMUA's entire water service area in the Township of Brick and the Ramtown section of Howell Township. The scope of the project includes the purchase of approximately 11,560 water meters and accessories for assembly. The water meters will replace-in-kind existing brass water meters at individual customer homes or within existing external meter pits. The funding request is for the purchase of the meters equipment only and not for installation.

Need for Project

The project's purpose is to purchase water meters that will replace existing, old water meters.

Project Description

The planning area for the project includes Brick Township Municipal Utilities Authority's entire water service area in the Township of Brick and the Ramtown section of the Township of Howell. The scope of the project includes the purchase of approximately 11,560 water meters and appurtenances. The meters will include the following sizes: 3/4-inch, 1-inch, 1-1/2-inch and 2-inch. The water meters will replace-in-kind existing brass water meters at individual customer homes or within existing external meter pits. The funding request is for the purchase of the meters equipment only and not for installation.

City of Linden

Need for Project

The redevelopment of the former GM Linden plant will result in significant improvement to the States water quality by both infrastructure improvements and site re-mediation activities. Infrastructure improvements will include creation of new and replacement of old storm water conveyances ensuring proper handling and transportation of storm water away from impervious surfaces and into the existing municipal system the installation of catch basins that will reduce TSS and sediment transport to surface water and complete replacement of the sanitary system that served the GM plant with new systems that will prevent infiltration of wastewater to groundwater. Site remediation activities will include re-mediation of groundwater contamination originating from the GM site excavation of contaminated soil and other sources of groundwater contamination and installation of engineering and institutional controls to protect water quality. Linden Development anticipates use of sustainable building components including solar panels and low TSS roofing to mitigate sediment runoff.

Project Description

Demolition environmental re-mediation new infrastructure and redevelopment of a shuttered General Motors Plant at 1016 W. Edgar Rd. (US Rte. 1 & 9) in Linden New Jersey. It is about 13 miles from Manhattan adjacent to a major thoroughfare. The site is approximately 102 contiguous acres in size and will be re-developed into mixed-commercial uses. This revitalization project will bring a significant number of sorely needed jobs to the area and will dramatically increase tax income for the City and the State. This project is fully supported by the City of Linden Mayors office and administrative office.

Need for Project

A former chemical site requires remedial measures to support brownfield development and provide significant environmental benefits. Placement of an impermeable cap along with installation of stormwater controls will ensure that rain water will not mobilize contaminants and pollute groundwater or the adjacent waterways.

Project Description

The proposed project includes clean-up of soils and groundwater installation of an impermeable cap and cover system installation of stormwater controls.

Need for Project

Reduce portable water usage by 8 million

Project Description

The turbines in the plant are at the end of their useful life and use an antiquated water injection system to reduce NOX, which is disallowed under current DEP rules. The turbines have become unreliable and fail regularly, requiring excess maintenance and repairs. Replacement will be required in the near term to maintain a functioning plant. The proposed project consists of: - Replace the 3 existing turbines with three (3) Solar Mercury 50 Turbines with Duct fired slant tube Heat Recovery Steam Generators with an increased capacity of 2.8MW - New Gas Compressor - New Controls and Connections - Switchgear - Alterations to accommodate installation of the larger sized turbines.

System-Wide meter replacement

Need for Project

System wide water meters have reached their anticipated useful life and are no longer meeting efficiency. Installation of new water meters, with radio read capabilities will enable accurate and timely meter readings that will in return, properly capture non-revenue / unaccounted for water and yield an anticipated decrease in water consumption.

Project Description

East Windsor MUA intends to procure new meters for system-wide replacements. The MUA is considering replacing the meters in-house or may consider to bid out the installation efforts pending SRF program eligibility. In addition, the MUA is interested to consider install of new meters at the curb stop with installation of a meter pit. This is contingent on eligibility of Energy and Water Efficiency Projects, PF packages. System wide water meters have reached their anticipated useful life and are no longer meeting efficiency. Installation of new water meters, with radio read capabilities will enable accurate and timely meter readings that will in return, properly capture non-revenue / unaccounted for water and yield an anticipated decrease in water consumption.

Service Area

The service area for the proposed phased construction contracts is coterminous with the Township boundary limits.

Need for Project

The proposed project is intended to replace aging meters with current technology that is in compliance with AWWA standards, as well as, assist the Township in tracking water usage and enhancing leak detection.

Project Description

The Township of Mahwah proposes to replace their existing distribution system water meters that have exceeded their useful life with new water service meters. The proposed replacement work will include disposal of the existing meters, installation of approximately 8,500 new water service meters throughout the Township, and installation of approximately 2,000 smart valves in large residential properties and/or commercial lots, as well as an Advanced Metering Infrastructure Network (AMI) system.

Need for Project

The Shackamaxon Lake has not been dredged since 1997. Since the sediment has accumulated in many areas to the point where it is above the surface elevation of the Lake. The Lake is no longer able to serve the purpose of sedimentation of pollutants prior to flowing downstream. Cleaning the Lake and restoring its storage capacity will increase the quality of the water flowing into the Middlesex Water Company Reservoir that is less than one mile downstream of the dam and will limit rainfall induced flooding downstream. Removing and replacing the inadequately sized bridges with properly engineered bridges will eliminate bank erosion around the bridges and will reduce the amount of silt accumulation in the storage volume from these areas.

