Camden County Municipal Utilities Authority Clean Water Project

Executive Summary

To qualify for annual State Revolving Fund (SRF) capitalization grants from US Environmental Protection Agency (USEPA), New Jersey Water Bank, a partnership between the New Jersey Department of Environmental Protection (DEP or Department) and the New Jersey Infrastructure Bank (I-Bank), must develop the Clean Water Intended Use Plan (IUP) document. The IUP provides information on how funds, available through the Water Bank, will be used to provide financial assistance for clean water projects and identifies State policies governing funding awards. Each Federal Fiscal Year (FFY) and corresponding State Fiscal Year (SFY) the Department develops the Clean Water IUP to reflect policy and program changes, available funds, and current funding packages. For FFY 2023 and SFY 2024, a Summary of Available Funding Packages is provided in the following table:

Summary of Funding Package Details

Clean Water Funding Packages	PF Share	PF Cap per Applicant	Projected PF Available	DEP Share (Loan w/ PF)	I-Bank Share
CSO LTCP ARPA Projects ¹	80%	No Cap	\$215M	90%	10%
CSO Abatement	50%	\$5M	\$30M ⁶	75%	25%
CSO Abatement/ Affordability Criteria ²	100% ⁵	\$5M	\$30M ⁶	75% Min	25% Max
Water Quality Restoration	50%	\$2.5M	\$8M	75%	25%
Affordability Criteria ³	100% ⁵	\$2M	\$36M	75% Min	25% Max
Energy and Water Efficiency Projects	50%	\$2M	\$20M	75%	25%
Overflow and Stormwater Grant (OSG) CW SRF PF Loans ⁴	20%	\$0.2M	\$2M	20%	-
Emerging Contaminants	100% ⁵	\$2M	\$9 M	75% Min	25% Max
Base CWSRF	-	-	-	50%	50%
Brownfield Redevelopment (Conduit/PPP)	-	-	-	25%	75%

1. When CSO LTCP ARPA principal forgiveness funds are exhausted, applicants may access financing available under other applicable CWSRF principal forgiveness and funding categories
2. CSO Abatement/Affordability project costs from \$10 million to \$20 million may be financed under the Affordability Criteria package. Costs over the caps may be financed under the Base CWSRF package.
3. CSO Abatement and CSO Abatement/Affordability cannot be stacked. CSO Abatement/Affordability and Affordability Criteria can be stacked, totaling the PF Cap at \$7M
4. OSG CW SRF PF Loans will be awarded to CWSRF projects that receive an Overflow and Stormwater Grant. The OSG will cover 80% of the project costs (project costs capped at \$1 million) and the OSG CW SRF PF Loan will cover 20% of the project costs. DACs are eligible to receive OSG grant funding for up to 100% of eligible project costs. Costs in excess of \$1 million may be eligible for funding and PF under the CSO Abatement or CSO Abatement/Affordability Criteria categories.
5. The first \$5 million of CSO Abatement/Affordability projects, the first \$2 million of Affordability Criteria projects, and the first \$2 million of Emerging Contaminants project will receive 100% principal forgiveness to the extent principal forgiveness funds are available.
6. \$5M set aside for CSO Green Infrastructure Projects

Highlights for SFY2024!

Enhanced Assistance to Environmental Justice and Disadvantaged Communities

Historically, New Jersey's low-income communities and communities of color have been subject to a disproportionately high number of environmental and public health stressors, including pollution from numerous industrial, commercial, and governmental facilities located in those communities and, as a result, suffer from increased adverse health effects including, but not limited to, asthma, cancer, elevated blood lead levels, cardiovascular disease, and developmental disorders.

Signed into law by Governor Phil Murphy on September 18, 2020, New Jersey's groundbreaking Environmental Justice Law, N.J.S.A. 13:1D-157, (Law) requires the New Jersey Department of Environmental Protection (NJDEP) to evaluate the contributions of certain facilities to existing environmental and public health stressors in overburdened communities when reviewing certain permit applications. The law also directs the NJDEP to publish a list of overburdened communities and provide notice to the 331 municipalities in which those communities are located. NJ Water Bank will continue to use the Affordability Criteria developed last year which better aligns the Clean Water Affordability Criteria with the Drinking Water Disadvantaged Community criteria and the Environmental Justice Law's **economic criteria** for overburdened communities. For projects sponsored by borrowers that meet the new Clean Water Affordability Criteria, the CWSRF will set aside \$36 million in principal forgiveness for eligible clean water projects (capped at \$2 million per applicant), \$30 million for Combined Sewer Overflow (CSO) Abatement projects (capped at \$5 million per applicant), and \$86 million (40% of available funds) for CSO LTCP (ARPA) projects.

To ensure the current historic level of funding reaches disadvantaged and overburdened communities, the Water Bank Program has expanded technical assistance (previously directed a small drinking water systems). The expanded Technical Assistance programs are designed to deploy early engineering and engagement assistance to communities that meet the Department's Affordability Criteria, overburdened communities identified on the list maintained by the Department pursuant to the Environmental Justice Law, N.J.S.A. 13:1D-159 (2021), and small and rural communities as defined by the USEPA. This assistance will help these communities understand the funding that is available, particularly principal forgiveness funds, refine their water infrastructure needs, facilitate communications within their communities, and navigate the Water Bank application and permitting process.

As further incentive for disadvantaged communities to take advantage of Technical Assistance opportunities available through the Water Bank, the program is authorized to utilize up to \$40 million of the funds appropriated and reappropriated to the department for the capital construction of drinking water and clean water infrastructure by the State fiscal year 2024 appropriations act for project loans to disadvantaged communities participating in the department's technical assistance program. This will provide assurance to disadvantaged communities that funding will be available for their project when they complete the planning and design process.

The Water Bank is also authorized to utilize up to \$40 million of the funds appropriated and reappropriated to the department for the capital construction of drinking water and clean water infrastructure by the State fiscal year 2024 appropriations act for principal forgiveness loans to disadvantaged communities for planning and design costs associated with clean water or drinking water environmental infrastructure projects. This program is currently being developed and will launch during SFY2024.

An online [Technical Assistance Request Form](#) is currently available on our Water Infrastructure Investment Plan (WIIP) webpage. Available technical assistance includes:

- Asset Management Plan Development
- Technical, Managerial, and Financial Capacity Evaluation
- Capital Improvement Plan Development
- Lead Service Line Inventory Development

- Lead Service Line Replacement Law Compliance Assistance
- Lead Service Line Replacement Program Creation and Implementation
- Drinking Water Infrastructure Project Development
- Clean Water Infrastructure Project Development
- State Revolving Fund Loan Application Submittal Assistance
- Preliminary Technical Assistance (needs and fiscal assessments and public outreach)
- Early education and public engagement services

45-Year Loan Terms for CSO Projects

The Department is committed to working with Combined Sewer Overflow (CSO) communities to implement projects that reduce or eliminate CSOs. CSO projects include, but are not limited to, CSO conveyance, CSO storage basins, green or grey infrastructure that reduces the quantity of storm water runoff into the CSO system and sanitary sewer pipes associated with separating storm and wastewater sewers.

New Jersey finds itself at a significant juncture, where the implementation of huge environmental infrastructure improvement projects, particularly for Combined Sewer Overflow abatement projects (CSOs), coincides with ever-increasing project construction and materials costs and delays. This confluence creates a serious affordability problem particularly for the disadvantaged and marginalized communities in the State that are most often impacted by the need for these projects. New Jersey communities, facing some of the most expensive capital improvements in their history, are bumping up against the limits of affordability. The Water Bank is addressing the issue of affordability with financing program innovations which include a low-cost short-term construction loan program, utilization of the WIFIA Loan Program, prioritized ranking, lower loan rates for CSO projects, and the dedication of federal ARPA funds to increase principal forgiveness opportunities for CSO projects within communities that meet the Department's Affordability Criteria.

EPA has approved extended term financing to CSO projects for up to 45 years and projects financed with proceeds of a WIFIA loan with a term up to 35 years. Offering extended term financing for these projects addresses affordability concerns by reducing each repayment amount.

Climate Change

New Jersey is already experiencing many of the impacts of climate change such as increasing temperatures, rising sea levels, and more frequent and intense storms. In July 2019, Governor Murphy signed into law amendments to the Global Warming Response Act (GWRA) reaffirming New Jersey's commitment to climate action. First passed in 2007 and since amended to enhance the state's response, the GWRA introduced a fixed goal of reducing greenhouse gas emissions by 80% from their 2006 levels by 2050.

To further the goal of reducing greenhouse gas emissions, the Department will set aside \$20 million in principal forgiveness for borrowers implementing projects that address water or energy efficiency (capped at \$2 million per applicant) as defined in [USEPA's Green Project Reserve Guidance](#).

Projects implementing climate resilience measures will receive an additional 100 priority points if the resilience components represent a significant amount of the overall project activities. See Eligible Projects to learn what kinds of projects qualify.

Projects that implement green infrastructure, water, or energy efficiency improvements (including projects that are designed to reduce greenhouse gas emissions) will receive an additional 50 priority points if the green components represent a significant amount of the overall project activities.

The Department has published “[Building Resilient Water Infrastructure, Climate Change Resilience Guidance for New Jersey’s Clean Water & Drinking Water State Revolving Funds](#)”. This document establishes climate impact standards to assess resilience of project alternatives and include resilience as a consideration within the alternatives analysis, which are required elements for new projects seeking State funding through the Water Bank, beginning SFY 2024. The guidance is informed by data in the following reports and documents:

- [2020 New Jersey Scientific Report on Climate Change](#)
- [Sea Level Rise Guidance for New Jersey](#)
- [State of New Jersey Climate Change Resilience Strategy](#)

Projects implementing climate resilience measures will receive an additional 100 priority points if the resilience components represent a significant amount of the overall project activities. Resilience measures for wastewater, and stormwater infrastructure projects must apply the best available and most geographically relevant climate information, projections, and standards.

Build America Buy America (BABA)

Congress passed BABA in 2021 concurrently with the BIL. For SRF recipients, BABA expands existing American Iron and Steel (AIS) domestic preference requirements to include construction materials and manufactured products. The Department recognizes this is a new and complex provision, and we will work closely with project sponsors and the USEPA to provide appropriate guidance, technical assistance, and training.

American Rescue Plan Act (ARPA) Funds

New Jersey’s SFY 2023 budget allocated \$300 million of ARPA funds to the Department to make transformative investments in critical water infrastructure upgrades. The Department will use approximately \$250 million of this allocation to make principal forgiveness loans to applicants sponsoring eligible Combined Sewer Overflow (CSO) projects listed on CSO Long Term Control Plans (LTCP) submitted to the Department. The Department awarded approximately \$35 million of the ARPA funds to clean water projects in SFY 2023, leaving a carryover of \$215 million for award in SFY 2024. The ARPA funds must be obligated to projects through funding agreements executed before December 31, 2024, and all funds must be disbursed to project sponsors by December 31, 2026. Therefore, these funds will be awarded to eligible CSO LTCP projects on a readiness to proceed basis.

Approximately \$45 million of the ARPA allocation will be used to make principal forgiveness loans to applicants sponsoring DWSRF projects that address climate change concerns and to ensure long-term drinking water resilience in New Jersey or projects for the installation of treatment to address multiple Maximum Contaminant Level (MCL) violations at one system as described in the SFY 2024 Drinking Water State Revolving Fund Intended Use Plan.

The remaining funds of approximately \$5 million are set aside for: (1) Projects that address contaminants in private residential wells; (2) Public Water System assessment, planning and design efforts which are likely to lead to the implementation of Drinking Water SRF eligible capital improvement projects; and (3) Water and Wastewater System 360-Degree Assessments that are expected to result in the identification and implementation of eligible Clean Water and Drinking Water State Revolving Fund capital improvement projects.

Bipartisan Infrastructure Law (BIL) Funds

On November 15, 2021, President Joe Biden signed the Infrastructure Investment and Jobs Act (IIJA), or the Bipartisan Infrastructure Law (BIL), which DEP estimates could provide nearly \$1 billion in funding over the law’s five-year

appropriation to New Jersey's Clean Water and Drinking Water SRFs. For SFY 2024, New Jersey's SRFs expect a total allocation of \$227.8 million, which includes \$93.9 million for the Clean Water SRF and \$133.9 million for the Drinking Water SRF. The SFY 2024/FFY 2023 Clean Water SRF BIL funds will be awarded in two separate capitalization grants, one estimated at \$85.2 million to be used for any eligible clean water project (CW BIL SUPP) and the other estimated at \$8.7 million to be used for projects that address emerging contaminants (CW BIL EC).

Program Description

Program Goals

Short-term:

- Provide funding to needed, construction ready, highly ranked water quality improvement projects.
- Incorporate resilience guidance using the best available and most geographically relevant climate information, projections, and standards in evaluating the technical, environmental, and financial feasibility of proposed projects.
- Provide CWSRF financial incentives and technical assistance to disadvantaged communities with the goal of meeting the Justice40, government-wide initiative to facilitate the delivery of 40 percent of overall benefits of relevant federal investments to disadvantaged communities.

Long-term:

- Provide capital for clean water infrastructure renewal to protect public health and the environment for multiple generations of New Jersey citizens;
- Continue serving as the Garden State’s premier source of environmental infrastructure financing through self-sustaining, efficient, and transparent programs;
- Establish and efficiently manage a permanent source of funding for clean water infrastructure projects;
- Provide project financing at a much lower cost than program participants could achieve individually thereby passing substantial savings on to New Jersey taxpayers and rate payers; and
- Increase access to capital markets for those participants that find it difficult or expensive on their own, due to lower credit ratings or a lack of familiarity with debt financing.

Short-Term and Long-Term Loans

All projects are encouraged to secure short-term loans at the time of execution of an engineering design contract for the entirety of the project (planning, design, and construction). Funding will be committed upon certification of each operable segment and satisfaction of the program’s credit worthiness standards. Such loans are currently available for terms of up to 5 full fiscal years. At the time a project is at or near construction completion, long-term financing will be issued. For short-term loans issued upon certification of engineering contracts, long-term financing terms are established consistent with the IUP operative at the time of certification of the construction contract. For short-term loans issued at the time of certification of construction contracts, long-term financing terms are established consistent with the IUP operative at the time of short-term loan closing. For applicants financing the cost of construction through non-Water Bank sources or self-funding, long-term financing terms are established consistent with the IUP operative at the time of the long-term loan closing.

Loan Issues Upon	Applicable Financing Term Year
Certification of engineering contract	Date of certification of construction contract*
Certification of construction contract	Date of construction loan closing

*If a project has multiple operable segments, various financing year terms may apply to a single project loan which are set at the time of each contract certification.

Application

All applications are submitted on the H2LOans website (<https://www.h2loans.com/home>). For security reasons, the project sponsor's authorized official will need to call the I-Bank at 609-219-8601 to create an H2LOans account. The authorized official can then designate a project manager (authorized representative) to submit required information. Rolling applications are being accepted any time of the year.

H2LOans Tutorial Video (https://www.youtube.com/watch?v=UgDDV_SyqL0)

Loan Awards

Loan awards for new projects will be made in SFY24 in accordance with N.J.A.C. 7:22-3, 4, 5, and 9 (<http://www.nj.gov/dep/dwq/722.htm>). The loan term will generally be 30 years and in some project circumstances, the Water Bank may consider loan terms of up to 45 years. In either case, the loan term cannot exceed the useful life of the project.

Local government units are required to meet the technical, administrative, and environmental provisions of the rules of DEP and the I-Bank (N.J.A.C. 7:22-3, 4, 5, 8, 9, and 10 <http://www.nj.gov/dep/dwq/722.htm>). Disbursement and loan repayment provisions must be consistent with the rules.

DEP & I-Bank Fee

In accordance with the USEPA Policy on Fees Charged on Assistance Provided Under the SRF Programs, states must disclose information regarding the assessment and use of any fees associated with SRF activities that are passed on to the program participants. In New Jersey, DEP reserves 0.5% of the CWSRF loan portfolio to cover a portion of the administrative costs of the program. In addition, the annual legislation for the SFY 2006 Program established a "Department Loan Origination Fund" that is administered by the I-Bank. DEP now has a stable fixed fee of 2% of the project costs. No SRF funding is involved in DEP's loan origination fee. DEP's loan origination fee is not included in the principal amount of the CWSRF loan and is accounted for separately.

The I-Bank's loan is issued at the same market interest rate as the I-Bank obtains from the sale of its bonds. Rather than bonding for the eligible closing costs associated with each financing, the I-Bank charged the borrowers a one-time charge of 0.1% of the principal I-Bank loan amount to partially cover the costs associated with that particular series' bond issuance expenses. These costs include such activities as: bond counsel, financial advisor, rating agencies, printing and publishing of the Notice of Sale, the Preliminary Official Statement, the Official Statement, and other costs related to the I-Bank's bond sale. In addition, the I-Bank will charge long-term SFY2024 Borrowers an administrative fee of up to 0.17% per annum on the total original loan amount. This fee will be uniformly applied annually to all Borrowers receiving loans in the SFY2024 Financing Program for the duration of each loan. Administrative fees of .15% of the total original loan amount collected from Borrowers of all financing program years may be utilized to fund the I-Bank's activities as enumerated in the SFY2024 operating budget, or provide loans, credit collateral, or match funds for the Program as appropriate or needed. The balance of the administrative fees collected (up to .02% of total original loan amount) shall be set aside and dedicated to assist communities that meet the environmental justice economic overburdened community or affordability criteria with early technical assistance to develop and support the success of capital projects. The I-Bank's annual administrative fee is not included in the principal amount of the loan and is held in an account outside of the SRF. Changes to the I-Bank's fee annual structure is subject to all applicable approvals and publication in the SFY 2024 Financial Plan in May of 2023.

Use of Water Infrastructure Finance and Innovation Act (WIFIA) Funds

The I-Bank intends to use WIFIA loan funds in lieu of a portion of the funds the I-Bank would otherwise secure through the issuance of tax-exempt bonds. Use of WIFIA loan funds offers several potential advantages over tax-exempt bonds, including lower interest rates, call options, and structuring flexibility. All borrowers in the pool of projects

financed with WIFIA loan funds would still receive a long-term loan package with a blended interest rate no greater than if the I-Bank used its AAA market rate bonds for its portion of project financing as described in the applicable IUP.

Interest Subsidy Loans

In addition to the WIFIA funds discussed above, the I-Bank may also leverage a portion of funds appropriated to the Department to create additional SRF savings for the Department by blending the appropriated funds into loan packages for the I-Bank's portion of project financing. All borrowers receiving these appropriated funds in their loan packages would still receive a long-term loan package with a blended interest rate no greater than if the I-Bank used its AAA market rate bonds for its portion of project financing as described in the applicable IUP.

Borrower Eligibility

Owners of publicly owned treatment works (towns, boroughs, municipal utilities authorities, counties, regional water authorities, other local government units) with projects that help protect, maintain, or improve water quality are eligible for participation in the Water Bank. Private entities are eligible through public conduit borrowers. Project sponsor eligibility has also been expanded to private colleges and universities that are interested in sponsoring nonpoint source pollution projects. Project sponsors must satisfy the I-Bank and State of New Jersey creditworthiness standards to receive funding.

Project Eligibility

Wastewater

Most projects associated with sewage collection, treatment, or disposal are eligible for financing, including correction of inflow/infiltration problems, sludge management and CSOs. Eligible projects include:

- Secondary and advanced wastewater treatment
- Well Sealing, Water Meters (publicly sponsored)
- Sludge handling facilities
- Infiltration and inflow (I/I) correction
- Interceptors, pumping stations, and force mains
- Sewer system rehabilitation
- New collection systems
- Correction of CSOs
- Solutions for malfunctioning septic systems
- Wastewater reuse and conservation projects
- Emergency Repair Projects that have been reported to the NJDEP Hotline to replace, in kind, the failure of an essential portion of a wastewater system and poses a substantial threat to the public health, safety, and welfare. A record of NJDEP Hotline contact is required to maintain project eligibility.
- Climate Resilience for Treatment Works
 - Relocation/elevation of certain assets or entire facility above current/projected flood stage
 - Installation of flood attenuation, diversion, or retention infrastructure within or beyond the footprint of a treatment works that protects the treatment works including floodwater channels/culverts, green infrastructure, and natural systems capable of mitigating a storm surge (e.g., barrier beach and dune systems, tidal wetlands, and living shorelines)
 - Saltwater resistant equipment/components
 - Backup generators and fuel transport and storage tanks
 - Portable pumps
 - Physical hardening of electrical systems/equipment
 - Dry floodproofing of structures
 - Elevated walls/caps for treatment tanks
 - Installation of redundant equipment/components
 - Overflow tanks/tunnels

For information regarding permitting, see:

NJPDES Additional Information (www.nj.gov/dep/dwq/njpdess.htm)

NJDEP Treatment Works Approval program (www.nj.gov/dep/dwq/forms_twa.htm)

NJDEP Land Use Program (www.nj.gov/dep/landuse)

Stormwater

Eligible projects include construction, expansion, or replacement of stormwater management systems, including the following:

- Non-point Source Pollution/Stormwater management
- Construction of regional basins
- Major stormwater system rehabilitation
- Replacement of existing storm drains
- Rehabilitation of tide gates
- Extension of outfall points
- Runoff control (stream bank stabilization/ restoration)
- Stream/lake embankment restoration
- Salt dome construction

Borough of Carteret Stormwater Resiliency Project

For additional information, see: NJDEP

Stormwater Links (<https://www.nj.gov/dep/dwq/fd.htm>)

Green Infrastructure

Green projects are clean water projects that incorporate green infrastructure and water or energy efficiency improvements* (those that reduce greenhouse gas emissions, for example). Green infrastructure includes such practices as replacing existing pavement with porous pavement, utilizing bioretention, renewable energy, constructing green roofs, creating rain gardens, and other practices that restore natural hydrology and treat stormwater runoff through infiltration into the subsoil, treatment by vegetation or soil, or stored for reuse.

Hoboken City Clean Water Project, Southwest Park & Underground Retention System

*Water Bank eligibility for energy efficiency improvements is limited to the pro rata share of capital costs that provide power to a publicly owned treatment works.

For additional information, see:

Green Infrastructure in New Jersey

(www.nj.gov/dep/gi/index.html)

NJDEP Sustainability and Green Energy Guidance

(<https://www.state.nj.us/dep/ages/what-is-solar.html>)

Brownfields

The cleanup of abandoned and contaminated industrial sites is eligible for financing if a local or county government assumes the repayment obligation for the loan. The Water Bank will finance the removal of contaminated soil, site-capping, and the installation of stormwater controls.

Returning Brownfield sites to productive use protects and improves water quality and preserves open space. Every acre of Brownfield redevelopment spares 4.5 acres of pristine land from development. Brownfield redevelopment also boosts local tax revenue, creates jobs, revitalizes New Jersey's cities and towns, and improves the quality of life for area residents. The Water Bank provides loans to municipalities, counties, and public authorities to support a wide range of cleanup and remediation activities necessary to restore the Brownfield site for re-use.

For additional information, see: NJDEP Site Remediation Links (www.nj.gov/dep/srp/)

Landfills

Construction activities at landfills that have a water quality benefit are eligible for Water Bank financing. Examples include:

- Capping systems
- Liners
- Leachate collection systems
- Treatment systems
- Sewer connections
- Barge shelters
- Containment booms
- Litter fences
- Gas collection and treatment systems
- Monitoring wells
- Reclamation or reduction activities

Land Preservation

The Water Bank provides financing for the preservation of open space and farmland given the water quality benefit achieved through such acquisitions. The Program funds preservation of properties to protect stream headwaters and corridors, wetlands, and aquifer recharge areas. Financing for land is compatible with the Green Acres Program, the Garden State Preservation Trust, and Open Space programs financed by local and county Open Space taxes.

Although lands purchased through the Water Bank for preservation as part of Open Space cannot be developed, they may be used for passive recreational activities, such as hiking, fishing, and horseback riding. Placement of conservation easements on funded parcels is a requirement, which assures that the water quality benefits are preserved in perpetuity. The Water Bank will coordinate with the Green Acres Program, when appropriate, to maximize a community's limited open space funds for land acquisition. Through this partnership, municipalities can receive additional resources to facilitate the purchase of larger and/or more expensive parcels.

For additional information, see:

NJDEP Green Acres Program (www.nj.gov/dep/greenacres/)

Camden County Phoenix Park replaces former landfill

Equipment Purchase

Equipment that provides a water quality benefit can be financed under the Water Bank, including but not limited to:

- Street sweepers
- Generators
- Sewer flushing and cleaning equipment
- Dump trucks
- Crawler loaders
- Skimmer boats
- Aquatic weed harvesters
- Outfall netting

Security Monitoring

Projects designed to improve security at otherwise funding-eligible wastewater facilities are eligible, including but not limited to:

- Fencing
- Lighting
- Motion detectors
- Cameras
- Secure doors
- Alternative auxiliary power sources

Miscellaneous Allowable Costs

Miscellaneous allowable costs associated with above referenced eligible stand-alone projects include:

- Pavement restoration
- Utility relocation
- Site grading
- Purchasing land to utilize for stormwater management

Toms River Municipal Utilities Authority Equipment Purchase

Milltown Borough Electrical Substation Relocation

Planning and Emergency

Asset Management Plans

Projects to develop and implement asset management plans (AMP) are eligible for financing. The AMP loans must be rolled into a Water Bank capital improvement project or repaid in 2 years. Long-term financing terms are established consistent with the Intended Use Plan operative at the time of certification of the construction contract(s).

NJDEP Asset Management Program (www.nj.gov/dep/assetmanagement/)

NJDEP Asset Management Guidance and Best Practice (www.nj.gov/dep/watersupply/pdf/guidance-amp.pdf)

Long-Term Control Plans

The Long-Term Control Plan (LTCP) is a system wide evaluation of the sewage infrastructure, and the hydraulic relationship between the sewers, precipitation, treatment capacity and overflows. As part of the LTCP, the permittee must evaluate alternatives that will reduce or eliminate the discharges and develop a plan and implementation schedule to do so. LTCPs are created to identify the most cost-effective manner to regulate CSOs to meet water quality standards. The permittee must establish a public participation process that actively involves the affected public throughout the process. The LTCP is submitted to the DEP.

NJDEP Combined Sewer Overflow (<https://www.nj.gov/dep/dwq/cso.htm>)

Planning & Design Loans

The Program also offers short-term loans to cover the costs associated with planning and design of a water infrastructure project. Eligible costs include engineering fees, surveys, environmental or geological studies, and other costs related to project plan preparation. The loans must be rolled into a Water Bank capital improvement project or repaid in 2 years. Long-term financing terms are established consistent with the Intended Use Plan operative at the time of certification of the construction contract.

SAIL

The Statewide Assistance Infrastructure Loan (SAIL) program is a disaster relief loan program designed for project sponsors that anticipate receiving FEMA or other federal disaster relief grants. The SAIL program's goal is to provide timely and cost-effective funds, in advance of federal reimbursements, to expedite and support the impacted communities' recovery and rebuilding of environmental infrastructure. SAIL finances projects within a declared disaster area to rebuild water systems directly impacted by a declared disaster as well as costs associated with improving the resiliency of Clean Water and Drinking Water systems.

Funding packages

Principal Forgiveness Funds

The Department expects to use the maximum amount available for principal forgiveness (PF), or grant like funding, utilizing SRF monies subject to federal restrictions. The Department plans to utilize approximately \$72 million of unallocated CWSRF PF carried over at the end of SFY 2023 as PF in SFY 2024 for categories set forth in this IUP. The Department will supplement the carried over PF funds with approximately \$12 million projected to be available under the FFY 2023 CWSRF Base grant (CW Base FFY23). In addition to the FFY 2023 CW Base grant, the Department will receive authority to award approximately \$51 million in additional PF made available by the Bipartisan Infrastructure Law (BIL). The BIL will provide PF of approximately \$42 million for eligible clean water projects under the FFY 2023 CWSRF General Supplemental grant (CW BIL GEN) and approximately \$9 million in funds and PF authority for projects that address emerging contaminants under the FFY 2023 CWSRF Emerging Contaminants grant (CW BIL EC). Funds and PF authority available from the grant awards will be blended with carryover PF authority from prior grants (CW Base Prior), CWSRF repayments and state match funds, and other sources of CWSRF funds to provide funding to eligible projects.

In addition to the Clean Water State Revolving Fund PF described above, \$250 million of American Rescue Plan Act (ARPA) funds were allocated to the Department in SFY 2023 for water infrastructure will be used to provide PF loans to applicants sponsoring capital improvement projects listed on Combined Sewer Overflow (CSO) Long Term Control Plans (LTCP) submitted to the Department. The Department awarded approximately \$35 million of the ARPA funds in SFY 2023 and will carry over approximately \$215 million for award in SFY 2024. If a sufficient number of CSO LTCP projects are not able to proceed to contract award and project certification by December 31, 2024, the Department may use the remaining ARPA funds to finance portions of other PF loan funding packages described in this Intended Use Plan in order to utilize the entire amount of Clean Water ARPA allocation.

The Department may increase any amounts identified in the IUP reserved for PF and adjust any caps if additional SRF or non-SRF funds (including Natural Resource Damages (NRD) funds recovered by the State, Corporate Business Tax (CBT) diesel funds, and ARPA funds) are allocated to the program to supplement principal forgiveness or low-cost loan funding. In addition, the Department may bank any non-SRF financing towards future State Match requirements subject to EPA approval.

SFY 2024 Clean Water principal forgiveness funds will be reserved as follows:

SFY24 Funding Packages and PF Opportunities

Base CWSRF

The Base CWSRF funding package for SFY24 consists of loan funding with a blended interest rate of 50% of the I-Bank AAA Market Interest Rate for the allowable project costs.

DEP Loan Share (No Interest)	I-Bank Loan Share (AAA Market Rate)
50%	50%

Combined Sewer Overflows (CSOs)

CSO Long Term Control Plan Projects (American Rescue Plan Act (ARPA) Funds)

The DEP is allocating \$215 million in ARPA funds to help off-set the substantial costs communities face to implement Combined Sewer Overflow (CSO) Long Term Control Plans (LTCP). The DEP is reserving funds and providing principal forgiveness loans for projects identified on a CSO LTCP submitted to the Department. The DEP will use ARPA funds to provide project sponsors principal forgiveness loans for up to 80% of allowable costs and low interest loan funding with a blended interest rate of 50% of the I-Bank AAA Market Interest Rate for the balance of allowable project costs. Due to the high costs associated with these projects **there will not be a forgiveness cap for projects in this category**. Principal forgiveness funds will be allocated to CSO LTCP projects on a readiness to proceed basis.

Funding Package for CSO LTCP ARPA

Principle Forgiveness (No Cap) 80%	DEP Loan Share (No Interest) 10%	I-Bank Loan Share (AAA Market Rate) 10%
--	--	---

CSO LTCP ARPA projects must have implementation schedules that meet the deadlines for ARPA fund obligation (December 31, 2024) and disbursement (December 31, 2026). Project schedules must show the ability to award all contracts and close on a short-term funding agreement before December 31, 2024, and complete construction before December 31, 2026. When CSO LTCP ARPA principal forgiveness funds are exhausted, applicants will be able to access financing available under other applicable CWSRF principal forgiveness and funding categories. The Department is reserving 40% of the CSO LTCP ARPA principal forgiveness funds or \$86 million to project sponsors that meet the CWSRF Affordability criteria. If there is insufficient demand from eligible CSO LTCP ARPA sponsors that meet the affordability criteria in SFY24, unallocated funds may be awarded to CSO LTCP ARPA project sponsors that do not meet the CWSRF Affordability criteria.

CSO Abatement

The DEP is reserving funds and providing principal forgiveness loans for CSO abatement (CSO) projects utilizing grey and/or green practices (such as green roofs, rain gardens, porous pavement, and other activities that maintain and restore natural hydrology by treating stormwater runoff through infiltration into the subsoil, treatment by vegetation or soil, or stored for reuse). Principal forgiveness funds will be allocated to CSO Abatement projects on a readiness to proceed basis. Project sponsors are eligible to receive principal forgiveness for up to 50% of allowable costs and loan funding with a blended interest rate of 50% of the I-Bank AAA Market Interest Rate for the balance for the first \$10 million of allowable project costs. There is a total applicant principal forgiveness cap of \$5 million for CSO Abatement projects and CSO Abatement/Affordability projects in SFY24. For example, an applicant awarded \$5 million under the CSO Abatement/Affordability category would be limited by the cap and

Principle Forgiveness (\$5M Cap) Up to 50%	DEP Loan Share (No Interest) 25%	I-Bank Loan Share (AAA Market Rate) 25%
--	--	---

Project Cost	Principle Forgiveness	DEP Loan Share (Interest Free)	I-Bank Loan Share (AAA Market Rate)
First \$5M (CSO)	\$5M	\$2.5M	\$2.5M
Next 5M (Base)	\$0M	\$2.5M	\$2.5M
Total (\$15M)	\$5M	\$5M	\$5M

not eligible for additional principal forgiveness under the CSO Abatement principal forgiveness category in SFY24. Allowable project costs over \$10 million will receive loan funding at the Base CWSRF rate. A total of \$30 million in principal forgiveness will be available for CSO Abatement projects in SFY24 of which \$5M will be reserved exclusively for green infrastructure. If there is insufficient demand from eligible green infrastructure projects, in SFY24, unallocated funds may be used for CSO abatement projects that do not employ green infrastructure.

Funding Package for CSO Abatement with PF up to \$10M

Example: A \$15M CSO Abatement Project would receive the following package:

When the PF funds allocated to CSO Abatement projects in SFY24 are no longer available, the CWSRF funding package for CSO Abatement projects will consist of loan funding with a blended interest rate of 25% of the I-Bank AAA Market Interest Rate for the first \$10 million in allowable costs. Costs in excess of \$10 million will be financed under the Base CWSRF financing package below.

Funding Package for CSO Abatement with no PF funds up to \$10M

CSO Abatement/ Affordability

The DEP is reserving additional funds and providing additional principal forgiveness loans exclusively for CSO abatement projects in communities that meet the CWSRF Affordability Criteria. Principal forgiveness funds will be allocated to CSO Abatement/Affordability (CSO/A) projects on a readiness to proceed basis. Project sponsors are eligible to receive 100% principal forgiveness for the first \$5 million of allowable project costs and loan funding with a blended interest rate of 50% of the I-Bank AAA Market Interest Rate for allowable project costs between \$5 million and \$10 million. The DEP Fee is waived for the principal forgiveness portion of CSO/Affordability loans. There is a total applicant principal forgiveness cap of \$5 million for CSO Abatement projects and CSO Abatement/Affordability projects in SFY24. For example, an applicant is awarded \$5 million under the CSO Abatement/Affordability category would be limited by the cap and not eligible for additional principal forgiveness under the CSO Abatement principal forgiveness category in SFY24.

Funding Package for CSO Abatement/Affordability with PF for the first \$5M

Funding Package for CSO Abatement/Affordability with PF between \$5M and \$10M

A total of \$30 million in principal forgiveness will be available for CSO Abatement/Affordability projects in SFY24 of which \$5M will be reserved exclusively for Green Infrastructure. If there is insufficient demand from eligible green infrastructure projects, in SFY24, unallocated funds may be used for grey infrastructure. Applicants under this category meet the CWSRF Affordability Criteria and will also qualify for principal forgiveness and financing under the Affordability Category. For SFY24, eligible borrowers will be able to stack the Affordability principal forgiveness package (subject to availability and the applicable Affordability cap) on top of the CSO Abatement/Affordability package for allowable project costs between \$10 million and \$20 million. Allowable project costs over \$20 may receive loan funding at the Base CWSRF rate.

When the PF funds allocated to CSO Abatement/Affordability projects in SFY24 are no longer available, the CWSRF funding package for CSO Abatement/Affordability projects will consist of loan funding with a blended interest rate of 25% of the I-Bank AAA Market Interest Rate for the first \$10 million in allowable costs. Qualifying project sponsors may also elect to take advantage of the Affordability principal forgiveness package if funding is available in that category. Allowable CSO Abatement/Affordability project costs over \$10 million may be financed at the Affordability financing package rate. Allowable project costs over \$20 million will be financed under the Base CWSRF financing package.

Funding Package for CSO Abatement/Affordability with no PF up to \$10M

Example: A \$12M CSO Abatement/Affordability project would receive the following package when making use of their Affordability eligibility to stack the Affordability package on top of the CSO Abatement/Affordability package:

<i>Project Cost</i>	<i>Principle Forgiveness</i>	<i>DEP Loan Share (Interest Free)</i>	<i>I-Bank Loan Share (AAA Market Rate)</i>
First \$5M (CSO/A)	\$5M	\$0M	\$0M
Next 5M (CSO/A)	\$0M	\$2.5M	\$2.5M
Next \$2M (AC)	\$2M	\$0M	\$0M
Total (\$12M)	\$7M	\$2.5M	\$2.5M

Affordability Criteria

The DEP is reserving funds and providing principal forgiveness loans for any eligible clean water project sponsored by applicants that meet the clean water affordability criteria (AC). There is a \$2 million cap of principal forgiveness per applicant for Affordability projects in SFY24. Principal forgiveness funds will be allocated to Affordability projects on a readiness to proceed basis. Project sponsors are eligible to receive principal forgiveness for up to 100% of allowable costs for the first \$2 million of allowable projects costs and loan funding with a blended interest rate of 50% of the I-Bank AAA Market Interest Rate for the next \$2 million of allowable project costs.

Funding Package for Affordability Criteria with PF for the first \$2M

Funding Package for Affordability Criteria with PF between \$2M and \$4M

Allowable project costs between \$4 million and \$10 million will receive loan funding with a blended interest rate of 25% of the I-Bank AAA Market Interest Rate and project costs over \$10 million will receive loan funding at the Base CWSRF rate. The DEP Fee is waived for the principal forgiveness portion of Affordability loans. A total of \$36 million in principal forgiveness will be available for Affordability projects in SFY24.

When the PF funds allocated to Affordability projects SFY24 are no longer available, the CWSRF funding package for Affordability projects will consist of loan funding with a blended interest rate of 25% of the I-Bank AAA Market Interest Rate for the first \$10 million in allowable costs. Costs in excess of \$10 million will be financed under the Base CWSRF financing package.

Funding Package for Affordability Criteria with no PF up to \$10M

Example: A \$15M project qualifying under the affordability category would receive the following package:

<i>Project Cost</i>	<i>Principle Forgiveness</i>	<i>DEP Loan Share (Interest Free)</i>	<i>I-Bank Loan Share (AAA Market Rate)</i>
First \$2M (AC)	\$2M	\$0M	\$0M
Next \$2M (AC)	\$0M	\$1M	\$1M
Next \$6M (AC)	\$0M	\$4.5M	\$1.5M
Next \$5M (Base))	\$0M	\$2.5M	\$2.5M
Total (\$15M)	\$2M	\$8M	\$5M

Water Quality Restoration

The DEP is reserving funds and providing principal forgiveness loans for capital improvement projects, including equipment purchases, that will eliminate, prevent, or reduce documented occurrences of water quality advisories, beach closings and shellfish bed downgrades due to the presence of harmful algal blooms (HABs). Priority for principal forgiveness funds will be given to eligible projects that address HABs (HAB Projects) and principal forgiveness funds will be allocated to HAB projects on a readiness to proceed basis. If there is insufficient demand from eligible HAB projects in SFY24, unallocated principal forgiveness funds may be used for projects that address shellfish bed downgrades, beach closings and advisories due to the presence of pathogens.

Projects would eliminate such potential sources as failing on-site wastewater systems or cross-connections between storm sewers and sanitary sewers. Eligible projects also include the expansion or replacement of stormwater management systems as well as the purchase of skimmer boats, aquatic weed harvesters and equipment to maintain stormwater management facilities. There is a \$2.5 million cap of principal forgiveness per applicant for Water Quality Restoration (WQR) projects in SFY24. Project sponsors are eligible to receive principal forgiveness for up to 50% of allowable costs and loan funding with a blended interest rate of 50% of the I-Bank AAA Market Interest Rate for the balance for the first \$5 million of allowable costs.

Funding Package for Water Quality Restoration with PF up to \$5M

Principle Forgiveness (\$2.5M Cap)	DEP Loan Share (No Interest)	I-Bank Loan Share (AAA Market Rate)
50%	25%	25%

Allowable project costs between \$5 million and \$10 million will receive loan funding with a blended interest rate of 25% of the I-Bank AAA Market Interest Rate and project costs over \$10 million will receive loan funding at the Base CWSRF rate. A total of \$8 million in principal forgiveness funds will be available for Water Quality Restoration projects in SFY24. When the PF funds allocated to Water Quality Restoration projects in SFY24 are no longer available, the CWSRF funding package for Water Quality Restoration projects will consist of loan funding with a blended interest rate of 25% of the I-Bank AAA Market Interest Rate for the first \$10 million in allowable costs. Costs in excess of \$10 million will be financed under the Base CWSRF.

Funding Package for Water Quality Restoration with PF between \$5M and \$10M and without PF up to \$10M

DEP Loan Share (No Interest)	I-Bank Loan Share (AAA Market Rate)
75%	25%

Example: A \$15M Water Quality Restoration Project would receive the following package:

Project Cost	Principle Forgiveness	DEP Loan Share (Interest Free)	I-Bank Loan Share (AAA Market Rate)
First \$5M (WQR)	\$2.5M	\$1.25M	\$1.25M
Next 5M (WQR)	\$0M	\$3.75M	\$1.25M
Next 5M (Base)	\$0M	\$2.5M	\$2.5M
Total (\$15M)	\$2.5M	\$7.5M	\$5M

Emerging Contaminants

Emerging contaminants refer to substances and microorganisms, including manufactured or naturally occurring physical, chemical, biological, radiological, or nuclear materials, which are known or anticipated in the environment, that may pose newly identified or re-emerging risks to human health, aquatic life, or the environment. These substances, microorganisms, or materials can include many different types of natural or manufactured chemicals and substances – such as those in some compounds of personal care products, pharmaceuticals, industrial chemicals, pesticides, and microplastics. A description of emerging contaminants for the purposes of CWSRF financing can be found in Appendix B to [USEPA's March 8, 2023, Memorandum regarding the Implementation of the Clean Water and Drinking Water State Revolving Fund Provisions of the Bipartisan Infrastructure Law](#).

The DEP is reserving funds and providing principal forgiveness loans for clean water projects that primarily address emerging contaminants (EC). There is a \$2 million cap of principal forgiveness for EC projects per applicant in SFY24. Principal forgiveness funds will be allocated to projects that address emerging contaminants on a readiness to proceed basis. Project sponsors are eligible to receive principal forgiveness for up to 100% of the first \$2 million of allowable costs and loan funding with a blended interest rate of 50% of the I-Bank AAA Market Interest Rate for the next \$2 million of allowable project costs. The DEP Fee is waived for the principal forgiveness portion of Emerging Contaminants loans.

Funding Package for Emerging Contaminants with PF for the first \$2M

Total (\$10M)	\$2M	\$5.5M	\$2.5M

State Recovery and Reuse of SRF Funds Applied to PFAS Contamination

The State of New Jersey (State) does not intend by issuing to any Recipient authorized financial assistance through the Drinking Water State Revolving Fund or the Clean Water State Revolving Fund (together “SRF”) to abrogate, resolve or relieve the responsibility or liability of any third-party that caused or contributed to the contamination impacting the State’s drinking water, groundwater, surface waters or natural environment in any manner, including without limitation, through the sale, distribution, supply, or direct discharge of any per-and polyfluoroalkyl substances (“PFAS”), including PFAS in aqueous film-forming foam (“AFFF”) or other PFAS-containing materials (collectively “PFAS contamination”).

New Jersey intends to recoup and recover authorized financial assistance that the State issues to any borrower for the purposes of investigation, treatment, or replacement of water or water systems impacted by PFAS contamination from culpable third parties that caused or contributed to such PFAS contamination. New Jersey intends to reuse and reapply recouped SRF funds to other water systems, sites and eligible recipients in the State that have been impacted by PFAS contamination or that are otherwise eligible for SRF financial assistance. New Jersey thus reserves its direct claims and causes of action to recover any financial assistance provided to recipients from those persons that caused or contributed to such PFAS contamination.

Likewise, payment of any SRF authorized financial assistance by the New Jersey will be subject to the State’s right to acquire by subrogation the rights, claims and causes of action of the Recipient to recover those SRF funds paid to Recipient, with interest, administrative costs, and attorneys’ fees and costs incurred by the State by reason of such claim, from those persons that caused or contributed to such PFAS Contamination, and Recipients will be required to reasonably cooperate with the State in any such action.

Energy and Water Efficiency

The DEP is reserving funds and providing principal forgiveness loans for clean water projects that address water and energy efficiency goals and meet the eligibility requirements for water and energy efficiency as defined in [USEPA’s Green Project Reserve Guidance](#). Principal forgiveness funds will be allocated to Energy and Water Efficiency (EWE) projects on a readiness to proceed basis. There is a \$2 million cap of principal forgiveness for Energy and Water Efficiency projects per applicant in SFY24. Project sponsors are eligible to receive principal forgiveness for up to 50% of allowable costs and loan funding with a blended interest rate of 50% of the I-Bank AAA market interest rate for the balance for the first \$4 million.

Funding Package for Energy and Water Efficiency with PF up to \$4M

Principle Forgiveness (\$2M Cap) 50%	DEP Loan Share (No Interest) 25%	I-Bank Loan Share (AAA Market Rate) 25%
--	--	---

Allowable project costs between \$4 million and \$10 million will receive loan funding with a blended interest rate of 25% of the I-Bank AAA Market Interest Rate and project costs over \$10 million will receive loan funding at the Base CWSRF rate. A total of \$20 million in principal forgiveness will be available for Energy and Water Efficiency

projects in SFY24. When the PF funds allocated to Energy and Water Efficiency projects in SFY24 are no longer available, the CWSRF funding package for Energy and Water Efficiency projects will consist of loan funding with a blended interest rate of 25% of the I-Bank AAA Market Interest Rate for the first \$10 million in allowable costs. Costs in excess of \$10 million will be financed under the Base CWSRF financing package.

Funding Package for Energy and Water Efficiency with PF between \$4M and \$10M and without PF up to \$10M

DEP Loan Share (No Interest)	I-Bank Loan Share (AAA Market Rate)
75%	25%

Example: A \$15M project qualifying under the Energy and Water Efficiency category would receive the following package:

<i>Project Cost</i>	<i>Principle Forgiveness</i>	<i>DEP Loan Share (Interest Free)</i>	<i>I-Bank Loan Share (AAA Market Rate)</i>
First \$4M (EWE)	\$2M	\$1M	\$1M
Next \$6M (EWE)	\$0M	\$4.5M	\$1.5M
Next \$5M (EWE)	\$0M	\$2.5M	\$2.5M
Total (\$15M)	\$2M	\$8M	\$5M

Sewer Overflow and Stormwater Reuse Grant (OSG) Program CWSRF Loans

New Jersey expects an allocation of approximately \$10 million from the USEPA under the Sewer Overflow and Stormwater Reuse Grants Program (OSG) for use in SFY24. This program is intended to address infrastructure needs for combined sewer overflows (CSO), sanitary sewer overflows (SSO), and stormwater management. The Federal share of the cost of activities carried out using OSG money shall be not less than 80% of the cost and at least 20% of a state’s allocation must be used for green infrastructure, water and energy efficiency improvements, and other environmentally innovative activities. States are to prioritize the award of subawards to eligible subrecipients that are financially distressed communities; implementing a long-term control plan for CSOs or SSOs; or requesting funds for a project included on the CWSRF Intended Use Plan. The CWSRF intends to use OSG funds for a limited number of eligible projects. Eligible projects exist under the following two general categories:

The term “financially distressed community” means a community that meets affordability criteria established by the State in which the community is located.

- 1) Combined sewer overflow correction, and
- 2) Stormwater and subsurface drainage water.

In all cases, municipalities or municipal entities are eligible for assistance. Only capital improvement projects are eligible. This includes infrastructure planning, design, construction, and equipment purchases. Operations and maintenance activities are not eligible for funding. A project that receives grant money is subject to the same

requirements as a project that receives money from CWSRF. OSG Grant funds will be awarded based on rank and readiness to proceed.

Project sponsors that receive a Sewer Overflow and Stormwater Reuse Grant for up to 80% of eligible project costs are eligible to receive a principal forgiveness loan for the remaining 20% of costs. Disadvantaged communities are eligible to receive OSG grant funding for up to 100% of eligible project costs. The DEP Fee is waived for the principal forgiveness portion of OSG loans. Total project costs are capped at \$1 million. Approximately \$2 million will be reserved for OSG CWSRF PF loans. The balance of the project would have to be separately funded and would be eligible for SRF funds at the rates offered for the applicable project type as indicated in this IUP.

Funding Package for OSG Grant up to \$1M in Project Costs

<i>Project Cost</i>	<i>Grant</i>	<i>Principal Forgiveness</i>	<i>DEP Loan Share (Interest Free)</i>	<i>I-Bank Loan Share (AAA Market Rate)</i>
First \$1M (OSG)	\$0.8M	\$0.2M	\$0M	\$0M
Total (\$1M)	\$0.8M	\$0.2M	\$0M	\$0M

Example: A \$1M project that qualifies for an OSG grant would receive the following package:

Prioritization of Sewer Overflow and Stormwater Reuse Grants Program (OSG) Projects

Projects will be prioritized to eligible subrecipients that are financially distressed communities; implementing a long-term control plan for CSOs and requesting funds for a project included on the CWSRF Intended Use Plan. Projects will be further prioritized based on whether it serves an overburdened community identified on the NJDEP Office of Environmental Justice interactive mapping tool, the quantity of flow anticipated to be removed from a system or flood prone area, and the use of green technology consistent with the design and performance standards under [N.J.A.C. 7:8 \(Green Infrastructure in New Jersey\)](#). Additional points will be awarded for documented localized flooding based on storm intensity and for applicants implementing local hiring requirements in the contract documents.

OSG Ranking Category	OSG Ranking Points
CWSRF Project Priority Points	CWSRF Points
Project Identified in Long Term Control Plan	100
Project Located in a Financially Distressed Community	50
Project Serves an Environmental Justice Overburdened Community	50
Flow Removed from Flood Prone Area per MG removed	10
Use of Green Technology	50
Documented Localized Flooding after 2-year Rain Event	50
Documented Localized Flooding after 5-year Rain Event	25

Brownfield Redevelopment (Conduit/Public Private Partnership)

Brownfield redevelopment by private entities is eligible for a funding package that will consist of loan funding with a blended interest rate of 75% of the I-Bank AAA Market Interest Rate for allowable project costs. Private entities must have a public conduit that will sponsor the project.

Sandy Relief

Sandy Relief funds remain available for clean water facilities that were damaged by Superstorm Sandy and are constructing repairs or resiliency to prevent future damage to a treatment facility or water system from a similar event. Resiliency projects include elevating critical infrastructure, flood walls, backup power sources and more. Sandy Relief funds were made available in a one-time installment and offered while funds remain. It is expected that all remaining Sandy Relief funding will be allocated to the Linden Roselle Sewerage Authority's S340299-08 project. This project also qualifies for a Community Development Block Grants (CDBG) Loan which will be offered to qualifying projects in low to moderate income communities as a 100% DEP loan with principal forgiveness for the borrower of up to 25% of the total loan amount. For Sandy-related loans that accept US HUD Community Development Block Grant ("CDBG") funds, DEP may waive all or a portion of its 2% Loan Origination Fee to offset the cost of complying with HUD's additional requirements. If all the Sandy Relief funds are awarded in SFY24, new submittals will be eligible under the Base SRF loan structure.

Pinelands Infrastructure Trust Financing Program

The Water Bank expects to make loans to eligible clean water projects identified in the Pinelands Infrastructure Trust Fund Infrastructure Master Plan in SFY24. These loans will help local governments and utility authorities defray the costs associated with supporting the population and economic growth targeted to Pinelands Regional Growth Areas. Approximately \$15.9 million will be available from the Pinelands Infrastructure Fund for qualifying clean water, drinking water and transportation projects. Project financing will generally consist of 50% loan, 40% grant, and 10% local match. **In cases where a hardship has been identified, the local match may be waived, and the award will be allocated as 50% loan and 50% grant.** The Department is planning to capture any eligible clean water projects and utilize State Bond funds from the Pinelands Program as credit towards the State Match requirement or future State Match requirements.

Sponsors under state supervision

The DEP may make a loan for 100% of the allowable project costs to: (a) municipalities that do not satisfy the New Jersey Infrastructure Bank credit policy but are subject to State financial supervision and oversight pursuant to the “Local Government Supervision Act (1947),” P.L.1947, c.151 (C.52:27BB-1 et seq.), or (b) municipal, county, or regional sewerage authorities, or utilities authorities, that do not satisfy the New Jersey Infrastructure Bank credit policy but where the municipal participant through its service agreement with the authority or utility is under State financial supervision and oversight pursuant to the “Local Government Supervision Act (1947),” P.L.1947, c.151 (C.52:27BB-1 et seq.), and the repayment obligation of the authority or utility is secured by the full faith and credit of the participating municipality pursuant to the service agreement.

Supplementary Information

Financial Relationships between the CWSRF and DWSRF

The federal Safe Drinking Water Act Amendments of 1996 offer states the flexibility to meet the funding needs for drinking water and wastewater facilities by transferring funds from one SRF program to the other. Annually, an amount up to 33% of the Drinking Water SRF Capitalization Grant may be transferred from the CWSRF program to the DWSRF program, or vice versa. The USEPA has issued guidance that would allow utilization of transfer credits and transfer of funds on a net basis (i.e., funds could be moved in both directions), provided that the final transferred amount does not exceed the authorized ceiling. Additionally, The Water Infrastructure Funding Transfer Act (WIFTA) allowed the State to transfer up to 5% of the cumulative clean water revolving fund, or approximately \$113M to the drinking water revolving fund to provide additional subsidy to eligible recipients for projects that abate exposure to lead in drinking water. New Jersey completed the \$113M maximum transfer amount allowed under WIFTA authority from the CWSRF to the DWSRF in SFY 2021.

The SRF program evaluates funds available to determine if adequate monies are available to be used for clean water projects in the current fiscal year. In addition, the type and number of DWSRF projects are reviewed and a determination is made on the need of the funds to be transferred from the CWSRF accounts to the DWSRF accounts or vice-versa. DEP reserves the right to transfer funds from the CWSRF to the DWSRF (or vice-versa) each fiscal year to the extent allowed by law, including Sandy SRF funds, and SRF funds awarded under the Bipartisan Infrastructure Law.

While all projects that meet the program requirements and are ready to proceed have been able to receive a CWSRF loan in the past, the ability of the program to continue to finance all qualifying projects in the future is uncertain because of a steady increase in program demand over the last several years. As such, if the Department determines that there is a shortage of available funds, the Department will utilize the remaining funds for high priority projects in accordance with the existing ranking methodology.

In addition to the potential transfer of funds between the CWSRF and DWSRF, DEP is continuing its policy to cross-collateralize the DWSRF with the CWSRF. This feature results in significant savings to project sponsors. This benefits the drinking water project sponsors since there is a large source of revenue available via the CWSRF repayments to cover possible loan defaults. Under the EPA-approved procedures associated with cross-collateralization, a temporary transfer of funds between the two SRFs may occur, if necessary, to cover the default of a loan repayment or other financial obligation. DEP and the I-Bank would take steps to collect any obligations resulting from a loan default and reimburse the appropriate drinking water or clean water account.

Additional SRF Provisions

Programmatic requirements are listed below. It is anticipated that these provisions will be maintained in a subsequent federal reauthorization act or federal policy. If substantial changes in the Act necessitate DEP's revision of the FFY 2023 document, additional public participation efforts will be conducted.

1. The schedule of state capitalization grant payments, jointly agreed upon by the administrator of the EPA and each state, is based upon the state's IUP.
2. States are required to deposit in the SRF, from state monies, an amount equal to at least 20% of the total amount of the FFY 2023 base capitalization grant made to the state. States are required to deposit in the SRF, from state monies, an amount equal to at least 10% of the total amount of the FFY 2023 BIL CWSRF General Supplemental capitalization grant made to the state. A state match is not required for the FFY 2023 BIL CWSRF Emerging Contaminants capitalization grant.

3. Monies in the SRF may be used to provide loans at or below market interest rate, for terms not greater than 30 (or 35 or 45 (extended term, see below)) years or the useful life, whichever is less. Repayments must begin no later than one year after completion of the project and must be credited to the SRF (principal and interest). The recipient of a loan must establish a dedicated source of repayments.
4. Extended term financing will only be available for either (i) CSO projects for up to 45 years or (ii) projects included in a federal loan program such as WIFIA for up to 35 years. CSO projects include CSO conveyance, CSO storage basins, green or grey infrastructure that reduces the quantity of storm water runoff into the CSO system, sanitary sewer pipes associated with separating storm and wastewater sewers, etc.
5. The Department may, based on the availability of funds, establish a de minimis reserve (up to \$5 million) utilizing CWSRF funds to support CSO and/or stormwater management activities associated with a co-funded transportation project financed through the I-Bank.
6. The Department also administers the Pinelands Infrastructure Trust Financing Program, and the Department is planning to capture any eligible clean water projects and utilize State Bond funds from the Pinelands Program as credit towards the State Match requirement or future State Match requirements.
7. The Water Bank is investigating opportunities to create a linked deposit program to finance individual septic system (on-site disposal system) repairs, rehabilitation, or replacement. This program is in its early stages of development.
8. States have the flexibility to use up to an amount equal to 2% of their annual CWSRF capitalization grants for the purpose of hiring staff, nonprofit organizations, or regional, interstate, or municipal entities to assist rural, small, and tribal publicly owned treatment works. The form of that assistance is flexible and could include, but is not limited to, community outreach, technical evaluation of wastewater solutions, preparation of applications, preliminary engineering reports, and financial documents necessary for receiving SRF assistance. This provision applies to the base program, the BIL CWSRF General Supplemental fund, and the BIL CWSRF Emerging Contaminants fund. States must include in the IUP the amount of the technical assistance funds they plan to use and a description of the activities they plan to fund. In the Annual Report and the SRF Reporting System, states must provide a detailed accounting of the use of the funds. The Water Bank does not intend to use the technical assistance funds allowed under the FFY 2023 capitalization grants but reserves the right to utilize the unused funds at a later date.
9. The maximum annual amount of CWSRF money (not including any fees collected) that may be used to cover the reasonable costs of administering the fund is the greatest of the following: an amount equal to 4% of all grant awards to the fund received by a state CWSRF from 1988 through the current fiscal year less any CWSRF amounts that have been used in previous years to cover administrative expenses; \$400,000; or 1/5th percent of the current valuation of the fund. Per the CWA, states make this calculation once per year, taking into account all federal capitalization grants received that year. The Water Bank intends to take \$4,980,800, the maximum amount available in SFY24 ($0.04 \times (\$85,178,000 \text{ (BIL SUP Cap Grant)} + \$8,689,000 \text{ (BIL EC Cap Grant)} + \$30,653,000 \text{ (Base Cap Grant)})$).

Appendix 1: Response Document for The FFY2023/SFY2024 Priority System, Intended Use Plan and Project Priority List

APPENDIX 1: RESPONSE DOCUMENT FOR THE FFY2023/SFY2024 PRIORITY SYSTEM, INTENDED USE PLAN AND PROJECT PRIORITY LIST

The federal Safe Drinking Water Act and Clean Water Act require the United States Environmental Protection Agency (USEPA) and the states to provide for and encourage public participation in the development and implementation of the federally supported Drinking Water State Revolving Fund and Clean Water State Revolving Fund (SRF) Program. In New Jersey, the SRF is a component of the New Jersey Water Bank that provides financing for a wide variety of drinking water and wastewater projects including treatment for emerging contaminants, lead service line replacement, stormwater, and nonpoint source pollution control projects. In accordance with the federal rules, the requirements for public participation activities also apply to the development and/or major revision(s) of the State's Priority System, Intended Use Plan (IUP), and Project Priority List for the SRF.

On January 18, 2023, the New Jersey Department of Environmental Protection (Department) issued a Notice of Open Public Comment Period regarding the availability of the FFY2023/SFY2024 Drinking Water State Revolving Fund (DWSRF) and Clean Water State Revolving Fund (CWSRF) Intended Use Plans. This notice was sent to interested parties including community water systems, wastewater systems, engineers, municipalities, potential applicants, and others to seek public input. A public hearing was held remotely on February 1, 2023, using Microsoft Teams. In addition to Department and I-Bank staff, eight (8) individuals from outside the Department attended the hearing. One (1) commenter provided oral testimony and followed up with written comments on the Clean Water and Drinking Water proposals. In addition, written comments were received from an additional eight (8) individuals and organizations prior to the April 22, 2023, close of public comment.

The following persons submitted timely comments on the Amendments to the Final FFY2023/SFY2024 Drinking Water and Clean Water IUPs dated January 18, 2023:

1. Gary Brune, New Jersey Future and Lawrence Levine, Natural Resources Defense Council
2. Pete Byron, Mayor, City of Wildwood
3. Don Cabrera, Mayor, Borough of Wildwood Crest
4. Jersey Water Works Asset Management and Finance Committee Asset Management and Finance Committee Co-Chairs: Christine Ballard, CDM Smith and Zachery Greene, Raftelis
5. Matthew Ksiazek, Mayor, Borough of West Wildwood
6. Patricia Lindsay-Harvey, Community Activist, Proud Willingboro resident
7. Zachary Mullock, Mayor, City of Cape May
8. Mayor William Pikolycky, Borough of Woodbine
9. Patrick Rosenello, Mayor, City of North Wildwood

The public comments received on the FFY2023/SFY2024 IUPs dated January 18, 2023, are summarized below.

AFFORDABILITY

Comment

Willingboro is an Environmental Justice Community. Our residents make good salaries, but those good salaries are dismissed by circumstance thrust upon our community. Residents have been racially redlined for as long as I can remember. Therefore, we have great difficulty attracting economic development which puts our town and residents at a disadvantage. The result is that our community is underserved as residents have to leave town to obtain their goods and services. We have higher than necessary taxes because we do not have the commerce to offset costs which causes residents to be overburdened. All these factors reduce the great salaries earned by our residents and adds to unaffordability. To have a so-called EJ funding criteria that only focuses on income without taking into account other factors is just wrong in my opinion. It is not a true picture of affordability. I ask that the above factor be added to the "affordability criteria" in determining funding discount criteria.

Comment

The IUP's existing affordability criteria relies almost exclusively on one indicator, median household income (MHI), and has been liberalized in recent years to include all localities below 80% of the statewide MHI. NJDEP should consider further adjustments to the affordability criteria, and alternative measures of affordability such as those that capture local tax base attributable to commercial property, and the actual cost of water service relative to residential customers' ability to pay (particularly low-income customers). The Department should consider alternative metrics for its affordability criteria, including the following:

- **DCA's Municipal Revitalization Index (MRI)** - This index, published by the Department of Community Affairs, is a multi-dimensional tool that provides a more robust measure of local affordability, including a composite score for each locality.
- **Water Affordability Index** - In August 2021, New Jersey Future released a report, A New Jersey Affordability Methodology and Assessment for Drinking Water and Sewer Utility Costs, for Jersey Water Works with Dan Van Abs from Rutgers University. The report presents a detailed methodology for assessing the extent to which current drinking water and sewer utility costs pose a financial burden for low-income New Jersey households.

Response

While the current affordability criteria focuses on the median household income (MHI) or percentage of low-income households for a water or wastewater system's service area, the affordability criteria also considers the unemployment rate and population growth in the project service area. The Department acknowledges that other factors may have an impact on a community's ability to afford the implementation of water or wastewater infrastructure projects. As such, the Department is actively studying the benefits of using alternative measures, such as the New Jersey Department of Community Affairs Municipal Revitalization Index (MRI). For those applications that have been submitted to the Department and are based on the recently established SFY 2023 criteria, the Department will continue to use the existing criteria in SFY 2024 while evaluating the impacts of potential changes.

Comment

Has the Department considered a more aggressive funding package for disadvantaged communities (DACs), such as planning and design grants, selective waiving of funding caps for high priority projects, and zero interest loans for the loan portion of any award to a DAC involving federal Infrastructure Investment and Jobs Act (IIJA) funds, in order to increase spending in the year that funds are originally provided?

Response

As further incentive for disadvantaged communities to take advantage of Technical Assistance opportunities available through the Water Bank, the program is authorized to utilize up to \$40 million of the funds appropriated and reappropriated to the department for the capital construction of drinking water and clean water infrastructure by the State fiscal year 2024 appropriations act for principal forgiveness loans to disadvantaged communities for planning and design costs associated with clean water or drinking water environmental infrastructure projects. This program is currently being developed and will launch during SFY2024.

The Federal Government has established as a goal that 40 percent of the overall benefits of certain Federal investments, including investments in critical clean water and wastewater infrastructure, should flow to disadvantaged communities that are marginalized, underserved, and overburdened by pollution ([Justice40, A WHOLE-OF-GOVERNMENT INITIATIVE](#)). President Biden made this historic commitment when he signed Executive Order 14008 within days of taking office. The Department will track progress towards this goal over the five (5) years of BIL funding through the annual Clean Water and biannual Drinking Water SRF Reports submitted to USEPA Region 2. Projects financed in disadvantaged communities will be identified and the funding amounts will be listed in the reports. Progress toward meeting the 40 percent goal for disadvantaged communities will be evaluated and financing packages and technical assistance offered to disadvantaged communities will be analyzed to ensure the Department continues to make progress towards this goal.

Comment

Affordability Criteria Scaling Priority Points - To recognize the different levels of need that exist among localities that presently qualify as “disadvantaged communities”, NJDEP should consider distributing financial assistance (e.g., principal forgiveness or funding packages) by issuing priority points on a sliding scale, as some other states (e.g., Wisconsin) have done. Ideally, this approach would include a broader set of indicators to properly account for the relative environmental challenges, fiscal distress, and the potential burden per taxpayer on the water rates in various communities. Most importantly, it would allow for financial assistance to be differentiated among DACs, providing more to the most needy and less to water utilities that barely qualify. At least six states have adopted some version of a sliding scale or tiering system and others are considering it. (See ASDWA’s recent report ASDWA - State DAC Definitions.)

Response

The Department acknowledges that other states offer a sliding scale or tiered system to award financial assistance to disadvantaged communities based on the level of fiscal distress. The Department will evaluate whether similar strategies would be appropriate in New Jersey to assist the most challenged communities in implementation of water infrastructure projects. For those applications that have been submitted to the Department and are based on the recently established SFY 2023 criteria, the Department will continue to use the existing funding packages for projects sponsored by communities meeting the affordability criteria in SFY 2024 while evaluating the impacts of potential changes.

Comment

Affordability Points for Project Priority List Ranking - NJDEP continues to provide only 80 extra points to localities that satisfy the Environmental Justice Economic Overburdened Community Criteria. Given the sheer size of the points provided under other measures in the scoring system, has NJDEP considered providing a higher amount of points to help differentiate environmental justice communities?

Response

Over \$300 million of principal forgiveness and funding is set aside in the SFY2024 Clean Water and Drinking Water IUPs for projects sponsored by communities that meet the Affordability Criteria through the Environmental Justice Economic Overburdened Community Criteria. The award of 80 extra points to communities that meet the Environmental Justice Economic Overburdened Community Criteria has a large impact on ranking for projects that meet these criteria. The communities that receive the extra points are in a better position to compete for funds not set aside for DACs, such as DWSRF Emerging Contaminant principal forgiveness. The Department will continue to monitor, and, if appropriate, make adjustments in the future, to ensure this level of scoring has a meaningful impact on DAC project ranking and the ability of DACs to obtain the benefits of SRF financing.

Comment

DAC Funding Package—AAA Rate - Since by their nature DACs have recognized affordability issues, why charge the AAA rate to them at all? Why not 50% principal forgiveness and 50% as a zero-interest loan?

Response

The Water Bank offers financing packages for disadvantaged communities, including 100% principal forgiveness for the first \$2 million of clean water project costs and high-ranking drinking water project costs, 100% principal forgiveness for the first \$5 million of combined sewer overflow project costs, and 50% of the first \$10 million of lead service line replacement project costs. The Department closely monitors the amount of funding available to make interest free DEP fund loans from federal capitalization grants and DEP fund loan repayments and the Department has found that the current funding packages strike an appropriate balance of providing maximum benefits to disadvantaged communities while ensuring the water infrastructure needs of the state can be funded in perpetuity.

TECHNICAL ASSISTANCE

Comment

We appreciate the steps taken to offer technical assistance programs and recognize that this important step will help remove barriers for under-resourced communities and help to proactively identify projects with the greatest environmental benefit. In the proposed SFY 2024 IUP, it is obvious that not all the prior year's available principal forgiveness was utilized, thus leaving a balance to roll into this year. Moving forward, we would like to see additional efforts to encourage participation in the SRF program as it takes advantage of additional funding from the Bipartisan Infrastructure Law and would like to know how is the State considering tracking which projects are considered "ready to proceed" so that projects in under-resourced communities do not languish for long?

Comment

NJDEP's Enhanced Technical Assistance program is an important step to help the SRF program shift from a historically "passive" approach, in which most applications are triggered by local initiative, to aggressively identify and develop projects that provide the greatest environmental benefit. However, sole reliance on that

effort will not prove to be sufficient. That is, though “readiness to proceed” is a vital feature for project selection, a better balance needs to be struck. To ensure that projects that promise a significant “bang for the buck” in overburdened communities do not continue to languish, the Department should independently track such projects and use CWSRF and the DWSRF funds to advance them aggressively.

Response

The Department is unable to predict how the availability of funds, project delays, or additional funding sources may change from year to year. However, the Department remains committed to working with all applicants, including disadvantaged communities, to move critical infrastructure projects forward to take advantage of the funding provided by the Bipartisan Infrastructure Law. The Department tracks all active Water Bank applications through the publicly available [“New Jersey Infrastructure Bank Living List”](#) to focus review and project management efforts on highly ranked and high priority projects and projects sponsored by disadvantaged communities.

The Department designed the SFY 2024 funding and principal forgiveness packages with the intention of fully funding expected demand from eligible projects. In addition, the Department intends to provide technical and program navigation assistance to disadvantaged and overburdened communities by proactively engaging with these sponsors and guiding them through the Water Bank process from application to project completion. These efforts will help to ensure that their projects meet program requirements, and these communities receive their fair share of program funds.

The Federal Government has established as a goal that 40 percent of the overall benefits of certain Federal investments, including investments in critical clean water and wastewater infrastructure, should flow to disadvantaged communities that are marginalized, underserved, and overburdened by pollution ([Justice40. A WHOLE-OF-GOVERNMENT INITIATIVE](#)). President Biden made this historic commitment when he signed Executive Order 14008 within days of taking office. The Department has expanded technical assistance programs which include targeted outreach to disadvantaged and overburdened communities. The Department will track progress toward delivering 40 percent of overall benefits to disadvantaged communities through the annual Clean Water and biannual Drinking Water SRF Reports to USEPA Region 2. Projects financed in disadvantaged communities will be identified and the funding amounts will be listed in the reports. Progress toward meeting the 40 percent goal for disadvantaged communities will be evaluated and financing packages and technical assistance offered to disadvantaged communities will be optimized to ensure the Department continues to meet this goal.

Comment

While the SFY 2024 IUPs references planned improvements in technical assistance services, they do not provide a detailed description. Given that TA programs are planned by the NJ Infrastructure Bank (Early Engineering and Engagement Assistance), NJDEP (Enhanced Technical Assistance), and EPA (Environmental Finance Centers), when will NJDEP release a full description of these services, including how they will be implemented to avoid duplication?

NJDEP should consider using a portion of TA set-asides to help water and wastewater systems develop low-income affordability programs and equitable rate designs, which can enhance a community’s “technical, managerial, and financial capability” to maintain adequate revenue for operation, maintenance, and improvement of the system. Affordability programs and rate structure reforms can enable systems to increase rates without burdening low-income customers. (As noted by the state’s 2018 Joint Legislative Task Force on Drinking Water Infrastructure, Final Report, “A major deterrent to proper investment in water infrastructure is affordability . . . Municipalities with a larger share of low-income residents find it difficult to raise rates to fund water infrastructure upgrades due to the detrimental effect higher rates will have on those residents. The result is underinvestment, which is a losing proposition . . . However, while increasing

rates can adversely affect low-income households, as several witnesses noted, these effects are not inevitable and can be avoided . . .”) For example, Michigan— although not with SRF funds—has offered affordability planning grants to water and wastewater systems that supported development of local affordability plans, with significant community engagement.

Response

Certain technical assistance programs are available now for qualifying drinking water projects. In response to the historic levels of funding provided by both the BIL and ARPA additional technical assistance programs are currently being developed in a coordinated effort with the I-bank. Further information on the technical assistance programs can be found on the Department’s [Water Infrastructure Investment Plan Website](#). This will be updated as more technical assistance opportunities come on-line, including financial assessments mentioned by the commenter. However, technical assistance offered to disadvantaged communities will be optimized to ensure the Department meets or exceeds the goal of delivering 40 percent of overall benefits to disadvantaged communities ([Justice40, A WHOLE-OF-GOVERNMENT INITIATIVE](#)).

PRINCIPAL FORGIVENESS

Comment

Several commenters requested that the Department increase the principal forgiveness percentage and maximum annual cap for projects located in or directly impacting the most disadvantaged communities (with an MRI in the top 5%) – this would mean that the PF amount would be greater than 50% of the total project cost (up to \$20 million) based on need and affordability. Further, it was suggested that for projects located in or directly impacting municipalities with an MRI between 6% and 20% in the state, the PF amount be greater than 50% (up to \$10 million) based on need and affordability. These changes would positively impact the 112 most distressed communities in the State which are the municipalities with the greatest financial needs and the fewest resources to afford costly infrastructure improvements.

Comment

Recognizing that the pool of principal forgiveness is understated and the need to spread it as effectively as possible, the Department should nonetheless consider waiving principal forgiveness caps for projects that would provide vital environmental benefits to disadvantaged communities (DACs) that require additional financial assistance to move forward (i.e., If such flexibility was exercised on at least a limited basis for DAC projects that the Department deems critical, wouldn’t that represent a better use of funds?).

Response

The Department set principal forgiveness share of project costs and caps to optimize the number of projects that receive funds while also ensuring the principal forgiveness has a meaningful impact on a community's ability to implement critical infrastructure projects. The Department will continue to offer principal forgiveness funding packages for disadvantaged communities, including 100% principal forgiveness for the first \$2 million of clean water project costs and high-ranking drinking water project costs, 100% principal forgiveness for the first \$5 million of combined sewer overflow project costs, and 50% of the first \$10 million of lead service line replacement project costs. It is important to maintain the current program requirements to promote efficiency and provide assurance to project sponsors with applications under review. At the same time, the Department is committed to evaluating ways to incorporate changes, such as tiering of financial assistance packages to level of distress, to better serve disadvantaged communities.

LEAD SERVICE LINE REPLACEMENT

Comment

For Lead Service Line Replacement (LSLR) where priority is given to water utilities that exceed the lead action level, will the amount and terms of assistance take into account each utility's fiscal condition (i.e., relative to others)?

Response

Lead Service Line Replacement (LSLR) principal forgiveness is reserved for projects with a service area that meets the affordability criteria. These projects for communities that meet the affordability criteria are also eligible for the Affordability funding package with a Blended Interest Rate of 25% of I-Bank's AAA Market Interest Rate capped at \$10 million. LSLR projects that do not meet the affordability criteria are eligible for the Base DWSRF funding packages. Water systems in both categories that exceed the lead action level receive additional ranking points. Funding is awarded in both categories based on project rank, however terms of the LSLR and DWSRF assistance packages do not change based on project rank.

Comment

With respect to Infrastructure Investment and Jobs Act (IIJA) LSLR funds, examples of eligible uses of set-asides are provided at: <https://www.policyinnovation.org/blog/setasidefunds>. Most or all of these uses would be valuable in supporting equitable implementation of New Jersey's ten-year LSLR mandate (see N.J.S.A. 58:12A-44).

Response

The Department acknowledges this comment and notes that it has previously adopted many of the recommendations presented in this article. This includes the use of set-aside funds to support technical assistance and the completion of LSL inventories, ongoing work to map LSL data and establish a GIS dashboard on the progress of LSLR statewide, and work with water systems to prioritize multi-year planning for large LSLR projects.

Comment

Customer Cost Share Policy - The SFY 2024 IUP addresses the issue of water utilities charging a customer "cost share" to contribute toward the cost of replacing the privately-owned portion of a LSL as follows: "Principal forgiveness shall be utilized to address the cost-share of the property owner as applicable." Please clarify what is meant by this statement, i.e., does it mean that, in any instance in which a SRF-funded LSLR project involves a customer-owned LSL that needs to be replaced to achieve a "full replacement" (i.e., to avoid a prohibited "partial replacement"), the water utility must apply any principal forgiveness portion of the SRF award to cover the customer-side costs, at least until the principal forgiveness is exhausted?

Response

Principal forgiveness for a lead service line replacement project that involves replacing the customer owned portion of the service line must be applied to the cost of the customer owned portion of the service line. This is intended to reduce or completely cover the cost of replacement for the customer owned portion of the service line.

Comment

Given the major inefficiencies and environmental justice issues associated with charging a customer cost share for this work, NJDEP should stipulate that no customer cost share may be charged by any water utility that accepts financial assistance for any LSLR project that is funded with SRF funds. For SRF-funded

projects, DEP should require the water system to pay to replace the portions of the lead service line that are owned by the water utility and the customer. Based on numerous examples across the country, the imposition of a cost share requirement will disproportionately exclude low-income households and people of color from participating in the LSLR program, and places New Jersey at risk of violating Title VI of the Civil Rights Act. Indeed, in August 2022, the State of New Jersey filed a brief in federal court challenging EPA’s Lead and Copper Rule under the Safe Drinking Water Act on the ground that, by failing to ensure that all water systems replace customer-side lines even when the customer cannot afford the expense, EPA’s approach imposes “disproportionate effects...on minority and low-income individuals who face greater lead exposure, but may not be able to afford replacement of a privately-owned lead service line, or live in rental housing where the landlord refuses to pay for such Replacement.” *Newburgh Clean Water Project v. USEPA* (D.C. Cir., No. 21-1019), Initial Opening Brief of State Petitioners, Aug. 8, 2022, pp. 38-39.) (The Lead and Copper Rule applies to all water systems, independently of whether they receive SRF funds. Accordingly, the challenged EPA regulation does not define or limit NJDEP’s obligations regarding the use of SRF funds for LSLR.)

Further, we note that EPA emphasized in its March 2022 IJA guidance (e.g., on p. 25) that the agency will keep a close watch on Title VI compliance in the use of IJA water infrastructure funds, including a burden on states to demonstrate compliance in their IUPs.

References concerning Title VI complaint against Providence, RI:

Environmental Defense Fund: “Update: EPA agrees to investigate civil rights allegations against Providence Water’s LSL replacement practices” (March 2022)

EPA Response (Feb. 10, 2022)

Response

For a water system using SRF money for replacement, the Department requires that lead service line replacement principal forgiveness be utilized to address the cost-share of the property owner as applicable and will continue to work with water systems to assist in implementing projects that do not include a customer cost share charge.

Comment

Lead Service Line Replacements — Public Health Protections - The federal Lead and Copper Rule Revisions (LCRR) require notification to homeowners/tenants, certified filters, and water testing when LSLs are replaced or disturbed. EPA has delayed the LCRR compliance date to October 2024. However, especially with the infusion of IJA LSLR funds, the DWSRF will be funding extensive LSLR activities before October 2024, as well as other activities (e.g., water main or meter replacement) that may result in unplanned disturbances of LSLs. Those activities present public health concerns if best practices are not followed to mitigate the risk of lead exposure. To protect public health, the IUP should require that all projects receiving DWSRF assistance must immediately implement the following LCRR provisions concerning notification, filters, and testing: 40 CFR 141.84(d) here — applies to partial LSL replacements (note that subparagraph.(1) is probably not applicable in NJ since the state generally bans partials, but (2) would be applicable in the event of emergency work that results in a partial replacement); 40 CFR 141.84(e) here — applies to full LSL replacements; and 40 CFR 141.85(f) here — applies to other activities that disturb a LSL.

Response

It is a best practice for water systems to notify, provide filters and test water for lead levels when conducting a replacement or disturbing an existing lead service line, and the NJDEP highly recommends that these steps are followed. The purpose of the IUP is to address how Water Bank funds will be used to provide

financial assistance. The NJDEP intends to provide specific guidance addressing these concerns as part of the implementation of New Jersey's LSLR requirements and pending New Jersey and federal Lead and Copper rule changes.

SET ASIDES

Comment

SRF Set Asides - Has NJDEP considered maximizing the use of set asides permitted by the U.S. Environmental Protection Agency (EPA) to assist DACs, including funding for planning and design phases for projects with vital environmental benefits?

For example, federal law allows states to set aside up to 31% of their DWSRF capitalization grants (including "base" funds and IIJA funds) under the following categories:

- Administration and technical assistance (4% of federal grant)
- Small System (<10,000) Technical Assistance (2% of federal grant)
- State Program Management (10% of federal grant)
- Local assistance and other state programs (15% of federal grant).

Comment

Please provide in the final IUPs a table that outlines the planned set asides for both the CWSRF and the DWSRF, showing both the SFY24 planned amount and the maximum amount permitted by the EPA. (The latter would amplify the table presently listed on page 25 of the DWSRF IUP).

Response

The Department uses the allowable set asides to the extent it can efficiently use the funds for the intended programs. The Department must balance the benefits of using these funds for set-aside programs (i.e. Technical Assistance, Capacity Development and Operator Certification) against the alternative use of SRF funds for project financing. Maximizing the set-aside amount permitted by EPA reduces the amount of funds available for capital improvement projects and diminishes the revolving fund. Historically, NJDEP has had more projects than funds available, which emphasized the need to establish a balance to fund critical projects. The NJDEP will continue to evaluate the use of available set-aside amounts.

The Clean Water set asides are addressed on page 31 of the final IUP.

Drinking set asides are reported in New Jersey's biennial DWSRF report to USEPA.

OTHER COMMENTS

Comment

The \$500 million SWIFIA loan and leveraged portion of \$60 million state appropriation (i.e., private bank financing). Explain the footnote on the Source and Uses chart re: "leveraging the \$25 million I-Bank share to generate \$110 million" as it does not seem to be included in the IUP's "Sources and Uses" chart for the CWSRF or the DWSRF. Does each provide additional funding for projects in SFY24, and if so, how would they be allocated by program?

Response

In SFY 2022, the I-Bank closed a \$221 million loan with the United States Environmental Protection Agency ("USEPA") as part of the WIFIA program. Additionally, in SFY 2023 the I-Bank closed a \$500 million loan

with the USEPA as part of the new State infrastructure financing authority program under WIFIA (“SWIFIA”). These funds will be available to long-term finance projects as an alternative to the I-Bank’s traditional municipal revenue bond proceeds. A portion of the WIFIA and SWIFIA loan proceeds are included in the anticipated I-Bank share in the Sources and Uses of Funds tables for SFY 2023 and SFY 2024. A portion of the proceeds will be used in future financing years. The program does not intend to use any state appropriation funds for interest-subsidy loans in SFY 2024. The \$25 million appropriated to the I-Bank was intended to be used to buy down interest on I-Bank loan funds in lieu of providing \$110 million in interest free NJDEP funds.

Comment

What determines the level of the I-Bank share and how much discretion exists in setting that amount? For example, the I-Bank share of the DWSRF program in SFY22 was 50% of the total (i.e., \$90 million of \$180 million total), while in SFY24, it represents only 23% of the total (i.e., \$125 million of \$537 million). The I-Bank share in the CWSRF seems to follow a different pattern (i.e. 23% of total sources in SFY23 (\$314 million of \$1,353 million) but 32% in SFY24 (\$287 million of \$909 million)).

Response

The I-Bank Share in the IUP Sources and Uses tables represent the total expected I-Bank loan share for projects expected to be financed in the state fiscal year based on the funding packages described in the IUPs and expected mix of project types projected to close in the state fiscal year. Because the I-Bank Share is project dependent, it is subject to variability from year-to-year.

Comment

DWSRF: Why does the amount of “Funds Unused in Previous Years” increase steadily in the DWSRF IUP from SFY22 (\$30 million) to SFY23 (\$188 million) to SFY24 (\$269 million)? For the CWSRF a bit more than half of the projected 33% drop (\$445 million) in the size of the CWSRF program from SFY23 (\$1,353 million) to SFY24 (\$908 million) is attributable to non-recurring federal ARP funds (\$248 million). What explains the large decline (\$178 million) in “Funds Unused in Prior Years”?

Response

The “Funds Available from prior years” figures in the IUP Sources and Uses tables reflect the actual balances at the start of the current fiscal year and the projected starting balance at the start of the next fiscal year based on the estimated loan demands in the current fiscal year. These tables are used to evaluate whether the programs have sufficient resources given the expected demand for funds based on program estimates and the design of the funding packages to be offered in the upcoming fiscal year. The increase in DWSRF funds available reflects recent program changes, such as the use of WIFIA funds, and the revision of base program funding from 75% DEP funding to 50% DEP funds, that generally decreased the use of DEP funds and increased the I-Bank funds. Furthermore, drinking water systems are taking longer to design and bid lead service line replacement and emerging contaminant projects that will be utilizing the influx of BIL drinking water funds. The Department anticipates that the rate of DW fund utilization will increase in SFY 2024 and the years ahead as lead service line replacement and emerging contaminant projects proceed to contract award and funding. The decrease in estimated clean water reflects the large number of high-cost combined sewer overflow long-term control plan projects moving through the pipeline.

Comment

If it is not possible to obligate the federal American Rescue Plan (ARP) funds for combined sewer overflow projects by the December 2024 deadline established by the U.S. Department of Treasury and a reallocation is necessary, will those funds remain within the CWSRF program? We recommend that the Department consider the “highest and best use” of the funds across both drinking water and clean water projects requested by disadvantaged communities.

Response

The obligation of ARPA funds will be monitored and evaluated throughout SFY 2024. The Department will determine if there is any need to alter the current allocations and funding packages to ensure obligation of all funds by the December 2024 deadline. Any change in allocations or funding packages will be presented in the proposed SFY 2025 Intended Use Plans and/or Amendments to the SFY 2024 Intended Use Plans which will be subject to additional public review and comment.

Comment

Please provide a complete reconciliation of the planned uses of the \$60 million state appropriation to the State Revolving Fund program, including all planned uses beyond the state matching fund requirements.

Response

Beyond the state matching requirements (approximately \$22 million), the program’s intended use of SFY 2024 state appropriation funds includes: (1) \$3 million for direct grants to very small water systems (reserved in IUP); (2) \$20 million for Planning and Design Loans for Disadvantaged Communities (subject to approval in future IUPs); and (3) \$15 million for project loans for Disadvantaged Communities participating in the Technical Assistance Program (subject to approval in future IUPs).

Comment

For DWSRF Emerging Contaminant (EC) projects, 25% of available principal forgiveness (PF) will be awarded to disadvantaged communities or those serving populations of 25,000 or less. Is that provision new, what is the intent, and is EC the only category that is so affected?

Response

The Department's provision for Emerging Contaminants principal forgiveness was established in the SFY 2023 IUP. At least 25% of the Emerging Contaminant principal forgiveness will be awarded to disadvantaged communities that meet NJ's Affordability Criteria or public water systems serving a population of fewer than 25,000. This provision conforms with guidance in USEPA's March 8, 2022 BIL Implementation Memo: "... 100% of the capitalization grant amount, net of set-asides taken, as additional subsidization in the form of principal forgiveness and/or grants. Per SDWA, states must direct at least 25% of these funds to disadvantaged communities (as defined by the state under SDWA 1452(d)) or public water systems serving fewer than 25,000 persons."

Comment

Beyond the Project Priority List, which reflects project requests submitted by potential borrowers, does DEP maintain a list of the most critical drinking water and clean water projects across the state (i.e., those with the highest environmental benefits)? If not, how does NJDEP judge the impact that the SRF program is having on environmental quality in New Jersey versus the impact that it otherwise could have?

Response

The Clean Water and Drinking Water Project Priority Lists are the primary Department source for the most critical clean water and drinking water projects across the state.

Project environmental benefit is evaluated during the project ranking process with the assignment of points in accordance with the Clean Water and Drinking Water Project Priority Systems contained in the respective Intended Use Plans. The principal elements of the Clean Water Priority System are: A) Sustainable Community Planning Activities, B) Project Discharge Category, C) Water Use/Water Quality, D) Smart Growth Approvals, E) Environmental Justice Economic Overburdened Community Criteria, F) Population, and G) Established Local Employment Program. The principal elements of the Drinking Water Priority System are: A) Compliance and Public Health Criteria, B) Environmental Justice Economic Overburdened Community Criteria, C) Smart Growth Approvals, D) Population, and E) Established Local Employment Program.

The Department collects data through Clean Water Benefits Reporting (CBR) forms and Drinking Water Project Benefits Reporting (PBR) forms at loan closing and reports this information to USEPA's SRF database.

Comment

"Sponsors Under State Supervision" - The Draft IUPs state that NJDEP may choose to provide a 100% loan to municipalities (or local authorities whose repayment is secured by participating towns) that do not satisfy the I-Bank's credit policy but are subject to State financial supervision. To further enhance the credit of DACs, has the NJDEP considered expanded use of a State intercept of local aid through the Municipal Qualified Bond Act program or bond insurance to reduce "repayment risk"?

Response

The program continually evaluates issues that prevent disadvantaged communities from accessing SRF funding, including the ability to satisfy the I-Bank's credit policy. This evaluation has led to a recent change that waives the [I-Bank credit policy](#) for disadvantaged communities eligible to receive 100% principal forgiveness loans. This credit rating waiver is available to Project Sponsors of Water Bank Projects that would otherwise not have access to Water Bank Funds (e.g., communities that have a non-investment grade rating and/or cannot provide satisfactory QBA) anticipated to receive long-term funding solely through a Fund Loan for the total project costs (inclusive of all Program fees) which will receive 100% Principal Forgiveness. Any additional project costs requiring a loan not subject to principal forgiveness must satisfy all conditions in the I-Bank's Credit Policy or otherwise receive approval from the Department for a 100% Fund Loan pursuant to section VI.2 of the Credit Policy.