Project Description

The proposed project includes dredging accumulated sediment that comes from upstream roads lawns and stream banks stabilization of eroded bank areas and removal and replacement of inadequately sized RCP pipe vehicand pedestrian bridges.

County

Ocean

Existing Population

21,650

Service Area

The service area is Manchester Township Water Utility's Eastern Service Area which is generally the eastern portion of the Township. It includes the areas east of Lakehurst, the military base (Joint Base McGuire-Dix-Lakehurst) and the Consolidated Rail tracks that lie just west of and parallel to State Highway Route 37 West as well as the proposed development area (approximately 1,000 acres) of the Heritage Minerals tract that lies to the west of the aforementioned Consolidated Rail tracks.

Need for Project

Consumer's water quality will be improved in those locations that water meters are being replaced since the existing water meters were manufactured long before the current standards were implemented. The current standards reduced the probability of lead leaching into water from drinking water system components including water meters.

Project Description

Install an automated water meter reading system capable of remotely reading meters without entering the properties at which they are located. Also, the project will include the replacement of meters that are beyond their expected service life.

Need for Project

The Riverview at Delaware Station development project will reinvigorate Phillipsburg. The area is contaminated. It has a Contaminated Historic Fill Chlorinated Solvent Impacted Soil and Ground Water TPHC Impacted Soil Impacted Subsurface Soil Gas Vapor Suspected Gasoline UST Abandoned Seepage Pit and Asbestos impacts.

Project Description

The project involves the remediation of an old railway train station and the building of 449 town house residential units on the site. The project seeks funding to embark on the remediation of the site as well as construction of storm water remediation systems and drinking water and waste water systems. The developers have done a storm water plan according to NJDEP storm water regulations. Storm water management will be achieved on the site through the use of a conventional storm water collection system of 8230 linear feet of reinforced concrete pipe and 66 storm water inlets. The collected storm water is routed through two detentioninfiltration basins and one retention basin before being discharged into the Delaware River. Through the review of local county and state regulatory agencies the system as designed meets the required regulatory design standards. This project has received all state county and municipal and DEP approvals based on current plans. The project involves a land remediation process. Areas needing remedial action include the Contaminated Historic Fill Chlorinated Solvent Impacted Soil and Ground Water TPHC Impacted Soil Impacted Subsurface Soil Gas Vapor Suspected Gasoline UST Abandoned Seepage Pit Closure Railroad Tie removal and disposal and Asbestos Removal. This involves a number of processes including Strip Topsoil - 1 depth General Excavation Fill compaction Rough Grade R.O.W. Landscape Berm Grading Detention Basin Grading Basin Topsoil Return Subgrade after utilities Fine grade topsoil return Rough Grade Open Space Truck in fill Excavation of loose material and Re-Install & Compact Material

Service Area

The service area for the proposed project includes the entire municipality.

Need for Project

Proposed project is intended to replace aging meters with current technology that is in compliance with AWWA standards, as well as, assist the Borough in tracking water usage and enhancing leak detection.

Project Description

The proposed project includes replacement of existing aging water meters with new SENSUS IPERL radio read smart point readers. The project will include disposal of the existing meters, installation of up to 3400 new water service meters throughout the Borough, and construction of a receiving base station (both hardware and software) to be located on the Borough's existing water tower in order to track water usage data. All replacement work will be done inside residential and commercial properties.

Water meters and pits will be installed at all residential dwelling units within the municipality.

Need for Project

This project will address the requirements of the previously issued water allocation permit.

Project Description

The Borough proposes to provide water meters in meter pits for every unmetered service connection within the Borough. The number of connections is approximately 1350. The Borough currently has 500 Sensus Meter installations. Ship Bottom has a shared service agreement with Stafford Township and the Township will install the 1350 meters over a 3 year period. Stafford & Ship Bottom also have a Cooperative Pricing System Agreement for meter pits and materials needed for the installation. Bid documents have been prepared and are included with this application.

Water Efficiency / Water Meters

Priority List Rank

1074

County

Atlantic

Existing Population

0

Service Area

This project will address system-wide water meter replacement

Need for Project

In efforts to properly track water usage across the system, new meters need to be installed. Current meters are beyond their useful life and water utility readings require manual checks and physical effort to get usage readings.

Project Description

Weymouth Township MUA is seeking financial assistance to replace water meters system-wide.

Need for Project

Remediation of this site will significantly improve the quality of the groundwater.

Project Description

This project is a Brownfield Redevelopment Project of a former manufacturing facility. The applicant proposes to remediate both soil and groundwater at the project site through soil excavation and in-situ treatment.

Need for Project

A redevelopment project in Teterboro will eliminate contaminated runoff and leachate from discharges to surrounding water bodies and groundwater that could adversely impact water quality in the project area. New sewer and stormwater infrastructure will eliminate an existing combined system.

Project Description

The proposed project includes construction of stormwater management controls and a sanitary sewer conveyance system.