Appendix 2: Clean Water Priority System Ranking Methodology

Project Priority List — General Information

Clean water projects must be listed on the Project Priority List in order to be considered eligible for financial assistance under the CWSRF. The Priority List identifies the estimated total eligible building costs under the appropriate project category. Except for certain project types, the figure under the "Total Eligible Project Cost" includes the estimated total eligible building costs, the related costs for construction services (i.e., administrative, legal, engineering, inspection, one-year start-up services, etc.), the actual or estimated planning and/or design costs, 3% for the recipient's administrative costs, and a 5% contingency cost. The figure under the "Total State Amount" column represents 100% of the estimated total eligible project costs.

DEP has established a rolling application process and will update and post the Priority List up to four times during a fiscal year. The Department expects to notify potential borrowers and other interested parties upon each posting of an amendment to the Priority List on the DEP and I-Bank websites.

DEP began awarding ranking points in two new categories in SFY 2023 (Climate Resilience Measures and Environmental Justice Economic Overburdened Community Criteria). Project applications submitted after June 30, 2022, will be evaluated and, if eligible, awarded points in these new categories. Project sponsors that submitted applications prior to July 1, 2022, may submit documentation for consideration of ranking point awards in the new categories as well. Project scores for the new categories and updated rankings will be reflected in the next amendment to the Priority List.

Ranking Methodology

DEP assigns points to each project using the Project Priority System and ranks all eligible projects according to the total number of points each project receives. All projects are subsequently placed on the Project Priority Comprehensive List according to their ranking. Projects with more points are ranked above those with fewer points. The addition of new projects to the Project Priority Comprehensive List, periodic revisions to the Priority System, or the identification of new information regarding a project, may result in changes to an individual project ranking. Updated rankings based on changes to the priority ranking system will be reflected in the next amendment to the Priority List.

The principal elements of the Priority System are: A) Sustainable Community Planning Activities, B) Project Discharge Category, C) Water Use/Water Quality, D) Smart Growth Approvals, E) Environmental Justice Economic Overburdened Community Criteria, F) Population, and G) Established Local Employment Program. Points are assigned for each of the 7 priority categories, as applicable, and are discussed in more detail below.

The prospective applicant must notify DEP of any changes to project scope or any other circumstance that may affect the calculation of priority points. DEP recalculates, if appropriate, the prospective applicant's ranking utilizing the new information submitted and revises the priority ranking accordingly.

The ranking system gives highest priority to projects that address discharges of raw, diluted, or inadequately treated sewage to the state's waters during wet weather, including projects to abate CSOs and projects to address sanitary sewer systems that overflow. CSO abatement projects are expensive and are usually located in financially distressed urban areas, making cost a serious concern. Discharges from combined sewer systems and sanitary sewer overflows can impair water uses.

DEP's Priority List provides a strategic foundation for structural changes and includes objectives to implement projects that will help to protect, maintain, and improve water quality in and around the Barnegat Bay, while also determining the best long-term approach for restoring the ecological health of Barnegat Bay. To support these efforts to improve

the water quality of the Bay, the project ranking methodology for the SFY 2024 Financing Program provides an additional 300 priority points to nonpoint source and stormwater runoff control projects that are intended to benefit the Barnegat Bay. The additional 300 points will be assigned to wastewater reuse projects that are intended to offset the loss of freshwater flows caused by the regionalization of sewage treatment plants and the use of ocean outfalls.

A. Sustainable Community Planning Activities

The purpose of the provisions in this section is to encourage and facilitate implementation of environmentally sustainable practices at the local government level. Prudent environmental planning that incorporates sustainability measures is necessary to achieve cost-effective and environmentally sound water quality improvement within the watershed. Additional priority points will be awarded to projects located in or benefiting municipalities that have implemented programs and actions that go beyond compliance with existing regulatory requirements and incorporate the planning strategies discussed below.

Watershed-Based Implementation Plans: Watershed-Based Implementation Plans address impairment(s) found on Sublists 4 or 5 of the New Jersey Integrated Water Quality Monitoring and Assessment Report. Prudent watershed planning is necessary to achieve cost-effective and environmentally sound water quality improvement within the watershed. To provide an incentive for project sponsors to complete watershed-based plans that promote the implementation of point and nonpoint source pollution control projects that are consistent with Department goals, projects located in or benefiting municipalities that demonstrate implementation of watershed-based plans will be given an additional 50 priority points.

Implementation of Regional Stormwater Management Plans: Regional stormwater management plans are voluntary local analyses that provide targeted protection to a specific area based on local issues and conditions. Regional stormwater management plans are adopted into Water Quality Management Plans and may include specific implementation projects that address existing impacts of stormwater runoff. Projects located in or benefiting municipalities with adopted regional stormwater management plans will be provided an additional 50 priority points.

Sustainable Community Planning: Sustainable communities develop and adopt master plans and ordinances that improve the overall quality of life for citizens of today as well as future generations by planning within natural resource capacity constraints and providing for a healthy economy, environment, and society. Projects located in or benefiting municipalities where sustainable community strategies have been developed and master plans and/or ordinances adopted will be awarded an additional 100 priority points. These strategies/ordinances must include, but are not limited to, the following:

- A plan to reduce water consumption and increase water efficiency and re-use.
- Policies that require consideration of green design in municipal construction projects and redevelopment projects, such as green roofs, green streets, tree filters, rain gardens, rain barrels, porous pavements, etc. (Green design principles include green building practices that increase energy and water efficiency; use renewable energy; use environmentally friendly building materials that are made with recycled materials, are durable, sustainability harvested or produced locally; improve indoor air quality; and makes appropriate site selection and minimizes site disturbance to reduce environmental impacts.)

B. Project Discharge Category Points

All projects receive ranking points based on the project discharge category. In case of multiple purpose proposals, projects qualify for the discharge category that represents the major scope of the project. If a project has aspects that can be described by more than one category, the project may be broken into separate projects. Tables IA and IB show the project discharge categories and their corresponding ranking points.

**Table 1A: Ranking Points Related to Project Discharge Category
for Wastewater Treatment Facilities**

Project Discharge Category	Description	Points
Combined Sewer Overflow (CSO) & Sanitary Sewer Overflow (SSO)	Combined sewer system (CSS) rehabilitation/repair, the construction of treatment and/or storage facilities within CSS, at discharge locations or at STPs that reduce or eliminate CSOs, or the separation of combined sewer systems by the consolidation and elimination or sealing of CSO discharge points. Projects that implement corrective measures to fix overloaded conveyance systems that experience chronic overflows.	600
Sewage Treatment Plant (STP) Improvements	STP improvements include upgrades or other improvements to a treatment process or the elimination of an existing STP and the connection to an alternative treatment facility to meet applicable treatment levels and the purchase and installation of security and energy efficiency measures at the STP.	500
Sanitary Sewer System Rehabilitation	Wide variety of corrective measures to sanitary sewer collection and conveyance systems that do not experience chronic overflows, such as the rehabilitation, repair, or replacement of sanitary sewers, pump stations, interceptors, or the purchase of equipment to properly maintain the sanitary sewer system.	450
Sludge Treatment/Disposal Facilities	Projects involving the construction of facilities to manage sludge from STPs or from potable water treatment activities, such as the installation of dewatering equipment, the implementation of land application or composting activities or improvements or repairs to sludge incinerators.	350
Wastewater Reuse	The construction of facilities that promote the reclamation of water for beneficial reuse such as the use of treated effluent for agricultural or other purposes and/or construction of conveyance and distribution systems to allow for reuse activities.	300
Septic System Repair/Replacement	Projects that involve repairs, improvements, and/or replacement of individual or small community, on-site septic systems.	275
New Systems	The expansion of a STP's treatment capacity, and the construction of new facilities to provide collection, conveyance, or treatment of sanitary sewage.	250

Table 1B: Ranking Points Related to Project Categories for Stormwater and Nonpoint Source Pollution Management Facilities

Project Category	Description	Points
Stormwater Management and other NPS activities	The construction or rehabilitation of stormwater basins, sewer systems or storm drains, the extension of outfall pipes, green roofs, blue roofs, green streets, tree filters, rain gardens, rain barrels, porous pavement, or the purchase of maintenance equipment (such as street sweepers, aquatic weed harvesters and skimmer boats). Projects that stabilize streambanks, restore lakes or address runoff from salt storage facilities and the implementation of measures to address pollution concerns from agricultural cropland activities and manure runoff management and feedlot operations.	225
Landfill Closure, Open Space Land Acquisition and Conservation and Well Sealing	The implementation of measures to prevent and control pollutants from entering groundwater at non-operating landfill sites that are publicly owned and at abandoned well locations. Open space land acquisition and conservation projects that help to protect or maintain water quality.	150
Landfill Construction and Remedial Action Activities	The construction of facilities to collect, convey and/or treat leachate and runoff from publicly owned landfill cells or from publicly owned contaminated sites.	75
Projects sponsored by Conduit Borrowers/ Private Activity	Environmental infrastructure projects where a developer, LLC, partnership, or other private party is involved in the project; landfill closure measures and remedial action activities where the project site is privately owned. If a local government unit that sponsors a project on behalf of a private entity commits to providing a general obligation pledge (including its unlimited taxing power) or municipal guarantee as security for the DEP and I-Bank loans, the project is considered exempt from the conduit financing classification and corresponding funding limitations.	50

In addition to the points awarded in Table 1A and 1B, points will be awarded to projects that meet the following criteria:

- Projects that implement green infrastructure, water, or energy efficiency improvements (including projects that are designed to reduce greenhouse gas emissions) will receive an additional 50 priority points if the green components represent a significant amount of the overall project activities.
- Projects implementing climate resilience measures will receive an additional 100 priority points if the resilience components represent a significant amount of the overall project activities. Resilience measures for wastewater, and stormwater infrastructure projects must apply the best available and most geographically relevant climate information, projections, and standards.

C. Water Use/Water Quality Points

Points are awarded based on the designated water uses of the receiving water as well as the existing water quality conditions in comparison to the ambient water quality standards. The assignment of points for “public nuisance” is given to on-site system projects where failures have been identified. Table II below shows the breakdown of the ranking points for water use; in general, the highest values are given for projects that discharge to water bodies with potable, recreational, and fishing uses.

Table II. Ranking Points Related to Water Use (Existing and Potential)		
Water Use		Basis/Description
Public Potable Water Supply		Wastewater treatment plant discharges likely to have adverse impacts on an existing downstream potable surface water supply intake. Projects are evaluated based on relative distance between STP discharge and public potable water intake locations.
Recreation (“Primary Contact”)		Waters with bathing areas monitored routinely as public beaches as well as the Delaware River upstream of Trenton (north of East Bridge Street at the Lower Trenton Bridge).
Fishing:	Shellfish	State water bodies that are designated as shellfish growing waters by N.J.A.C. 7:12.
	Trout	State freshwater bodies designated for trout production or maintenance by the NJ Water Quality Standards (N.J.A.C. 7:9B).
	Non-trout	State freshwater classifications not designated trout production or maintenance by N.J.A.C. 7:9B (see Trout description above), including all Delaware River freshwater zones above mile-point 85 as defined by the Delaware River Basin Commission.
Public Nuisance		Indirect water use impacts: applies to areas with identified on-site wastewater treatment system failures.
Agriculture		Surface water for agricultural use, such as irrigation and farm ponds, based on Department diversion permit (permits required for >70 gal/min diversion).
Industry		Surface water known to be used for industrial use such as cooling.

Table III shows the points for not meeting or marginally meeting certain water quality parameters. The points reflect the impact the parameters have on meeting the state’s goal to protect and enhance surface water resources, quality criteria, and designated water uses. The magnitude of the contribution that municipal sewerage facilities have on each of the conditions is reflected in the points awarded under these categories.

Nutrients reflect the presence of phosphorus/phosphates and nitrates/nitrites in a water body. Excessive nutrient levels in freshwater streams and lakes may result a decrease in water quality and an increase in treatment costs. Points are given for nutrients only if the surface waters involved significantly impact existing potable water reservoirs, surface water impoundments or lakes, public bathing areas, or shellfish growing waters. Since there are no nutrient standards for coastal and estuarine waters, no points were assigned for discharges to those water bodies.

Points for toxics address the relative magnitude of ammonia, metals, pesticides, and organic chemicals in the water body. Toxics were given lower points since in most cases the significant contributions of toxic substances come from industrial sources that are better controlled through pretreatment and are only incidentally abated by municipal treatment facilities. In the case of the toxicity of ammonia, municipal facilities are usually the main source, but the

most significant impact is associated with streams designated for trout production/maintenance, which already receive a high number of points under the water use category.

Table III. Ranking Points Related to Water Quality				
Water Quality		Points for Water Quality that		
		Meet	Marginally Meet	Do Not Meet
		The Water Quality Standard*		
Parameter	Dissolved Oxygen	0	50	100
	Fecal Coliform	0	50	100
Parameter	Nutrients	0	25	50
Category	Toxics	0	25	50

*The Surface Water Quality Standard for the applicable parameter or category.

D. Smart Growth Approvals

DEP seeks to coordinate and enhance the efforts to encourage smart growth through the implementation of the State Development and Redevelopment Plan. DEP assigns ranking points to eligible clean water projects consistent with an approved Water Quality Management Plan that serve municipalities that have been approved under the Center Designation or Plan Endorsement Process.

For a project serving more than one municipality, the points were included for ranking purposes if the designated center or the endorsed plan is a significant component of the overall project. For further information regarding the State Development and Redevelopment Plan, contact the Office of Planning Advocacy in the New Jersey Department of State at (609) 292-7156.

Table IV. Ranking Points Related to State Planning Commission Approvals	
Community Type	Points
Urban Centers and Complexes	50
Regional Centers	25
Existing Designated Towns	15
Existing Villages	10
Hamlets	5

Projects located in or benefiting areas designated as Brownfield Development Areas, Transfer of Development Rights receiving areas or Transit Villages receive 10 points, so that these projects will rank higher than similar projects that are not located in, or provide benefit to, these smart growth areas.

E. Environmental Justice Economic Overburdened Community Criteria

Projects are assigned 80 Environmental Justice Economic Overburdened Community Criteria points if at least 35% of the households served by the project, on a municipal basis, qualify as low-income households (at or below twice the poverty threshold in accordance with the most recent United States Census as determined by the United States Census Bureau). A weighted economic OBC criteria is calculated for a project sponsor whose water system serves more than one municipality as shown in the example below. Population served is based on the permanent population of the service area. Consideration will be given for projects with a qualifying service area population within a municipality that does not meet the 35% threshold.

Example:

Municipalities Served	% low-income households	Populations Served	Fraction of total population served	Weighted % of low-income households
Lancaster	30%	5,000	0.167	5.01%
Mayberry	40%	10,000	0.333	13.32%
Hometown	35%	15,000	0.500	17.50%%
Total		30,000	1.00	35.83%

Please note for applicants that service more than 10 municipalities, the 10 municipalities that have the highest populations served will be considered in the above table for the affordability factor.

F. Population Points

Projects are assigned points based on the population of the area served by the project. One point is given for every 1 million people living year-round in the project area. Thus, if projects have the same number of ranking points after having received all eligible points, population points become the tiebreaker, with higher priority given to the project serving the larger population.

G. Established Local Employment Program

Projects are assigned one point to applicants that have an established program to employ at the project facility, or at related offices or facilities, persons who reside in the municipality in which the project is located, the service area of the project, or in surrounding municipalities that meet the criteria for State aid pursuant to P.L.1978, c.14 (C.52:27D-178 et seq.)”.

APPENDIX 3: Clean Water Affordability Criteria

Section 603(i)(2) of WRRDA requires States to develop affordability criteria that will assist in identifying applicants that would have difficulty financing projects without additional subsidization. The law requires that states establish affordability criteria by September 30, 2015, after providing notice and an opportunity for public comment, which is being accomplished through this new feature of NJ's CW Intended Use Plan.

In New Jersey, those applicants that meet either of the following two criteria are considered to have satisfied the State's **CWSRF Affordability Criteria**:

1. **Project Affordability Score** of 80 or less; or
2. The project is eligible to receive 80 **Environmental Justice Economic Overburdened Community Criteria** CWSRF ranking points.

Project Affordability Score = Project Median Household Income (MHI) Factor – Project Unemployment (UE) Factor – Project Population Trend (PT) Factor

Project MHI Factor = $100 \times (\text{Project MHI} / \text{State MHI})$ (Rounded down to the nearest integer)

Project UE Factor = 1 if Project Unemployment Rate > State Unemployment Rate

Project UE Factor = 0 if Project Unemployment Rate < or = State Unemployment Rate

Project PT Factor = 1 if Project Population Trend < State Population Trend

Project PT Factor = 0 if Project Population Trend > or = State Population Trend

Project Unemployment Rate is equal to weighted unemployment rate of the project service area using service area populations and county unemployment data. Calculation is similar to weighted MHI example below.

Project Population Trend is equal to the weighted population trend for the project service area using service area populations and municipal population trend data. Calculation is similar to weighted MHI example below.

Consideration will be given for projects with a qualifying service area population within a municipality that does not meet the CWSRF Affordability Criteria.

Data Sources:

MHI Percent - Municipal median reported household income (MHI) as a percent of the statewide MHI. The income reported is an estimate from 2019 from the U.S. Census Bureau's ACT 2014-2019 5-year estimates, [as found in the 2020 Municipal Revitalization Index \(link\)](https://www.nj.gov/dca/home/MuniRevitIndex.html) <https://www.nj.gov/dca/home/MuniRevitIndex.html> provided by the New Jersey Department of Community Affairs. Values are expressed in 2020 dollars. Values over 100 indicate that the municipality has a MHI greater than the state as a whole. Conversely, values under 100 show that the MHI in the municipality is lower than state. This statewide MHI used was \$85,245.

County Unemployment - Annual average county unemployment rate as provided by the New Jersey Department of Labor [of Labor \(link\)](https://www.nj.gov/labor/labormarketinformation/assets/PDFs/employ/uirate/fmth_2010-2021.xlsx) https://www.nj.gov/labor/labormarketinformation/assets/PDFs/employ/uirate/fmth_2010-2021.xlsx. These values are compared to the statewide annual average unemployment rate. The statewide annual average used was 3.4%. In order to correct for labor market distortions caused by the pandemic, 2019 values were used here.

Population Change - The average annual rate of change in total population from 2009 to 2019, also provided by NJDCA in the [Municipal Revitalization Index](#). These values are compared to the statewide population change during that same time period. The statewide rate of change used in this analysis was - 0.3%

A weighted MHI is calculated for a project sponsor whose clean water system serves more than one municipality, as shown in the example below. Population served is based on the permanent population of the water system service area.

Example:

Municipalities Served	MHI	Populations Served	Fraction of total population served	Weighted municipal MHI
Lancaster	30,000	5,000	0.167	5,000
Mayberry	20,000	10,000	0.333	6,660
Hometown	25,000	15,000	0.500	12,500
Total		30,000	1.00	24,160

Please note for applicants that service more than 10 municipalities, the 10 municipalities that have the highest populations served will be considered in the above table for the affordability factor.

A weighted unemployment rate for use in the UE Factor is calculated for a project sponsor whose clean water system serves more than one municipality/county, as shown in the example below. Population served is based on the permanent population of the water system service area.

Example:

Municipalities Served	County Unemployment Rate	Populations Served	Fraction of total population served	Weighted Municipal Unemployment Rate
Lancaster, County A	4.0%	5,000	0.167	0.668%
Mayberry, County A	4.0%	10,000	0.333	1.332%
Hometown, County B	6.5%	15,000	0.500	3.250%
Total		30,000	1.00	5.25% (Project Unemployment Rate)

Please note for applicants that service more than 10 municipalities, the 10 municipalities that have the highest populations served will be considered in the above table for the affordability factor.

A weighted population trend for use in the Population Trend Factor is calculated for a project sponsor whose clean water system serves more than one municipality/county, as shown in the example below. Population served is based on the permanent population of the water system service area.

Example:

Municipalities Served	Municipal Population Trend	Populations Served	Fraction of total population served	Weighted Municipal Population Trend
Lancaster	2.0%	5,000	0.167	0.334%
Mayberry	2.0%	10,000	0.333	0.660%
Hometown	-1.0. %	15,000	0.500	-0.500%
Total		30,000	1.00	0.494% (Project Population Trend)

Please note for applicants that service more than 10 municipalities, the 10 municipalities that have the highest populations served will be considered in the above table for the affordability factor.

APPENDIX 4: Clean Water Project List (Combined - CWSRF Base, CWSRF General Supplemental, CWSRF Emerging Contaminants)

All projects on the list are eligible to receive CWSRF Base and CWSRF General Supplemental grant funds.

Projects designated (BIL EC) are eligible to receive CWSRF Emerging Contaminants grant funds and principal forgiveness.

Appendix 4 - Final Clean Water Project Priority List (Combined - CWSRF Base, CWSRF General Supplemental, CWSRF Emerging Contaminants) for Federal Fiscal Year 2023 (and State Fiscal Year 2024)

Genrerated on November 29, 2023

* All projects on the list are eligible to receive CWSRF Base and CWSRF General Supplemental grant funds.
** Projects designated (BIL EC) are eligible to receive CWSRF Emerging Contaminants grant funds and principal forgiveness.

STATE OF NEW JERSEY
FINAL FEDERAL FISCAL YEAR 2023 (SFY 2024) CLEAN WATER PROJECT PRIORITY LIST

Rank	Project Sponsor	Project Number	Cat 1	Cat 2	Cat 3	Cat 4	Cat 5	Cat 6	Cat 7	Total Building Costs	Estimated Cost	BIL Eligibility
1	Musconetcong Sewerage Authority	S340384-09	\$ -	\$ 4,550,000	\$ -	\$ -	\$ -	\$ -	\$ -	\$ 4,550,000	\$ 5,953,572	BIL (GEN)

Musconetcong Sewerage Authority
S340384-09
Sewage Treatment Plant (STP) - Improvement/Upgrade

Priority List Rank

1

County

Morris

Existing Population

61,661

Service Area

The Musconetcong Sewerage Authority receives wastewater from seven (7) communities. They are as follows: Netcong, Roxbury, Stanhope, Mt Olive, Mt. Arlington, Hopatcong and Byram.

Need for Project

The microstrainers for Plant 1 and Plant 2 are approaching the end of their useful life and are experiencing ongoing operation and maintenance issues. An improvement to the microstrainer system for Plant 1 and Plant 2 is desired to enhance the reliability of the screening systems in efforts to comply with the effluent discharge limits set forth in the Authority's NJPDES permit.

Project Description

The Musconetcong Sewerage Authority is currently planning to perform capital improvement projects at their existing wastewater treatment plant including a new Influent Screening Facility and the replacement of the plant effluent Micro-Strainers. In addition, the MSA plans to acquire a total of nineteen (19) pumps through the Passaic Valley Sewerage Authority Co-Op.

Camden County Municipal Utilities Authority
S340640-19
Combined Sewer Overflow (CSO) - Green Infrastructure

Priority List Rank

3

County

Camden

Existing Population

513,657

Service Area

Separation and improvements to Camden's combined sewer system will reduce the potential of combined sewage flooding in Camden. Green infrastructure will also reduce the potential for combined sewage flooding, as well as improve quality of life for Camden's residents. Creation of a new waterfront park will also improve quality of life for Camden's residents

Need for Project

Improvements to Camden's combined sewer system and green infrastructure will reduce the potential of combined sewage flooding and overflows into the Delaware River and its tributaries. The creation of the North Camden Waterfront Park will improve water quality by eliminating contaminated soil runoff into the Delaware River

Project Description

separation of combined sewers in Camden City, implementation of green infrastructure projects and creation of a new riverfront park. Elimination of stormwater from Camden City's combined sewer system will reduce pumping and treatment requirements, thereby reducing energy consumption and energy costs

Combined Sewer Overflow (CSO) - Traditional Infrastructure

Priority List Rank

3

County

Camden

Existing Population

513,657

Service Area

Camden County

Need for Project

Green infrastructure will reduce the potential for stormwater to enter the Camden City combined sewer system which will reduce combined sewage flooding and overflow to the Delaware River.

Project Description

The project consists of constructing pervious surfaces, including green infrastructure and playing fields, in the area of what is currently Campbell's Field in Camden City including green infrastructure and playing fields. The increase in pervious surfaces will allow less stormwater to enter the Camden City combined sewer system and therefore will aid in limiting combined sewage flooding.

Service Area

City of Camden

Need for Project

Project will reduce the potential of combined sewage flooding and combined sewage overflows into the Delaware River

Project Description

Construction of several green infrastructure projects in Camden City to reduce the potential of combined sewage flooding , particularly in the Camden waterfront area. Implementation of green infrastructure not only reduces combined sewage flooding and/or overflows but also reduces pumping and treatment costs, thereby reducing energy consumption

Project Name, Number

Newton Town
S340449-05
Sewage Treatment Plant (STP) - Improvement/Upgrade

Priority List Rank

5

County

Sussex

Existing Population

7,997

Service Area

The Town's wastewater collection system includes approximately 25 miles of gravity sewers ranging in diameter from 6" through 24". The gravity sewer collection system is constructed mostly of vitrified clay pipes, with approximately 90 percent of the pipes being 8-inch diameter. The manholes were mostly constructed of concrete block or brick through 1965, while more recently-installed manholes are constructed predominately of precast concrete. The collection system has six (6) tributary drainage areas that ultimately convey to the Town's wastewater treatment plant.

Need for Project

This project is to replace the equipment for one of the key processes in use at the Wastewater Treatment Plant. Although this is addressing the biosolids portion of the facility, it is needed to maintain the overall proper operation of the plant and as such maintain the proper operation of the wet processes as well.

Project Description

The existing anaerobic digesters were originally constructed in 1953 and renovated in 1990. The facility is currently in disrepair and not fully operational and the cover is damaged. Currently, the tank provides limited service as a sludge storage tank. Sludge is currently hauled away without significant treatment for volume and pathogen reduction. Based on a previously conducted study, upgrade by conversion to aerobic digestion was recommended in lieu of reconditioning of the existing anaerobic digestion process. Conversion to an aerobic system is recommended because it would reduce approximately the same quantity of sludge, with lower associated capital costs, simpler operation and maintenance, lower strength of the return supernatant, and less potential for odors. The project will also include the replacement of various pumps, valves, etc.

Service Area

The service areas for this project are Camden and Gloucester Cities

Need for Project

Due, in part, to CSOs, the Cooper River, Newton Creek and Delaware River have the following water quality based needs. Cooper River (Below Rt 130) - Does not support: Aquatic Life, Fish Consumption, Primary Contact Recreation Newton Creek (LDVR - Kaighn Ave to LT Creek) - Does not support: Aquatic Life, Fish Consumption, Primary Contact Recreation, Public Water Supply Delaware River (Zone 3) - Does not support - Fish Consumption,

Project Description

The Long Term Control Plan (LTCP) is a system wide evaluation of the sewage infrastructure, and the hydraulic relationship between the sewers, precipitation, treatment capacity and overflows in Camden and Gloucester Cities. As part of the LTCP, Camden and Gloucester Cities and the CCMUA must evaluate alternatives that will reduce or eliminate the discharges, and develop a plan and implementation schedule to do so. LTCPs are created to identify the most cost-effective manner to regulate CSOs to meet water quality standards.

Service Area

The Camden County MUA's service area consists of all of Camden County. This project is located in Camden City, one of Camden County's 37 municipalities

Need for Project

Camden City's combined sewer system overflows into the Delaware River, or floods the streets, parks and homes of Camden's residents. These green and grey infrastructure projects will reduce the amount of storm water that enters the system and improve the resiliency and capacity of Camden's system, thereby reducing the potential for flooding and overflows

Project Description

(Carryover SFY2015) - The scope of the project includes the construction of 10 new rain gardens in the City, replacing deteriorating combined sewer pipes in some of the roadways in the City and remediation & construction of second and final phase of Phoenix Park to control storm water and improve water quality in the City.

Rahway Valley Sewerage Authority
S340547-17
Sewage Treatment Plant (STP) - Improvement/Upgrade

Priority List Rank

10

County

Union

Existing Population

273,788

Service Area

The Rahway Valley Sewerage Authority (RVSA) is a wastewater treatment authority that processes wastewater from 11 member communities and 3 additional non-member communities. The RVSA eleven member municipalities are the Township of Clark, Township of Cranford, Borough of Garwood, Borough of Kenilworth, Borough of Mountainside, City of Rahway, Borough of Roselle Park, Township of Scotch Plains, Township of Springfield, and Town of Westfield all of which are in Union County and the Township of Woodbridge in Middlesex County. The RVSA serves the Township of Winfield through an agreement with the Township of Clark. While Scotch Plains, Roselle Park and Woodbridge are member municipalities, the RVSA does not serve these communities in their entirety. A very small portion of Fanwood is served through an agreement with the Township of Scotch Plains and the Authority also serves a very small portion of Linden.

Need for Project

The existing screens at RVSA frequently blind, especially during wet weather flow, because the existing rake mechanism cannot clean the screens fast enough, resulting in a lower level of treatment by allowing raw wastewater to bypass the screening treatment process. This can negatively affect downstream processes required for NJDEPS permit compliance. This project replaces the existing screens with multi-rake fine bar screens which will reduce blinding and maintenance requirements of the screens. Also, new screenings washer and compactors will be installed for more efficient handling of screenings and reduced organic loading being discharged to a landfill.

Project Description

This project represents replacement in kind of existing preliminary screening equipment and does not involve increased capacity of the system and the procurement and replacement of the main influent pump variable frequency drives..

Rahway Valley Sewerage Authority
S340547-16
Sewage Treatment Plant (STP) - Improvement/Upgrade

Priority List Rank

11

County

Union

Existing Population

250,000

Service Area

The service area is primarily sections of Union County and half of Woodbridge which is in Middlesex County. The municipalities in Union County that are served include: Clark, Cranford, Garwood, Kenilworth, Mountainside, Rahway, Roselle Park, Scotch Plains Springfield, Westfield, Winfield, a section of Fanwood and several streets in Linden.

Need for Project

Not applicable. This project is not related to water quality.

Project Description

This project consists of a number of miscellaneous projects. One element is to make modifications to the controls in order to allow for black start of the Cogeneration Engines. Another major element is installation of a redundant electric distribution bus. This application is also for installation of heat exchangers that would allow for recovery of exhaust heat from the Cogeneration Engines for use in the plant hot water loop. The last components of this loan application consist of two flood proofing elements. Specifically they consist of installing flood proof doors on the Administration Building in order to prevent flooding of the building basement and the installation of a tide gate or check valve in order to prevent the backflow of water from the Rahway River through the plants emergency outfall. In addition this project includes the repair of an existing centrifuge and installation of another centrifuge.

Service Area

The RVSA member communities are Clark Cranford Garwood Kenilworth Mountainside Rahway Roselle Park Scotch Plains Springfield Westfield and Woodbridge. In addition the Authority serves Winfield Park through an agreement with Clark and also serves a section of Fanwood and a section of Linden.

Need for Project

The project is needed in order to make the WWTP more energy efficient and reliable to reduce the possibility of loss of power causing sanitary sewer overflows and/or the bypassing of wastewater treatment which would result in the discharge of raw wastewater to the Rahway River.

Project Description

This project includes construction of a waste receiving station and digester installation of a plant hot water heat exchanger on the cogeneration engine exhaust LED lighting for the plant digester gas fired boilers installation of a 750-800 KW CHP engine and installation of an adsorption chiller.

Priority List Rank

12

County

Union

Existing Population

204,921

Service Area

The Rahway Valley Sewerage Authority (RVSA) is a wastewater treatment authority that processes wastewater from 11 member communities and 3 additional non-member communities. The RVSA eleven member municipalities are the Township of Clark, Township of Cranford, Borough of Garwood, Borough of Kenilworth, Borough of Mountainside, City of Rahway, Borough of Roselle Park, Township of Scotch Plains, Township of Springfield, and Town of Westfield all of which are in Union County and the Township of Woodbridge in Middlesex County. The RVSA serves the Township of Winfield through an agreement with the Township of Clark. While Scotch Plains, Roselle Park and Woodbridge are member municipalities, the RVSA does not serve these communities in their entirety. A very small portion of Fanwood is served through an agreement with the Township of Scotch Plains and the Authority also serves a very small portion of Linden.

Need for Project

The existing air handlers in the RVSA Headworks Facility were installed on 2009 and include internal heat exchangers to recover heat from the exhaust air. Due to the moist environment within the facility, these units have severe levels of corrosion, scaling, and build-up of debris within the housings causing equipment failures and allowing exhaust air to leak into the supply airstream side of the units. The ability to provide the proper level of air changes within the facility is critical to the safety of the RVSA personnel and the long-term protection of the building and equipment. This project rehabilitates four existing air handlers, replaces one air handler with a new split unit to segregate the supply and exhaust air systems, and modifies portions of the ductwork to better exhaust the corrosive air.

Project Description

This loan will include two (2) contracts. Contract 1 - RVSA Headworks Bldg HVAC and Gas Detection Systems Upgrades which includes HVAC modifications at the RVSA's Headworks Building and H2S, LEL and Smoke Alarm Upgrades. Contract 2 - Grit Removal Tank and Bridge Upgrades

A very small portion of Fanwood is served through an agreement with the Township of Scotch Plains and the Authority also serves a very small portion of Linden.

Need for Project

Not Applicable. This project is not related to a water quality-based need.

Project Description

This project consists of constructing a trucked-in waste receiving station and includes construction of a equalization/blend tank with metering pumps for feeding of liquid waste to existing anaerobic digesters. The addition of liquid waste will result in an increase in digester gas production which will be used to fuel existing cogeneration engines. The electric generated will reduce the plants electrical consumption and recovery of waste heat will be used to heat the anaerobic digesters and plant hot water loop thereby decreasing the need for purchase and use of utility energy.

Raritan Borough
S340781-04
Sanitary Sewer System Rehabilitation

Priority List Rank

15

County

Somerset

Existing Population

5,990

Service Area

Raritan Borough

Need for Project

Many of the sewers in the Borough of Raritan are at least 75 years old and have never been rehabilitated. The infiltration/inflow (I/I) resulting from sewer pipe decay is estimated at 40-50 percent of the total flow from the Borough. This condition results in raw sewage overflows which adversely impact the Raritan River by contributing to the elevated nutrient and bacteriological levels in the River which is classified as FW2-NT. Toxic levels marginally meet existing standards. The River is used as an industrial water supply and as a potable water supply for the Elizabethtown Water Company.

Project Description

The project will include rehabilitating a portion of the existing 20 miles of sewers or replacing that which is beyond repair. It may also be necessary to replace some of the undersized sewers with larger ones. This rehabilitation work will eliminate the sewage overflows from this system and reduce excessive flow into the Somerset-Raritan Valley Sewerage Authority (SRVSA) plant.

The Mendham Boro Water Reclamation Facility (WRF) services the majority of the northern portion of the Borough of Mendham.

Need for Project

The various improvements proposed at the WRF are to replace existing equipment that has reached the end of its useful life or to alleviate operational concerns at the plant. This is necessary to maintain operational compliance at the WRF.

Project Description

The Borough of Mendham is currently planning to perform capital improvement projects at their existing wastewater treatment plant. The Borough will be undertaking miscellaneous water reclamation facility improvements as part of the Capital Improvement Plan resulting from Asset Management efforts. These improvements include: New grit collection and handling equipment, oxidation ditch modifications, replacement of Motor Control Center No. 2, clarifier rehabilitation and various other miscellaneous improvements.

Combined Sewer Overflow (CSO) - Green Infrastructure

Priority List Rank

17

County

Essex

Existing Population

277,140

Service Area

The pilot project will serve the Clinton Hill neighborhood within Newark's South Ward. However, the impact of reducing CSOs through green stormwater infrastructure will eventually be felt throughout the City of Newark, particularly in the major portions of the city served by the Combined Sewer System.

Need for Project

Storm water management through green infrastructure is needed to improve water quality in the Passaic River, which experiences frequent overflow instances from the 17 CSO outlets within Newark. Green infrastructure projects not only reduce volume during peak storm events, thus reducing the likelihood of CSOs, they also filter pollutants from the stormwater before it reaches the treatment plant.

Project Description

At this site the existing concrete traffic triangle will be removed replaced and expanded with permeable surfaces that promote groundwater recharge. Approximately 195 square feet of pervious pavers will be installed adjacent to Clinton Ave that will capture and infiltrate stormwater runoff. A paved gathering space and sidewalk adjacent to Badger Ave will be comprised of approximately 1000 square feet of pervious concrete that will capture and infiltrate stormwater runoff. A 1005 square foot stormwater planter along with three curb cut inlets will be installed that will intercept treat and filter stormwater runoff from portions of Clinton Ave and West Alpine St. The remainder of the site will be de-paved and planted with various shrubs and trees. This project is intended as the first of many green infrastructure projects designed to divert stormwater within the CSS area and reduce incidence of CSOs.

Combined Sewer Overflow (CSO) - Green Infrastructure

Priority List Rank

17

County

Essex

Existing Population

277,140

Service Area

Based on the 2010 U.S. Census, there are 277,138 people (92,303 households) residing in the City of Newark. The population density was 11,458 people per square mile. The racial makeup of the City was 26.3 percent (72,887) White, 52.4 percent (145,220) Black or African American, 0.6 percent (1,663) Native American, 1.6 percent (4,434) Asian, and 3.8 percent (10,531) from two or more races. Hispanics or Latinos of any race were 33.8 percent (93,148) of the population. The Newark Bay Treatment Plant serves more than 1.4 million residents in the Passaic Valley Service District including The City of Newark. This includes residents of 48 municipalities in Bergen, Essex, Hudson, Union, and Passaic Counties.

Need for Project

The City of Newark consists of large areas of impervious cover that generate large volumes of stormwater runoff. These projects will serve to manage stormwater runoff from impervious areas reducing the pressure on Newark's combined sewer system and a reduction of nonpoint source pollution into the Lower Passaic River and Newark Bay which is listed on the NJ 303(d) list of impaired water bodies.

Project Description

This application is for the construction of four (4) green stormwater infrastructure projects in the City of Newark. These projects will reduce stormwater runoff in the City of Newark's neighborhoods that flow directly into the existing sewer system. These projects include porous pavements, rain gardens, stormwater planters, and tree trenches that will manage runoff from rooftops and parking areas.

Existing Population

277,140

Service Area

THE CITY OF NEWARK SERVED BY THE COMBINED SEWER SYSTEM IN THE EAST WARD.

Need for Project

DURING WET WEATHER, THE COMBINATION OF STORM WATER AND WASTE WATER IN THE CSS MAY EXCEED THE CAPACITY OF THE SYSTEM. THE EXCESS FLOW (i.e., CSO), IS DISCHARGED DIRECTLY TO A WATERWAY THROUGH THE PERMITTED OUTFALLS. SINCE CSO DISCHARGES INCLUDE RAW SEWAGE, THEY WILL CONTAIN A COMBINATION OF UNTREATED HUMAN WASTE AND COMMERCIAL AND INDUSTRIAL POLLUTANTS. THE PURPOSE OF THE PROJECT IS TO IMPROVE THE EXISTING DRAINAGE SYSTEM WITHIN TWO DRAINAGE AREAS THAT ARE HYDRAULICALLY CONNECTED TO A CSS TO ADDRESS SAFETY, TRAFFIC IMPEDIMENT AND WATER QUALITY CONCERNS. THE REDUCTION IN PEAK FLOW RUNOFF BY IMPLEMENTING GI WILL ASSIST IN IMPROVING WATER QUALITY.

Project Description

Drainage Improvements are proposed at South Street and Adams Street, as well as along Miller Street to Avenue C. At South Street and Adams Street the proposed design will incorporate roadway reconstruction, resurfacing, sidewalk, curb and ADA curb ramp improvements, new drainage inlets, manholes and pipes to alleviate flooding. Sewer separation is proposed along Adams Street. No new outfalls are proposed. At Miller Street, the proposed design includes installation of new inlets, manholes, pipes and a pump station to alleviate flooding at the end of Avenue C to redirect flow and not separate. Green Infrastructure (GI) is also proposed at both of these locations.

Need for Project

Studies performed by NJDEP and the Cape May Board of Health have shown a need to find an alternate water source. The U.S. Geological Survey also indicated the need for an alternative water source. The existing discharge adversely impacts primary contact recreation and shellfish harvesting uses. Water quality does not meet standards for fecal coliform and nutrients and marginally meets standards for dissolved oxygen and toxics. Sewage Treatment Flow Effluent Plant (STP) Name (mgd) Reported BOD Reported SS (NJPDES) Design Present mg/l mg/l Lower Township STP (NJ0023809) 4.0 1.44 91.4 18.52 93.4 12.62

Project Description

The proposed solution is to construct a sand filter with an ultraviolet system and distribution system so the water can be used to recharge the local aquifers and halt salt water intrusion. Land application of the effluent to local golf courses and farms will be considered.

Borough of Oakland

Need for Project

The area is currently served by septic systems and some small package treatment plants. As treatment requirements increase from Level 4 to Level 5 the plants will be unable to meet their effluent requirements. Ground and surface waters (Ramapo River FW2-NT) are used for recreation as well as a potable water source and are being degraded by the failure of existing disposal facilities.

Project Description

The proposed project includes the construction of a wastewater treatment plant interceptor sewer and collection system. The proposed interceptor sewer and collection system will convey all flows from the six (6) wastewater treatment plants (that will be abandoned) to the proposed wastewater treatment plant.

Need for Project

Reduction of combined sewage overflows and combined sewage flooding

Project Description

The CCMUA owns Camden City outfall C32 which is the largest outfall by volume of overflow in the Camden City, Gloucester City, CCMUA system. Currently, flow that originates in Pennsauken enters the Camden system at 42nd and High Street 51 times during the Typical Year with a total volume of 37.8 million gallons and a simulated peak flow that can reach 30 million gallons per day during the typical year. This project would eliminate the flow from entering the Camden City system and would, instead, convey the flow to a Delaware River outfall. This project would eliminate the need for satellite treatment or storage at the C32 outfall.

Service Area

Consistent with the current Wastewater Management Plan, the service area of this project consists of a portion of Montgomery Township.

Need for Project

The project will include various improvements to the Skillman Village WWTP to address aging infrastructure, accommodate consolidated flows and improve plant operations, thereby enabling reliable plant performance and water quality protection.

Project Description

This project includes demolition of the Cherry Valley wastewater treatment plant (WWTP) and consolidation of sewage flows at the Skillman Village WWTP. An existing pump station will be modified and a new force main will be constructed to convey flows from the Cherry Valley service area to the Skillman Village WWTP. The project will include various improvements to the Skillman Village WWTP to address aging infrastructure, accommodate the consolidate flows and improve plant operations, thereby enabling continued reliable performance and water quality protection. The project will not increase the plant's permitted capacity.

Service Area

Consistent with the current Wastewater Management Plan, the service area of existing plant and this project consists of a portion of Montgomery Township and Rocky Hill Borough

Need for Project

This project is needed to prevent damage to the plant during flooding of the Millstone River and to replace plant components at the end of their service lives thereby enabling reliable and resilient plant performance and water quality protection.

Project Description

This project will provide flood protection of the existing wastewater treatment plant, thereby significantly improving its resiliency, and will replace various plant components that have reached the end of their service lives, thereby enabling continued reliable performance and water quality protection. This project will not increase the plant's permitted capacity.

Service Area

The study area consists of that portion of Sparta Township (48) which is situated within the Upper Wallkill River Basin. On-site rehabilitation in conjunction with a Septic System Management District would consider the entire Township as a

Need for Project

All existing point source discharges must be addressed. Should these discharges remain in existence they must be upgraded to meet the effluent limitations needed to protect existing water quality. In cases of discharge to the Wallkill River (FW2-TM) (Plaza and H.S. 1 and 2 plants) advanced wastewater treatment will be required to diminish any impacts to Franklin Pond a downstream potable water source for Franklin Borough. Primary contact recreation is also adversely impacted by these discharges. The Wallkill river marginally meets standards for fecal coliform nutrients and toxics. In addition the failure rate for individual septic systems is averaging about 3 per year. Many of the existing systems (e.g. cesspool) cannot meet the minimum requirements for subsurface disposal and must be replaced. Sewage Treatment Flow Effluent Plant (STP) Name (mgd) Reported BOD Reported SS (NJPDES) Design Present mgl mgl Plaza STP (NJ0027057) AST-90 .030 .040 91.3 12.6 86.0 23.3 Board of Ed.- Alpine School (NJ0027065) AST-95 .027 .008 97 7.4 93 16 Board of Ed.- H.S. Plant 1 (NJ0027073) .022 .005 98.6 4.14 97 1.44 Board of Ed.- H.S.Plant 2 (NJ0027081) .027 .008 87.6 4.2 98 2.56

Project Description

A likely alternative for wastewater disposal in Sparta Township is on-site rehabilitation in conjunction with initiation of septic management district planning. Therefore the major scope of work for this project would include the upgrading of all existing point source discharges to acceptable treatment levels. This would preclude development of any future point source discharges in Sparta Township for the 20 year planning period.

Need for Project

Chemical Room Upgrades - Most of the existing equipment including the chemical feed pumps, piping and tankage are original to the previous upgrade in 1990 and are in need of upgrade/replacement. WWTP ABW Sand Filter Rehab - given the age and condition of the filter system, the unit is in need of renovation to address media loss, corrosion, wear on the chain and sprocket system, etc. Transfer Switch (generator), Main electrical switch - both are in need of replacement as they are critical to operation of the plant.

Project Description

Contract 1 - Chemical Room Upgrades Contract 2 - WWTP Sand Filter Rehab Contract 3 - Transfer Switch Replacement (generator) and main electrical switch replacement All 3 contracts will upgrade antiquated equipment at end of useful life. The newer equipment will be more energy efficient.

Service Area

The above population is for all of Warren Township. The project will serve Warren Township's Stage I/II, Stage IV and Stage V Sewer Service Areas which consists of approximately 2,407 households out of 4,754 total customers or approximately 50% of Warren Township's population.

Need for Project

This project is needed to maintain compliance with existing discharge permits while improving the headworks at all three plants. The project will improve the CBOD and TSS treatment capabilities at Stage I/II and Stage IV.

Project Description

This project consists of miscellaneous improvements at the WTSA's Stage I/II (NJ0022489), Stage IV (NJ0022497), and Stage V (NJ0050369) STPs. The primary improvements include: 1.) Installing screening within the headworks at all three WTSA STPs; 2.) Installation of cloth filters at the Stage I/II and Stage IV; 3.) New Stage IV effluent pumping system; 4.) Abandonment/replacement of the Stage I/II emergency generator and fuel storage tank; and 5.) Oxidation Ditch outlet control at Stage V. The minor improvements include miscellaneous buildings and grounds improvements at all WTSA STPs.

Need for Project

The City has identified a need to replace the existing inoperative pneumatic air ejector pump station with a new station utilizing submersible pumps.

Project Description

This task involves the replacement of the existing can lift station located at Broadway and Morgan Boulevard. The existing lift station is inoperable and requires frequent jetting/vacuuming. The proposed scope of work includes removal of existing sewer lift station installation of new station reconnection/replacement of force main and installation of safety equipment.

County

Camden

Existing Population

77,344

Service Area

City of Camden (various)

Need for Project

The age and poor condition of the system has resulted significant infiltration and inflow problems, sewer cave-ins, sewer backups and flooding. These conditions pose a hazard to the public and increase liability risk to the City of Camden. The situation that forces the City not only to repair numerous sewer collapses a year, but also to repair the street and the nearby utilities. The number of collapsed sewers continues to increase, and the repair costs are higher than they should be due to the sudden nature of these occurrences. Some sewers are too fragile to clean and evaluate, and therefore need to be replaced.

Project Description

Furnish and install approximately 112,700 linear feet of PVC and reinforced concrete gravity combined and separate sanitary sewer ranging in size from 12- inch diameter to 60-inch diameter, and install approximately 2,310 linear feet of cured in place pipe liner

Service Area

Camden, New Jersey is located directly across the Delaware River from Philadelphia, Pennsylvania. The 2010 United States Census, the city had a population of 77,344. According to the US Census Bureau, the city total area is 10.341 square miles, including 8.921 square miles of land and 1.420 square miles of water

Need for Project

The area (basins C10 and C11) located between Delaware Avenue and the Delaware River have experienced frequent and significant flooding events along the waterfront area. As a result, the impacted drainage areas experience significant flooding and sewage backup which pose a hazard to the public and increase liability risk to the City of Camden. Based on preliminary assessment, the options recommended to address the flooding are (1) rehabilitation of Arch Street PS, (2) inspection/cleaning/upgrade of existing interceptor pipe running from Arch St PS to CCMUA, and (3) disconnect Pine St PS interceptor from the Delaware River Interceptor System and install of a new direct interceptor pipe from the Pine St Pump Station to CCMUA, to alleviate this flooding thereby mitigating public exposure to the hazardous environmental conditions caused by said flooding.

Project Description

Project involves (1) rehabilitation of Arch Street PS, (2) inspection/cleaning/upgrade of existing interceptor pipe running from Arch St PS to CCMUA, and (3) disconnect Pine St PS interceptor from the Delaware River Interceptor System and install of a new direct interceptor pipe from the Pine St Pump Station to CCMUA, to alleviate sewer backup and street flooding.

Service Area

Camden, NJ is located in Camden County directly across the Delaware River from Philadelphia, Pennsylvania. According to the United States Census Bureau, the city had a total area of 10.341 square miles (26.784 km²), including 8.921 square miles (23.106 km²) of land and 1.420 square miles (3.677 km²) of water (13.73%).

Need for Project

The combined sewer outfalls are blocked/obstructed primarily due to sediment build up resulting in an inability of the system to operate as designed (i.e., inability of combined sewage to drain from the Camden collection system). The condition of these structures has resulted significant environmental problems including overloading of interceptor system and treatment facility, sewer backups and street flooding. These conditions pose a hazard to the public and increase liability risk to the City of Camden.

Project Description

The project involves the cleaning/dredging and rehabilitation of fifteen (15) combined sewer outfalls and ten (10) storm sewer outfalls to restore the aforementioned systems to their intended design capacity and operability.

Combined Sewer Overflow (CSO) - Traditional Infrastructure

Priority List Rank

33

County

Camden

Existing Population

77,344

Service Area

The City of Camden is located in Camden County, New Jersey directly across the Delaware River from Philadelphia, Pennsylvania. According to the United States Census Bureau, the city had a total area of 10.341 square miles. The wastewater collection system serves the entire population for the City of Camden and is comprised almost entirely of combined sewers (i.e., sewers conveying both sewage and stormwater runoff in the same pipe). According to available records there is approximately 150 miles of combined sewers of which approximately ninety-three (93%) was installed prior to 1930. There also is approximately 25 mile of sanitary sewers and 5 miles of storm sewers. Currently, the City has eight (8) sewer pumping stations and approximately twenty-eight (28) regulator structures and twenty-two (22) combined sewer outfalls.

Need for Project

The sewer outfalls covered under this project are not functioning properly (i.e., as designed) due to sediment buildup and varying degrees of deterioration/disrepair. The reported obstructions of combined sewer overflow pipes at their points of discharge result in the inability of combined sewage to drain from the Camden collection system; thereby contributing to street flooding and potentially over-loading interceptor sewer conveyance and wastewater treatment plant capacities. All of the mechanical regulators are also not functioning properly which contributes to the aforementioned problems.

Project Description

The project involves the rehabilitation of the approximately 28 regulator chambers at various locations within the City of Camden.

This project involves the removal and replacement or rehabilitation of existing combined sewer mains on various roadways within the City of Jersey City. The work will take place within existing paved roadways within the City's right-of-ways. The roads are both in residential and commercial areas.

Need for Project

This project is required to improve the combined sewer system by reducing the amount of infiltration/exfiltration by installing new watertight pipes and manholes.

Project Description

As part of a capital improvements program, the Jersey City Municipal Utilities Authority intends on replacing approximately 28,757 linear feet of various size combined sewer mains, including manholes, sewer laterals and storm water inlets. In addition, the project will also include the rehabilitation of approximately 1,036 linear feet of combined sewer main using trenchless technology including the rehabilitation of manholes.

Project Description

(Carryover SFY2015) - The proposed repairs for the intersection of Trumbull Street and Sixth Street are intended to limit the roadway flooding to maintain passable travel lanes. Inlets will be installed at the intersection several feet off the curb allowing the existing drainage system to function during smaller storms. When the capacity of the existing storm inlets is exceeded excess stormwater will flow into the new inlets. Piping connecting the inlets will direct flow to a watertight 1.5 million gallon concrete vault which will store the flow below grade rather than allowing the surface to flood. The concrete vault will consist of modular precast concrete unit to maximize the volume the entire structure will be wrapped in an impermeable pond liner. It will extend under Block 7 Lot 1227 as well as under Bond Street and will be rated for traffic loads. The existing business on Block 7 Lot 1227 will be acquired and demolished. The vault will be equipped with a small pumping station. A level sensor will be installed in the combined sewer. When the water level in the sewer has receded the level sensor will activate the pumps and the tank will be emptied into the combined sewer and the flow treated at the Joint Meeting of Essex and Union County WWTP. The pump is capable of dewatering the vault in one day and it is intended that the tank will be emptied within two days of a storm event allowing one day for the water level in the combined sewer to recede. The existing roads and curbing will be restored. Block 7 Lot 1227 will be converted into a passive park for the enjoyment of the residents. This project will also serve as a test case for installing Green Stormwater Infrastructure. A bioswale will be installed on the northeast side of Trumbull Street a rain garden will be installed in the proposed park and if possible tree boxes will be installed along Bond Street.

Service Area

The Middlesex County Utilities Authority (MCUA) owns and operates a regional wastewater treatment facility referred to as the Central Treatment Plant (CTP) that serves 36 municipalities within Middlesex County and portions of Somerset and Union Counties in Central New Jersey.

Need for Project

The rehabilitation of these treatment units will allow the Authority to continue to meet the plant's effluent water quality permit requirements and assist with processing of the solids which are resultant of the liquid stage processes. The Admin Annex houses the laboratory which is essential to assist with process control and reporting which allows the plant to achieve their effluent quality permit requirements.

Project Description

The Authority will be undertaking the Phase V of Central Treatment Plant (CTP) rehabilitation which consists of two (2) projects: Admin Annex Building HVAC Improvements and Process Air Piping Replacement. The process air piping replacement includes replacement of the air diffuser assemblies for the eight aerated channels around the treatment plant and installation of an additional blower to maintain dissolved air levels and keep solids in suspension. The Administration Annex Building HVAC Improvements include mechanical systems improvements to address humidity issues in the laboratory and other portions of the building including new boilers, fan coils, and make up air units to improve air quality and enhance suitable laboratory

Service Area

The Middlesex County Utilities Authority (MCUA) owns and operates a regional wastewater treatment facility referred to as the Central Treatment Plant (CTP) that serves 36 municipalities within Middlesex County and portions of Somerset and Union Counties in Central New Jersey.

Need for Project

The improvements will allow the Authority to continue to meet the plant's effluent water quality permit requirements and assist with processing of the solids which are resultant of the liquid stage processes. The proposed Septage Receiving Facility is intended to minimize the solids loading on the CTP's wastewater treatment processes and improve the quality of the resulting solid waste to be disposed at the Middlesex County Landfill by separation of solids and liquids at the facility. Upgrades to the CTP main substation will provide reliability of the incoming utility electric distribution to the various treatment facilities which if interrupted may cause a permit excursion.

Project Description

The Authority will be undertaking the Phase VI of Central Treatment Plant (CTP) rehabilitation which consists of four (4) projects: 1) Aerated Grit Chamber (AGC) Improvements; 2) New Septage Receiving Facilities; 3) CTP Incoming Substation Rehabilitation; and 4) Plant Influent Screens/ TTO Repairs. The AGC Improvements include replacement of grit removal method process which utilizes a gantry crane and clamshell bucket, with a continuous grit removal system, and also includes the construction of odor control system. The proposed new Septage Receiving Facility consists of an enclosure for Septage Receiving Equipment, office, restroom, electrical room, containment area, Pump Station, Force Main and Odor Control Unit. The CTP Substation project involves the replacement and upgrades of various high voltage switches and breakers at the incoming main substation. The Influent Screens project includes the installation of new influent screens at the CTP's Primary Tanks and TTO piping repairs.

Need for Project

The rehabilitation of these treatment units will allow the Authority to continue to meet the Plant's effluent water quality permit requirements and assist with processing of solids which are resultant of the liquid stage processes.

Project Description

The Authority will be undertaking the final phases of treatment unit rehabilitation at its Central Treatment Plant for three arrays of treatment units. The rehabilitation consists of structural and electrical rehabilitation of the two Primary Tank traveling bridges; the replacement of the collector mechanisms in the remaining three Final Clarifier units including recoating two of the newer (1990s) mechanisms; and, the replacement of the collector mechanisms in the remaining five Gravity Thickener units. These are phases IV, IV, and II respectively to complete the planned rehabilitation of these treatment unit arrays. Each of these facilities were constructed in the 1970s.

Need for Project

Upgrading Camden County's wastewater treatment plant will enable it to optimize its water quality performance and thereby minimize adverse impact from the plant effluent upon the Delaware River. In addition, these improvements will significantly improve the plant's resiliency and also reduce the plant's carbon footprint as well.

Project Description

The CCMUA operates an 80 MGD wastewater treatment plant in Camden City the Delaware No. 1 WPCF. The CCMUA is proposing several upgrades to the wastewater treatment plant to (1) improvesustain optimal wastewater performance (2) improve resiliency and (3) reduce the plants carbon footprint. The most significant project is construction of a sludge digester at the wastewater treatment plant which would reduce the sludge generated at the plant by about 50 thereby reducing odor potential and generate sufficient biogas to generate about 50 of the electricity needed to run the plant. Thus the projects will render the plant more resilient and significantly reduce the carbon footprint of the facility

Need for Project

The MCUA treatment plant currently discharges its treated effluent into the Raritan Bay (SE-1) through a submerged outfall constructed in 1958. Despite the initiation of secondary treatment in 1978 this discharge acting in conjunction with various other discharges serves to degrade the water quality of the Bay. Fecal coliform and toxics standards are in violation while DO levels are marginally acceptable. This water quality degradation ultimately limits the use of the Bay for its intended uses of shellfish harvesting and primary contact recreation.

Project Description

This project entails the construction of an extended outfall to discharge to the Raritan Bay. The point of discharge will be determined to maximum diffusion and dilution. When this project is constructed the Bay should be able to be utilized for its intended uses.

Service Area

The Woodcliff WWTF treats sewage from portions of North Bergen and Guttenberg. The service area encompasses approximately 1.15 square miles (734 acres). A map depicting this service area has been included as Attachment 5 to the Planning Document. Although the Woodcliff WWTF only treats sewage from a portion of North Bergen, all customers within North Bergen are billed for the operation and maintenance of the facility. Therefore, the borrower population for this project includes all of North Bergen and all of Guttenberg.

Need for Project

The WWTF has recently been the site of a large rehabilitation project, during which several other items were noted as requiring minor to significant rehabilitation and/or replacement work. The project will ensure that this facility continues to meet or exceed all relevant New Jersey Department of Environmental Protection regulations. In addition, the Woodcliff WWTF is part of the NBMUA's CSO system and this project will allow the continued CSO system treatment.

Project Description

During a recent rehabilitation project at the NBMUA's Woodcliff WWTF several other items were noted as requiring minor to significant rehabilitation and/or replacement work. These items include replacement of primary clarifier equipment, repairing the leaking sludge storage tank, replacement of the lamella-type secondary clarifiers, improvements to ensure compliance with the NJDEP's permit limitations for Whole Effluent Toxicity, evaluation and possible upgrades of the existing sludge dewatering facilities, and replacing the chemical feed systems and controls.

Service Area

The Woodcliff WWTF treats sewage from portions of North Bergen and Guttenberg. The service area encompasses approximately 1.15 square miles (734 acres). A map depicting this service area has been included as Attachment 5 to the Planning Document. Although the Woodcliff WWTF only treats sewage from a portion of North Bergen, all customers within North Bergen are billed for the operation and maintenance of the facility. Therefore, the borrower population for this project includes all of North Bergen and all of Guttenberg.

Need for Project

The WWTF has recently been the site of a large rehabilitation project, during which several other items were noted as requiring minor to significant rehabilitation and/or replacement work. The project will ensure that this facility continues to meet or exceed all relevant New Jersey Department of Environmental Protection regulations. In addition, the Woodcliff WWTF is part of the NBMUA's CSO system and this project will allow the continued CSO system treatment.

Project Description

During a recent rehabilitation project at the NBMUA's Woodcliff WWTF several other items were noted as requiring minor to significant rehabilitation and/or replacement work. These items include replacement of primary clarifier equipment, repairing the leaking sludge storage tank, replacement of the lamella-type secondary clarifiers, improvements to ensure compliance with the NJDEP's permit limitations for Whole Effluent Toxicity, evaluation and possible upgrades of the existing sludge dewatering facilities, and replacing the chemical feed systems and controls.

Project Name, Number

Hoboken City
S340635-08
Combined Sewer Overflow (CSO) - Green Infrastructure

Priority List Rank

43

County

Hudson

Existing Population

50,005

Service Area

As its name entails, the Southwest Resiliency Park is located in the southwest quadrant of Hoboken. The Site is bounded by NJ Transit's Hudson Bergen Light Rail Transit tracks and the Palisades Cliffs in Jersey City to the west, Observer Highway and the Hoboken Business Center to the south, Harrison Street and the Southwest Resiliency Park on Block 12 (phase I) to the east and Academy Bus and Paterson St. to the north. The resiliency park will capture stormwater run-off from the immediate vicinity.

Need for Project

Hoboken's combined sewer system is operated by the North Hudson Sewerage Authority. All stormwater in the southwest quadrant of Hoboken flows into the combined sewer system contributing to CSO events. The southwest neighborhood is also at a relatively low point (+2' elevation). During high tides and rain events, the neighborhood experiences urbanized on-street flooding and sewer back-ups. By eliminating the impervious parking lot on block 10 and installing green infrastructure, the city anticipates reducing CSO events, stormwater run-off, non-point source pollution and urbanized flooding.

Project Description

The City of Hoboken seeks a low interest loan to implement phase II of Southwest Resiliency Park. The Southwest Resiliency Park (phase 1) was a one acre parking lot which will be transformed into an urban oasis using green infrastructure (rain gardens, bioswales, tree pits, porous pavers and subsurface chambers) to detain approximately 10,939 cubic feet of stormwater and keep it out of the combined sewer system during rain events. Phase II will expand the park westward by financing the acquisition of Block 10 (Lots 1-7 and 30-36). In addition, the City seeks financing for planning and design to engage in a robust public planning process to develop concept and schematic designs, engineering plans, specifications and estimates, as well as to obtain necessary permits and approvals (deleted Block 9 and lot 37 from Block 10 according to the email from Stephen Marks dated 5/15/17).

Sanitary Sewer System - New

Priority List Rank

44

County

Sussex

Existing Population

15,888

Service Area

Borough of Hopatcong

Need for Project

This project is necessary to protect the waters of Lake Hopatcong (FW2-TM) a potable water supply source. Wastewater treatment methods in Hopatcong Borough consist of individual on-site systems. There are reported septic system failures which have been determined to adversely affect fishable (trout) and primary contact recreation uses of the lake. Water quality does not meet standards for dissolved oxygen and nutrients and marginally meet standards for fecal coliform and toxics. Nutrient inputs from existing septic systems would continue to be a major source of excessive aquatic plant and algae growth even if all systems were operating properly. The project is needed to eliminate septic systems in the densely developed portion of the watershed.

Project Description

The proposed project includes the installation of a collection and conveyance system to connect approximately 609 homes to the Musconetcong Sewerage Authority's STP which will treat the new flows from the Borough of Hopatcong.

Priority List Rank

45

County

Passaic

Existing Population

146,753

Service Area

Service area includes a school, commercial and industrial businesses, and some residential properties.

Need for Project

Project objective is to separate the CSO to reduce burden on the treatment facility and to construct a storm sewer system to alleviate local flooding.

Project Description

There is a limited storm sewer system that is currently connected to the sanitary sewer on W. Railway Avenue. However, approximately 90% of the road does not include any storm water collection system and as such the area; which includes a school, commercial and industrial businesses, and some residential properties, are subject to frequent flooding. In consideration of the chronic flooding, it is economically prudent to construct a storm sewer system to alleviate the flooding that impacts the local business and the well being of the school and residential public. It is proposed to disconnect the storm sewers inlets from the existing sanitary sewer and to construct a new storm sewer system for the full length of W. Railway Avenue and to connect to a County storm sewer system on Crooks Avenue at the Paterson/Clifton boundary.

Service Area

This is one of the outfalls that services the downtown Paterson area

Need for Project

CSO solids and floatables control is one of the primary focuses of the Department and is one of the key first steps to improve water quality in the Passaic River.

Project Description

During the course of construction of the Solids and floatables control facility for CSO 029, NJDEP Project Number 340850-04, the project encountered two major issues. Despite preconstruction evaluation and testing, an extraordinary amount of soil contamination was encountered. This required testing and disposal at an appropriate out of State facility. The second item was that there was a utility conflict between one of the diversion chambers and the main electrical duct bank that supplies downtown Paterson. This required the redesign of the chamber and extensive measures to monitor and protect the ductbank during the construction of the chamber.

Pennsauken Township
S340349-03
Combined Sewer Overflow (CSO) - Traditional Infrastructure

Priority List Rank

47

County

Camden

Existing Population

34,740

Service Area

Township of Pennsauken

Need for Project

A portion of Pennsauken Township is served by combined storm and sanitary sewers. During high intensity rainfalls the capacity of the system is exceeded resulting in sanitary sewer overflows into homes streets and waterways. The existing situation results in sewage discharges to the Back Channel of the Delaware River near the Cooper River. Public water supply shellfish agricultural and industrial water uses are adversely impacted. Water quality in the area of the discharge marginally meets standards for dissolved oxygen nutrients and toxics.

Project Description

The project involves the construction of a large diameter storm sewer along Browning Avenue from Route 130Madison Avenue to the Delaware River to prevent flow from entering the combined sewer system and the Camden City system stormwater detention facilities to detain stormwater prior to its entering the combined system the separation of the sanitary and storm sewer systems in portions of the Township and the enlargement of the existing storm sewer system to handle a greater capacity.

Project Name, Number

Hopatcong Borough
S340488-08
Sanitary Sewer System - New

Priority List Rank

48

County

Sussex

Existing Population

15,147

Service Area

The Hopatcong Sewer Department provides sanitary sewer service in the Borough of Hopatcong. The customers are primarily residential except for municipal facilities, schools and some small businesses. The sanitary sewer system does not serve the entire Borough. The system presently has approximately 3,000 active accounts. Assuming 3 persons per account, the system supplies approximately 9,000 persons, or 63 percent of the total population. Residents not connected to the municipal sanitary sewer system have septic systems. The homeowners frequently turn to the municipal sanitary sewer system when their septic systems fail.

Need for Project

The existing property owners on Hudson Avenue currently utilize septic systems. These septic systems are in close proximity to Lake Hopatcong and, as a result, often have water quality and health concerns. The availability of sanitary sewer would alleviate the water quality and health concerns for these residents and improve the water quality within Lake Hopatcong.

Project Description

The project is to construct approximately 2,300 L.F. of new sanitary sewer on Hudson Avenue within the Borough of Hopatcong. New SDR-21 PVC sewer pipe will be installed from approximately house # 130 Hudson Avenue to approximately house #243 Hudson Avenue in the Hudson Road Right of Way. A 2.5-inch SDR-21 PVC low pressure sewer pipe is proposed for the purpose of carrying sanitary sewer in the Hudson Road Right of Way. The project will also include the installation of services for the 32 residential homes on Hudson Avenue. Grinder pumps will be supplied to the homeowners for connection into the low pressure sewer main. Rock excavation is anticipated to be required as part of the installation.

Service Area

The service area description is a portion of Princeton Avenue between Linden Avenue and Cator Avenue. In addition, a portion of Danforth Avenue between Garfield Avenue and Princeton Avenue will be serviced.

Need for Project

The project is for the reconstruction of public water and public sewer systems. In order to separate an existing combined sewer, separate storm sewer lines will be construction. There is not a water quality need / component of the project.

Project Description

The Jersey City Municipal Utilities Authority is proposing the replacement of the existing combined sewers along a portion of Princeton Avenue and Danforth Avenue. The work involves the construction of a new sanitary sewer main on Princeton Avenue between Cantor Avenue and Danforth Avenue; a new sanitary sewer main on Danforth Avenue between Princeton Avenue and Garfield Avenue; and the abandonment of two (2) existing combined sewers. Existing dwellings affected will be connected to the new sewer main. The project also includes the construction of new water mains along Princeton Avenue and Danforth Avenue where 35 residential services will be affected. The construction of new stormwater inlets and piping to convey runoff to an existing outfall are proposed. The project seeks to correct an existing flooding problem at the end of Princeton Avenue and Cator Avenue. Upon completion of the work, the roads will be repaved within the project area.

This project involves the removal and replacement or rehabilitation of existing combined sewer mains on various roads within the City of Jersey City, Hudson County. The work will take place within the existing paved roadways within the City's right-of-ways. The roads are located within both residential and commercial districts.

Need for Project

This project is required to improve the combined sewer system by reducing the amount of infiltration/exfiltration by installing new watertight pipes and manholes.

Project Description

As part of their capital improvements program the Jersey City Municipal Utilities Authority intends on replacing approximately 31,040 linear feet of various size combined sewer mains including manholes, sewer laterals and storm water inlets. In addition, the project will also include the rehabilitation of approximately 1,921 linear feet of combined sewer main using trenchless technology including rehabilitation of manholes.

Service Area

The JCMUA combined sewer system services an area of approximately 6,500 acres with a population of over 250,000 (based on US Census data). Additional flow is also accepted from parts of Union City, North Bergen and Bayonne.

Need for Project

The water quality need for the project is to prevent and/or minimize the continued deterioration and eventual failure of the existing sanitary sewage infrastructure that would result in backup and overflow of the system's raw sanitary sewage and storm water into residential and commercial areas impacting area residents and businesses and creating potential health hazards, as well as, impacting the surrounding receiving water bodies. The project is also necessary to address issues noted in the Consent Decree issued by the USEPA and entered into by the JCMUA.

Project Description

The JCMUA proposes to implement various construction improvements to its existing combined sewer system. The work includes replacement of approximately 20,000 LF of combined sewer pipe ranging in size from 8 to 24 inches in diameter in various sections of central Jersey City. Other work includes replacement of up to 150 sewer manholes (4 to 7 feet in diameter); interior lining of up to 90 sewer manholes; reconnection of existing sewer service laterals and drainage piping, trench and road restoration.

Service Area

The service area includes upstream areas of Jersey City that discharge through the existing 96" Claremont Carteret outfall , approximately 609 acres.

Need for Project

This project is an emergency repair of an existing sewer. This project will maintain proper function of the collection system.

Project Description

The existing Carteret Outfall conveys combined sewer overflows from the eastern side of the City. The outfall consists of a 96-inch steel pipe that was constructed about 100-years ago. A section of the pipeline has been severely damaged by a surcharge load placed over the conduit by the placement of recycled concrete aggregate from the operations of a Liberty Recycling. As a result, approximately 360 linear feet of the pipe was deformed and had the potential to collapse. This section of the pipeline will be replaced via open cut under an emergency declaration.

Service Area

Jersey City is the second largest city in the State of New Jersey with a population of approximately 265,000 based on the estimated 2018 U.S. Census data. Jersey City is approximately 21 square miles and is bordered by Secaucus, North Bergen, Union City and Hoboken to the North and Bayonne to the South. The sewer mains convey, on average, approximately 50 million gallons of sewage per day (MGD). The project is required as part of an EPA consent order. The project area is located in the Communipaw Avenue Area of Jersey City.

Need for Project

This project is necessary to provide a reliable sanitary sewer collection system and storm water collection system to Van Horne Street. The new gravity sanitary sewer main will be used to service both residential and commercial buildings. The storm sewer will be used for drainage and storm water management.

Project Description

The project consists of replacing the existing combined sewer on Van Horne Street between Johnston Avenue and the Hudson Bergen Light Rail and on Woodward Street between Communipaw Avenue and the Hudson Bergen Light Rail with separated storm and sanitary sewers. Additionally, a 42" storm sewer shall be installed using trenchless methods underneath the Hudson Bergen Light Rail and the existing combined sewer underneath the Light Rail shall be rehabilitated and converted into a dedicated sanitary sewer.

Existing Population

265,549

Service Area

Jersey City is the second largest city in the State of New Jersey with a population of approximately 265,000 based on the estimated 2018 U.S. Census data. Jersey City is approximately 21 square miles and is bordered by Secaucus, North Bergen, Union City and Hoboken to the North and Bayonne to the South. The sewer mains convey, on average, approximately 50 million gallons of sewage per day (MGD). The project is required as part of an EPA consent order. The project area is located in the Communipaw Avenue Area of Jersey City.

Need for Project

This project is necessary to provide a reliable sanitary sewer collection system and storm water collection system throughout the Pine Street drainage area. The new gravity sanitary sewer main will be used to service both residential and commercial buildings. The storm sewer will be used for drainage and storm water management.

Project Description

The project consists of replacing approximately 13,000 linear feet of existing combined sewer in the Pine Street Drainage Basin with separated storm and sanitary sewers. Additionally, storm sewers shall be installed beneath the Hudson Bergen Light Rail at Suydam Avenue and Pine Street.

Service Area

Jersey City is the second largest city in the State of New Jersey with a population in excess of 250,000 persons. Sewer service is supplied to the population throughout the municipal limits of the City through a network of collection sewers (both combined and separated) and pump stations.

Need for Project

The replacement of the existing bar screens will reduce the risk of future failure and allow for continuous operation in the future.

Project Description

The project generally consists of the replacement of three (3) existing bar screens at the Westside Pump Station and three (3) existing bar screens at the Eastside Pump Station. In addition, the existing screenings conveyor at the Westside Pump Station will be replaced. The existing screens are proposed to be replaced in-kind.

Combined Sewer Overflow (CSO) - Traditional Infrastructure

Priority List Rank

51

County

Hudson

Existing Population

247,597

Service Area

The Jersey City sewer system services an area of 6,500 acres with a population of approximately 247,597 (2010 Census). Additional flow is accepted from parts of Union City, North Bergen and Bayonne.

Need for Project

Deterioration and eventual failure of the existing infrastructure resulting in the backup and overflow of raw sanitary sewage and storm water that would create a health hazard for residents, workers and transients in the area served by the sewer system and in the waters receiving the discharge from the collapsed sewer. No action would also be contrary to the Consent Decree that the JCMUA has entered into with the USEPA.

Project Description

The JCMUA plans to implement the replacement of approximately 85 sewer pipes with pipes of the same diameter which the JCMUAs Phase V of Combined Sewer and Condition Assessment Study identified as in imminent danger of collapse and the repair of approximately 89 sewer pipes that are in imminent danger of collapse based upon results of JCMUAs Phase V of Combined Sewer and Condition Assessment Study.

Existing Population

247,597

Service Area

The JCMUA service area consists of approximately 6,500 acres with a 2010 census population of 247,597. Some flow from Union City, North Bergen and Bayonne flows into the system. The total flow discharged to PVSC by the Jersey City sewer system is approximately 54 MGD.

Need for Project

This project will carry out sewer rehabilitation work included in the Consent Decree between JCMUA and USEPA. The Project will consist of three contracts. Contract 1A will remove blockage and conduct emergency repairs for approximately 17,000 linear feet of existing combined sewers with the goal of the restoring the capacity of the existing sewers. Contract 1B will include replacement of sections of sewers that were determined to be beyond repair under Contract 1A. Contract 2 will replace approximately 11,500 linear feet of existing combined sewers which have been identified through detailed video inspection. Under its Combined Sewer System Capacity and Condition Assessment Study, the Authority has implemented an extensive program to inspect and evaluate its sewer system in order to identify actions needed to address structural and functional issues. The sewers scheduled to be addressed under this improvements project were initially evaluated under Phases 3 and 4 of the Capacity and Co

Project Description

(Carryover SFY2015) - The Project will consist of three contracts. Contract 1A will remove blockage and conduct emergency repairs for approximately 17000 linear feet of existing combined sewers with the goal of the restoring the capacity of the existing sewers. Contract 1B will include replacement of sections of sewers that were determined to be beyond repair under Contract 1A. Service Area

The Sewer Service area for this project is in the vicinity of Sixth Street in Jersey City in Hudson County.

Need for Project

This project is needed to correct a serious problem with silt damming the Sixth Street Combined Sewer Outfall preventing the discharge of wet weather flows, which causes the flows to back up into the combined sewer system creating flooding conditions.

Project Description

(Carryover SFY2015) - The proposed project includes the extension of the Sixth Street Combined Sewer Outfall. The outfall will be extended 1300 linear feet into the Hudson River where it will be submerged on timber pipe cradles to prevent the pipe from floating. A tide flex valve will also be installed to prevent backflow from the river.

Service Area

The service area tributary to the project includes the residential area known as Country Village which is approximately 35 acres. Country Village is bounded on the West by State Highway Route 440, on the East by Sycamore Road, on the North by Pinecrest Road and to the South by the municipal border with Bayonne. It also includes the Mina Drive subdrainage area which consists of 192 acres and a majority of which is residential.

Need for Project

The sewage collection system in Jersey City is mostly combined. The system carries away the sanitary sewage on a daily basis and handles most storm flow adequately. Recently heavy rains experienced during periods of high tide have resulted in street and building flooding. The residents of this area have experienced many backups and suffered property loss and have voiced their concern about possible health hazards created by these backups. In an attempt to abate/resolve some of the flooding issues the JCMUA is proposing to install submersible pumps downstream of the nets in the netting facility. The pumps will facilitate pumping the water out which would normally be gravity fed into the receiving waterway but is hindered due to high tide conditions.

Project Description

(Carryover SFY2015) - JCMUA is proposing to install submersible pumps downstream of the nets in the netting facility. The pumps will facilitate pumping the water out which would normally be gravity fed into the receiving waterway but is hindered due to high tide conditions.

Service Area

The service area for JCMUA is coterminous with the City of Jersey City boundary line.

Need for Project

The existing facilities are part of JCMUA's combined sewer system and were severely damaged during Superstorm Sandy resulting in failure of all three pumping stations during the storm event. All three facilities service the waterfront section of Jersey City in the Port Jersey/Port Liberte areas and are directly adjacent to the Upper New York Bay. Proposed improvements are intended to make the existing pumping stations and its equipment more resilient against future storm events.

Project Description

We would like to pursue CBDG Funds. JCMUA proposes various mechanical, electrical and structural improvements to three (3) existing sub-pumping stations that were severely damaged during Superstorm Sandy. Proposed improvements are intended to repair and/or replaced damaged equipment/structures and make the pumping facilities more resilient during future storm events. Improvements include pump replacement, emergency generator replacement, and storm hardening of the critical equipment at each facility. This work includes construction of elevated platforms for the generator and electrical equipment, structural modifications to the dry well manways to raise them up to the new platform elevations, relocation of critical equipment and installation of water tight hatches.

Combined Sewer Overflow (CSO) - Traditional Infrastructure

Priority List Rank

51

County

Hudson

Existing Population

247,597

Service Area

The Jersey City Municipal Utilities Authority service area consists of approximately 6,500 acres with a 2014 population estimate per the United States Census Bureau of 262,146 persons (2010 United States Census population of 247,597 persons). Two regional pump stations, associated with east side and west side of the City respectively, convey a total of approximately 54 million gallons per day (MGD) of wastewater to the Passaic Valley Sewerage Commission treatment plant in Newark, NJ. The proposed project involves the rehabilitation of particular combined sewer segments located throughout the municipality. The majority of the sewers within the City are combined sewers and most are estimated to be over eighty years old.

Need for Project

The Authority plans to implement the improvements identified for this project to restore the structural condition and hydraulic capacity of the targeted combined sewers. The project is needed to prevent the continued deterioration and eventual failure of the sewers, which would result in the backup and discharge of raw sewage that would create a public health hazard to the residents, workers, and institutions in the areas served. Such a discharge would also further degrade the already impaired water quality of the CSO receiving waters, such as the Hackensack River, Newark Bay, and Hudson River. The project also addresses requirements of a Consent Decree with the USEPA and the NJPDES Combined Sewer Management permit.

Project Description

The City of Jersey City is pursuing green infrastructure projects in the City to reduce the combined sewer impacts to the community. These projects are not to exceed \$1,000,000.00. This project involves the rehabilitation of existing combined sewer mains and associated manholes, inlets, and appurtenances owned and operated by the Jersey City Municipal Utilities Authority located throughout the municipality of Jersey City (Hudson County, NJ). Under the proposed project, approximately 7,400 linear feet of existing combined sewer mains will be repaired by the method of cured-in-place pipe (CIPP) lining, including associated sewer cleaning, internal television inspection, pipeline sealing, and other appurtenant work. The Phase 1-2 Sewer Rehabilitation Project also proposes to replace approximately 7,000 linear feet of existing combined sewers with pipes of essentially the same internal dimensions and capacity of existing sewers that have been determined to be beyond repair.

Service Area

Jersey City is the second largest city in the State of New Jersey with a population of approximately 260,000 persons. The project described in this report consists of force main replacement in the area along the New Jersey Transit Light Rail bounded by West Side Avenue to the west, and Martin Luther King Drive to the east.

Need for Project

The replacement of the portion of 54" diameter force main will reduce the risk of future failure of the pipe and the discharge of raw sewage into waterways.

Project Description

The JCMUA has undertaken an analysis of pipe replacement needs in the 54 inch PCCP force main. The analysis included internal inspections using acoustic leak and gas pocket detection, electromagnetic inspection and internal video television inspection. Upon television inspection, hydrogen sulfide eroded the inner core of the PCCP, exposing the steel cylinder. The structural deterioration of the inner core identifies the priority areas for the replacement of the force main. The JCMUA proposes to replace approximately 2,800 lf of the 54" diameter force main in the deteriorated areas. The Project described in this report is considered by the JCMUA as the highest priority.

Project Name, Number

Jersey City Municipal Utilities Authority
S340928-34
Sanitary Sewer System Rehabilitation

Priority List Rank

51

County

Hudson

Existing Population

247,597

Service Area

Jersey City is located in south central Hudson County and has a land area of 14.79 square miles. The rapidly growing population is estimated at 264,290 . This represents an increase of about 6.7 percent from the 2010 population of 247,597 . The city is bounded by the Hackensack River and Newark Bay to the west, the City of Bayonne to the south, the City of Hoboken to the north, and the Hudson River to the east. Land use within the project area is categorized as urban residential, high density or multiple dwelling, commercial/services, railroads, industrial, other urban or built-up land, and mixed urban or built-up land.

Need for Project

It is essential the aging infrastructure be replaced or rehabilitated. The selected sanitary sewers have significant damage and deterioration, as was determined through a televised inspection of the sewers. Without action, there is the potential for collapse of these existing sewer mains which would leave all the associated residents without sewer service. Additionally, infiltration of groundwater into the sewers reduces capacity of all downstream pipes, which may restrict or prohibit future development. The added flow caused by infiltration and inflow also causes a burden on the receiving treatment plant. Rehabilitation of these sewer mains, as opposed to replacing the mains outright, will mitigate inflow and infiltration while limiting negative impact to the community.

Project Description

This project consists of the rehabilitation of approximately 1,335 linear feet (L.F.) of existing sanitary sewer main at four (4) locations in Jersey City, Hudson County, New Jersey. 1. Pacific Avenue; 2. Halladay Street; 3. Pine Street and Suydam Avenue; and 4. Grand Street. The selected sections of sewer main have shown increased deterioration due to the close proximity to New Jersey Transit railways. Rehabilitation of the sewer mains will be performed utilizing trenchless technology.

Service Area

Jersey City is the second largest city in the State of New Jersey with a population of approximately 260,000 persons. The project generally consists of the replacement of 240 LF of the 54" brick siphon and sanitary sewer from the intersection of Pine and Ash Street across the Conrail Tracks to a downstream manhole. In addition, the project will include the cleaning and lining of approximately 600 LF of existing sewer main along Pine Street.

Need for Project

The replacement of this portion of the 54" diameter brick sewer will reduce the risk of future failure of the pipe and the discharge of raw sewage into waterways.

Project Description

The project generally consists of the replacement of an existing 54" brick siphon that crosses below the Conrail tracks in the area of Pine Street in Jersey City. An internal inspection of the brick siphon revealed that the interior is deteriorating and in need of immediate replacement as it has reached the end of its useful life. The 54" brick pipe will be replaced with approximately 160 LF of 54" diameter centrifugally cast fiberglass reinforced polymer mortar (CCFRPM) pipe in a 72" steel casing installed via trenchless installation beneath the railroad tracks. An additional 75 LF of CCFRPM pipe will be installed by open-cut and approximately 600 LF of upstream sewer pipe will be cleaned and lined.

This project will be located on various roads within Jersey City, with all work taking place within the City's existing right-of-ways. All work will also be in existing asphalt paved roadways.

Need for Project

This project is required to improve the combined sewer system by removing the infiltration/exfiltration.

Project Description

As part of the capital improvements required to maintain their combined sewer system, the Jersey City Municipal Utilities Authority is proposing to remove and replace or rehabilitate by trenchless technology approximately 13,126 linear feet of sewer mains. This project will also include removal and replacement of associated manholes, storm inlets, sanitary sewer laterals and restorations.

S340928-39
Combined Sewer Overflow (CSO) - Traditional Infrastructure

Priority List Rank

51

County

Hudson

Existing Population

247,597

Service Area

The JCMUA is responsible for the operation and maintenance of the local sewer system throughout Jersey City. All sewer rehabilitation locations are within the sewer service area under the jurisdiction of the Passaic Valley Sewerage Commission (PVSC). The local sewer mains ultimately feed a 22-mile interceptor sewer line maintained by PVSC that passes through five (5) New Jersey counties and discharges to PVSC's Newark Bay Treatment plant. The plant can handle approximately 330 million gallons per day (mgd) under average conditions. Jersey City has a population of 247,597 (2010 US Census).

Need for Project

The purpose of this project is to comply with the Consent Decree Agreement with the United States Environmental Protection Agency (EPA). A copy of this agreement is included in Appendix B of the project report. It is essential that the aging infrastructure be replaced or rehabilitated. A majority of the JCMUA sewers are combined sewers and are over 75 years old. The selected sanitary sewers have significant damage and deterioration, as was determined through a televised inspection of the sewers. Without action, there is the potential for collapse of these existing sewer mains which would leave all the associated residents without sewer service. Additionally, infiltration of groundwater into the sewers reduces capacity of all downstream pipes, which may restrict or prohibit future development. The added flow caused by infiltration and inflow also causes a burden on the receiving treatment plant.

Project Description

The project scope includes the replacement of approximately 23,248 LF of sewer main containing approximately 1,050 services, 840 residential services and 210 commercial services, respectively. The existing mains will be replaced with new PVC pipe, ranging from 10" to 24", or CCFRPM pipe, ranging from 30" to 54". The replacement is to include installation of a new main in the same location, new laterals to the new main, and removal of the existing main. The scope will also include installation of new manholes or rehabilitation of existing manholes. The depth of the sewer main pipe construction will range from four (4) feet to 15 feet. The project will also include municipal roadway final pavement for the full width of the roadway in the project areas, including cutting in keyway and installation of Hot Mix Asphalt and surface course.

Jersey City is the second largest city in the State of New Jersey with a population of approximately 250,000 persons. The selected plan will include the replacement of approximately 182 LF of 8" pipe, 135 LF of 10" pipe, 1730 LF of 12" pipe, 830 LF of 15" pipe, 4563 LF of 18" pipe, 100 LF of 20" pipe, 1790 LF of 24" pipe, 300 LF of 27" pipe, 460 LF of 30" pipe, 560 LF of 54" pipe, and 200 LF of 27"x 20" pipe. These areas of the sewer system have been identified as nearing the end of their useful lives. Manholes, sending and receiving pits, excavation, backfill, and restoration are also included in construction.

Need for Project

N/A

Project Description

5B Sewer - There are approximately 38 locations throughout the city where the sewer main is to be replaced based on earlier CCTV work completed by the JCMUA and an assessment of the sewer condition. The total length of sewer mains for replacement is approximately 10,850 FT.

Service Area

The Van Winkle Avenue drainage area is the impacted area affected by this project. Van Winkle Avenue is located in the northern section of Jersey City and consists of both residential and commercial establishments.

Need for Project

This project is required to correct an undersized, deteriorated combined sewer outfall which is causing upstream flooding.

Project Description

The Jersey City Municipal Utilities Authority (JCMUA) is proposing to remove approximately 700 LF of existing, undersized, deteriorated thirty six (36) inch diameter RCP combined sewer main and replace it with new seven by five (7 x 5) feet precast box culvert. The proposed replacement gravity combined sewer main would be replaced in the same location as the existing sewer main within Block 7402, Lots 4, 6 & 8 which are an extension to the Van Winkle Avenue combined sewer system. This project also includes the rehabilitation or replacement of manholes, rip rap lining the channel on the discharge section of the existing netting chamber and all appurtenance

Service Area

Jersey City Kearny Secaucus

Need for Project

The combined sewer overflows in the planning area discharge to the Hackensack and Hudson Rivers and Upper New York Bay. The designated uses for these waters include secondary contact recreation propagation and maintenance of fish and wildlife populations the migration of anadromous fish industrial water supply and other reasonable uses. The water quality is defined as poor due to the presence of high concentrations of indicator organisms such as fecal coliforms and toxic substances and the observation of depressed levels of dissolved oxygen. The unsatisfactory water quality has been attributed to high pollutant loadings from inadequately treated municipal and industrial effluents combined sewer overflows and non-point sources.

Project Description

The proposed project includes construction of a grit chamber on the interceptor just downstream of the CSO regulator to collect and remove inorganic material that could potentially clog the interceptor and cause DWOs. The MUA also proposes to construct a new pump station sewer line and force main to handle sanitary flows while separating out the stormwater flow.

The service area includes the following streets: South Street from Third Avenue to the Elizabeth River; South Spring Street between Third Avenue and Fourth Avenue; Third Avenue between South Spring Street and South Street; South Reid Street near Third Avenue; Fourth Avenue from John Street to South Street; the area west of Fourth Avenue, including Centre Street, High Street, South Seventh Street and John Street as well as the South Street Pump Station and surrounding ponding areas.

Need for Project

Combined Sewer Overflow Correction - The project will reduce significant localized street flooding caused by a backup of the combined sewers in the service area.

Project Description

(Carryover SFY2015) - The project includes installation of new sewers and conduit for storage and conveyance of storm water to the South Street Pumping Station installation of new manholes storm sewers sanitary sewers utility relocations testing and disposal of soil road repaving including curb and sidewalk replacement of existing pumps integration of automatic controls for the station redesign of areas subject to ponding and installation of a standby generator and associated electrical work.

Project Description

(Carryover SFY2015) - The recommended alternative calls for isolating the flooding area from the CSO outfall by rerouting the existing outfall through an industrial property to Progress Street and reconnecting to the existing outfall on Progress Street. The local drainage that connected to the outfall will be connected to an existing storm sewer on Dowd Avenue. Additional protection against high water levels in the great ditch will be provided by using box culverts in the Progress Street right-of-way to provide storage for excess runoff low areas. Flow into the box culverts will be controlled by a weir and tide gates which will allow stormwater to drain until the tail water becomes too high at which point the stormwater will overtop the weir and enter the storage conduit. The netting facility adjacent to Dowd Avenue will have its walls extended vertically to contain any potential overflows. The cost of the recommended plan is \$3.3M and greatly reduces the frequency of flooding matching the temporary condition that allowed for reasonable operation of the local businesses.

Contract#1 improvements will provide flooding relief for residential properties along Delaware street, Erie Street, Florida Street, Geneva Street, South Second Street, and 3rd Avenue Contract#2 CSO tank will reduce overflows volumes from CSO outfalls 035, 038 and 43 in Elizabeth which will provide flooding relief to residents along Atlantic Street, 3rd Avenue, and Doyle Street.

Need for Project

CSO tank will reduce sewage overflows volumes into project outfalls by approximately 75% and will positively impact the water quality of the river

Project Description

This project has two separate contracts. Both contracts will mitigate flooding in their respective drainage areas. Contract #1 is drainage improvements in the area of South 2nd St. Contract #2 is a CSO tank and related improvement at the intersection of 3rd Ave and Atlantic Street. 1. South 2nd St. Project consists of drainage improvements along 3rd Ave from Geneva St. to South 2nd, Along South 2nd St. East of the intersection with 3rd Ave, rehabilitation of a drainage ditch from the eastern end of South 2nd Street to South 1st Street, electrical improvement to South 2nd Street Stormwater Pumping Station and an emergency generator for South 2nd Street Pumping Station. 2. Atlantic Street CSO project consists of a one million gallon underground CSO tank that takes overflows from combined sewage pipes along Atlantic Street and a sewage pump station to evacuate the tank once the peak of the storm is passed. A recycling center is planned to be built on top of the CSO tank area.

Need for Project

The preliminary treatment systems (Screening and Grit removal) are one of the most important treatment systems in the wastewater treatment process. Along with removal of the large debris, they protect all the essential physical and biological wastewater treatment processes downstream. Both Screening equipment (Bar screens) and Grit Removal equipment (Grit Separator/Washers) are well past their useful life and experience an increase in both emergency failures and frequency of repair maintenance. CCMUA also had hired a consultant to provide an evaluation of the structural integrity of the grit piping. A non-destructive evaluation of the piping showed that most of the piping lost close to have of its original wall thickness. This condition requires an immediate scheduled replacement of the effect piping to avoid a catastrophic failure of this system, and to compromise the ability of the system to treat wastewater and to control the cost of repairs by avoiding unscheduled emergency

Project Description

Project consists of replacement of the three existing coarse bar screen systems with three new fine bar screens; replacement of three existing grit separator and washer systems with three new; replacement of the grit piping between grit pumps and new grit separator/washers. The work will include mechanical and electrical demolition, mechanical and electrical new work, new instrumentation and control work, ventilation ductwork upgrade, structural work related to equipment installation, plumbing work and painting work.

Need for Project

The main purpose of the project is to reduce the energy costs and corresponding carbon footprint of the treatment plant. However the replacement of old outdated equipment with newer generation equipment will increase the reliability of the treatment plant with a correspondingly positive impact on water quality of the Delaware River.

Project Description

The proposed improvements include upgrades to four existing raw sewage pumps including replacement of existing motors, replacement of existing variable speed drives and replacement pump casings and rotating assemblies. The work also includes furnishing and installing a related new power distribution system with outdoor transformers, indoor motor control centers, underground duct work and various site and utility work at the CCMUA wastewater treatment plant.

Service Area

The City of Bayonne is located in Hudson County, which is a tightly compacted urban area that is ranked the third most densely populated county in the U.S. Bayonne is a peninsula comprised of 5.8 square miles, with a population density of 11,151 per square mile. Bayonne is bordered to the north by Jersey City, NJ; to the south by Staten Island, NY via a vehicular bridge crossing the Kill Van Kull; to the west by Newark, NJ, via a vehicular bridge crossing Newark Bay; and to the east by the lower New York Bay. Bayonne is a fully developed, densely populated city with a significant amount of industrial land in the southern and eastern portions of the City, including ports, warehouses, and shipping terminals reflecting the City's history as a port and industrial center. There is also a high level of economic distress. According to the 2019 US Census, the overall rate of individuals living below the federal poverty level in Bayonne was 13.5% as compared to 9.2% across the state.

Need for Project

The project is to replace very old combined sanitary sewers and manholes that are in danger of complete collapse. Many repairs have been conducted on these sewer to prevent fine soils and gravels and other debris from washing into the sewers and clogging a regulator chamber that diverts storm flows to CSO Outfall 001 into the kill Van Kull.

Project Description

The needed project consists of the replacement of approximately 400 LF of 18" diameter and approximately 200 LF of 12" diameter Bayonne VCP sanitary sewer located between Mechanic Street and 24th Street on Avenue F in Bayonne, NJ. The project also involves sanitary manhole modifications, connections of sanitary laterals, trench excavation and backfill, roadway trench restoration and final milling and paving. The cost to complete the identified necessary upgrades is \$741,200. City of Bayonne is a combined sewer overflow (CSO) community, NJPDES number NJ0109240. The Avenue F / 24th Street area of sewer main is in need of immediate replacement because of sewer collapses and extensive damage, which has led to a history of sanitary sewer overflows (SSO's) and environmental incidences in this area. Additional development has put a further strain on the sewer infrastructure which has amplified the need to upgrade the aged piping system.

Need for Project

The EPA CSO Control Policy requires that all CSO discharge points come into compliance with water quality standards and that all CSO permittees undertake the development and implementation of a CSO Long Term Control Plan. The Authoritys existing CSO Permit required the development of a plan for disinfection of CSO discharges. In the development of the plan it was recognized that there is very little information on the use and effectiveness of various treatment and disinfection methods for CSO discharges and it was stated that pilot testing needed to be undertaken. The information developed from this project will provide valuable data for the evaluation and implementation of treatment and disinfection of CSO discharges and will be valuable to any and all permittees with CSOs.

Project Description

Project will include pilot testing of various means of treatment and disinfection of CSO discharges at the Oak Street Pumping Station and CSO Outfall Serial No. 001005. Project will include modifications to the existing piping and possible re-activation of one or more primary settling basins from the old primary STP which has been decommissioned but not eliminated in addition to provisions of other chemical feed and treatment technologies.

Service Area

The service area consists of the drainage area bounded by Wilson Avenue on the north, Dukes Street on the south, Devon Street on the west and Bergen Avenue and the Erie Lackawanna Railroad (Newark and Hudson Branch) on the east. Herein, we will refer to this area as the Dead Horse Creek Watershed. The area west of Schuyler Avenue is predominantly comprised of residential dwellings whereas the low lying area east of Schuyler Avenue is a blend of residential, commercial, warehousing and industrial establishments. This service area is generally considered to be fully developed with little green space remaining and little space for above ground detention storage.

Need for Project

The area of Dukes Street, in the vicinity of Schuyler Avenue in the Town of Kearny, continually experiences significant drainage problems. The area frequently floods during and after heavy rainfall events causing undue burden to the residential community west of Schuyler Avenue as well as a blend of commercial, warehousing, and industrial establishments in the low lying area east of Schuyler Avenue.

Project Description

The proposed project includes construction of a new stormwater pumping station at Dukes Street tide gate replacement at Franks Creek rehabilitation of stormwater pump stations at Harrison Ave. Garfield Ave. and John Hay.

Need for Project

The Bergen Avenue Pumping Station will serve the western portion of the KMUA Meadowlands Sewer District. The pumping station will collect leachate from the Keegan Landfill and serve existing development. The Harrison Avenue Force Main will serve the Bergen Avenue Pumping Station and the proposed MSLA 1-D Landfill Pumping Station which will allow for the closure of the landfill.

Project Description

The construction of the Bergen Avenue Pumping Station includes construction of a control and generator building a triplex wet well manholes sewage grinder manhole two metering vaults a valve chamber installation of a flow meter a sewage grinder site piping an instrumentation shelter and three submersible pumps. The Harrison Avenue Force Main project includes placing approximately 7600 linear feet of 8 diameter HDPE pipe from the future Bergen Avenue Pumping Station to the existing Harrison Avenue Pumping Station. The other portion of the project includes installing approximately 200 linear feet of 6 HDPE pipe from the new MSLA 1-D Pumping Station to a tie-in point with the Harrison Avenue Force Main.

Need for Project

This project addresses an immediate public health threat that is currently present in the Town due to the devastation of Superstorm Sandy which has resulted in three sewage pumping stations being placed out of service as well as the remaining 6 storm and sanitary stations operating at limited capacity.

Project Description

This project addresses the rehabilitation and hardening of the towns existing stormwater and sanitary pumping station infrastructure at 9 existing stations that have been damaged by Superstorm Sandy. All 9 stations will not only be restored but also improved to meet all current codes and standards set by state and federal regulation.

Per the LTCP this project will focus on CSO Section 004A as described above

Need for Project

Mitigation of Combined Sewer Overflows (CSO) by implementing localized sewer separation to provide additional linear storage of stormwater discharge throughout the Municipal limits, storing and delaying this discharge during peak rain events.

Project Description

The Village of Ridgefield Park is interested to pursue Long Term Control Plan (LTCP) efforts for localized sewer separation in the LTCP referenced section 004A which is in the general vicinity South of Rt. 80 to Preston / Poplar Streets across various municipal streets and Municipal Right of Way (ROW). The Village is interested to revisit the LTCP and evaluate areas that can benefit and contribute to the LTCP goals for localized sewer separation. This project will cover these evaluation efforts as well as the first project to commence sewer separation.

Service Area

In the vicinity of Drainage Section 006 as outlined in the LTCP

Need for Project

Localized Sewer Separation to mitigate Combined Sewer Overflows to the Hackensack River and further apply water quality measures for stormwater discharge, separated and discharged directly to the river.

Project Description

Focusing on Drainage Area 006 as depicted in the LTCP - completing the feasibility study of the combined sewer upstream of Regulator 006, near outfall 006A to determine condition assessment of existing infrastructure, and best means and cost-effectiveness to divert dry weather sanitary flows from the combined sewer system, to allow Outfall 006A to be converted to stormwater discharge only. Proceed with a localized sewer separation project as determined from efforts above, while continuing to evaluate cost effective, localized sewer separation throughout the Village.

Project Name, Number

Guttenberg Town
S340854-04
Combined Sewer Overflow (CSO) - Traditional Infrastructure

Priority List Rank

62

County

Hudson

Existing Population

11,176

Service Area

The proposed improvements will benefit the residents of Guttenberg, neighboring communities, and Hudson County. The flooding that occurs typically spills onto River Road, which is a major regional thoroughfare. Residents and commuters use River Road to access municipalities across Hudson County and major roadways present in the area. The flooding also impacts the residents of Guttenberg's ability to access public transportation. The section of River Road near the project location is a bus stop for NJ Transit routes 156, 158, 159, and 188 which travel. The flooding prevents residents from accessing these transportation routes on foot and disrupts the route itself. The flooding experienced near the waterfront limits the ability of residents to access nearby businesses, schools, houses of worship, and municipal buildings as well. Hudson County is very dense and urban and therefore a disruption such as flooding has the potential to prevent residents from accessing numerous locations.

Need for Project

The project is intended to address existing issues with the CSO pipe that travels through the Galaxy Towers residential development, then discharges through an existing netting chamber adjacent to River Road and ultimately outfalls in the Hudson River. During intense storm events, the existing CSO pipe overflows at the netting chamber and at a chamber/manhole located on the Galaxy Towers property. The overflow during these storm events is made up of raw sewage and rain water which is a health and safety hazard to motorists utilizing this stretch of River Road, residents of the Galaxy Towers, which houses 1/5 of the total population of Guttenberg, and any pedestrians seeking to walk along River Road or access the Galaxy Towers.

Project Description

The Town of Guttenberg owns and operates a Combined Sewer Overflow (CSO) pipe that runs from the regulator chamber G-1 on JFK Boulevard East down the face of the Palisades, through the property of the Galaxy Towers residential complex, and across River Road to the Towns Netting Chamber and outfall in the Hudson River. On the Galaxy property, there is a concrete chamber where storm water flows from Galaxys pump station and enters the CSO line. This chamber has been the location of intermittent discharges of CSO flow through the manhole on top of the chamber. Due to issues with the existing stormwater management systems, raw sewage mixes in with the rainwater which creates a hazardous experience for the residents of Galaxy Towers and motorists utilizing the nearby stretch of River Road. In conjunction with the ongoing separation of the Galaxy storm flow from the CSO pipe, this project is intended to close the CSO pipe in order to eliminate the discharge of stormwater and raw sewage.

Service Area

Guttenberg

Need for Project

The combined sewer overflow in the planning area discharges to the Hudson River. The designated water uses for the Hudson River include secondary contact recreation propagation and maintenance of fish and wildlife populations the migration of anadromous fish industrial water supply and other reasonable uses. The water quality has been defined as poor due to the presence of high concentrations of indicator organisms such as fecal coliforms and toxic substances and the observation of depressed levels of dissolved oxygen.

Project Description

The proposed project involves the construction of solidsfloatables control measures at the combined sewer overflow point located off River Road which discharges to the Hudson River.

Project Name, Number

Carneys Point Sewerage Authority
S340502-09
Sewage Treatment Plant (STP) - Improvement/Upgrade

Priority List Rank

64

County

Salem

Existing Population

8,049

Service Area

CPTSA sewer service area serves approximately 2,123 residences and 134 businesses within Carneys Point Township and Oldmans Township. At an average rate of 2.58 persons per household (U.S. Census Bureau 2012-2016), the estimated population served by CPTSA is 5,477. Please refer to the sewer service map in the reports and maps section for further details.

Need for Project

This project is being undertaken in order to protect and enhance existing sanitary sewer infrastructure within the CPTSA service area. Failing to maintain current infrastructure will only serve to increase the risk of future service interruption. The reconstruction of existing wastewater treatment plant infrastructure will serve to protect local water quality from disturbances related to failure of the existing tertiary treatment systems. Overall the proposed work will enable CPTSA to keep the wastewater treatment plant infrastructure in good operating condition and to facilitate its continuing efforts to provide sanitary sewer service for its residents, businesses, and industry. In addition it will enable the CPTSA to eliminate the sodium hypochlorite disinfection, which will provide a benefit to the Delaware River ecosystem.

Project Description

This project is being completed to upgrade and replace the existing tertiary sand filters and UV disinfection system at the Carneys Point Township Sewerage Authority wastewater treatment plant located at Cleveland Ave and E Street in Carneys Point, NJ. The existing sand filters will be demolished in order to provide sufficient space to install the proposed tertiary disc filters and UV system. The existing UV equipment will be disassembled and removed from the site. On site piping will be reconfigured to support the proposed equipment. Since the existing equipment is at the end of its service life, our office estimates that replacement of both tertiary treatment systems will provide the greatest cost savings in the long term, including costs saved by discontinuing operation of the existing sodium hypochlorite disinfection system.

Need for Project

The Rancocas Creek and the lakes in the headwaters of the Haynes Creek are classified as FW2-NT nontrot waters with primary contact recreational uses. The existing water quality does not meet standards for fecal coliform nutrients and toxics and marginally meets standards for dissolved oxygen. The effluent from the existing wastewater treatment facilities have exceeded the assimilative capacity of the stream and the facilities do not afford the degree of treatment to safely accommodate the current and future population within the service area. The project is needed to provide advanced wastewater treatment in order to comply with the Boroughs NJPDES permit and ACO requirements. The following is the existing inventory of the wastewater facilities Sewage Treatment Flow Effluent Plant (STP) Name (mgd) Reported BOD Reported SS (NJPDES) Design Present mgl mgl Medford Lakes Borough (NJ0021326) 0.55 0.41 89.7 19.3 95.6 5.1

Project Description

The proposed project consists of the construction of a new Bardenpho treatment process (biological treatment for BOD SS and nutrient removal) combined with rapid sand filters for effluent polishing and the demolition of existing Imhoff tanks trickling filter and slow sand filter. The ultimate sludge disposal will be incorporated into the county-wide sludge management facility.

Service Area

The LBSA service area covers approximately 5.36 square miles in central eastern Monmouth County, New Jersey. The area is bounded by the Ocean to the east; Monmouth Beach and Oceanport to the north; Oceanport, West Long Branch and Ocean Township to the west; and Ocean Township and Deal to the south. The land area breakdown contained in each of the municipalities included within the LBSA Wastewater Management Plan (WMP) area is as follows: the City of Long Branch (5.10 square miles), the Borough of West Long Branch (0.2565 square miles), and the Borough of Monmouth Beach (0.0011 square miles). The City of Long Branch is the only "participating" municipality. The small areas of the other two municipalities are "customers" of LBSA.

Need for Project

The projects are needed to increase efficiency, reduce energy use, improve functionality, and reduce operating and maintenance costs. Both projects address aging infrastructure. The solar project is needed to provide energy savings and reduce electric costs. Roof improvements will replace aging infrastructure and provide a reliable surface for mounting solar arrays.

Project Description

There are 3 projects. The 1st is Wastewater Treatment Plant (WWTP) Mechanical, Structural, Electrical and Control Improvements. Work includes: Effluent Pumps, Pipe Gallery and Controls Replacement; High Efficiency Flare Installation; Raw Pumps, Pipe Gallery and Controls Replacement; Primary Tank and Final Tank Flight/Skimmer Replacement and Concrete Repairs; Polymer Feed System Installation; WWTP Digester Tank Cleaning and Cover Replacement; WWTP Inlet Building Structural Repairs; WWTP Hot Water Piping and Heating Improvements; Blower Building, Sludge Handling Building and Administrative Building Electrical Improvements; Administration Building HVAC, Office and Laboratory Improvements. The 2nd project is Improvements to the WWTP and Pumping Station SCADA, Alarm and Security Cameras for increased functionality, service. Both projects address aging infrastructure. The 3rd project is Building Roof & Solar Improvements.

Service Area

The project area is a street within a residential neighborhood that extends between the City's downtown train station and the Raritan River waterfront. Given that this corridor connects so many of the City's assets, we expect the impact of this project to be Citywide.

Need for Project

Perth Amboy must find ways to manage our storm water in order to minimize the frequency and severity of our combined sewer outfalls. This project includes several green infrastructure techniques that will assist in capturing stormwater and divert it from our combined sewer system such as vegetated bioswales fed by graded crosswalks and several additional street trees.

Project Description

The Second Street Corridor Project is a street improvement project that will include elements to increase pedestrian safety and manage stormwater runoff. The concept includes pedestrian bumpouts with vegetated bioswales that can collect runoff from the street at four three-way intersections that are along Second Street. Additionally, it features pitched grade to feed these bioswales all along the street to collect and channel stormwater runoff from both the street and sidewalks. These curb extensions can create high visibility crosswalks with marked pedestrian crossings and a raised surface that will further channel runoff to the bioswales. Another primary component of this project are enhanced sidewalks, approximately ten to fifteen feet in width, which could be designed with pervious pavement.

The City of Long Branch is the only "participating" municipality. The small areas of the other two municipalities are "customers" of LBSA.

Need for Project

The wastewater treatment plant improvement projects will improve performance, efficiency, and extend the life expectancy of the various components.

Project Description

This loan application comprises two projects, including 1) WWTP Hot Water Piping System and Final Settling Tank Mechanical Improvements Project: the replacement of and modification to the existing underground hot water piping system providing hot water supply and return services. Then abandon in place water supply and return services from the Plant Control Building to Sludge Handling Building. The Final Settling Tank sludge collector drives will then be replaced with modern and separate drive systems for sludge long collectors and sludge cross collectors as required; and, 2) Sludge Holding System Improvements Project: improvements to the sludge holding tank and piping system. This entails demolition of internal installations, then a rehabilitation of the tank chamber interior as required for new operation. A Sludge Mixing System will be installed within the proposed Sludge Holding Tank along with a new cover over the tank, vent system, and Sludge Transfer Pump and Pump Controls.

Service Area

Jefferson Township (Musconetcong River Basin)

Need for Project

Existing on-site systems are failing and may eventually lead to serious health hazards throughout this part of the Township. The failures are occurring because of certain soils limitations shallow depth to bedrock high water tables and steep slopes. Repairs have been attempted but with few successful results. A large number of on-site systems border Lake Hopatcong (FW2-TM) a potable water supply and Lake Shawnee (FW2-TM). These waters are fishable (trout) and primary recreation quality. This portion of Jefferson Township contains a package sewage treatment plant servicing the Consolidated School. This system provides secondary treatment and discharge into tributaries of Lake Hopatcong. Water quality marginally meets standards for fecal coliform and toxics. Nutrient and D.O. levels violate existing standards. Sewage Treatment Flow Effluent Plant (STP) Name (mgd) Reported BOD Reported SS (NJPDES) Design Present mgl mgl Consolidated School Secondary (NJ0021091) 0.0075 0.01156 97.8 4.35 96.2 4.85 If the plan to connect into the Musconetcong Sewer Authority (MSA) is implemented this sewage treatment plant will also connect into the MSA.

Project Description

This project includes the construction of a collection system for the Musconetcong River Basin portion of Jefferson which may also include an interceptor pump station and force main. Also a septic system management plan will be recommended for the remaining portion of the Township.

Sewage Treatment Plant (STP) - Improvement/Upgrade

Priority List Rank

71

County

Warren

Existing Population

4,890

Service Area

Blairstown Township

Need for Project

Portions of Blairstown have documented septic failure which may eventually lead to health problems. It was determined that the fecal coliform count violates the water quality standards and marginally meets standards for nutrients and toxics. At present there are two privately owned and operated STPs in the study area. At the time the regional facilities become available the existing plants will tie into it. North Warren Regional High School is occasionally in noncompliance with their NJPDES permit requirements which indicates inadequate secondary treatment. Primary contact recreation and agricultural water use are adversely impacted. This project is proposed in order to meet the stringent requirements established for the receiving waters. Sewage Treatment Flow Effluent Plant (STP) Name (mgd) Reported BOD Reported SS (NJPDES) Design Present mgl mgl Blair Academy (Secondary) (NJ0022101) 0.050 0.008 96.1 5.2 90.7 7.4 North Warren Regional High School (Secondary) (NJ0031046) 0.005 0.007 92.8 15.8 94.0 9.7

Project Description

The selected plan for this project will include a sewage treatment plant interceptor pump station force main and possible sludgeseptage management.

Service Area

Court Street and Anderson Drainage Areas West of Railroad Avenue

Need for Project

Reduction of Combined Sewer Overflows (CSOs) to the Hackensack River. Reduction of combined sewer surcharge within public rights-of-way and public/private properties.

Project Description

Pursuant to New Jersey Pollutant Discharge Elimination System Combined Sewer Overflow Permit requirements, the City's Long Term Control Plan (LTCP) was submitted on October 1, 2020. Per the implementation schedule detailed in this document, this project addresses the goal of Green Infrastructure implementation in support of water quality measures necessary for localized sewer separation efforts in the area. This project will consist of GI infrastructure, public education and recreation/conservation in support of sewer separation efforts near the border of the City's Anderson and Court Street Drainage Areas in the vicinity of Railroad Avenue. The improvements will provide stormwater recharge and delay of discharge, reducing combined sewer surcharge and overflows.

Service Area

The proposed clarifier improvements will be completed at the Northern Water Pollution Control Facility (NWPCF) and the Central Water Pollution Control Facility (CWPCF). The Northern Service Area (NSA) provides service to the municipalities of Bay Head, Brick, Jackson, Lakewood, Pt. Pleasant, Pt. Pleasant Beach, and the Manasquan River Regional Sewerage Authority in Monmouth County. The Central Service Area (CSA) provides service to the municipalities of Barnegat, Beachwood, Berkeley, Brick (barrier island portion), Island Heights, Lacey, Lakehurst, Lavallette, Manchester, Mantoloking, Ocean, Ocean Gate, Pine Beach, Seaside Heights, Seaside Park, South Toms River and Toms River. The NSA is comprised of the NWPCF and eight pump stations with the CSA being comprised of the CWPCF and 19 pump stations.

Need for Project

Since being placed into operation these clarifiers have been subjected to the corrosive and destructive elements associated with the treatment of wastewater. The mechanical components, structural steel and concrete walls and floors shows signs of degradation and are need of repair. The operation of the two secondary treatment wastewater treatment plants requires the proper operation of the primary and secondary clarifiers. The clarifiers are currently reaching the end of their useful life and are in need of rehabilitation to ensure the continued efficient treatment of raw wastewater.

Project Description

The Ocean County Utilities Authority (Authority) owns and operates three wastewater treatment plants, namely, the Northern, Central, and Southern Water Pollution Control Facilities (WPCF). The Southern WPCF is permitted to treat 20 million gallons-per-day (mgd) and the Northern and Central WPCFs are permitted for 32 mgd. The total service area covers all of Ocean County and a portion of Southern Monmouth County. This project is a continuation of an on-going effort to maintain and rehabilitate the assets of the Authority. The clarifier and concentration tank rehabilitation portion of this project involves improvements to FC-4 and Concentration Tank Nos. 1 and 2 at the NWPCF located in Brick Township and Final Clarifier FC-7 at the CWPCF located in Bayville. Modifications to the existing concentration tank scum pumping equipment and piping, and the associated electrical controls are also included in the project. Concentration Tank Nos. 1 and 2 odor control system valves will be repla

Service Area

The proposed clarifier improvements will be completed at the Central Water Pollution Control Facility (CWPCF) and the Southern Water Pollution Control Facility (SWPCF). The Central Service Area (CSA) is depicted in Figure 3. The Central Service Area (CSA) provides service to the municipalities of Barnegat, Beachwood, Berkeley, Brick (barrier island portion), Toms River, Island Heights, Lacey, Lakehurst, Lavallette, Manchester, Mantoloking, Ocean, Ocean Gate, Pine Beach, Seaside Heights, Seaside Park, and South Toms River. The CSA is comprised of the CWPCF, 19 pumpstations, 76 miles of forcemain and gravity interceptors and is rated at 32 mgd. The Southern Service Area (SSA) provides service to the municipalities of Barnegat Light, Beach Haven, Eagleswood, Harvey Cedars, Little Egg Harbor, Long Beach, Ship Bottom, Stafford, Surf City, and Tuckerton. The SSA is comprised of the SWPCF, 13 pumpstations, 42 miles of forcemain and gravity interceptors and is rated at 20 mgd.

Need for Project

This project includes the rehabilitation of Primary Clarifier PC-2 and PC-4 at the CWPCF and Primary Clarifier PC-2 and PC-3 and Final Clarifier FC-4 at the SWPCF. Since being placed into operation, these clarifiers have been subjected to the corrosive and destructive elements associated with the treatment of wastewater. The mechanical components, structural steel and concrete walls and floors show signs of degradation and are in need of repair. The operation of the two secondary treatment wastewater treatment plans requires the proper operation of the primary and secondary clarifiers. The clarifiers are currently reaching the end of their useful life and are in need of rehabilitation to ensure the continued efficient treatment of raw wastewater. The proposed improvements will include the rehabilitation of all concrete surfaces, the installation of stainless steel mechanical components and all associated equipment.

Project Description

Clarifiers PC-2 and PC-4 at the CWPCF and Primary Clarifiers-2 and 3 and Final Clarifier FC-4 at the SWPCF. Since being placed into service these clarifiers have been subjected to the corrosive and destructive elements associated with the treatment of wastewater. The mechanical components structural steel and concrete walls and floors show signs of degradation and are in need of repair or replacement. The new mechanical components will be fabricated with stainless steel with an operating life in excess of twenty-five years.

The BRSA owns and operates a wastewater collection and treatment system that conveys and treats on average 8 million gallon per day (MGD) of wastewater from three (3) member municipalities, including Hazlet Township, Holmdel Township and Union Beach Borough, and five (5) customer municipalities consisting of Aberdeen Township, Keansburg Borough, Keyport Borough, Matawan Borough, and a portion of Marlboro Township known as Morganville. A list of municipalities and a map of the overall service area are included in the Project Report.

Need for Project

The purpose of this work is two-fold : to return the Facilities (BRSA's Water Pollution Control Plant, remote meter chambers and pump stations) to pre-storm design condition, and to protect the Facilities from incurring the damages associated with a future flood event of equivalent or greater magnitude than Hurricane Sandy, therefore both restoration and mitigation measures are included in our estimated costs. These measures require the restoration of numerous components throughout the Facilities that have yet to be fully repaired, as well as the protection of all critical structures and aspects of the wastewater treatment process. These projects are intended to maintain proper operations and maintenance of the Facilities as required by regulations, thereby preventing improperly treated wastewater discharges from the Facilities caused by equipment failures, power outages and flooding, to enter the nearby wetlands and surface waters .

Project Description

(Carryover SFY2015) - This project application includes work at the Bayshore Regional Sewerage Authoritys (BRSA) Water Pollution Control Plant associated with the permanent restoration and mitigation of the existing Blower Building No. 1 and existing Blower Building No. 2 as well as the permanent restoration and mitigation of treatment plants power distribution system.

Flood Resiliency

Priority List Rank

75

County

Monmouth

Existing Population

478,000

Service Area

The BRSA owns and operates a wastewater collection and treatment system that conveys and treats on average 8 million gallon per day (MGD) of wastewater from three (3) member municipalities, including Hazlet Township, Holmdel Township and Union Beach Borough, and five (5) customer municipalities consisting of Aberdeen Township, Keansburg Borough, Keyport Borough, Matawan Borough, and a portion of Marlboro Township known as Morganville. These also include five (5) industrial users and a major hospital in Monmouth County which overall represent a combined current serviced population of over 90,000 people. Plant Effluent flows by gravity to the MCBOA. MCBOA pumps this effluent using three pumps (2-500HP VS Pumps, 1 diesel driven pump as standby) along 14 miles of pipeline to the Atlantic Ocean.

Need for Project

The project would provide BRSA and MCBOA the ability to safely treat and dispose of wastewater during periods of prolonged Utility power outage similar to that experienced during Superstorm Sandy (approximately 7 consecutive days). It will prevent an uncontrolled discharge of improperly or untreated sewage into wetlands areas and the Raritan Bay located in the vicinity of the Facilities. This mitigation project will also prevent future catastrophic events such as the complete inoperability of the Facilities that occurred during Superstorm Sandy. In fact, the proposed improvements will enhance the environment by reducing or eliminating the potential for Facility flooding or failures, thus negating the chance of untreated wastewater to enter wetlands and/or surface waters.

Project Description

BRSA plans to construct a new Power Resiliency Generator System to maintain continuous power supply to BRSA and MCBOA Pump Station for a minimum of seven (7) consecutive days, the period of time that utility power was down as a result of Hurricane Sandy. Components would include: - Standby Power available from Natural Gas Fired Generators enclosed in Generator Building elevated above the 500-year flood plain including wave action. - Paralleling Switchgear for automatic synchronous switchover from JCP&L supplied line power to gensets - Controls for Monitoring and Automation of Power supplies - Power cables, duct banks, and electrical gear to integrate with BRSA and MCBOA equipment and facilities - Mitigation against flooding of affected MCBOA Facilities

Service Area

The Northern Service Area (NSA) provides service to the municipalities of Farmingdale, Freehold Borough, Freehold Township, Howell, and a portion of Wall in Monmouth County, as well as Bay Head, Brick (mainland portion), Jackson, Lakewood, Pt. Pleasant, and Pt. Pleasant Beach in Northern Ocean County. Ocean through an outfall diffuser approximately 6,000 feet out from the shore of Mantoloking Beach.

Need for Project

This project will provide for improved influent screw pump capacity and reliability to the NWPCF. Maintaining reliability by having the capacity to convey the peak hourly flow by operating three influent screw pumps, is achieved by providing a fourth influent screw pump that is available for service in the event of inoperability of one of the other three influent screw pumps. The potential for a discharge of wastewater is greatly reduced or eliminated by maintaining the ability to convey wastewater into the NWPCF.

Project Description

The Northern Water Pollution Control Facility (NWPCF) is located off Mantoloking Road in Brick Township, New Jersey; serves the Northern Service Area (NSA) and has eight (8) pump and lift stations that convey wastewater to the NWPCF. There are four (4) Archimedes, spiral flight screw pumps at the NWPCF, which lift the influent wastewater to an elevation where it then flows by gravity through the treatment plant. Influent Screw Pump Nos. 1, 2 and 4, were installed in 2003, with each screw having a capacity of 29.4 mgd. Screw Pump No. 3, which was installed in 1994 has an existing capacity of 26 mgd. Recently, Influent Screw Pump No. 2 failed, was rebuilt and placed back in-service. All four screw pumps will be replaced as a part of this project.

Service Area

The Northern Service Area (NSA) provides service to the municipalities of Farmingdale, Freehold Borough, Freehold Township, Howell, and a portion of Wall in Monmouth County, as well as Bay Head, Brick (mainland portion), Jackson, Lakewood, Pt. Pleasant, and Pt. Pleasant Beach in Northern Ocean County.

Need for Project

This project will provide for long-term wastewater treatment process for removing total suspended solids, a NJPDES permit requirement and maintaining reliability by providing treatment capacity in excess of that need to treat the AADF.

Project Description

This clarifier project is a continuation of an on-going effort to maintain and rehabilitate the assets of the Authority. This clarifier rehabilitation project involves improvements to Final Clarifiers FC-1 and FC-8 at the Northern Water Pollution Control Facility (NWPCF) located in Brick Township, New Jersey. Both clarifiers were original to the completed treatment plant in 1976. Rehabilitation will include replacement of mechanical and metallic components with new, rehabilitation of concrete surfaces, and new conduit, conductors and lighting.

Pleasant, and Pt. Pleasant Beach in Northern Ocean County. The NSA is comprised of the Northern Water Pollution Control Facility (NWPCF) located on Mantoloking Road (Route 528) in Brick Township, eight pump/lift stations, seven miles of force main, and approximately 43 miles of gravity flow interceptors. The NWPCF was placed into operation in 1976, and provides secondary treatment and is rated at a capacity of 32 MGD. Effluent is discharged into the Atlantic Ocean through an outfall approximately 6,800 feet out from the shore of Mantoloking.

Need for Project

This project will provide for the continuation of the long term wastewater treatment process by providing for the replacement of the roof system at the NWPCF Solids Handling Facility. .

Project Description

The Northern Water Pollution Control Facilities (NWPCF) is located on Mantoloking Road in Brick Township, New Jersey. The treatment facility began operations in 1976 and is designed to treat a combination of domestic, light industrial and commercial wastewaters. This project is a continuation of an ongoing effort by the Authority to restore building sites to their original condition for the protection of equipment and property (NJAC 7:22-5.6 a.5). Specifically, this work involves the replacement of the existing Built-Up Roofing (BUR) system installed on the Solids Handling Facility (SHF) at the NWPCF. The existing BUR system on the SHF was installed in 1975, has been deemed to be in poor condition and is need of replacement. Alterations have been made to sludge processing methods since the SHF was originally constructed. Those retired systems, which have all since been removed, required numerous roof penetrations for intake and exhaust air. The elimination of these systems ha

Need for Project

This project will provide for the continuation of the long term wastewater treatment process by providing equipment for sustained and reliable production of biosolids by the manufacturing of OceanGro fertilizer

Project Description

The Ocean County Utilities Authority (Authority) owns and operates three wastewater treatment plants, namely, the Northern, Central, and Southern Water Pollution Control Facilities (WPCF) and 40 pump and lift stations that convey wastewater to the three WPCFs. The Northern Water Pollution Control Facility (NWPCF) is located in Brick Township, New Jersey and treats flow from the Authority's Northern Service Area which has 8 pumping stations. For the year 2022, the NWPCF had an annual average daily flow of 22.6 mgd. This project involves the installation of a third BFP, and associated pipe, pumps, electrical, HVAC and SCADA improvements. The planning level estimate for this project is \$3,219,725.

Service Area

The proposed clarifier improvements will be completed at the Central Water Pollution Control Facility (CWPCF) and the Southern Water Pollution Control Facility (SWPCF). The Central Service Area (CSA) provides service to the municipalities of Barnegat, Beachwood, Berkeley, Brick (barrier island portion), Toms River, Island Heights, Lacey, Lakehurst, Lavallette, Manchester, Mantoloking, Ocean, Ocean Gate, Pine Beach, Seaside Heights, Seaside Park, and South Toms River. The CSA is comprised of the CWPCF, 19 pumpstations, 76 miles of forcemain and gravity interceptors and is rated at 32 mgd. The Southern Service Area (SSA) provides service to the municipalities of Barnegat Light, Beach Haven, Eagleswood, Harvey Cedars, Little Egg Harbor, Long Beach, Ship Bottom, Stafford, Surf City, and Tuckerton. The SSA is comprised of the SWPCF, 13 pumpstations, 42 miles of forcemain and gravity interceptors and is rated at 20 mgd.

Need for Project

This project includes the rehabilitation of Primary Clarifier PC-1 and PC-3 and Final Clarifier FC-8 at the CWPCF and Primary Clarifier PC-1 and PC-4 and Final Clarifier FC-3 at the SWPCF. Since being placed into operation these clarifiers have been subjected to the corrosive and destructive elements associated with the treatment of wastewater. The mechanical components structural steel and concrete walls and floors shows signs of degradation and are need of repair. The operation of the two secondary treatment wastewater treatment plans requires the proper operation of the primary and secondary clarifiers. The clarifiers are currently reaching the end of their useful life and are in need of rehabilitation to ensure the continued efficient treatment of raw wastewater. The proposed improvements will include the rehabilitation of all concrete surfaces and the installation of stainless steel mechanical components and all associated equipment.

Project Description

This clarifier project is a continuation of an on-going effort to maintain and rehabilitate the assets of the Authority. This project concerns the rehabilitation of Primary Clarifiers PC-1 and PC-3 and Final Clarifier FC-8 at the CWPCF and Primary Clarifiers PC1 and PC-4 and Final Clarifier FC-3 at the SWPCF. Since being placed into service, these clarifiers have been subjected to the corrosive and destructive elements associated with the treatment of wastewater. The mechanical components, structural steel and concrete walls and floors show signs of degradation and are in need of repair or replacement. The new mechanical components will be fabricated with stainless steel with an operating life in excess of twenty-five years.

Service Area

The Central Service Area (CSA) is depicted in Figure 1. The CSA provides service to the municipalities of Barnegat, Beachwood, Berkeley, Brick (barrier island portion), Toms River, Island Heights, Lacey, Lakehurst, Lavallette, Manchester, Mantoloking, Ocean, Ocean Gate, Pine Beach, Seaside Heights, Seaside Park, and South Toms River. The Authority's CSA is comprised of the CWPCF located on Hickory Lane in Bayville, 19 pump/lift stations, 24 miles of force main, and 52 miles of gravity interceptors. The CWPCF was placed into operation in 1979, provides secondary treatment, and is rated at a capacity of 32 MGD. Effluent is discharged into the Atlantic Ocean through an outfall diffuser located approximately 6,000 feet out from the shore of Seaside Park.

Need for Project

The subject project will assure the continuation of wastewater process by providing improvement to primary treatment, more efficient influent pumping and flow measurement, removal of inorganic material and grit, more even distribution of flow to in-service aeration tanks and more efficient pumping of low pressure service water.

Project Description

1.Main Influent Pumping Station a.Replace Pump No. 2 and Pump No. 3 b.Replace Motors on Pump No. 1 and No. 4 c.Install 4-new 4160 variable frequency drives, one per pump d.Interior 54-inch diameter and valve replacement e.Replacement exterior located buried of 54-inch diameter gate valves. 2.Grit Removal System a.Modification of Existing Aerated Grit Chamber No. 1, 2 and 3 with stacked tray unit plate settlers. b.Installation of Aerated Grit Chamber No. 4. c.Installation of New Grit Washing and Conveying System. 3.Primary Influent Distribution a.Installation of new 54-inch diameter primary distribution pipes w/mag meters b.Installation of new Primary Distribution Box and 36-inch diameter piping to primary clarifiers. 4.Replace existing 42-inch primary effluent distribution valve 5.Installation of flow measurement instruments at aeration tanks. 6.Replacement of low pressure service water pumps. 7.Installation of new plant drain pipe and manholes.

Service Area

SERVICE AREA The Central Service Area (CSA) provides service to the municipalities of Barnegat, Beachwood, Berkeley, Brick (barrier island portion), Toms River, Island Heights, Lacey, Lakehurst, Lavallette, Manchester, Mantoloking, Ocean, Ocean Gate, Pine Beach, Seaside Heights, Seaside Park, and South Toms River. The Authority's CSA is comprised of the Central Water Pollution Control located on Hickory Lane in Bayville, 19 pump/lift stations, 24 miles of force main, and 52 miles of gravity interceptors. The CWPCF was placed into operation in 1979, provides secondary treatment, and is rated at a capacity of 32 MGD. Effluent is discharged into the Atlantic Ocean through an outfall diffuser located approximately 6,000 feet out from the shore of Seaside Park.

Need for Project

The Federal and State Act require that all wastewater management plans be in conformance with the WQMP and permits issued under the New Jersey Pollutant Discharge Elimination System (NJPDES) must also conform to the plan. None of the proposed projects under this Planning Document Submission will modify the ability to collect and treat sewage in any of the service areas. Therefore, these projects are consistent with the Ocean County Water Quality Management Plan (WQMP). Pursuant to NJAC 7:22-3.11 and 4.11, "A cost-effective analysis of the feasible, conventional, innovative and alternative technologies capable of meeting the applicable effluent, water quality, and public health requirements over the design life of the facility while recognizing environment and other non-monetary considerations" must be performed. This project will ensure that all of the facilities continue to achieve permit conditions, as well as protect the environment from system or equipment failure.

Project Description

The OCUA owns and operates the Central Water Pollution Control Facility located in Bayville, New Jersey. When constructed, the CWPCF was a secondary treatment plant utilizing the activated sludge process and was placed into operation in 1979. The CWPCF utilizes mesophilic anaerobic digestion to handle sludges resulting from the wastewater treatment process. There are 4-85-ft. diameter primary digesters. Primary Digester No. 2 is an original digester that was placed in-service when the CWPCF was commissioned. The original steel digester floating cover for PD-2 was replaced with a new steel fixed cover in 2000. Since that time this cover has suffered a failure to the steel skirt plates. The steel cover will be replaced with a flexible membrane cover. Installation of a flexible membrane cover and the resulting additional storage will provide for increase beneficial reuse of the biogas in the cogeneration process with additional electrical production and a reduction in flared gas.

Need for Project

Wastewater Treatment Project

Project Description

(Carryover SFY2015) - The ACUA is developing a project to protect certain facilities within the treatment plant site from potential storm surge water from hurricane type events similar to the Super Storm Sandy. The intent of this project would be to provide portable open trailer mounted pumps to be able to pump out facilities at the plant construct permanent sump areas within existing building structures to be able to pump out storm surge and to raise the treatment plant access road elevation to above flood level.

Combined Sewer Overflow (CSO) - Traditional Infrastructure

Priority List Rank

82

County

Hudson

Existing Population

194,440

Service Area

Guttenberg Hoboken Union City Weehawken West New York (HCUA Planning Area III)

Need for Project

The combined sewer overflows in the planning area discharge to the Hudson River. The designated water uses for the Hudson River include secondary contact recreation propagation and maintenance of fish and wildlife populations the migration of anadromous fish industrial water supply and other reasonable uses. The water quality has been defined as poor due to the presence of high concentrations of indicator organisms such as fecal coliforms and toxic substances and the observation of depressed levels of dissolved oxygen. The unsatisfactory water quality has been attributed to the continuous diversion of dry and wet weather sanitary sewer flows to the river. The combined sewer system which is 100 years old contains collapsing sewer lines and regulators and tide gates that are deteriorated and stuck. This condition has resulted in diversions of sewage flows to the river and intrusion of tidal flows into the system and treatment works.

Project Description

The construction of in-line storage facilities utilizing existing sewers is planned for Hoboken. In West New York the construction of swirl concentrators is proposed. Studies indicate that facilities to abate pollution in Union City and Weehawken would not be cost effective. Although this project has not been formally adopted by HCUA studies indicate that this work is the most cost effective solution to pollution abatement. The rehabilitation of tide gates and regulation in Hoboken Weehawken and Union City has been funded under Marine CSO funds. However the major portion of the project in this planning area has not been funded.

Service Area

The NHSA service area extends throughout 4 municipalities (WNY, UC, Weehawken, and Hoboken). The inclusion of green infrastructure projects within the NHSA sewer service area reduces impacts of stormwater discharge to the NHSA CSO system, through the NHSA support for GI, it also promotes local measures for storm water attenuation. This project proposes four new bioswale planters on Park Avenue in Union City.

Need for Project

GI promotes improved water quality.

Project Description

The project consists of the construction of rain gardens, porous pavement and/or stormwater planters at various locations within West New York, Union City and Weehawken

Sewage Treatment Plant (STP) - Improvement/Upgrade

Priority List Rank

84

County

Monmouth

Existing Population

127,000

Service Area

The plant serves wastewater needs of six member municipalities, Fair Haven, Little Silver, Monmouth Beach, Oceanport, Shrewsbury, West Long Branch, and six customer towns: Red Bank, Eatontown, Rumson, Sea Bright, Shrewsbury Township and Tinton Falls, and two military bases. The map of the service area is included as Exhibit 3 of the Planning Document.

Need for Project

The goals of this project are to: - Enable two (2) BFP's to operate concurrently in order to reduce the current operating schedule from seven (7) days per week three (3) shifts per day to five (5) days per week three (3) shifts per day. This will result in a savings on the current operating costs. - Rehabilitate or replace system components nearing the end of their useful life. - Enhance operational flexibility and reliability.

Project Description

The following improvements are proposed as part of this project: 1. Replace BFP No. 2 with a unit identical to BFP No. 1. 2. Replace the existing sludge cake bin and Schwing pump with a higher capacity bin and pump, and procure an "on the shelf" spare pump. 3. Install a sludge mixing system in Sludge Storage Tank No. 1 that is of the same type that presently exists in Sludge Storage Tank No. 2. 4. Replace gear type polymer pumps with progressive cavity type pumps. 5. Implement sludge cake flow metering.

Service Area

The service area for Two Rivers Water Reclamation Authority (TRWRA) includes its 6 member communities (Fair Haven, Little Silver, Monmouth Beach, Oceanport, Shrewsbury Borough, and West Long Branch), as well as, 6 customer communities including Rumson, Sea Bright, Shrewsbury Township, Tinton Falls, Eatontown and Red Bank. All communities are located within Monmouth County.

Need for Project

TRWRA's existing infrastructure is in need of rehabilitation and/or replacement. Existing components are nearing their life expectancy and in some cases in danger of imminent failure. Portions of the interceptor system being rehabilitated as part of Contract 169 are located in easement areas in forested/vegetative areas and various water bodies. Catastrophic failure of these components may result into spillage onto surrounding communities and environmentally sensitive areas impacting the health and safety of its member and customer communities.

Project Description

TRWRA proposes several contracts for improvements to its WWTP. Contract 183 Plant RAS Rehabilitation includes removal/replacement of existing Return Activated Sludge (RAS) piping located throughout the WWTP, as well as, installation of new magnetic flow meters and other appurtenances. Lastly, TRWRA proposes various electrical upgrades at its WWTP including new PLCs, VFDs and other miscellaneous electrical work.

Project Name, Number

Linden Roselle Sewerage Authority
S340299-04
Interconnection

Priority List Rank

88

County

Union

Existing Population

60,000

Service Area

The planning area includes the City of Linden and the Borough of Roselle

Need for Project

The Authority is required to complete a rehabilitation program to eliminate discharge points 003 and 004 and a sewer separation program to eliminate discharge points 001 and 002 as per the Part IIIb Special Conditions of the existing grant No. C340299-01. These discharges affect the quality of the Rahway River (SE-3). Fishable non-trout and industrial water uses are presently impacted due to fecal coliform toxics and DO (marginal) levels being unacceptable.

Project Description

The project is for the construction of relief sewers to enable the LRSA to eliminate discharge points 003 and 004 in the City of Linden. Elimination of these discharge points will improve water quality in the receiving stream. The alignment of relief sewers falls within the Wheeler Park Easement. This project requires the approval from Green Acres.

Stormwater Management - Green Infrastructure

Priority List Rank

89

County

Hudson

Existing Population

50,005

Service Area

The service area is a 1.4 acre property in Southwest Hoboken, currently an asphalt parking lot, that will be transformed into a public park with green infrastructure.

Need for Project

The proposed design for Block 12 Park in Southwest Hoboken addresses current flooding issues through green infrastructure and underground retention. Hoboken's combined sewer system collects both sanitary and stormwater flows, a condition which diminishes water quality and leads to flooding. During wet weather, excess water bypasses the waste water treatment plant and flows out of combined sewer overflows (CSO), directly into the Hudson River. During high tide, the CSOs can become submerged, preventing the excess water from discharging. When the collection system reaches capacity, water cannot flow in and this causes local flooding. Block 12 lies in an area suitable to store and slowly discharge stormwater. The site is currently 90% impervious, but it has the potential to collect and store stormwater from a 100-year storm. The site presents an ideal opportunity to combine green infrastructure and water retention with the creation of a public open space.

Project Description

The new Block 12 Public Park in Southwest Hoboken will address current flooding issues with green infrastructure and an underground retention system designed to handle a 10-year storm. The stormwater design combines passive rainwater collection with permeable paving rain gardens and bioswales with subsurface storage beneath the park. On the perimeter curb-side infiltration basins will filter and delay street runoff. All of the pavements within the park will be permeable so that the first rainfall will be absorbed within the pavement. The paved areas will be pitched towards rain gardens so the next increment of rain will be held above the surface of the rain gardens and slowly absorbed. Subterranean storage chambers located in the zone between the park pavement and the water table will collect overflow from the rain garden and any drain inlets within the park. The stored rainwater will slowly be released greatly reducing the peak flow to the City's sewer system.

Combined Sewer Overflow (CSO) - Green Infrastructure

Priority List Rank

89

County

Hudson

Existing Population

50,005

Service Area

The BASF park will provide open space opportunities for the City of Hoboken, and surrounding communities. North Hudson Sewerage authority serves Union City, West New York, Weehawken and the City of Hoboken. The sub-surface storage component of the project has the ability to serve the H5 and H7 catchment areas of the NHSA combined sewer system. Additionally, the sub-surface component will serve the North End Redevelopment area, which is bounded by 17th Street to the North, 14th Street to the South, Park Ave to the east, and the Palisades to the west.

Need for Project

The proposed design for the BASF Park in Northwest Hoboken addresses current flooding issues through green infrastructure and underground retention. Hoboken's combined sewer system collects both sanitary and stormwater flows, a condition which diminishes water quality and leads to flooding. During wet weather, excess water bypasses the water treatment plant and flows out of combined sewer overflows (CSO) directly into the Hudson River. During high tide, the CSOs can become submerged, preventing the excess water from discharging. When the collection system reaches capacity, water cannot flow in and this causes local flooding. The BASF Park lies in an area suitable to store and slowly discharge stormwater. The site is currently 50% impervious, but it has the potential to collect and store stormwater from a larger collection area, prone to severe flooding. The site presents an ideal opportunity to combine green infrastructure and with water retention to improve water quality.

Project Description

The Northwest Resiliency Park (former BASF Property) is a multi-phase project that includes the acquisition, environmental investigation, design, planning, and construction of a 5.418 acre park in Northwest Hoboken. The project will serve a number of different purposes including but not limited to on-grade stormwater detention through green infrastructure, on-grade public park and open space, and sub-surface stormwater quantity and quality treatment. The sub-surface stormwater storage will be designed to receive approximately 1 million gallons of stormwater flows from a new high-level storm sewer system designed by the North Hudson Sewerage Authority (NHSA), treat for water quality, and either reuse for irrigation or pump to discharge through the existing NHSA outfall. The surface green infrastructure and on-site stormwater management measures will be designed to manage all stormwater falling on-site and on adjacent roadways to accommodate up to a 10 year, 12 hour rain event. The public park has been designed through a community planning process to include a multi-purpose athletic field, play areas, trees, lowland rain gardens, a central civic terrace, ice rink/fountain, and open space. The asphalt cap that currently serves as an engineering control pursuant to the approved Remedial Action Work Plans will be replaced with site specific engineering controls comprised of soil, visual and engineered barriers, and pavements. The property address is located at 1113-1131 Madison Street, Block 103 Lot 7 (1.148 acres) and 1201 Madison/1200 Adams Street, Block 107 Lot 1 (4.27 acres).

Combined Sewer Overflow (CSO) - Green Infrastructure

Priority List Rank

89

County

Hudson

Existing Population

50,005

Service Area

City of Hoboken

Need for Project

The use of green infrastructure best management practices (BMPs), which reduce immediate dependence on drainage to the combined sewer, may reduce the occurrence of untreated combined sewer outflow events and control adverse effects of runoff.

Project Description

Hoboken faces major challenges related to stormwater management which includes (a) flooding on low-lying areas during storm events (b) reliance upon a combined sewer outflow (CSO) system that treats both sewerage and stormwater (c) discharge of untreated combined stormwater and sewerage during major storm events (d) susceptibility to tidal flooding due to elevation and proximity to the Hudson River. Stormwater collection along Washington Street contributes to heavy stormwater concentration into the CSO which in turn contributes to untreated outflows. Unmanaged runoff from (or traversing) Washington Street may contribute to flooding in low-lying areas of the City. The use of green infrastructure best management practices (BMPs) which reduce immediate dependence on drainage to the combined sewer may reduce the occurrence of untreated combined sewer outflow events and control adverse effects of runoff.

Combined Sewer Overflow (CSO) - Green Infrastructure

Priority List Rank

89

County

Hudson

Existing Population

50,005

Service Area

The project serves to reduce the volume of stormwater entering the combined sewer system owned and operated by the North Hudson Sewerage Authority, which is subject to an individual CSO permit from NJDEP. Therefore, the service area for the project includes the immediate areas surrounding the 4 right of way green infrastructure installations that will experience reduced localized street flooding during rainfall events, as well as the City of Hoboken and the greater NHSA service area that will benefit from improved water quality.

Need for Project

The combined sewer system in Hoboken is overtaxed during rainfall events, resulting in CSO events up to five times per month. NHSA is developing a Long Term Control Plan to reduce CSO events and improve water quality, as required by its individual CSO permit from NJDEP. These right of way green infrastructure sites will benefit CSO-reduction efforts because they allow for the capture of local street drainage during a rainfall event through a porous pavement surface and existing roadway curb gutter, store the rainfall runoff volume in a subsurface detention tank during the peak of the storm, and then discharge through a pipe with a backflow preventer into the combined sewer system. CSO reduction will improve water quality by preventing the discharge of untreated combined sewage into the Hudson River.

Project Description

Four right-of-way green infrastructure facilities recommended by the NJDEP Rebuild by Design Hudson River project will be installed on street segments that are adjacent to water main upgrades. As coded in the Rebuild by Design Hudson River Environmental Impact Statement and Feasibility Study, these are: T2-MON, T5-JEF, T1-GAR, and TD8-GAR. Collectively, these green infrastructure measures will detain up to 10,000 gallons of stormwater from entering the combined sewer system during rainfall events.

Stormwater Management - Gray Infrastructure

Priority List Rank

89

County

Hudson

Existing Population

50,005

Service Area

The project will take place at 9 locations throughout the City of Hoboken. A total of 61 small ROW sites are proposed throughout Hoboken in the Hudson River-Rebuild By Design project. The green/gray stormwater tanks will be located in the public right-of-way.

Need for Project

Hoboken is one of the most densely populated municipalities in the state and nation and there is minimal open space acreage, pervious surface area, or other natural features that adequately support stormwater infiltration. The green/gray tanks will capture stormwater throughout the City and support other subsurface detention, green infrastructure, and combined sewer correction projects planned and completed across the City. As a result, the project supports the implementation North Hudson Sewerage Authority's Long Term Control Plan for Hoboken and leverages other federal, state, county, local and private sector investments. The project will support fewer CSO events and reduce the volume of pollutants from entering the Hudson River as a result of stormwater runoff.

Project Description

The project scope includes the construction of nine (9) right-of-way (ROW) green/gray stormwater tanks of the 61 tanks included in the Delay/Store/Discharge (DSD) components of the Hudson River Rebuild By Design (RBD-HR) Project. The proposed project involves the innovative application of green/gray infrastructure design strategies which will support the implementation of the North Hudson Sewerage Authority (NHSA) Long-Term Control Plan for CSOs in Hoboken. A total of 61 small ROW sites are proposed throughout Hoboken that would each hold between 1,500 and 7,000 gallons of stormwater for a total of approximately 220,000 gallons in capacity. Depending on the selection of the nine sites proposed to be constructed with the requested funding, the project would increase stormwater detention capacity in Hoboken by 15,000 to 70,000 gallons.

Ridgewood Village
S340639-05
Sanitary Sewer System Rehabilitation

Priority List Rank

93

County

Bergen

Existing Population

24,860

Service Area

Village of Ridgewood

Need for Project

An Infiltration/Inflow (I/I) analysis has been completed which documents the existence of excessive I/I within the service area. An additional study will be undertaken to further define the quantity of excessive I/I that can be cost-effectively removed from this system. This project is needed to eliminate periodic overflow causing discharge of untreated sewage into the HoHoKus and Diamond Brooks (FW2-NT previously FW-2) which is adversely affecting the quality of these waterways and posing a potential public health problem. The brooks have fishing and industrial uses. The affected waterways do not meet standards for fecal coliform and toxics and marginally meets the dissolved oxygen standard.

Project Description

The proposed project will consist of 820 feet of gravity sewers and 8400 feet of force main. Three pumping stations will be modified - Ridgewood Lawns P.S. Bellair Road P.S. and Andover P.S. These mechanical improvements will enable the pump stations to handle additional sewage flows previously bypassed. These improvements are currently being designed.

Service Area

Jefferson Township

Need for Project

The need for the development of a wastewater management plan for the Township of Jefferson has resulted from problems being experienced with existing on-site disposal systems. These systems are adversely affecting fishable trout and primary contact recreation waters and the limited ability of four small treatment plants to provide adequate treatment. Fecal coliform and toxics levels are marginally acceptable and nutrients levels are totally unacceptable. Also the sludge generated is being stored in an old tank on-site at the White Rock Lake STP which is an unsatisfactory sludge disposal method. The receiving stream is a tributary of Mitt Pond which ultimately flows in the Boonton reservoir. High and Middle School discharges to Russia Brook (FW2-TM). Sewage Treatment Flow Effluent Plant (STP) Name (mgd) Reported BOD Reported SS (NJPDES) Design Present mgd mgd High and Middle School (secondary) 0.28 Not Available 99.6 5.96 99.9 7.15 White Rock Lake (AWT) (NJ0026867) 0.155 0.0621 98.7 6.375 95.7 5.0

Project Description

Jefferson Township performed a 201 Study for portions of Jefferson which lie both in the Rockaway Basin and Upper Musconetcong Basin (See C340747-05 for description of the Musconetcong plan). The proposed plan for Rockaway consists of expansion and upgrading of the existing White Rock Lake STP to 250000 gpd and using the oxidation ditch process. Wastewater from the Cozy Lake Lake Swannomoa and the White Rock Lake areas would be treated there. The proposed facility would include a pumping station force main interceptor and collection system.

Service Area

(Project name: Stormwater Green Infrastructure - Street Cleaning for Clean Water) Jersey City DPW cleans 220.59 miles of municipal roads using mechanical and air street sweepers all year-round. Main thoroughfares are swept six times a week both sides on alternating days; while secondary roads are swept four times a week on alternating days. DPW street sweepers operate in densely populated neighborhoods that include six wards (A-F) with high volume of pedestrian and vehicular traffic. The greatest beneficiary of having street sweeping it helps water quality and street sweepers, particularly the vacuum models, remove fine particles and contaminants that would otherwise wash in to the storm sewers such as leaves and litter. The older models are less efficient and consequently have an influence on water quality and the environment.

Need for Project

Jersey City is part of a coastal peninsula and includes tidally influenced watershed: the Hackensack Watershed, the Passaic River, the Rahway River/Arthur Kill/Kill Van Kull. DPW all year-round street sweeping prevented a total 3465.45 tonnage of debris in 2015-2016 to entering storm drains reaching our local waterways.

Project Description

(Project name: Stormwater Infrastructure-Street Sweeping for Clean Water) The proposed project is to phased out the older models of street sweepers that are less efficient and consequently have an influence on water quality and the environment. Street sweeping is one method to prevent dirt and grit pollution from entering storm drains and reaching our local waterways. The newer sweepers will enhance the effectiveness of sweeping by reducing street-dirt yield. DPW proposed to purchase (6) RAVO 5ISeries Tier 3 Engine @ \$252,087.00 per vehicle with extended 5 year warranty included and (1) vacuum high pressure sewer cleaning trucks & associated equipment @ \$455,000.00 per vehicle. In addition, DPW proposed to purchase (7) sidewalk sweepers - Tennant ATL 4300 Diesel (Kubota D1105) @ \$41,631.36 per vehicle.

North Hudson Sewer Authority
S340952-24
Combined Sewer Overflow (CSO) - Traditional Infrastructure

Priority List Rank

103

County

Hudson

Existing Population

200,000

Service Area

The Adams Street plant treats all of the sewage generated within the City of Hoboken, approximately 83% of the sewage generated in Weehawken and approximately 45 percent of that generated in Union City.

Need for Project

Existing sewers are currently undersized, causing local street flooding.

Project Description

The existing sewers located on Hamilton Avenue and JFK Boulevard are currently undersized. The proposed project would enable the combined sewer pipe located on JFK Boulevard between Hamilton Avenue and Parkview Avenue to accommodate a 1-year storm. The proposed project would require installing approximately 920 lf of new 27 combined sewer on Hamilton Avenue and 1120 lf of 48 pipe on JFK Boulevard. Installing the larger pipe would prevent the need to upgrade the pipe again.

Decentralized Wastewater (or Septic) System Repair/Replacement

Priority List Rank

103

County

Hudson

Existing Population

200,000

Service Area

The North Hudson Sewerage Authority serves as a regional conveyance, transmission, treatment and disposal authority for wastewater generated in the municipalities of Hoboken, Union City, Weehawken, and West New York.

Need for Project

As part of the New Jersey Pollutant Discharge Elimination System (NJPDDES) permit for the NHSA Adams Street Wastewater Treatment Plant, the NHSA must implement measures that will capture, remove, and prevent the discharge of Solids and Floatables which can not pass through a bar screen having a bar spacing of 0.5 inches from all CSO points. The NHSA has negotiated an Administrative Consent Order (ACO) with the New Jersey Department of Environmental Protection for implementation of the Solids and Floatables Control Program. The W1234 outfall is the final remaining outfall within the S/F Control Program that requires a Solids/Floatables Screening Facility.

Project Description

(Carryover SFY2015) - The proposed project includes construction of an end-of-pipe solids and floatables screening facility. Including in the project is a pier structure to facilitate access and maintenance of facility.

Need for Project

The proposed replacement and upgrade projects are required to maintain the current reliability and operability of the existing wastewater collection system.

Project Description

The pumps at the 5th Street Pump Station clog frequently particularly after storm events which affect the reliable pumping of sewage through this station. An analysis was conducted to evaluate the potential screeninggrinding technologies which would help protect the pumps from clogging. Evaluation indicated that the ABS contrablock pump offers the best combination of minimum installation costs and the highest potential for reduced operational issues. Therefore the 5th Street Pump Station Contrablock Pump Replacement project is conducted to replace the existing pumps at the 5th street pump station with the ABS contrablock pumps.

Need for Project

The Authority's combined sewer system and collection system is subject to excessive amounts of inflow and infiltration causing sewage to overflow during wet weather periods.

Project Description

The purpose of the project is to reduce rainfall-induced surcharging in the collection and combined systems. The project involves an infiltration/inflow correction program in conjunction with the replacement/rehabilitation of sections of pipes.

Need for Project

This project is proposed in compliance with the Long Term Control Plan to reduce combined sewer overflows to the Hudson River

Project Description

H6H7 Phase 3 is a continuation of two projects for the NHSA . the H6H7 project is a sewer separation project for two drainage areas located within Northwest Hoboken. Under Phase 1, a new pumping station has been established. Phase 2 included the key construction of the force main and a section of the new stormwater gravity sewer. The current project (Phase 3) will include the construction of the new storm sewer throughout the service area and separation from the combined sewer system within the H6H7 drainage areas.

Service Area

The service area relates to the Adams Road WWTP service area of the North Hudson Sewerage Area Collection System.

Need for Project

Reduction of Flooding and CSO

Project Description

The 84-inch outfall will be developed to treated outfall from the Adams Street WWTP Outfall. During wet weather events, when the flow rate to the plant exceeds the treatment capacity of the WWTP, the CSO flow bypass the WWTP before discharge through the 84-inch pipe.

The Adams Street plant treats all of the sewage generated within the City of Hoboken, approximately 83% of the sewage generated in Weehawken and approximately 45 percent of that generated in Union City.

Need for Project

The secondary treatment process for the Adams Street WWTP has reached the end of its useful life and requires rehabilitation so the facility can comply with its permit limits.

Project Description

Includes Phase 3 of the rehabilitation of the Secondary Treatment System (PURAC): The work consists of furnishing and installing Dissolved air flotation equipment, filter underdrains, media and backwash troughs, filter valves and actuators, filter influent gates and actuators, instrument air and process air compressors, backwash air blowers, plant water system pumps and piping, sludge pumps, structural repairs and installations, painting, instrument and control systems modifications and improvements, and electrical system modifications and improvements.

Service Area

The North Hudson service area is completely developed area in Hudson County, New Jersey. The area is served by a combined sewers that discharges into the Hudson River. The land use is primarily residential with a high percentage of impervious coverage.

Need for Project

The project is part of the Authority's Long Term Control Plan.

Project Description

The project consists of the construction of rain gardens, porous pavement and stormwater planters at three locations in West New York, Union City and Weehawken, NJ.

Hudson

Existing Population

11,660

Service Area

Portions of North Bergen (Area III)

Need for Project

North Bergen Area III is serviced by the Woodcliff STP. A portion of this district is currently unsewered and contains malfunctioning septic systems. Sanitary connections have been made to an existing storm water system resulting in discharge of untreated sewage to the Hudson River. This discharge impacts industrial water use and freshwater-nontrot uses as well as contributing to fecal coliform violations. The Hillcrest pumping station contains an overflow and requires rehabilitation.

Project Description

A new sanitary sewer collection system will be constructed to convey flows from the unsewered areas. The illegal connections will be corrected and the flow collected for treatment. Sewage will be transported to the Woodcliff STP or to a neighboring facility for treatment. The Hillcrest Pumping Station will also be rehabilitated.

Project Description

The Riverside Primary Digester Mixing System project consists of adding a recirculating jet mixing system to the existing primary anaerobic sludge digester. The project will include the abandonment of the current gas recirculation mixing system, installing new chopper type centrifugal pumps and jet mixing nozzles within the tank, interconnecting piping, electrical controls, and a new flare. As part of the project, the digester will need to be drained and cleaned.

Service Area

Hamilton Township Washington Township 31 of West Windsor Township

Need for Project

The effluent from the existing treatment plant is not meeting water quality standards for ammonia required under the NJPDES permit conditions. The Hamilton Township facility discharges into Crosswicks Creek (FW2-NT) classified as fishable non-trout which also has agricultural and industrial uses this water body does not meet standards for fecal coliform and nutrients and is marginally acceptable for dissolved oxygen. Sewage Treatment Flow Effluent Plant (STP) Name (mgd) Reported BOD Reported SS (NJPDES) Design Present mgl mgl Hamilton Twp.(NJ0026301) 16.0 10.2 91.4 16 94.1 12.3

Project Description

The proposed project involves the construction of an addition to the existing wastewater treatment plant for treatment of ammonia to comply with water quality standards.

Service Area

Perth Amboy was formed on October 31, 1693. The City is 6.0 square miles large. According to the US Census Bureau, in 2020 the estimated population was 55,436; the median household income is \$52,563 and over 80% of the population is Hispanic. Perth Amboy is border by Woodbridge, South Amboy, Sayreville and Staten Island. Most of industries move out and competition from malls outside of the City and NY forced big chain and higher end stores out of Perth Amboy. Small businesses have started to open up with the presence of an Urban Enterprise Zone and the reduced sales tax rate of 3.3%. The City's sewer system consists of 94 miles of sewer main. Over 90% is combine sewer system. The system also has 16 Combine Sewer Overflows that discharges into the Raritan Bay and the Arthur Kill during rainfall events. Presently, the City is discharging an average of 70 times per year. As per the DEP CSO permit, the City needs to reduce this amount to at least 4 events or capture 85% of the discharge.

Need for Project

To reduce or eliminate combine sewer overflows into the Raritan Bay and the Arthur Kill. This is a mandate under the Clean Water Act enforce under a DEP CSO Permit.

Project Description

The City of Perth Amboy was issued a CSO permit on March 12, 2015. Under the permit, the City is required to submit a Long Term Control Plan that identifies actions the City would need to take to reduce or eliminate the overflows into the Raritan Bay and the Arthur Kill. The City of Perth Amboy has 95 miles of sewer mains and 16 CSOs. The regulations states the City needs to develop a plant that would take into consideration various control alternatives to reduce or eliminate the discharge of combine sewer into the receiving waters. One of the control alternative to be considered is the development of GI program. The GI will capture storm water before it gets into the combine sewer system. This will reduce the amount of water going into the combine sewer system and therefore, helping in the reduction of overflows. Based on the submitted LTCP, the City would have to install GI to capture 10% of the storm water in at least 48 acres of land.

County

Middlesex

Existing Population

51,309

Service Area

Perth Amboy was formed on October 31, 1693. The City is 6.0 square miles large. According to the US Census Bureau, in 2020 the estimated population was 55,436; the median household income is \$52,563 and over 80% of the population is Hispanic. Perth Amboy is border by Woodbridge, South Amboy, Sayreville and Staten Island. Most of industries move out and competition from malls outside of the City and NY forced big chain and higher end stores out of Perth Amboy. Small businesses have started to open up with the presence of an Urban Enterprise Zone and the reduced sales tax rate of 3.3%. The City's sewer system consists of 94 miles of sewer main. Over 90% is combine sewer system. The system also has 16 Combine Sewer Overflows that discharges into the Raritan Bay and the Arthur Kill during rainfall events. Presently, the City is discharging an average of 70 times per year making the beach unsafe for recreational purposes.

Need for Project

To help reduce or eliminate combine sewer overflows into the Raritan and Arthur Kill as required under the Clean Water Act and enforce by the DEP.

Project Description

The City's CSO Permit requires the consideration of various control alternatives to reduce the frequency of discharges into the Raritan Bay and the Arthur Kill. As required, a LTCP was submitted to the DEP. Various alternatives were considered one of which is the construction of a force main that will allow the city pump the sewerage directly to the MCUA instead of going through the shared Woodbridge trunk main. The size of the existing force main is limiting the amount of sewerage that can be convey to the MCUA. The new force main will provide more flexibility to increase flow to the MCUA and also eliminate maintenance and fees charges the City is paying Woodbridge. The existing force main is over 25 years old and deterioration due to hydrogen sulfide is already taken place. It is of the upmost importance the City replace this main as soon as possible to increase flow to the MCUA , avoid potential catastrophes if it breaks a occurs and reduce the overflows into receiving waters.

Priority List Rank

115

County

Middlesex

Existing Population

51,309

Service Area

The City is 6.0 square miles large. According to the US Census Bureau, in 2020 the estimated population was 55,436; the median household income is \$52,563 and over 80% of the population is Hispanic. Perth Amboy is border by Woodbridge, South Amboy, Sayreville and Staten Island. Most of industries move out and competition from malls outside of the City and NY forced big chain and higher end stores out of Perth Amboy. Small businesses have started to open up with the presence of an Urban Enterprise Zone and the reduced sales tax rate of 3.3%. The City's sewer system consists of 94 miles of sewer main. Over 90% is combine sewer system. The system also has 16 Combine Sewer Overflows that discharges into the Raritan Bay and the Arthur Kill during rainfall events. Many of the sewer are made of brick and already falling apart causing the sewer to collapse. Bricks and dirt getting into the sewer reduces the carrying capacity of the main and consequently causing more overflows.

Need for Project

This is in compliance of the Clean Water Act and as a requirement under the City's CSO Permit. Discharges are to be reduced to at least 4 discharges per year or capture at least 85% of the flow.

Project Description

The sewer system is over 125 years old and many of the mains are made of brick. Bricks are already falling off causing the main to collapse and creating back ups and sewer surge charge into residents basement. Sewer collapses also create many inconveniences to the residents in the area and the flow of traffic.. Bricks and dirt falling inside the main reduces the carrying capacity of the main and therefore, causing more overflows. The cleaning and lining of the aged sewer mains will rehabilitate these mains to its original conditions or better. The low friction factor will help increase the cleaning velocity inside the main providing more storage capacity and consequently helping the reduction of overflows. Similarly, man holes are made of brick and caving in. The bricks and dirt is falling inside the mains causing clogs and reducing the carrying capacity of the main. This will translate in less storage capacity and more overflows.

Service Area

Perth Amboy was formed on October 31, 1693. The City is 6.0 square miles large. According to the US Census Bureau, in 2020 the estimated population was 55,436; the median household income is \$52,563 and over 80% of the population is Hispanic. Perth Amboy is border by Woodbridge, South Amboy, Sayreville and Staten Island. Most of industries move out and competition from malls outside of the City and NY forced big chain and higher end stores out of Perth Amboy. Small businesses have started to open up with the presence of an Urban Enterprise Zone and the reduced sales tax rate of 3.3%. The City's sewer system consists of 94 miles of sewer main. Over 90% is combine sewer system. The system also has 16 Combine Sewer Overflows that discharges into the Raritan Bay and the Arthur Kill during rainfall events. Presently, the City is discharging an average of 70 times per year. As per the DEP CSO permit, the City needs to reduce this amount to at least 4 events or capture 85% of the discharge.

Need for Project

To comply with the Clean Water Act and as require under the CSO Permit. The City of Perth Amboy is required to submit under the CSO Permit a LTCP considering the use of various alternatives to eliminate or reduce the amount of overflows into the Raritan Bay and Arthur Kill. The City's sewer system is over 125 years old and has over 1,200 catch basins. Many of these catch basins are made of brick and many others with cinder blocks. In both cases, many of them are dilapidated to the point that replacement is the only option. Bricks and soil from these catch basin fall inside the combine sewer system reducing the carrying capacity of the mains, potential clogging of the sewer main and consequently sewer back ups into residents basements. This also reduces the storage capacity of the mains causing more overflows into the receiving waters.

Small businesses have started to open up with the presence of an Urban Enterprise Zone and the reduced sales tax rate of 3.3%. The City's sewer system consists of 94 miles of sewer main. Over 90% is combine sewer system. The system also has 16 Combine Sewer Overflows that discharges into the Raritan Bay and the Arthur Kill during rainfall events. The City has two interceptors, east and west. The west interceptor carries sewer and storm water during rain events from the north west area of the city. This interceptor runs under a park and very close to multifamily buildings.

Need for Project

To comply with the Clean Water Act and in accordance with the LTCP as required under the City's CSO Permit.

Project Description

This project is to rehabilitate a section of the combine sewer system interceptor. This interceptor is made of bricks and run under some structure and near a multifamily building. The interceptor carries sewer from the north west part of town to the Second Street main Pump Station. Failure of this interceptor can be catastrophic. During rain events, the interceptor runs full and sometime shocks causing floods in some areas. Rehabilitating the interceptor will help with the flow velocity which in turn help with the cleaning of the main. Debris inside the main reduces the carrying capacity of the main, reduces storage capacity which will result in more overflows. The interceptor will be lined with a material that will bring the the structural integrity to or better than the original conditions. This rehabilitation will increase the life of the main to more than 30 years.

The proposed project is to reduce the flood damages risk and vulnerability and to enhance the resiliency to a future disaster at the Second Street Pump Station located at 2 Second Street, Perth Amboy, New Jersey, Middlesex County. Only the residents of the City of Perth Amboy will benefit from this project.

Need for Project

The proposed improvements will reduce the possibility of flood damages to the pump station and therefore reducing the discharge of raw sewerage into the Raritan Bay.

Project Description

The proposed project will include at a minimum the relocation of offices to a second floor mezzanine replacement of 3 existing pumps with dry pit submersible pumps relocate all essential electrical equipment to a new electrical room on the second floor mezzanine modify the bar screenswet well room to flood protected it from external flood waters and sewer system surcharging relocate boiler system and water heater to second floor mezzanine miscellaneous dry flood proofing of building openings provide new stand by generator with acoustical enclosure to be installed on a new elevated concrete slab and provide heating and ventilation for new electrical room and boiler room and second floor mezzanine.

Service Area

The projects will be located in the Crescent Park, Bald Eagle Village, Olde Milford Estates, Birch Hill and Highview service areas.

Need for Project

The treatment plants and pumping stations at which the emergency power generators will be rehabilitated are no longer reliable. They did not function properly during Superstorm Sandy and have the potential to cause discharges of improperly treated sewage in the event of their failure.

Project Description

(Carryover SFY2015) - The proposed project includes rehabilitation of emergency power generators at the Crescent Park Bald Eagle Village Olde Milford Estates Birch Hill and Highview treatment plants and also at the Braderick Bissett Milford Manor and Morris lift stations.

Service Area

West Milford Township

Need for Project

The project is intended to correct deficiencies noted in Administrative Consent Orders being issued by the NJDEP. The treatment plants to be improved discharge either to small streams that are upstream from primary recreation areas and drinking water intakes or to groundwater. The discharge violations currently being experienced impair these water bodies.

Project Description

The proposed project includes replace the Olde Milford STP with new facilities to provide advanced treatment in accordance with its NJPDES permit. Renovate the two disposal fields at the Bald Eagle STP. Rehabilitate rapid media filters at two STPs. Installation of influent grinder at the Highview STP and an odor control system at the Crescent Park STP. Rehabilitate generators at various STPs and pumping stations throughout the town.

Sewer Separation in parts of James, Clay and Court Streets

Need for Project

Pursuant to New Jersey Pollutant Discharge Elimination System Combined Sewer Overflow permit requirements the City's Long Term Control Plan must be completed by July 2020. Water quality based need for these projects are to reduce overflow occurrence and mitigate surcharge of CSOs by facilitating sewer separation of sanitary and storm sewers with an ultimate goal of not to exceed four (4) overflows per year.

Project Description

Pursuant to New Jersey Pollutant Discharge Elimination System Combined Sewer Overflow permit requirements the City's Long Term Control Plan (LTCP) must be completed by July 2020. The City is seeking financial assistance for the preparation, creation and implementation of the LTCP / System Characterization Report as well as CSO separation efforts for parts of James, Clay and Court Streets which will be constructed under three construction contracts to replace the existing drainage structures, and design new separated drainage improvements including inlets to increase storage capacity of stormwater, reducing the frequency of flooding and CSO discharging events. These projects incorporate consideration of future sewer separation in the region that will be included in the final conclusions of LTCP.

Anderson and Court Street Drainage Areas to the west of Railroad Avenue and south of Passaic Street.

Need for Project

Reduction of Combined Sewer Overflows (CSOs) to the Hackensack River. Reduction of combined sewer surcharge within public rights-of-way and public/private properties.

Project Description

Pursuant to New Jersey Pollutant Discharge Elimination System Combined Sewer Overflow Permit requirements, the City's Long Term Control Plan (LTCP) was submitted on October 1, 2020. Per the implementation schedule detailed in this document, for Year 2022 the anticipated activity is to, "Identify and construct additional localized partial sewer separation projects, if feasible, that are beneficial for the City to undertake." This project will consist of sewer separation efforts, including but not limited to, the design and installation of new separated storm and sanitary sewers along with the rehabilitation of existing sewers. These activities will take place near the border of the City's Anderson and Court Street Drainage Areas in the vicinity of Railroad Avenue. The improvements will provide linear stormwater storage while reducing combined sewer surcharge and overflows. It should be noted, green infrastructure will also be evaluated and implemented where necessary and beneficial.

Combined Sewer Overflow (CSO) - Traditional Infrastructure

Priority List Rank

119

County

Bergen

Existing Population

43,010

Service Area

Court Street Drainage Area in the vicinity of Lodi Street and Green Street.

Need for Project

Reduction of Combined Sewer Overflows (CSOs) to the Hackensack River. Reduction of combined sewer surcharge within public rights-of-way and public/private properties.

Project Description

Pursuant to New Jersey Pollutant Discharge Elimination System Combined Sewer Overflow Permit requirements, the City's Long Term Control Plan (LTCP) was submitted on October 1, 2020. Per the implementation schedule detailed in this document, for Year 2022 the anticipated activity is to, "Identify and construct additional localized partial sewer separation projects, if feasible, that are beneficial for the City to undertake." This project will consist of sewer separation efforts, including but not limited to, the design and installation of new separated storm and sanitary sewers, the rehabilitation of existing sewers where necessary, the connection into and upgrade of an existing pump station and green infrastructure where feasible. These activities will take place at the south of the Court Street Drainage Area near Lodi Street and continue until reaching the Hackensack River. The improvements will provide stormwater conveyance capacity to reduce combined sewer surcharge and overflows.

Service Area

Court Street Drainage Area West of NJ Transit Railroad - Clay Street, 1st Street, 2nd Street, 3rd Street, James Street, High Street, and Central Avenue.

Need for Project

Reduction of Combined Sewer Overflows (CSOs) to the Hackensack River. Reduction of combined sewer surcharge within public rights-of-way and public/private properties.

Project Description

Per the implementation schedule in the City of Hackensack's Long Term Control Plan, for Year 2022 the anticipated activity is to, "Identify and construct additional localized partial sewer separation projects, if feasible, that are beneficial for the City to undertake." Due to the significant combined sewer surcharge in the area, it was determined that the most beneficial sewer separation project would be to expand upon the S340923-13 project. This new project will consist of the design and installation of separated storm and sanitary sewers along with the rehabilitation of existing sewers. These improvements will take place in the Court Street Drainage Area within Clay Street, 1st Street, 2nd Street, 3rd Street, James Street, High Street, and Central Avenue. The improvements will provide linear stormwater storage while reducing combined sewer surcharge and overflows. The project's water quality requirements will be met by utilizing a combination of grey and green infrastructure.

Sewage Treatment Plant (STP) - Improvement/Upgrade

Priority List Rank

120

County

Cumberland

Existing Population

0

Service Area

The City of Millville is a community located in the central portion of Cumberland County. The WWTP is the only public owned treatment works within the bounds of the City limits. The City of Millville service area contains all of the area bounded by the official City limits. Of the 44 square miles that make up the City of Millville, approximately 13 square miles are serviced by the wastewater collection system. The collection system consists of approximately 90 miles of sewer mains ranging in size from 8 to 30 inches in diameter and 20 pump stations of varying capacities. The Millville treatment plant is located on an approximate 4 acre portion of Block 546, Lot 36 situated on the eastern side of the Maurice River, approximately 1.3 miles below the New Jersey State Highway Route 49 bridge crossing in the center of this urban area.

Need for Project

The third clarifier was originally designed to address challenges with meeting effluent water quality limits, particularly fecal coliforms. The facility is permitted for a 5 MGD average daily flow and 12.5 MGD peak flow but has struggled to meet permit limits at an average daily flow of 2.5 MGD. This expansion of secondary clarifier capacity will allow the plant to reliably meet its permit requirements at its permitted capacity.

Project Description

The WWTP underwent the Phase II upgrade project in 2017, which included the addition of or improvements to secondary clarification, return activated sludge pumping, ultraviolet disinfection, and plant (utility) water filtration. Prior to this work, the plant struggled to meet permit limits even at flows below the plants permitted capacity, specifically the fecal coliform limit. The addition of a third secondary clarifier was included as part of the 2017 design but was removed from the project prior to construction. This purpose of the current project is to update the 2017 design of the third secondary clarifier and prepare contract documents for construction. The project includes the demolition of an abandoned clarifier foundation and the construction of a new secondary clarifier, a scum pump station, a secondary effluent flow meter vault, process piping, and electrical and instrumentation upgrades.

Need for Project

To lessen CSO water outflows.

Project Description

Sections of deteriorating sidewalk will be removed and replaced with pervious surfaces that will recharge groundwater. Two existing downspouts will be directed into six pre-cast downspout planter boxes. The planter boxes will be equipped with perforated underdrains that will discharge to approximately 1760 square feet of pervious concrete sidewalk that will intercept treat and filter stormwater runoff from the rooftop. Portions of parking lot will be removed and replaced with permeable surfaces that promote groundwater recharge. Approximately 8540 square feet of porous asphalt parking spaces will be installed to intercept treat and filter stormwater runoff from the parking lot. Two rain gardens totaling 480 square feet will be installed in front of the building to capture stormwater runoff from the adjacent parking lot. Additionally three rain gardens totaling 1200 square feet will be installed along New Jersey 440 to intercept treat and filter stormwater runoff from a portion of the roadway.

Branchburg Township, Bridgewater Township, Hillsborough Township, Manville Borough, Raritan Borough, Somerville Borough, Warren Township and portions of Greenbrook via Warren.

Need for Project

These treatment plant improvements are necessary to replace aging equipment and infrastructure for the continued uninterrupted operation of the Somerset Raritan Valley Sewerage Authority's (SRVSA) regional wastewater treatment plant. Interruptions to wastewater treatment plant operations could potentially result in discharge of partially- or untreated wastewater that would negatively impact surface water quality. These treatment plant improvements will help to minimize such treatment plant interruptions and aide in treatment plant operations that will be beneficial to maintaining water quality of the surrounding water bodies, including the Raritan River.

Project Description

Description: This project includes the planning, design and construction of various treatment plant rehabilitation improvements at the Somerset Raritan Valley Sewerage Authority's (SRVSA's) regional wastewater treatment plant located in Bridgewater, Somerset County, New Jersey. These will include the following: 1. Replacement of an existing flat roof that has reached the end of its useful life with a new pitched roof structure on the Headworks Building. 2. Replacement of two existing grit collection systems in the Headworks Building that have reached the end of their useful life with two new grit collection systems. 3. Rehabilitation of existing plant-wide electrical systems, including motor control centers, conduits and conductors, as well as indoor and outdoor facility lighting that have reached the end of their useful life with new electrical systems. 4. Remediation of asbestos containing materials in Building 600 and Building 603

Existing Population

117,000

Service Area

The SRVSA provides service to the Township of Bridgewater, Township of Branchburg, the Township of Hillsborough, the Borough of Manville, the Borough of Raritan, the Borough of Somerville (Somerville), the Township of Warren, and portions of the Township of Green Brook. Combined, all municipalities contribute to a service area of over 67 square miles.

Need for Project

In the event of a major storm, the Somerset Raritan Valley Sewerage Authority's (SRVSA) interceptor system becomes surcharged due to excessive infiltration/inflow, also known as I/I, from its member municipalities' sewer collection systems. Given these conditions, wastewater from the Borough of Somerville escapes from its sanitary sewer system as an overflow. Preliminary analysis estimates prepared by SRVSA's engineers indicate that overflows are occurring during these excessive wet weather events upwards of several times each year.

Project Description

This project includes the design and construction of a treatment facility to capture and treat sanitary sewer overflows and safely discharge the treated water into the Raritan River. The proposed Storm Control Treatment Facility (SCTF) will eliminate discharge of raw sewage at its source properly treat the overflows and relieve wet weather flow to the SRVSAs plant in a cost-effective manner. The SCTF will generally consist of coarse and fine screening clarification filtration and disinfection.

Borough Rockaway Township Roxbury Victory Gardens Wharton

Need for Project

Rockaway Valley Regional Sewerage Authority is proposing improvements to its treatment facility to ensure continued compliance with the current NJPDES effluent parameter for CBOD as flows increase to the current design flow. The project will also provide advanced phosphorous reduction capability as well as significantly lowering nitrate levels in Rockaway River.

Project Description

The proposed project includes the construction of advanced wastewater treatment facilities at the existing RVRSA treatment plant. The new facilities will consist of chemical addition equipment process reactors and advanced solidsliquid separation treatment facilities.

Service Area

The Project will take place in the City of Bayonne, which is located in Hudson County, New Jersey. Residents of 59 homes in the Country Village neighborhood of Bayonne who are reliant on service from the 63rd St. Pump Station will directly benefit from the Project.

Need for Project

The Project will reduce to loss of service due to a power outage thereby reducing the risk of backups in homes and roads in the Pump Station Service Area.

Project Description

The lack of a permanent backup generator and much needed upgrades to City Line (63rd Street) Pump Station has unfortunately, due to extraordinary circumstances, been the cause of damaging backups to local residences. The 63rd Street Pump Station relies solely on mains electrical power to control flood water and sanitary flows emanating from the Country Village area of Bayonne which consists of 59 residential units of single and two-family homes. The 63rd Street Flood Resiliency Project consists of, but is not limited to, the procurement, installation, start-up, and testing of a 400 KW diesel emergency generator. The project also includes related electrical work and instrumentation for monitoring of the generator and some improvements to the pump station building. The 400 KW generator and electrical equipment will be elevated above the level of the 500-year floodplain elevation.

Cottage Street and the surrounding area.

Need for Project

Sanitary sewer and stormwater runoff for the area

Project Description

The project consists of storm water management improvements, including an underground basin, to provide a reduction in the rate of run-off for storm events in the vicinity of Cottage Street Park, and along Hobart Avenue, Evergreen Street and Cottage Street. The project will reduce the flooding problems in the area, and ease the strain on the combined sanitary sewer system. The project also replaces the existing undersized storm sewer in the area, and rehabilitates the existing along 5th Street.

Need for Project

The South Branch of the Pennsauken Creek is classified as FW2-NT nontrout waters with industrial water use. The existing water quality is violated for fecal coliform and toxics with marginal violation of dissolved oxygen. The effluent from the existing wastewater treatment facilities have exceeded the assimilative capacity of the stream and the facilities do not afford the degree of treatment to safely accommodate the current and future population within the Project Area. The following is the existing inventory of the wastewater facilities Sewage Treatment Flow Effluent Plant (STP) Name (mgd) Reported BOD Reported SS (NJPDES) Design Present mgl mgl Woodstream (NJ0024040) 1.25 0.91 96.8 10.9 99.1 3.3

Project Description

This project is to provide a cost effective regional sewerage system for the Southwest Branch Rancocas Creek drainage basin. Implementation of the project will accomplish the attainment of water quality in area streams the prevention of health hazards and the protection of the environment. Presently the facility planning effort is evaluating the various alternatives which will accommodate the required levels of treatment necessary to alleviate the pollution problem. The alternatives which can be implemented are land disposal discharge to the confluence of the Southwest Branch or discharge at the present location. The ultimate sludge disposal will be incorporated into the on-going countywide sludge and septage management plan recommendations.

Service Area

The City of Millville is a community located in the central portion of Cumberland County. The WWTP is the only public owned treatment works within the bounds of the City limits. The City of Millville service area contains all of the area bounded by the official City limits. Of the 44 square miles that make up the City of Millville, approximately 13 square miles are serviced by the wastewater collection system. The collection system consists of approximately 90 miles of sewer mains ranging in size from 8 to 30 inches in diameter and 20 pump stations of varying capacities. The Millville treatment plant is located on an approximate 4 acre portion of Block 546, Lot 36 situated on the eastern side of the Maurice River, approximately 1.3 miles below the New Jersey State Highway Route 49 bridge crossing in the center of this urban area.

Need for Project

Upgrade existing clarifiers - updraft of the sludge blanket due to density currents coupled with poor settling sludge quality Third secondary clarifier - to complete upgrades to the ex. clarifiers, and comply with discharge requirements. RAS Pumps - pumps oversized RAS Piping - mods for addtl flexibility RAS Chlorination - reduce frothing which causes slippery foam. Walkway from Splitter Box to Aeration Tank - Allow staff to move btwn locations Auto Cleaned Strainer - ex. strainer clogs overnight causing pump failure Rotary Presses - ex. presses produce solids content well below what is desired by disposal outlets. DumpsterVeyor - staff manually distributes sludge in dumpsters. Sludge Process Building - roof leaks, masonry cracked, reduce energy costs Foam Skimmer - frothing in aeration tanks UV Disinfection - old technology and is failing resulting in fecal coliform violations Check valves on Odor Control - air in ductwork reverses from the building to Odor control

Project Description

(Carryover SFY2015) - Upgrade existing clarifiers - install density current baffles seal cracks in launders third secondary clarifier - construct addtl clarifier RAS Pumps - install smaller pumps RAS Piping - Modify ex. RAS piping RAS Chlorination System - Install new sodium hypochlorite system Walkway from Splitter Box to Aeration Tank - construct walkway Auto Cleaned Strainer for Utility Water System - install new strainer Rotary Presses - replace with rotary presses DumpsterVeyor - install track-mounted container Sludge Process Building - new roof repair masonry consolidate sludge rooms Foam Skimmer - Install surface skimmer system UV Disinfection System - install new UV system and inlet chamber Check Valve on Odor Control System - install new check valve.

Service Area

The Township of Delran wastewater system serves all of the Township as well as approximately 10 users in Moorestown Township.

Need for Project

Sand Filter Improvements- The Township's Wastewater Treatment Plant includes an existing traveling bridge sand filter installed in 1994 as part of a plant upgrading. The plant staff has indicated that the existing unit is hydraulically inefficient and its rehabilitation or replacement has been identified as a priority project in the Township Sewer Utility Capital Improvement Program. Retrofitting the existing filter unit with similar technology will be considered as will replacement of the unit with a different technology. This improvement will not increase the capacity of the wastewater treatment plant. Fifth Street Pump Station Improvements- An evaluation of the Fifth Street Pump Station found it to be in need of varying degrees of improvement and it has been identified as a priority project in the Township Sewer Utility Capital Improvement Program. These improvements will not increase the capacity of the pump station.

Project Description

The proposed project will involve the improvements to the sand filter at the Townships existing Wastewater Treatment Plant.

Service Area

Township of Delran

Need for Project

The proposed plant improvements will enhance plant reliability and efficiency. Additionally, the project will reduce maintenance costs and decrease the likelihood of failures.

Project Description

The proposed project will consist of improvements to the Township of Delran's Wastewater Treatment Plant. These include upgrades to the plant service water system including new feed pumps, a service water storage tank, booster pumps and associated piping and electrical work. In addition, the improvements include replacement of existing over sized aeration blowers with new high efficiency turbo blowers and aeration operational controls.

Service Area

Wastewater is primarily collected from the Joint meeting's eleven member and six customer communities. Member (owner) communities include all or parts of: East Orange, Hillside, Irvington, Maplewood, Millburn, Newark, Roselle Park, South Orange, Summit, Union and West Orange. The City of Elizabeth and portions of Livingston, Orange, Berkeley Heights, Linden and New Providence are currently served as customers by the Joint Meeting.

Need for Project

The purpose of the project is to reduce the impact that natural disasters like Superstorm Sandy could have on the facility in the future and to avoid loss of wastewater service. The proposed project is needed to incorporate resiliency to minimize potential future facility failures, service interruption and/or loss of service, and to minimize future damages to the critical facility's infrastructure. In addition, the project will decrease the risk for release of untreated sewage into the environment, thereby protecting public health and natural resources.

Project Description

The project generally consists of the construction of reinforced concrete flood walls on piles with steel sheeting subsurface cut-off walls around the four (4) sides of the Biosolids Facilities Site including installation of flood gates for vehicular access, modifications to the existing entrance roadways, construction of stormwater facilities to redirect on-site stormwater to the proposed Biosolids Stormwater Pumping Station, and coordination with and/or relocation of various utilities within the project area.

Need for Project

Summary: post treatment, anaerobic digestion, filtration, dechlorination, pfas study Anaerobic Treatment (secondary treatment) Anaerobic processes work without oxygen to convert organic contaminants to biofuel gas. This process works without any form of oxygen and will occur in refurbished tanks as anaerobic bacteria break down organic waste. The anaerobic process uses less energy than the aerobic process because it does not require equipment to pump oxygen into the wastewater. Anaerobic water treatment produces biogas byproducts such as water vapor, carbon dioxide and methane. Wastewater treatment plants often reuse the resulting methane to reduce energy costs. Anaerobic treatment is ideal for plants that treat water containing concentrated amounts of biodegradable materials such as food waste, animal excrement or municipal waste. Filtration- post liquid and mechanical filtration is used to improve effluent water quality. Project includes PFAS study

Project Description

The project will utilize Danish technology and engineering to refurbish and redesign four under/ unutilized digester tanks at the Trenton Sewer Utility converting them to a system of anaerobic digesters that processes sewage sludge and source separated food waste to reduce carbon emissions, improve water quality and capture otherwise wasted energy.

In addition, the project will decrease the risk for release of untreated sewage into the environment, thereby protecting public health and natural resources.

Project Description

The project generally consists of the construction of reinforced concrete flood walls on piles with steel sheeting subsurface cut-off walls around the four (4) sides of the Biosolids Facilities Site including installation of flood gates for vehicular access, modifications to the existing entrance roadways, construction of stormwater facilities to redirect on-site stormwater to the proposed Biosolids Stormwater Pumping Station, and coordination with and/or relocation of various utilities within the project area.

Service Area

PVSC serves 48 municipalities in parts of Bergen, Essex, Hudson, Passaic and Union Counties.

Need for Project

PVSC is making improvements to its Headworks Grit and Screenings Facility which require an electrical upgrade to support. Additionally, the substation has exceeded its useful life and is in need of replacement. The substation is required to maintain operation of the treatment plant.

Project Description

The project includes construction of a new Substation M adjacent to the area occupied by the Grit and Screenings and the Incinerator Buildings at the east end of the grit channels. The project will also include the relocation of PVSC's Emergency Generator, new duct bank and manhole system to augment and replace the existing Substation M power supply and distribution system. To accommodate the new substation the existing access roads will be removed or relocated and new parking areas will also be constructed. This project also includes Headworks Reconstruction (increased scope from 689-47) including construction of a new Grit and Screenings Building, reconstruction of the grit sumps, installation of grit pumps, cyclone degritters, screw type classifiers, conveyors, screenings compactors and expansion of the existing bar screens and improvements to all electrical, HVAC and auxiliary equipment. The improvements also include a new grit and screenings unloading stations.

Service Area

PVSC serves 48 municipalities in parts of Bergen, Hudson, Essex, Passaic and Union Counties.

Need for Project

The project is to reconstruct PVSC's preliminary treatment processes to continue to maintain its ability to remove debris and grit from the wastewater flow. It is also one component of the PVSC's treatment plant improvements to increase its ability to treat wet weather flows to reduce CSOs. This project will also raise all equipment to higher elevations, reducing the risk of flood damage.

Project Description

This Headworks Reconstruction Project includes, but is not limited to, construction of a new Grit and Screenings Building, including the reconstruction of the grit sumps, installation of grit pumps, cyclone degritters, screw type classifiers, conveyors, screenings compactors and expansion of the existing bar screens. The project also includes improvements to all electrical, hvac and auxiliary equipment. The improvements also includes a new grit and screenings unloading stations.

Need for Project

The project will ensure reliable operations of the wastewater treatment facilities by replacing equipment that has reached the end of its useful life and would be overloaded when the Standby Power Generation Facility is operated in parallel with the utility power.. This project will ensure continuous wastewater treatment plant operations during storm events by providing reliable power distribution to both the wastewater treatment processes.

Project Description

In the wake of Superstorm Sandy, many of Passaic Valley Sewerage Commission's (PVSC's) facilities suffered extensive damage due to flood waters that submerged much of the plant. In response, PVSC is undertaking a multifaceted program to protect the facility against major flooding events up to a 100-year storm. A short circuit, load flow and motor starting analysis report completed in 2019 revealed multiple electric switchgear would exceed their device capabilities upon completion of the Standby Power Generation Facility (SPGF) when the SPGF is operated in parallel with the electric power utility: The Advanced Electrical II (AE II) project will replace the switchgear with new intelligent switchgear and also replace other impacted electrical equipment. The project will be divided into two contracts. An equipment procurement contract and a construction contract.

Need for Project

The project will ensure reliable operations of the wastewater treatment facilities by replacing equipment that has reached the end of its useful life and also provided new feeders from both the utility power (PSE&G) and the Standby Power Generation Facility. This project will ensure continuous wastewater treatment plant operations during storm events by providing reliable power distribution to both the wastewater treatment processes and the Stormwater Pumping Stations.

Project Description

Improvements and Upgrades to the Electrical Switchgear Equipment and Power Distribution around the Wastewater Treatment Facility. This project is part of a multi-faceted flood resiliency program that is being implemented to protect the facility against major flooding. The electrical system will be designed to support the existing wastewater treatment processes and the new stormwater pumping stations that are part of the flood resiliency program. The power sources that will be distributed will be both the PSE&G Utility Service and the Standby Power Plant. The Standby Power Plant which is also part of the flood resiliency program will be utilized when the utility service is disrupted.

Service Area

PVSC serves 48 municipalities in parts of Bergen, Essex, Hudson, Passaic, and Union counties

Need for Project

PVSC utilizes an in-plant Supervisory Control and Data Acquisition (SCADA) system comprised of Programmable Logic Controllers (PLCs), Human Machine Interface (HMI) components and associated communications network infrastructure. Parts of the in-plant SCADA system are nearing the end of their useful lifecycle. Other parts of the SCADA system were damaged during Super-storm Sandy and may not have been fully repaired or replaced. In addition, institutional SCADA knowledge has been lost over time. PVSC developed a comprehensive SCADA Master Plan to guide them toward achieving their operational vision and goals through leveraging the use of SCADA and related systems. The new SCADA system will ensure that PVSC continues to reliably treat wastewater efficiently and continue to meet the requirements of their NJPDES Permit.

Project Description

The project is a plantwide SCADA Improvements project. The work involves replacing existing control equipment that has reached the end of its useful life. The project will provide a more efficient and reliable control system to monitor and control the wastewater treatment processes. It will be divided into multiple contracts that will be bid at separate times.

PVSC serves 48 municipalities in parts of Bergen, Essex, Hudson, Passaic and Union counties

Need for Project

The Passaic Valley Sewerage Commission wastewater treatment facility reliably treats wastewater from approximately 1.5 million people, 200 significant industrial users (SIU) and 5,000 commercial users. The wastewater processes are interconnected by process piping. This piping is critical to reliable treatment plant operations and the ability to meet the facilities NJPDES Permit. The process piping is reaching the end of its useful life and in order to be able to provide continuous wastewater treatment, the piping needs to be evaluated and either be rehabilitated or replaced.

Project Description

The Passaic Valley Sewerage Commission has a series of Utility Tunnels that connect the various process areas and houses much of the process piping to interconnect the unit processes. The piping was installed and placed into service circa 1980. The piping varies in size and materials of construction including various lining systems. Although well maintained, the piping was evaluated via ultrasonic testing which identified potential issues due to normal "wear and tear". The project will further evaluate the condition of the piping and provide recommendations to rehabilitate or replace the lines. Design documents will be prepared based on the recommendations. A contractor will be engaged via the public bidding process and the lines will be rehabilitated. Also as part of the project, the pipe couplings that have experienced corrosion will be replaced.

1,509,654

Service Area

PVSC serves 48 municipalities in parts of Bergen, Essex, Hudson, Passaic and Union Counties

Need for Project

The Passaic Valley Sewerage Commission wastewater treatment facility reliably treats wastewater from approximately 1.5 million people, 200 significant industrial users (SIU) and 5,000 commercial users. The Oxygenation Tanks are critical part of the biological wastewater treatment process and reliable treatment plant operations is necessary for PVSC to meet the facilities NJPDES Permit. The concrete tanks and joints are in need of evaluation and repair. The process equipment, valves and piping have reached the end of their useful life and in need of replacement. In addition the mixers are inefficient and it is believed that large amounts of grit is accumulating in the tanks which takes away useable volume in the tanks which can cause an increase in the demand for oxygen.

Project Description

PVSC's Oxygenation Tanks Facility was constructed in 1980, with upgrades and improvements in 2007 and 2012, and consists of 12 concrete tanks with 4 stages each. Each stage is 58 feet square with an average side water depth of 29.94 feet with a total volume of 3.01 million gallons per tank. Flow from the Oxygenation Tanks Influent Conduit enters the tank in the center of the A Stage, flow follows a zig zag pattern passing through to stages B, C and D via a 10 ft. wide by 11 ft. tall opening between each stage. The work included in this project consists of an assessment and rehabilitation of the concrete, expansion joints, influent oxygen feed valves, vent valves, mixing system and the instrumentation and controls system at the existing Oxygenation Tanks Facility. The existing mixers a draw a large amount of electricity. More energy efficient mixers will be evaluated.

Service Area

PVSC serves 48 municipalities in parts of Bergen, Essex, Hudson, Passaic and Union counties.

Need for Project

PVSC utilizes an in-plant Supervisory Control and Data Acquisition (SCADA) system comprised of Programmable Logic Controllers (PLCs), Human Machine Interface (HMI) components and associated communications network infrastructure. Parts of the in-plant SCADA system are nearing the end of their useful lifecycle. Other parts of the SCADA system were damaged during Super-storm Sandy and may not have been fully repaired or replaced. In addition, institutional SCADA knowledge has been lost over time. PVSC developed a comprehensive SCADA Master Plan to guide them toward achieving their operational vision and goals through leveraging the use of SCADA and related systems. The new SCADA system will ensure that PVSC continues to reliably treat wastewater efficiently and continue to meet the requirements of their NJPDES Permit. This work is being instituted in 3 phases. This is the second of the three phases. The first phase is being completed under Project Number S340689-53

Project Description

The project is a SCADA Improvements Project to the Wet Train and Line Operations. It is part of a Plantwide SCADA Improvements project that is being done in 3 phases. This is the second phase. The project will provide a more efficient and reliable control system to monitor and control the line operations and treatment processes.

Service Area

PVSC serves 48 municipalities in parts of Bergen, Essex, Hudson, Passaic and Union Counties.

Need for Project

The inner lining of the Heat Treatment Plant Supernatant Return pipe line was in disrepair and removed. The pipeline requires a new lining and/or coating for use within the treatment plant for various purposes including, but not limited to, biological waste activated sludge conveyance and biosolids treatment return liquids conveyance. These processes are required to continue secondary treatment and biosolids treatment operations at the PVSC facility.

Project Description

The Passaic Valley Sewerage Commission utilizes the Zimpro Process to stabilize their sludge. After stabilization, the sludge is sent to Sludge Decant Tanks. The supernatant from the decant tanks is sent to their Oxygenation Tanks and/or the Supernatant Treatment Plant for further treatment via a 20-inch pipeline. The pipe was lined with a polyethylene liner that failed. The liner was removed under a separate project. PVSC is now looking to coat the interior of the pipe with a new coating system to extend the life of the pipeline. A pilot study was performed of various coating systems and one was identified as suitable.

Need for Project

As a result of Superstorm Sandy, PVSC's treatment plant was inundated with salt water. The flooding damage requires the replacement of the electrical cabling, switchgears and the replacement and relocation of motor control centers plantwide to maintain treatment plant operations.

Project Description

This project includes the replacement and relocation of electrical switchgear and MCCs throughout the wastewater treatment plant that were damaged due to flooding from Superstorm Sandy. The work includes, but is not necessarily limited to, furnishing and installing new switchgear, MCCs, electrical panels and other devices, conduit wiring, prefabricated electrical houses, foundations, access platforms, site work and associated work.

Service Area

PVSC serves 48 municipalities in parts of Bergen, Essex, Hudson, Passaic and Union Counties.

Need for Project

PVSC's final clarifiers are part of its secondary treatment process. In order to maintain secondary treatment operations, it needs to perform concrete and expansion joint repairs to its twelve (12) final clarifier tanks.

Project Description

This project involves concrete rehabilitation and protective coating of the final clarifiers at the PVSC treatment facility. The concrete surfaces are significantly deteriorated and the concrete rehabilitation and application of a protective coating to cover over 200,000 square feet of walls, concrete columns and miscellaneous areas will allow this significant asset to be utilized well into the future. The work involves surface preparation, concrete lining and resurfacing of all surfaces and epoxy coating of pre-approved and demonstrated products. All expansion and construction joints will be replaced in all twelve (12) final clarifiers. Concrete repairs to walkways and stairs are also included in this project. Influent sluice gates will be installed in each of the twelve (12) final clarifiers as well.

Need for Project

PVSC is constructing Flood Walls to protect the treatment plant during extreme weather events. As a result, the stormwater collection systems within the Flood Wall need to be redesigned and reconstructed to include stormwater pumping stations to prevent flooding from within the Flood Walls.

Project Description

In order to mitigate against future storm rain events and remove the water within the new flood wall, three pumping stations will be constructed. The pump stations will be provided on the east (2 No.) and west (1 No.) side of the treatment plant. Each pumping station will consist of pile supported reinforced concrete structures, mechanical pumps and electrical equipment.

Service Area

PVSC serves 48 municipalities in portions of Bergen, Hudson, Essex, Union and Passaic Counties.

Need for Project

PVSC is constructing a Floodwall to protect its treatment plant from extreme weather events. The construction of the floodwall requires that the stormwater collection system within the wall be redesigned and reconstructed to prevent internal flooding.

Project Description

In order to mitigate against future storm rain events and remove the water within the new flood wall, PVSC will be required to upgrade the existing storm water drainage system. The new drainage system will consist of a network of pipes throughout the plant ranging in sizes from 12" to 72" in diameter on pile supported foundations.

Service Area

PVSC serves 48 municipalities in parts of Bergen, Hudson, Essex, Union and Passaic Counties.

Need for Project

PVSC is constructing a Stand By Power Generating Station to provide continuous operation of the Wastewater Treatment Plant in the event of loss of utility power.

Project Description

In order to mitigate the possibility of the loss of power to the PVSC facility and the prevention of another regional bio solids treatment and disposal crisis, PVSC proposes to build a standby power generating facility to provide power for the entire wastewater treatment plant (WWTP). The standby power plant will enable the PVSC to continue operations during a grid power outage. PVSC would no longer need to rely on the local power utility for sustained operation. This project consists of the construction of a powerhouse building that will include three (3) gas turbines with ancillary support equipment with the capabilities of generating 34 megawatts of electricity.

Need for Project

The project will increase the wet weather treatment capacity from the current 400 MGD up to 720 MGD to reduce combined sewer overflow discharge volumes within the PVSC district. Additionally, the rerouting of the sludge train recycle streams will increase treatment plant stability in both wet and dry weather conditions for improved treatment plant performance.

Project Description

This project includes the design and construction of a secondary bypass to increase wet treatment capacity from the current 400 MGD up to 720 MGD for the reduction of CSO discharge volumes. The project includes, but is not limited to, the construction of a primary bypass and the re-routing of the sludge train recycle streams from the secondary processes to the primary clarifiers for improved plant performance during wet and dry weather conditions.

Service Area

PVSC serves 48 municipalities in parts of Bergen, Hudson, Essex, Union and Passaic Counties.

Need for Project

PVSC is constructing Flood Walls along the perimeter of the Wastewater Treatment Plant to protect the plant during extreme weather events.

Project Description

The PVSC proposes construction of a flood wall at its 140+ acre regional wastewater treatment facility located at 600 Wilson Avenue, Newark, New Jersey. The purpose of the project is to mitigate against the future risk of storm damage and consequent risk of service disruption. The New Jersey Department of Environmental Protection (NJDEP) has identified the PVSC facility as a critical component of New Jersey's infrastructure and has recommended that the facility be protected from similar events. Recent guidance issued by the NJDEP calls for the protection of wastewater treatment plants as critical infrastructure to the 500-year or 0.2% annual chance storm event consistent with Presidential executive orders. The flood wall will allow PVSC to keep the facility in operation. PVSC, through the New Jersey Office of Emergency Management, requested public assistance funding from the Department of Homeland Security, FEMA for the proposed project.

PVSC serves 48 municipalities in parts of Bergen, Hudson, Essex, Union and Passaic Counties.

Need for Project

PVSC is constructing Flood Walls along the perimeter of the Wastewater Treatment Plant to protect the plant during extreme weather events.

Project Description

This Project consists of three components: 1) construction of a flood wall at its 140+ acre regional wastewater treatment facility located at 600 Wilson Avenue, Newark, New Jersey to mitigate against the future risk of storm damage and consequent risk of service disruption. 2) upgrade the existing storm water drainage system that will consist of a network of pipes throughout the plant ranging in sizes from 12" to 72" in diameter on pile supported foundations. and 3) to mitigate against future storm rain events and remove the water within the new flood wall, three pumping stations will be constructed. The pump stations will be provided on the east (2 No.) and west (1 No.) side of the treatment plant. Each pumping station will consist of pile supported reinforced concrete structures, mechanical pumps and electrical equipment.

County

Essex

Existing Population

1,350,000

Service Area

PVSC provides wastewater treatment and bio solids management services for 1.4 million residents, over 5,000 commercial entities and 200 significant industrial users within its service area. The PVSC's service area (District) encompasses approximately 155 square miles and includes 48 municipalities in parts of Bergen, Essex, Hudson, Passaic and Union Counties. See Table 1-1 included in the Planning Document for more information. In addition, PVSC provides bio solids (sludge) management and Liquid Waste Acceptance ("LWA") services to out-of-District municipal and industrial entities that transport non-hazardous liquid wastes to the PVSC Plant by truck or barge. PVSC's hauled wastes also include potable water sludge from New Jersey and New York. In total, PVSC treats nearly 25% of the State of New Jersey's wastewater and/or sludge and approximately 15% of the sludge generated in New York City, which represents a service population of over 3.4 million residents.

Need for Project

Superstorm Sandy caused the PVSC's treatment plant facility to suffer catastrophic physical damages causing a protracted loss of treatment capability. Severe negative regional environmental and economic impacts occurred as a result of the plant's loss of function. Floodwaters entered the Plant's process galleries and utility/infrastructure tunnel system, damaging cabling, process equipment, dewatering pumps, maintenance equipment, mechanical equipment, process transmission piping, electrical equipment, and control equipment. Following the storm, the salt water tidal surge and sewage mixture was trapped in the lower levels of the Plant for more than 10 days before it could be completely pumped out. PVSC is planning on installing the generator provisions in order to ensure that temporary power can be provided to proposed sump pumps throughout the utility/infrastructure tunnel system, basements and galleries in the event of another catastrophic storms.

Project Description

In order to ensure that the sump pumps and dewatering pumps located throughout the utility tunnels galleries and basements at the PVSC Wastewater Treatment Plant will be capable of continued operation should flooding conditions occur again (as they did with Superstorm Sandy) this project proposes to provide a stand-by power electrical system setup where a roll-in stand-by generator system (brought to certain locations) which can be tied into temporary stand-by power electrical distribution to power sump pumps and de-watering pumps located in tunnels basements and galleries throughout the PVSC facility. The stand-by generator systems equipment (generators automatic transfer switches electrical panel boards controls etc.) will be located above elevation 13 in order to install them above the flood plain. To accomplish this electrical equipment will be located outside of building walls or indoor electrical room at or above elevation 13.

In total, PVSC treats nearly 25% of the State of New Jersey's wastewater and/or sludge and approximately 15% of the sludge generated in New York City, which represents a service population of over 3.4 million residents.

Need for Project

Superstorm Sandy caused the PVSC's treatment plant facility to suffer catastrophic physical damages causing a protracted loss of treatment capability. Severe negative regional environmental and economic impacts occurred as a result of the plant's loss of function. Floodwaters entered the Plant's process galleries and utility/infrastructure tunnel system, damaging cabling, process equipment, dewatering pumps, maintenance equipment, mechanical equipment, process transmission piping, electrical equipment, and control equipment. Following the storm, the salt water tidal surge and sewage mixture was trapped in the lower levels of the Plant for more than 10 days before it could be completely pumped out. PVSC is planning on completing the utility tunnel bulkheads in order to limit damage with major equipment and allow continued access to important sections of the tunnel system.

Project Description

The project scope is to furnish all labor materials and equipment and other facilities required to segment the utility tunnel system by the installation of watertight doors in bulkhead walls at various locations within the tunnel and to install watertight doors at access locations to process areas. The scope also includes HVAC work to provide ventilation to the segmented areas and associated electrical and above grade site work.

County

Essex

Existing Population

1,350,000

Service Area

PVSC serves 48 municipalities in portions of Bergen, Hudson, Essex, Passaic and Union Counties.

Need for Project

9 of the PVSC's 48 municipalities have combined sewer systems (CSS) and combined sewer overflow (CSO) discharges to the area waterways, including the Passaic, Hackensack and Hudson Rivers and the Newark Bay. This project is one component of PVSC's plant wide improvements to increase PVSC's wet weather treatment capacity and reduce the volume of CSO discharges.

Project Description

The Waste Pump Expansion project is one component of PVSCs Plant Wide Improvements to increase its wet weather treatment capacity to reduce the volume of CSO discharges. The project will be purchasing and installing new pumps valves piping flow meters process control sampling and monitoring equipment and providing electrical improvements as necessary to accommodate the new style pumps. Improvements to address hydraulic issues and improve pump operational characteristics are also being included in the project.

Need for Project

PVSCs treatment plant buildings equipment and electrical systems were severely damaged due to flooding of its utility tunnels and galleries from Super Storm Sandy. To prevent a future similar event this project will raise the tunnel system sump pump control panels above ground which will be accessible to connect generators in the event of a power outage. In addition bulkheads will be installed to provide the ability to isolate sections of the tunnels and galleries to contain floodwaters.

Project Description

This project includes improvements to the PVSCs sump pump systems to raise the control control panels above ground to prevent possible future flood damage and to allow for generator connections in the event of a power failure to allow for the ability to maintain operation of the facilities sump pump systems. The project also includes the installation of bulkheads in areas of the tunnels to provide the ability to isolate sections of the tunnels and galleries.

The municipalities of Absecon Atlantic City Brigantine Egg Harbor City Egg Harbor Township Galloway Hamilton Linwood Longport Margate Northfield Pleasantville Somers Point and Ventnor.

Need for Project

Improvements to the STP are needed to ensure operational reliability and component integrity. Certain process equipment must be replaced or improved. The existing discharge to the Atlantic Ocean has the potential to adversely impact shellfish and recreational uses.

Project Description

The project involves (1) installation of new variable speed drive units to replace existing single speed drive units controlling 500hp effluent pumps allowing the equalization basin to be taken off line for maintenance and cleaning (2) installation of a new bar screen and conveyor system to reduce rags and solids from passing through the process system (3) installation of a CEMDAS system to monitor the sludge furnace emission levels of oxygen and carbon-dioxide (4) replacement of the centrifuge back drive units with new units and a control panel for automatic torque control for higher efficiency (5) replacement of Dezurik valves to prevent leaking and the cross contamination of processes (6) installation of a supervisor computer and data acquisition system (SCATA) to electronically optimize unit processes (7) replacement and relocation of the plant washdown pumps and (8) sludge hopper enlargement. This project also includes minor necessary improvements to ensure operational reliability.

Existing Population

75,000

Service Area

The Authority's service area includes 11 municipalities including the Borough's of Allendale, Ho-Ho-Kus, Midland Park, Ramsey and Waldwick. Partially served are the municipalities of Mahwah, Wyckoff, Saddle River, Upper Saddle River, Franklin Lakes and Ridgewood.

Need for Project

The Wastewater Treatment Plant Improvements Project mitigates bottlenecks in systems which support the main wastewater treatment processes. An overflow or surcharge in any of these processes has the potential for sludge, grease, ash or other materials to reach the Ho-Ho-Kus Brook, which is located directly downstream from the existing unit processes. In addition, these processes support the primary treatment function of the plant. Bottlenecks in the processes can negatively impact the overall treatment capacity of the plant.

Project Description

The Authority proposes various improvements to its existing treatment processes at its Sewage Treatment Plant. Proposed improvements include the separation of the primary sludge and waste activated sludge (WAS) streams and installation of a disk thickener to treat the WAS. Installation of an automated system to remove the grease in the grease/scum pit, installation of larger pumps, piping and associated force main in the existing dewatering well, and construction of a new mechanical drying equipment for the existing ash tank.

S340943-08
Sewage Treatment Plant (STP) - Improvement/Upgrade

Priority List Rank

149

County

Burlington

Existing Population

41,870

Service Area

The MLTMUA service area covers approximately 21.99 square miles in northwestern Burlington County, New Jersey. The area is bounded by the Rancocas Creek to the northeast (with Willingboro and Westampton Townships on the other side of the creek; Hainesport, Lumberton and Medford Townships to the east; Evesham Township to the south; Camden County to the southwest; and Maple Shade and Moorestown Townships to the northwest). The land area included within the MLTMUA Wastewater Management Plan (WMP) area serviced by the Hartford Road WPCF includes the majority of Mount Laurel Township. The areas not included are one small section in the west of town, which is served by the Camden County MUA, and some areas which continue to utilize septic systems. In addition, the WPCF serves some individual developments in Medford, Moorestown, and Evesham near the municipal boundaries.

Need for Project

The project purpose is to reduce maintenance and operating problems and costs, while maintaining solids dewatering capability by replacing aging equipment. The project will improve the Authoritys operations, reduce the possibility of emergency expenditures due to equipment failures, reduce operating costs, and help ensure the timely delivery of the facility biosolids for reuse. Without the project the ability of the MLTMUA to dewater biosolids will degrade, and the facility will then need to have liquid hauled from the site. Hauling liquid is more expensive to the rate payers and results in more truck traffic on local roads.

Project Description

The project includes Process Equipment Upgrades all of which are located in the existing Sludge Dewatering Building. The improvements include the installation of one new Belt Filter Press (BFP) No. 4 to replace the existing BFP No. 3, a retrofit of the existing polymer system, replacement of the existing dewatered sludge pump, replacement of existing interior lighting with new LED lighting fixtures, upgrade of the existing belt wash system, replacement of the existing air compressor and dryer, building ventilation improvements, new interior coatings and walkway, as well as hopper, piping, structural, electrical, instrumentation, and controls systems modifications as necessary and appropriate to accommodate the improvements. The project will improve the Authoritys operations, reduce the possibility of emergency expenditures due to equipment failures, reduce operating costs, and help ensure the timely delivery of the facility biosolids for reuse.

Need for Project

The project proposed no changes to the existing treatment process but seeks to install solar photovoltaic facilities to meet the electric demands of the facilities.

Project Description

The project is for the construction of a 2.5 megawatt photovoltaic generation system at the East Windsor Municipal Utilities Authority Pollution Control Facility located on Millstone Rd. in East Windsor N.J. The project includes solar arrays current inverters wiring metering controls and miscellaneous appurtenances. This will allow the plant to operate on 100 of photovoltaic generation power.

Project Name, Number

Pennsville Sewerage Authority
S340870-05
Sanitary Sewer System Rehabilitation

Priority List Rank

152

County

Salem

Existing Population

13,409

Service Area

The Township estimated population is 13,900 residents, based on the 2010 census and interpolated data as indicated in the planning document. The sanitary sewer collection system is owned and maintained by the Pennsville Sewerage Authority (PSA). Sanitary sewer generated by the Township is conveyed to the Authority's WWTP for treatment.

Need for Project

This project is being undertaken in order to protect and enhance existing sanitary sewer infrastructure within the PSA service area. Failing to maintain the current infrastructure will only serve to increase the risk of future service interruption, chemical leaching and accidental discharges from aging infrastructure. The need for improvements has been identified as a result of aging wastewater treatment infrastructure. As wastewater treatment equipment deteriorates over time, the potential for wastewater spillage or the discharge of insufficiently treated water into the Delaware River grows. Overall the proposed work will enable PSA to keep the municipal infrastructure in good operating condition, reduce unscheduled maintenance, and improve system monitoring.

Project Description

Contract No.1, RBC Project: In the 1980's, the PSA installed six (6) RBC units following its primary treatment process at the WWTP to support its secondary biological treatment. The PSA has been maintaining and rebuilding these units for many years, and the overall structural integrity of the units has deteriorated to the point that the units are reaching the end of their service life. Consequently, the Authority recently replaced one (1) of the RBC units within the last couple of years and has decided to replace the remaining five (5) units. Contract No.2, Sludge Thickening System Project: The sludge thickening system is necessary to support the treatment operations and facilitates the removal of sludge from the WWTP. The Authority is planning to complete improvements to the system consisting of the rehabilitation of the sludge feed station, construction of new sludge thickener tank and sludge discharge pump.

Service Area

Gibbstown - Greenwich Township

Need for Project

The Gibbstown plant is discharging to Wiggins Pond a tributary of the Delaware River. The effluent is not in compliance with the permit requirements. Due to the stringent effluent limitations as established by the Department discontinuation of the discharge to Wiggins Pond has become necessary. Wiggins Pond (SE-2) is a non-trout stream with severe violations of fecal coliform and marginal violations of D.O. and toxics. Wiggins Pond supports industrial water use. Also there exists a major problem due to the presence of high-strength chemical wastes. The plant also receives intermittent discharges of slaughtering wastes from a local butchery. The combined effect of these wastes tend to upset the biological processes. Sewage Treatment Flow Effluent Plant (STP) Name (mgd) Reported BOD Reported SS (NJPDES) Design Present mgl mgl Gibbstown(Secondary)(NJ0030333) 1.0 0.77 92.2 19.8 89 25.7

Project Description

The project consists of upgrading the existing Gibbstown plant by using the oxidation ditch process and construction of an outfall for direct effluent discharge to the Delaware River. It also includes the construction of influent and effluent pump stations and force mains.

Service Area

The project will directly impact the drainage area between 10th Street and 7th Street east of Bay Avenue to the Bayfront. Additionally, this area is the main business district of the municipality and the continued instances of flooding are negatively affecting local commerce and tourism to the area.

Need for Project

At the present time, rain and flood waters from the Bay are deposited on the local streets where pollutants contaminate the water prior to it being drained back to the Manahawkin May. As part of the proposed project herein, two (2) manufactured treatment devices (MTD) will be installed. MTD's are proprietary stormwater treatment systems used to address the stormwater quality impacts of land development. Since this project is receiving New Jersey Environmental Infrastructure Financing Program (NJEIFP) funding, the MTD's will either be NJCAT verified and NJDEP certified or installed using the NJEIFP MTD Funding Policy.

Project Description

Applicant proposes to remove existing storm pipe and replace with approximately 4000 LF of new 18" HDPE pipe as well as install two (2) stormwater pumps at 7th Street and 10th Street along with two (2) manufactured treatment devices and inline tide valves.

Project Name, Number

Jersey City Municipal Utilities Authority
S340928-51
Sanitary Sewer System Rehabilitation

Priority List Rank

156

County

Hudson

Existing Population

0

Service Area

Jersey City is located in south central Hudson County and has a land area of 14.79 square miles. The rapidly growing population is estimated at 292,449. The city is bounded by the Hackensack River and Newark Bay to the west, the City of Bayonne to the south, the City of Hoboken to the north, and the Hudson River to the east. Land use within the project area is categorized as urban residential, high density or multiple dwelling, commercial/services, railroads, industrial, other urban or built-up land, and mixed urban or built-up land.

Need for Project

It is essential the aging infrastructure be replaced or rehabilitated. The selected sanitary sewers have significant damage and deterioration, as was determined through a televised inspection of the sewers. Without action, there is the potential for collapse of these existing sewer mains which would leave all the associated residents without sewer service. Additionally, infiltration of groundwater into the sewers reduces capacity of all downstream pipes, which may restrict or prohibit future development. The added flow caused by infiltration and inflow also causes a burden on the receiving treatment plant. Rehabilitation of these sewer mains, as opposed to replacing the mains outright, will mitigate inflow and infiltration while limiting negative impact to the community.

Project Description

This project consists of the rehabilitation of approximately 22,327 linear feet (L.F.) of existing sanitary sewer main along the following roads in Jersey City, Hudson County, New Jersey: West Side Ave from Fayette Ave to Danforth Ave, New York Ave from Monmouth St to Marshall St, portions of Manhattan Ave (under NJ Transit Rail) and Cator Ave (under NJ Transit Light Rail and Conrail). The City has experienced recent sewer collapses and desires to line the combined sanitary sewer pipe along West Side Avenue to eliminate the possibility of collapses in the future. Rehabilitation of the sewer mains will be performed utilizing trenchless technology.

0

Service Area

Jersey City is the second largest city in the State of New Jersey with a population of approximately 265,000 based on the estimated 2018 U.S. Census data. Jersey City is approximately 21 square miles and is bordered by Secaucus, North Bergen, Union City and Hoboken to the North and Bayonne to the South. The sewer mains convey, on average, approximately 50 million gallons of sewage per day (MGD). The project is required as part of an EPA consent order. The project area is located in the Bates Street Area of Jersey City.

Need for Project

This project is necessary to provide a reliable sanitary sewer collection system and storm water collection system to the Bates Street Area. The new gravity sanitary sewer main will be used to service both residential and commercial buildings. The storm sewer will be used for drainage and storm water management.

Project Description

This project generally consists of infrastructure improvements to separate existing combined sewers and mitigate flooding in the Bates Street Area, including stormwater management and collection systems, a stormwater screening facility and pumping station, and sanitary sewer collection systems. The infrastructure improvements consist of the replacement of approximately 4,000 LF of existing sewers of various sizes with separated storm and sanitary sewers including manholes, catch basins, and laterals; excavation, backfill, and restoration; and other associated work as contained in the Contract Documents.

Combined Sewer Overflow (CSO) - Traditional Infrastructure

Priority List Rank

159

County

Camden

Existing Population

11,456

Service Area

The City of Gloucester City is a small municipality of 2.2 square miles in proximity to Camden City, and is just across the river from Philadelphia. Gloucester City is among New Jersey's most economically distressed communities. According to the U.S. Census Bureau, total population in the city is estimated at 11,248 residents. The median resident age of 35.2 years, while median household income is \$59,394 and the median home value is \$125,800. The city is one of the most distressed municipalities in New Jersey; ranking 51st on the New Jersey Department of Community Affairs' (NJDCA) 2021 Municipal Revitalization Index. Gloucester City's population has shown a steady decline over the last two decades, including a 2.2% decrease between 2009 and 2019, according to the NJDCA 2020 Municipal Revitalization Index. Employment and population forecasts published by the Delaware Valley Regional Planning Commission project this decline for the city to last through at least 2025.

Need for Project

During heavy rainfall events or snowmelt events the Gloucester City combined sewer outflows (CSO) discharge rainwater runoff, domestic sewage, and industrial wastewater into the Delaware River. The NJDEP established goals for improving water quality by working with CSO communities to reduce or eliminate CSOs. This project is consistent with the NJDEP goals and will improve water quality by implementing strategies to reduce the amount of stormwater entering the combined sewer. The project will incorporate green infrastructure and include upgrading the sewer pipes. Rain gardens, porous paving and porous sidewalks will be constructed to reduce local flooding and reduce the flow of stormwater into the combined sewer systems.

Project Description

Gloucester City will utilize grant funds to mitigate flooding and combined sewer system backups in the area from Ellis to King Street, and from Monmouth to Mercer Street. This neighborhood has experienced decades of flooding which has been exacerbated by the impacts of climate change. The project will include the routing of stormwater runoff from impervious surfaces within the project area to rain gardens, curbside stormwater planters, pervious paving, and planter boxes. All of these facilities are intended to both infiltrate water volume into soils and regulate the discharge of non-infiltrated runoff volume to the combined sewer. The improvements will be performed within public rights-of-way and on private property, but all will be maintained by the City.

Service Area

Project is located in Delaware Township Hunterdon County in the Village of Sergeantsville. The facility currently serves the Village Residences an Elementary & Middle School (K- 8th) and a small commercial center

Need for Project

Resiliency, Energy Efficiency and maintain regulatory compliance

Project Description

The existing plant was constructed in 1967. The facility suffered significant flooding impacts during hurricane Ida in 2022. Process improvements are proposed to allow for more efficient operations as well as make the existing treatment facility site more resistant to flooding which will include but not limited to a new equalization tank at the head of the plant to be located at the upper end of the site to also serve as a site flood protection measure, installation of an enlarged clarifier to accommodate peak flows and address solids loading in the secondary treatment, construction of fixed film media biological contact filters and improvements to the headworks to include automated screening facility. The MUA also is looking to complete a comprehensive Asset Management Plan, GIS data collection and asset condition assessment system-wide.

Need for Project

The existing sand polishing filtration units have reached their useful life and continuously require maintenance and repairs. Switching to rotating disc filtration will increase treatment efficiency by reducing the volume of backwash water by approximately 85% and will provide efficiencies and savings in the overall operation to the treatment process.

Project Description

EWMUA intends to procure rotating disc filtration units to replace the existing conventional sand polishing filtration. The existing sand polishing filtration units have reached their useful life and continuously require maintenance and repairs. Switching to rotating disc filtration will increase treatment efficiency by reducing the volume of backwash water by approximately 85%. This will provide efficiencies in the operation and savings to the the process.

Union

Existing Population

0

Service Area

Wastewater is primarily collected from the Joint meeting's eleven member and six customer communities. Member (owner) communities include all or parts of: East Orange, Hillside, Irvington, Maplewood, Millburn, Newark, Roselle Park, South Orange, Summit, Union and West Orange. The City of Elizabeth and portions of Livingston, Orange, Berkeley Heights, Linden and New Providence are currently served as customers by the Joint Meeting.

Need for Project

The purpose of the project is to reduce the impact that natural disasters like Superstorm Sandy could have on the facility in the future and to avoid loss of wastewater service. The proposed project is needed to incorporate resiliency to minimize potential future facility failures, service interruption and/or loss of service, and to minimize future damages to the critical facility's infrastructure. In addition, the project will decrease the risk for release of untreated sewage into the environment, thereby protecting public health and natural resources.

Project Description

The project generally consists of construction of the Biosolids Facility Storm Water Pump Station including construction of the below grade wet well, installation of three (3) submersible storm water pumps and discharge piping, connection to the storm water surge tank, modifications to the existing twin outfall, relocation of existing and construction of new on-site storm sewer piping, relocation of utilities and other associated work as required for construction of the pumping station.

The five nonmember municipalities partially served by the BCUA WWTP include Alpine, Lodi, Lyndhurst, North Bergen, and Ridgewood. Portions of Cliffside Park, Fort Lee, Hackensack.

Need for Project

The BCUA intends to conduct a plant-wide facility assessment of the Little Ferry Water Pollution Control Facility (WPCF) and offsite pump stations to identify capital needs of antiquated equipment and/or process improvements. The assessment will be used to plan capital financing with emphasis to repair/replace critical assets. The preliminary findings indicate capital improvements to the components of the aeration tanks, bar screen, and Harrington Park Actuators .

Project Description

Conduct a plant-wide facility assessment of the Little Ferry Water Pollution Control Facility and offsite pump stations and identify areas in need of improvements.

The five nonmember municipalities partially served by the BCUA WWTP include Alpine, Lodi, Lyndhurst, North Bergen, and Ridgewood. Portions of Cliffside Park, Fort Lee, Hackensack.

Need for Project

To maintain continuous pumping stations and Plant operations during extreme weather events, improvements to the building roofs, windows , and access roads are needed to protect critical assets. Some of the critical assets are located at offsite pump stations, switchgear building, screening buildings, and other buildings with critical assets as well as Sludge Holding tanks access road.

Project Description

With extreme weather events over recent years, infrastructure protecting critical asset has deteriorated and needs improving.

Service Area

The BCUA's Service Area consists of forty-seven municipalities and a portion of five non-member municipalities. The thirty-eight municipalities entirely served by the BCUA WWTP include Bergenfield, Bogota, Carlstadt, Closter, Demarest, Dumont, Emerson, Edgewater, Englewood, Englewood Cliffs, Fairview, Harrington Park, Haworth, Hillsdale, Leonia, Little Ferry, Maywood, Montvale, Moonachie, New Milford, Northvale, Norwood, Old Tappan, Oradell, Palisades Park, Paramus, Park Ridge, Ridgefield, Ridgefield Park, River Edge, River Vale, Rochelle Park, Teaneck, Tenafly, Teterboro, Westwood, Woodcliff Lake and Wood-Ridge. The eight municipalities partially served by the BCUA WWTP include Cliffside Park, East Rutherford, Fort Lee, Hackensack, Hasbrouck Heights, Rutherford, South Hackensack and Washington Township. The five nonmember municipalities partially served by the BCUA WWTP include Alpine, Lodi, Lyndhurst, North Bergen, and Ridgewood. Portions of Cliffside Park, Fort Lee, Hackensack.

Need for Project

Several improvements were identified from an evaluation to increase the volatile solids reduction, reduce sludge volume, and maximize biogas production. The recommended improvements to be implemented are adding 3 sludge pre-heating heat exchangers, each rated at 3.0 MBtu/hr, including adding a 1,800 gpm sludge recirculation pump, with grinder and VFDs; replacing 4 external heat exchangers and one internal heat piping system with 5 new external heat exchangers, replacing existing mixers with new mixers, cleaning 5 tanks, conducting structural inspection, replacing 4 digester centrifugal sludge recirculation pumps with positive displacement sludge pumps with; adding 1 positive displacement sludge transfer pump adding two 400 scfm variable speed gas compressor system with cooling to convey biogas to Cogen Engines; providing new natural gas feed line to the existing CoGen engines and various other improvements.

Project Description

The sludge digester improvements are located within the Little Ferry Water Pollution Control Facilities, located at Little Ferry, NJ.

Combined Sewer Overflow (CSO) - Green Infrastructure

Priority List Rank

170

County

Camden

Existing Population

0

Service Area

About 0.8 sq. miles comprise Waterfront South & is home to an about 1,500 people. Waterfront South is a historic Camden neighborhood located along the bank of the Delaware River. A large majority of residents are non-Hispanic Black (47%); and non-Hispanic White residents (12%). Approximately 63% of residents earn less than \$50,000 a year and the median household income is \$29,922, about half that of Camden County at large. 38% of children under 18 and 23% of seniors over 65 live in poverty. Overall, 34.2% of Waterfront South residents live in poverty, more than double the rate of Camden County. Of the neighborhood's 630 housing units, 23% are estimated to be vacant; among occupied units, 59% are owner occupied. The majority of land surfaces in the project area are comprised of concrete and asphalt (impervious coverings), which prevent sw from infiltrating into the ground. Highlighting the need for GSI to alleviate issues related to sw. 2.3% of ground cover account for open space

Need for Project

In addition to environmental injustices stemming from the neighborhoods industrial land uses, the prevalence of impervious surfaces and the combine sewer system (CSS) makes the Waterfront South neighborhood highly prone to flooding. In some extreme cases, the improperly maintained CSS will even become backed up, discharging stormwater and sewage in parts of the neighborhood. With annual rainfall forecast to increase, it is important to address the need for increased stormwater capacity; GSI presents an effective way to reduce the amount of water that reaches the CSS

Project Description

The mitigation of combined sewer overflows and street flooding through the capture of stormwater using green stormwater infrastructure improvements in the overburdened Camden City neighborhood of Waterfront South. It is anticipated that this project will be funded under the Overflow and SW Grant (OSG) program.

Service Area

The BCUA's Service Area consists of 47 municipalities and a portion of five non-member municipalities. The thirty-eight municipalities entirely served by the BCUA WWTP include Bergenfield, Bogota, Carlstadt, Closter, Demarest, Dumont, Emerson, Edgewater, Englewood, Englewood Cliffs, Fairview, Harrington Park, Haworth, Hillsdale, Leonia, Little Ferry, Maywood, Montvale, Moonachie, New Milford, Northvale, Norwood, Old Tappan, Oradell, Palisades Park, Paramus, Park Ridge, Ridgefield, Ridgefield Park, River Edge, River Vale, Rochelle Park, Teaneck, Tenafly, Teterboro, Westwood, Woodcliff Lake and Wood-Ridge. The eight municipalities partially served by the BCUA WWTP include Cliffside Park, East Rutherford, Fort Lee, Hackensack, Hasbrouck Heights, Rutherford, South Hackensack and Washington Township. The five nonmember municipalities partially served by the BCUA WWTP include Alpine, Lodi, Lyndhurst, North Bergen, and Ridgewood. Portions of Cliffside Park, Fort Lee, Hackensack, Ridgefield

Need for Project

During significant rainfall events, the BCUA and its 47 member municipalities experience high flows in sanitary sewers and Water Pollution Control Facility (WPCF) mainly due to rain-induced infiltration/inflow (RII/I) from municipal sanitary sewers and private building sewer connections (PBSC). This excessive RII/I has caused sanitary sewer overflows (SSO) which is a public health and safety concern. In order for the BCUA to provide capacity for its member municipalities and to reduce RII/I and eliminate SSOs, the BCUA has undertaken this project to remediate the problem.

Project Description

The project will include cleaning of approximately 200000 lf of 8 to 24 inch diameter sewer video inspection during significant rain events of approximately 150000 lf of 8 to 24 inch diameter sewer. Based on the results the BCUA will implement a Fix It remedy that will include the following sealing of sanitary sewer joints in pipe ranging in size from 8-inch to 24-inch diameter grouting of manhole leaks rehabilitation by partial or complete cured-in-place-pipe (CIPP) lining of sewers ranging in size from 8-inch to 24-inch diameter rehabilitation by CIPP lining of 4 to 6 inch PBSCs repair by partial or complete excavation and replacement of 8-inch to 24-inch diameter sewers repair of pipe defects by excavation and installation of repair clamps for 8-inch to 24-inch diameter sewers replacement of defective branch connections by excavation and replacement repair of 4-inch to 6-inch defective PBSCs by excavation and replacement replacement of severely damaged and leaking manholes installation of rain barrels where roof leaders are connected to the sanitary sewer system installation of splash pads where roof leaders are disconnected redirection of sump pumps that are currently discharging into the sanitary sewer system disconnection and redirection to the storm sewer system of prohibited roof leaders and foundation drains which are currently discharging into sanitary sewers and installation of 6-inch to 8-inch clear water systems to collect sump pump clear water flow which currently discharge into sanitary sewers where there is no storm sewer system.

Need for Project

The proposed project includes raising metering chambers above the design flood elevation (DFE) or making them submersible. Electrical and instrumentation assets that can be relocated above the DFE will be replaced and raised at SB No.'s 1 & 2. To make the stations more resilient, the project also includes Dry Flood Proofing of walls, installation of flood resistant doors or barricades for the entrance and garage doors and the installation of a flood wall along the exterior of the SB's.

The five nonmember municipalities partially served by the BCUA WWTP include Alpine, Lodi, Lyndhurst, North Bergen, and Ridgewood. Portions of Cliffside Park, Fort Lee, Hackensack, Ridgefield

Need for Project

The proposed project includes dry flood proofing wall apertures that are considered potential sources of water infiltration, where appropriate, raising of grating wall height and air intakes, and installation of flood resistant doors or barricades at entrances. Installation of flood walls along the exterior of buildings and installation of submarine doors are also proposed. Holes and the inside of conduits, as well as the conduit or pipe penetration, through walls, ceilings, and floors, as appropriate, will be sealed. Attempts will also be made to seal any significant cracks that are identified. Electrical assets and instrumentation will be raised above the design flood elevation (DFE). Assets that cannot be raised will be replaced with submersible units or placed in NEMA 6 enclosures. For Grit Building No. 2 new electrical and instrumentation assets will be installed in NEMA 4X enclosures above the DFE. Wiring and conduit will be replaced with materials rated for wet locations.

Project Description

The proposed project includes various repairs at the Little Ferry Water Pollution Control Facility due to damage from Superstorm Sandy. The scope includes repairs to equipment in the following areas Main Pump Station Substations Conveyance Disinfection Primary Sludge Removal Blowers Grit Removal Secondary Sludge Pumping Stations Sludge Processing Control Building Administrative Building Operations and Support Security entrance and Pump Station.

Need for Project

This project protects high value power supply assets and protects the plant power supply using a Biogas Powered Electric Microgrid (BPEMG). Power supply assets include the Switchgear (SG) Building, Vault, the CoGen Building, and the Main Substation. The project includes expansion of the CoGen facility; installation of a digester gas storage tank; modification of the blowers and aeration control system to increase energy efficiency and improve process control, and installation of a fats, oil and grease receiving and handling station to augment digester gas production.

Service Area

Service Area: The BCUA's Service Area consists of forty-seven municipalities and a portion of five non-member municipalities. The thirty-eight municipalities entirely served by the BCUA WWTP include Bergenfield, Bogota, Carlstadt, Closter, Demarest, Dumont, Emerson, Edgewater, Englewood, Englewood Cliffs, Fairview, Harrington Park, Haworth, Hillsdale, Leonia, Little Ferry, Maywood, Montvale, Moonachie, New Milford, Northvale, Norwood, Old Tappan, Oradell, Palisades Park, Paramus, Park Ridge, Ridgefield, Ridgefield Park, River Edge, River Vale, Rochelle Park, Teaneck, Tenafly, Teterboro, Westwood, Woodcliff Lake and Wood-Ridge. The eight municipalities partially served by the BCUA WWTP include Cliffside Park, East Rutherford, Fort Lee, Hackensack, Hasbrouck Heights, Rutherford, South Hackensack and Washington Township. The five nonmember municipalities partially served by the BCUA WWTP include Alpine, Lodi, Lyndhurst, North Bergen, and Ridgewood. Portions of Cliffside Park, Fort Lee, Ha

Need for Project

Based on findings from an evaluation of the existing five anaerobic sludge digesters performed by Alaimo Group, several improvements were identified to increase the volatile solids reduction, reduce sludge volume, and maximize biogas production which serves as the fuel source for the aeration blowers, cogeneration engines, and hot water boilers. The recommended improvements consist of adding new sludge preheating heat exchangers, new digester membrane gas storage units, digester gas compressors, hot water pump, temperature monitoring equipment, and flow meters as well as replacing existing digester sludge recirculation pumps.

Project Description

(Carryover SFY2015) - The proposed project includes various improvements at the Little Ferry Water Pollution Control Facility. The improvements include a new centralized polymer building a new clarified effluent water sysstem sludge digester system improvements and second phase security improvements. The project also includes construction of two biogas storage tanks including gas bag steel tank foundation piles valve vault site work instrumentation and electrical work.

Need for Project

Currently treated wastewater from the Edgewater WPCF is discharged from the existing 42-inch diameter outfall at the shoreline of the Hudson River. During periods of low water the river bottom is exposed and the effluent flows over the tidal mud flats before reaching the receded river level. At high tide the outfall is submerged. This condition limits the amount of dilution of the effluent with the receiving waters. In order to provide adequate dilution of the effluent and achieve permit limits for ammonia copper and zinc an extension of the outfall to the deeper waters of the Hudson River is required before the NJPDES permit expires on August 31 2014.

Project Description

The proposed project includes extension of the outfall at the Edgewater Municipal Utility Authority to the deeper waters of the Hudson River.

Service Area

The service area for the Linden Roselle Sewerage Authority encompasses the Borough of Roselle and the City of Linden, both municipalities located within Union County.

Need for Project

The proposed improvements are necessary to maintain the existing buildings that house the Authority's personnel and treatment process. Further deterioration may result in potential safety hazards to personnel and/or disruptions to service if the treatment processes housed in the various buildings selected for improvement are impacted as a result of the ongoing building deterioration.

Project Description

Linden Roselle Sewerage Authority proposes various structural repairs to the facade and roofing of various existing buildings within its sewage treatment facility that house both personnel and various treatment processes. The proposed repair and rehabilitation work includes removal and replacement of existing roofing material, and re-pointing and replacement of the brick facade. Other improvements include installation of a new high pressure water effluent piping and yard hydrants and miscellaneous roadway and site improvements.

Need for Project

These capital improvements are necessary to replace and/or elevate aging equipment and infrastructure for the continued uninterrupted operation of the Linden Roselle Sewerage Authority's (LRSA) wastewater treatment plant. Interruptions to wastewater treatment plant operations, such as due to equipment malfunction, flooding or power outages, could potentially result in discharge of partially- or un-treated wastewater that would negatively impact surface water quality. These capital improvements will help to minimize such treatment plant interruptions and aide in treatment plant operations that will be beneficial to maintaining water quality of the surrounding water bodies, including the Arthur Kill.

Project Description

Five separate projects: Flood Hardening Raising/ replacing transformers, flood protection measures around electrical switchgear, generators and equipment, adding flood doors at several facilities, wrapping buildings with dry flood-proofing, relocating electrical conduits. Gravity Thickener Upgrade Replace sludge collection mechanism in the gravity thickener and replace the cover over the thickener. Screening Conveyance Provide automated screenings conveyors at Screen House to convey to grade, the screenings removed from the WW process eliminating the manual handling of the screenings containers. UV Disinfection Facility Upgrade UV disinfection facility upgrade and elevate outside the flood elevation; relocate existing electrical motor control center from basement to above the flood elevation. Electrical Switchgear/ Automatic Transfer Switch Replace electrical switchgear; provide automatic transfer switch to switch the facilities to emergency power during power outages.

Service Area

Wastewater is primarily collected from the Joint meeting's eleven member and six customer communities. Member (owner) communities include all or parts of: East Orange, Hillside, Irvington, Maplewood, Millburn, Newark, Roselle Park, South Orange, Summit, Union and West Orange. The City of Elizabeth and portions of Livingston, Orange, Berkeley Heights, Linden and New Providence are currently served as customers by the Joint Meeting.

Need for Project

The purpose of the project is to reduce the impact that natural disasters like Superstorm Sandy could have on the facility in the future and to avoid loss of wastewater service. The proposed project is needed to incorporate resiliency to minimize potential future facility failures, service interruption and/or loss of service, and to minimize future damages to the critical facility's infrastructure. In addition, the project will decrease the risk for release of untreated sewage into the environment, thereby protecting public health and natural resources.

Project Description

The project generally consists of the construction of reinforced concrete flood walls on piles with steel sheeting subsurface cut-off walls around the four (4) sides of the Biosolids Facilities Site including installation of flood gates for vehicular access, modifications to the existing entrance roadways, construction of stormwater facilities to redirect on-site stormwater to the proposed Biosolids Stormwater Pumping Station, and coordination with and/or relocation of various utilities within the project area.

Service Area

Wastewater is primarily collected from the Joint meeting's eleven member and six customer communities. Member (owner) communities include all or parts of: East Orange, Hillside, Irvington, Maplewood, Millburn, Newark, Roselle Park, South Orange, Summit, Union and West Orange. The City of Elizabeth and portions of Livingston, Orange, Berkeley Heights, Linden and New Providence are currently served as customers by the Joint Meeting.

Need for Project

Wastewater is primarily collected from the Joint meeting's eleven member and six customer communities. Member (owner) communities include all or parts of: East Orange, Hillside, Irvington, Maplewood, Millburn, Newark, Roselle Park, South Orange, Summit, Union and West Orange. The City of Elizabeth and portions of Livingston, Orange, Berkeley Heights, Linden and New Providence are currently served as customers by the Joint Meeting.

Project Description

The project generally consists of construction of the Biosolids Facility Storm Water Pump Station including construction of the below grade wet well, installation of three (3) submersible storm water pumps and discharge piping, connection to the storm water surge tank, modifications to the existing twin outfall, relocation of existing and construction of new on-site storm sewer piping, relocation of utilities and other associated work as required for construction of the pumping station.

The City of Elizabeth and portions of Livingston, Orange, Berkeley Heights, Linden and New Providence are currently served as customers by the Joint Meeting.

Need for Project

The purpose of the project is to reduce the impact that natural disasters like Superstorm Sandy could have on the facility in the future and to avoid loss of wastewater service. The proposed project is needed to incorporate resiliency to minimize potential future facility failures, service interruption and/or loss of service, and to minimize future damages to the critical facility's infrastructure. In addition, the project will decrease the risk for release of untreated sewage into the environment, thereby protecting public health and natural resources.

Project Description

The project generally consists of the construction of reinforced concrete flood walls on piles with steel sheeting subsurface cut-off walls around the four (4) sides of the Biosolids Facilities Site including installation of flood gates for vehicular access, modifications to the existing entrance roadways, construction of stormwater facilities to redirect on-site stormwater to the proposed Biosolids Stormwater Pumping Station, and coordination with and/or relocation of various utilities within the project area.

Project Name, Number

South Orange Village (JMEUC) Township
S340686-14i
Flood Resiliency

Priority List Rank

182

County

Union

Existing Population

0

Service Area

Wastewater is primarily collected from the Joint meeting's eleven member and six customer communities. Member (owner) communities include all or parts of: East Orange, Hillside, Irvington, Maplewood, Millburn, Newark, Roselle Park, South Orange, Summit, Union and West Orange. The City of Elizabeth and portions of Livingston, Orange, Berkeley Heights, Linden and New Providence are currently served as customers by the Joint Meeting.

Need for Project

The purpose of the project is to reduce the impact that natural disasters like Superstorm Sandy could have on the facility in the future and to avoid loss of wastewater service. The proposed project is needed to incorporate resiliency to minimize potential future facility failures, service interruption and/or loss of service, and to minimize future damages to the critical facility's infrastructure. In addition, the project will decrease the risk for release of untreated sewage into the environment, thereby protecting public health and natural resources.

Project Description

The project generally consists of the construction of reinforced concrete flood walls on piles with steel sheeting subsurface cut-off walls around the four (4) sides of the Biosolids Facilities Site including installation of flood gates for vehicular access, modifications to the existing entrance roadways, construction of stormwater facilities to redirect on-site stormwater to the proposed Biosolids Stormwater Pumping Station, and coordination with and/or relocation of various utilities within the project area.

Sewage Treatment Plant (STP) - Expansion

Priority List Rank

185

County

Salem

Existing Population

0

Service Area

The project is within the sanitary sewer service area for the CPTSA and the water service area of the New Jersey American Water Penns Grove System. The CPTSA sewer service area is 8.4 square miles and serves approximately 2,217 residences and 110 businesses within Carneys Point Township and Oldmans Township. The Borough is in close proximity to the Delaware River, major interstate highways, and cities of Wilmington and Philadelphia. In addition, it has experienced recent residential and commercial development, including fulfillment and distribution centers. Therefore, the population is expected to increase as a result of new interest in commercial development that will create jobs. Preliminary estimates of potential residential development include 300-400 new housing units, and there are several active incoming fulfillment center warehouse development plans.

Need for Project

Extending sewer treatment capacity will provide access for existing and future residences and businesses to connect to the wastewater treatment system, which will mitigate groundwater and surface water pollution. Health and sanitation management are at risk if the plant is not expanded, because the existing facility does not have the treatment capacity to treat all anticipated and proposed incoming flows, potentially leading to future permit exceedances and/or violations. Additionally, the plant expansion will future-proof against anticipated sea level rise. To address this challenge with a site so close to the banks of the Delaware river, critical operation controls, processes, and tankage will be raised above future anticipated flood levels, thus reducing the likelihood of flood-related water quality issues. Many treatment system components require frequent maintenance and have service interruptions, thus jeopardizing local water quality without improving the system components.

Project Description

The Carneys Point Township Sewerage Authority (CPTSA) is planning to commence its Wastewater Treatment Plant (WWTP) Expansion Project, which will replace the Authority's aging treatment facility while increasing treatment capacity to serve ongoing and planned development within the Township. The proposed project will construct new facilities, process tanks, and equipment adjacent to the existing WWTP. Much of the existing WWTP equipment is approaching, or has already reached, the end of its useful life. A feasibility study funded in part by the USDA and the Salem County Pollution Control Financing Authority found that the existing treatment plant will have to be replaced in order to satisfy NJDEPs anticipated effluent regulations, fulfill the Townships affordable housing obligations, provide capacity for job-generating commercial development, and meet existing flood hazard requirements and anticipated climate change needs.

Service Area

The Lambertville Municipal Utilities Authority (LMUA) Wastewater Management Plan (WMP) Planning Area includes portions of the following Hunterdon County municipalities: ô€€€ City of Lambertville ô€€€ Borough of Stockton Pursuant to an Agreement dated July 19, 1965 (amended August 4, 1980 and January 5, 1982, and July 6, 1995), the LMUA also provides service to the BCW&SA which is wholly contained in the State of Pennsylvania.

Need for Project

Water quality will be improved as a result of this project because potential wastewater discharges will be minimized or eliminated through the replacement and rehabilitation of wastewater treatment plant (WWTP) equipment and infrastructure that has reached the end of its useful life. In addition, WWTP service interruptions will be minimized and WWTP operations will be optimized.

Project Description

Roof replacements, purchase of replacement clarifier mechanisms, rehabilitation of chemical building, repavement of plant area and access road, and repair of drain lines in control building and BFP building

Diamond Hill Development

Need for Project

The existing facilities at the Diamond Hill Sewer Company (NJ0028592) which serves the Diamond Hill Development is inadequately treating sewage and has been doing so for a few decades. The discharge is to Hances Brook which is classified as FW2-Trout Production Category One waters. The private owner of the sewer company would not make the necessary repairs to the facilities so Mansfield Township is evaluating whether or not to takeover the Diamond Hill Sewer Company. Hunterdon

Existing Population

0

Service Area

The wastewater treatment plant treats flow from Raritan Township, Flemington Borough, and a portion of Readington Township.

Need for Project

All components of the project are to maintain the critical infrastructure at the sewage treatment plant so that effluent discharge remains in accordance with established NJPDES permit limits.

Project Description

The project consists of replacing or rehabilitating existing equipment at the main treatment plant including replacing existing influent pumps with new dry pit submersible influent pumps, check valves, and pipe modifications, installing new mechanical bar screens, and reconditioning of an existing belt filter press.

Need for Project

The plant operators have struggled recently to meet the requirements of the NJPDES permit. The improvements will provide increased capability for the operators to make process adjustments in response to changes in the influent wastewater flow and loadings. Replacement of the 50 year old sludge handling equipment will free up manpower for other tasks that improve effluent quality and allow for the disposal of all the biosolids from the plant at the Burlington County Co-Composting facility.

Project Description

Replace the existing surface aerators with a diffused aeration system and dissolve oxygen control logic. Provide capability to use back third of aeration tanks as anoxic zone to encourage denitrification. Replace the existing Somat presses and dissolved air flotation thickener with a rotating sludge thickener and a rotary fan press. Provide odor control equipment for all sludge handling equipment certain process building interior spaces. Replace pumps and piping and rehabilitate control building where required.

PVSC serves 48 municipalities in parts of Bergen, Essex, Hudson, Passaic and Union Counties.

Need for Project

In order to properly operate and maintain PVSC's secondary wastewater treatment plant and collections system, support buildings for the fleet, facilities and collections system staff are necessary. This project is to implement necessary improvements to PVSC's fleet maintenance and fueling facilities as well as improve work spaces, bathrooms and locker facilities for PVSC's staff.

Project Description

The project includes improvements to the Passaic Valley Sewerage Commission's Vehicle Maintenance Building, vehicle storage buildings, fuel storage and dispensing facilities, vehicle maintenance garages and car wash. The work includes, but is not limited to, roof improvements, structural repairs, hvac, electrical, replacement lighting and plumbing improvements. The project also includes replacement of underground fuel storage tanks, fuel dispensing equipment and replacement of the fuel island and canopy. PVSC's Vehicle Maintenance Facility also includes office and conference room spaces for PVSC's facilities and collection systems staff, improvements to the work spaces, bathrooms and locker rooms within this facility will also be performed under this project.

Service Area

PVSC serves 48 municipalities in parts of Bergen, Essex, Hudson, Passaic and Union Counties.

Need for Project

PVSC utilizes pure oxygen in its secondary wastewater treatment process. The oxygen is generated onsite by a cryogenic facility that has been in operation for approximately 40 years. The facility has reached the end of its useful life. The facility is also inefficient. In order to properly treat the wastewater, a new vapor pressure swing adsorption (VPSA) facility needs to be constructed to replace the existing facilities.

Project Description

PVSC utilizes pure oxygen as part of the secondary treatment process. The oxygen is currently generated using an onsite cryogenic facility. The facility is approximately 40 years old and has reached the end of its useful life and needs to be replaced with more reliable, energy efficient equipment. The project will be divided into two contracts. An equipment procurement contract and a construction contract.

Need for Project

PVSC's Wet Weather Pumping Station (WWPS) houses the wet weather pumps that are utilized to convey the wastewater into the treatment process during both dry and wet weather events. The building's features (roof, facade, etc) have reached the end of their useful life and need to be upgraded/replaced in order to protect the pumps, electrical equipment and associated controls in order to ensure reliable plant operations. In addition, PVSC's existing laboratory personnel are in need for additional space to perform additional laboratory analysis in order to properly monitor the plant operations to ensure compliance with PVSC's New Jersey Pollutant Discharge Elimination System Permit. A portion of the facility will be repurposed into laboratory space so the necessary analysis can be performed.

Project Description

The Passaic Valley Sewerage Commission (PVSC) Wet Weather Pumping Station (WWPS) was originally constructed and placed into operation circa 1914. The facility houses the wet weather pumps that are used to convey raw influent into the wastewater treatment process for treatment and ultimate discharge to the New York Harbor. The facilities faade, roof and other facilities have reached the end of their useful life and in order to ensure reliable operations, the facility needs to be upgraded. In addition, due to increase in laboratory analysis required due to more stringent QA/QC requirements and additional analysis required for proper operation of the wastewater treatment process, additional laboratory space needs to be provided for the analyses. The laboratory space will be provided by repurposing space in the Wet Weather Pumping Station

Need for Project

Although the Commission already has qualifying back-up for power outages through 2 PSEG sub-stations this CHP Facility will make the Commission wholly independent from utility outages thereby allowing the Commission to continue processing sewerage materials under all power conditions including that of a grid black-out. This would prevent the flow of untreated materials in those power challenged situations. The CHP Facility would allow the Commission to increase power to meet all demand during wet weather flow periods. The CHP Facility should result in operational efficiencies including cost savings in electricity heating and cooling so that the Commission can undertake other priority list projects through the Trust Program.

Project Description

The proposed project includes installation of a Combined Heat and Power Facility to be located on Commission property.

Need for Project

PVSC currently accepts sludge from the Bergen County Utilities Authority (BCUA) for treatment. Maintenance dredging is required to continue to accept the BCUA sludge. Dewatering the BCUA sludge at PVSC reduces nitrogen loadings to the Hackensack River. This project will also make improvements to PVSCs plant wide fire alarm system.

Project Description

The proposed project includes improvements to the plant wide fire alarm system. PVSCs docks require maintenance dredging to continue to bring sludges by barge from the Bergen County Utilities Authority and New York City.

The project sites consist of land use associated with residential, public and commercial/industrial development and are currently fully developed. At the present time, the WPCP services a population of approximately 15,425 people. The existing facility currently treats an average flow of 1.75 million gallons per day (mgd) and was designed to treat an average annual flow of 2.0 mgd.

Need for Project

The Township of Roxbury intends to improve the resiliency of the existing facilities by replacing equipment which has reached the end of its useful life and installing new facilities with the capability to provide a more robust treatment during extreme wet weather events. Some of the critical equipment at the Ajax Terrace WCP (RBCs and Main Pump Station Pumps) has aged and is in need of renewal, replacement or upgrade. Similarly the Highland Manor pumps and associated pipe is in poor conditions and must be rehabilitated in order to ensure and maintain reliable pumping operation, both now and in the future.

Project Description

This project is for the improvements at the Ajax Terrace Water Pollution Control Plant and Highlands Manor Pump Station (HMPS) facilities, located in the Township of Roxbury, Morris County, New Jersey. At the Ajax Terrace WPCP proposed work will include replacement of eight (8) RBC units. Due to the age and deteriorating function of the existing MPS equipment, the Township intends to replace the existing pumps and ancillary systems new equipment to improve operational efficiency and reliability. The proposed dry submersible pumps will protect against dry well flooding and eliminate the need for the intermediate shafts and bearings and the seal water system, which will also reduce maintenance requirements. Monorails and hoists are also proposed for easier and safer removal of pumps when service is needed. At HMPS, the project will provide new submersible pumps to the existing wet well and modify the structure so that confined space entries are no longer required for routine operations.

Need for Project

Improve Wastewater discharge at treatment plant. Intent is to replace aging equipment at the end of its useful life. Update equipment for current innovative technology and incorporation into RTMUA SCADA system

Project Description

Improve 2 unit processes at the main treatment plant. The first is the influent pump station where it is proposed to replace the screening equipment and make building structural, HVAC, electrical and SCADA upgrades. The second in the final clarifiers where it is proposed to refurbish and rebuild the internal components of the existing 4 clarifiers.

Upgrades to the Filter and Residuals Building located at the Town of Clinton Waste Water Treatment Plant, which serves as the point of treatment for all/part of 5 municipalities.

Need for Project

Replacement of fine screen filters, sludge press and building related items in order to operate the sewage treatment plant.

Project Description

The removal and replacement of the building outer metal skin and insulation, removal and replacement of all overhead and access doors, removal and replacement of most of the structural support girts, column footing anchor bolt and baseplate replacement, and painting minor site work consisting of a 36'x18' stone parking area, minor site paving and restoration. The work also includes electrical and mechanical upgrades to the sludge press and fine screen filter room with removal and replacement of blowers, heaters, lighting and electric and controls in order to conform to the latest explosion proof code Class I Div I Group D. A separate building will be constructed in order to house the electrical panels and controls. The work also includes replacement of the sludge belt press, polymer feed, 4 fine screen filters, and conveyors for both sludge and fine screen filter screenings. Other misc. mechanical, piping, pipe supports weir boxes, and miscellaneous metal work will be completed.

The Township of Allamuchy. The sewer service area include residential and commercial areas within the Township.

Need for Project

The Township of Allamuchy is currently meeting the existing NJDEP's permit limits for surface water discharge. This project will replace aging equipment to maintain compliance.

Project Description

The project scope includes replacement of the existing sand filter at the Township of Allamuchy treatment plant. The existing sand filter is over 50 years old and was last rehabilitated over 15 years ago. The filter replacement will include a new filter, pump and chamber, controls and electric services. The new filter will be more energy efficient than the existing equipment.

The Clarifier Improvements will impact all customers that are serviced by the CSD.

Need for Project

Replacement of aging infrastructure and rehabilitation of the Clarifier will allow long term and optimized functionality of the CSD Treatment Plant over the next 30 years.

Project Description

This project is for improvements to the Town of Clinton Sewer Department (CSD) Clarifier No. 2 at the CSD Treatment Plant. The Clarifier assessment revealed the need for an immediate rehabilitation program to ensure the optimal functionality and reliability of the Clarifier for the CSD. The project improvements will include the replacement and rehabilitation of various critical components including the clarifier internals, the feedwell and supports, the center shaft and drive shaft, the skimmer arm and trough, sludge rake arms, drive assembly, controller and motor, and both the influent and effluent pipes. Additionally, at this time the CSD wishes to enhance the Asset Management Plan to include both above and below ground assets. This effort may include but is not limited to CCTV efforts for sewer main and lateral condition assessments, GIS mapping of system assets, and evaluation of rates.

Borough of Flemington, Hunterdon County

Need for Project

The Borough has had for many years an aggressive program to improve its aging collection sewer system and to minimize sanitary system overflows (SSO). A grant from the OSG Program would be used to further the Boroughs long-term efforts in that regard. It is anticipated that this project, along with a new sanitary sewer along Hopewell Avenue from North Main Street to East Main Street that is currently under design, will significantly improve the system hydraulics in the northern portion of the Boroughs sanitary sewer system and thereby minimize the occurrence of SSO in the future.

Project Description

Construction of a new sanitary sewer starting from near the Hunterdon County Jail Complex on Park Avenue and extending to the intersection of North Main Street and Hopewell Avenue. It is anticipated that this project, along with a new sanitary sewer along Hopewell Avenue from North Main Street to East Main Street that is currently under design, will significantly improve the system hydraulics in the northern portion of the Boroughs sanitary sewer system and thereby minimize the occurrence of SSO in the future.

The Rahway Valley Sewerage Authority (RVSA) is a wastewater treatment authority that processes wastewater from 11 member communities and 3 additional non-member communities. The RVSA eleven member municipalities are the Township of Clark, Township of Cranford, Borough of Garwood, Borough of Kenilworth, Borough of Mountainside, City of Rahway, Borough of Roselle Park, Township of Scotch Plains, Township of Springfield, and Town of Westfield all of which are in Union County and the Township of Woodbridge in Middlesex County. The RVSA serves the Township of Winfield through an agreement with the Township of Clark. While Scotch Plains, Roselle Park and Woodbridge are member municipalities, the RVSA does not serve these communities in their entirety. A very small portion of Fanwood is served through an agreement with the Township of Scotch Plains and the Authority also serves a very small portion of Linden.

Need for Project

The existing gas conditioning system at RVSA does not have the capacity to treat all the digester gas produced at the RVSA, which prevents the RVSA from fully utilizing the onsite Cogeneration facility to produce the electricity needed to treat the wastewater. Because of this, the RVSA is forced to periodically adjust the operation of the digesters to limit gas production. This project will provide a consistent outlet for the digester gas, promoting more stable operation of the RVSA's digester system and long-term increases in volatile solids reductions in the digesters. The ability to treat all RVSA's digester gas will also provide increased resiliency by allowing the plant to run in full island mode during emergencies when the utilities are not available.

Project Description

This project includes gas handling equipment and infrastructure, a carbon/media system to remove H₂S and siloxanes, gas compression and drying, membrane filtration to remove CO₂, and compression to produce high quality renewable natural gas. Additionally, there will be a thermal oxidizer to treat the CO₂ removed from the biogas, and a flare for minimal use during startup and shut down situations. The gas will then be injected into the natural gas pipeline or burned in the RVSA's existing engines to produce electricity for the facility.

Service Area

The Joint Meeting's system serves an area of approximately 65 square miles. Wastewater is collected from the Joint Meeting's eleven members, one customer, and seven other communities. Member (owner) communities include all or portions of: East Orange, Hillside, Irvington, Maplewood, Millburn, Newark, Roselle Park, South Orange, Summit, Union and West Orange. The City of Elizabeth is served as a customer by the Joint Meeting. Joint Meeting's service and planning area's outer boundaries of its Wastewater Management Plan (WMP) are essentially the same, with the exception of the Borough of New Providence, the City of Summit and the Township of Berkeley Heights. New Providence owns and operates a wastewater treatment plant that receives all of the flow originating in New Providence and small sections of Summit and Berkeley Heights. The maximum allowable flow to be pumped from the New Providence plant to the Joint Meeting plant, via Summit's conveyance system, is 3.0 MGD.

Need for Project

The purpose of the proposed project is to reduce the impact that natural disasters like Superstorm Sandy could have on the facility in the future and to avoid loss of wastewater service. The proposed project is needed to incorporate resiliency to minimize potential future facility failures, service interruptions and/or loss of service, and to minimize future damages to the critical facility's infrastructure. In addition, the proposed project will decrease the risk for release of untreated sewage into the environment, thereby protecting public health and natural resources.

Project Description

Flood Mitigation Facilities projects, Phase II - Cogeneration Upgrade This project includes upgrades to the existing Co-Generation Facility to power the proposed Effluent Pumping Station, two (2) proposed stormwater pumping stations, and the existing Sludge Dewatering Facility. Two (2) new engine generator sets and associated equipment will be installed in the existing Co-Generation Facility including all required electrical and instrumentational connections to integrate the new engines into the existing systems, installation of new digester gas and natural gas piping to the new engines, construction of a new substation at the Sludge Dewatering Facility, and medium voltage connections to the Co-Generation grid. In addition, access platforms will be installed at the new and existing co-generation engines to allow for safe access to equipment for maintenance.

Need for Project

PVSC as part of its Liquid Waste Acceptance Program, receives trucked in landfill leachate. Leachate historically has been known to contain PFAS chemicals. PVSC WWTP is currently not designed to treat PFAS chemicals. PVSC is looking to repurpose its abandoned Supernatant Treatment Plant to a landfill leachate pretreatment facility and redirect the trucked in landfill leachate to be pretreated for any PFAS chemicals that may be present.

Project Description

The Passaic Valley Sewerage Commission (PVSC) has an abandoned Supernatant Treatment Plant (STP) that is no longer utilized on its property. The NJDEP in response to requirements from the USEPA is looking to Authorities and Agencies to start regulating Per- and Polyfluoroalkyl substances (or PFAS) originating in their sewer system. These chemicals have entered the environment through several pathways including landfill leachates. PVSC receives through its Liquid Waste Acceptance program landfill leachates for processing through its wastewater treatment process. PVSC is looking to convert the STP into a landfill leachate pretreatment facility to treat PFAS that may be present in the landfill leachate. As this project is still in the Study phase, PVSC at this time is not committing to fund the project through the NJIB until a more detailed evaluation is performed.

Service Area

Northern Areas of Gloucester County - Clayton Borough, Deptford Township, East Greenwich Township, Elk Township, Glassboro Borough, Mantua Township, Monroe Township, National Park Borough, Paulsboro Borough, Pitman Borough, Washington Township, Wenonah Borough, West Deptford Township, Westville Borough, Woodbury City and Woodbury Heights Borough.

Need for Project

This project is an extension of the anaerobic digester project which will be funded through the NJEIT as part of the 2016 funding cycle. Biogas from the digesters will be collected, processed and used for fuel in a combustion engine for energy generation to power the entire wastewater treatment facility. Constructing anaerobic digesters with combine heat and power generation from the digester gas will have an accumulated economic benefit, estimated to be in excess of \$50M over the next twenty years.

Project Description

This project consists of a combined heat and power cogeneration system for the anaerobic digesters and is an extension of the anaerobic digester project which will be funded through the NJEIT as part of the 2016 funding cycle. As part of this project, biogas generated through the digestion process will be collected, processed through a gas conditioning system and used for fuel in a combustion engine that will be linked to 1000kw power generating units. Energy generated by the system will be utilized to power the wastewater treatment facility. With implementation of this process, GCUA anticipates being close to net zero energy status. Construction of the system will include engine-cogenerating "sets", including the associated operations building, biogas conditioning system with the associated building and a gas storage tank.

Service Area

The Joint Meeting's system serves an area of approximately 65 square miles. Wastewater is collected from the Joint Meeting's eleven members, one customer, and seven other communities. Member (owner) communities include all or portions of: East Orange, Hillside, Irvington, Maplewood, Millburn, Newark, Roselle Park, South Orange, Summit, Union and West Orange. The City of Elizabeth is served as a customer by the Joint Meeting. Joint Meeting's service and planning area's outer boundaries of its Wastewater Management Plan (WMP) are essentially the same, with the exception of the Borough of New Providence, the City of Summit and the Township of Berkeley Heights. New Providence owns and operates a wastewater treatment plant that receives all of the flow originating in New Providence and small sections of Summit and Berkeley Heights. The maximum allowable flow to be pumped from the New Providence plant to the Joint Meeting plant, via Summit's conveyance system, is 3.0 MGD.

Need for Project

The purpose of the proposed project is to reduce the impact that natural disasters like Superstorm Sandy could have on the facility in the future and to avoid loss of wastewater service. The proposed project is needed to incorporate resiliency to minimize potential future facility failures, service interruptions and/or loss of service, and to minimize future damages to the critical facility's infrastructure. In addition, the proposed project will decrease the risk for release of untreated sewage into the environment, thereby protecting public health and natural resources.

Project Description

Flood Mitigation Facilities projects, Phase II - Cogeneration Upgrade This project includes upgrades to the existing Co-Generation Facility to power the proposed Effluent Pumping Station, two (2) proposed stormwater pumping stations, and the existing Sludge Dewatering Facility. Two (2) new engine generator sets and associated equipment will be installed in the existing Co-Generation Facility including all required electrical and instrumentational connections to integrate the new engines into the existing systems, installation of new digester gas and natural gas piping to the new engines, construction of a new substation at the Sludge Dewatering Facility, and medium voltage connections to the Co-Generation grid. In addition, access platforms will be installed at the new and existing co-generation engines to allow for safe access to equipment for maintenance.

Service Area

The service area for this project is Stafford Township.

Need for Project

The purchase of a Regenerative Street Sweeper and Vacuum Truck will improve stormwater runoff quality. The purchase of the equipment will remove organic matter from the streets and prevent it from entering the stormwater collection system prior to it draining to the Barnegat Bay. This will reduce total suspended solids, nitrogen and phosphorous loading throughout all of the streets.

Project Description

(Carryover SFY2015) - The proposed project includes the purchase of leaf collection equipment grit separators vehicle wash facility as well as other improvements to the stormwater sewer system

Service Area

The Service Area for this project is the Ocean Acres development in Stafford Township.

Need for Project

This project will consist of the construction of one secondary water quality basin for the Ocean Acres development downstream of the existing Neptune Basin. The secondary water quality basin will allow additional opportunity for nitrogen, total suspended solids and phosphorous reduction. Additionally, the new basin will collect additional petroleum hydrocarbons, and dissolved organic chemicals prior to discharge into the Barnegat Bay.

Project Description

(Carryover SFY2015) - The proposed project includes the construction and/or retrofit of one or more stormwater basins to improve its ability to remove nitrogen.

Service Area

The Joint Meeting's system serves an area of approximately 65 square miles. Wastewater is collected from the Joint Meeting's eleven members, one customer, and seven other communities. Member (owner) communities include all or portions of: East Orange, Hillside, Irvington, Maplewood, Millburn, Newark, Roselle Park, South Orange, Summit, Union and West Orange. The City of Elizabeth is served as a customer by the Joint Meeting. Joint Meeting's service and planning area's outer boundaries of its Wastewater Management Plan (WMP) are essentially the same, with the exception of the Borough of New Providence, the City of Summit and the Township of Berkeley Heights. New Providence owns and operates a wastewater treatment plant that receives all of the flow originating in New Providence and small sections of Summit and Berkeley Heights. The maximum allowable flow to be pumped from the New Providence plant to the Joint Meeting plant, via Summit's conveyance system, is 3.0 MGD.

Need for Project

The purpose of the proposed project is to reduce the impact that natural disasters like Superstorm Sandy could have on the facility in the future and to avoid loss of wastewater service. The proposed project is needed to incorporate resiliency to minimize potential future facility failures, service interruptions and/or loss of service, and to minimize future damages to the critical facility's infrastructure. In addition, the proposed project will decrease the risk for release of untreated sewage into the environment, thereby protecting public health and natural resources.

Project Description

Flood Mitigation Facilities projects, Phase II - Cogeneration Upgrade This project includes upgrades to the existing Co-Generation Facility to power the proposed Effluent Pumping Station, two (2) proposed stormwater pumping stations, and the existing Sludge Dewatering Facility. Two (2) new engine generator sets and associated equipment will be installed in the existing Co-Generation Facility including all required electrical and instrumentational connections to integrate the new engines into the existing systems, installation of new digester gas and natural gas piping to the new engines, construction of a new substation at the Sludge Dewatering Facility, and medium voltage connections to the Co-Generation grid. In addition, access platforms will be installed at the new and existing co-generation engines to allow for safe access to equipment for maintenance.

Need for Project

An Administrative Consent requires that the outfall must be relocated from Deep Run (Pineland waterway) to the Blackwater Branch Stream (a non-Pineland waterway).

Project Description

The proposed project involves the construction of a new effluent pump station and 3 miles of force main which will discharge the effluent to the Blackwater Branch Stream.

Service Area

The stormwater drainage area bounded by Sherman Avenue to the west, Veeder Lane to the north, Anchorage Avenue to the south and Red Bank Avenue to the east, will route through the proposed retention basing located between Red Bank Avenue and Moorage Avenue before releasing into lagoon waters of the Barnegat Bay.

Need for Project

Like many other communities in Ocean County, the Township saw enormous growth and development in the 1970's. This development negatively altered the quality of surface runoff entering Barnegat Bay. This project is a concentrated effort of the Township to increase the quality of storm water surface runoff that will be released to Barnegat Bay. The Township is concerned with the health of Barnegat Bay and is improving their approach to bettering Barnegat Bay for all residents.

Project Description

Construction of a Retention Basin designed to remove at least 80% of total suspended solids for a drainage area of approximately 90 acres. The basin will include an aerator and shall be designed according to New Jersey Best Management Practices Manual. Construction will also include replacement of storm sewer and associated structures.

Project Name, Number

Berkeley Township
S344020-01
Stormwater Management - Gray Infrastructure

Priority List Rank

223

County

Ocean

Existing Population

41,255

Service Area

The stormwater drainage area bounded by Sherman Avenue to the west, Veeder Lane to the north, Anchorage Avenue to the south and Red Bank Avenue to the east, will route through the proposed retention basing located between Red Bank Avenue and Moorage Avenue before releasing into lagoon waters of the Barnegat Bay.

Need for Project

Like many other communities in Ocean County, the Township saw enormous growth and development in the 1970's. This development negatively altered the quality of surface runoff entering Barnegat Bay. This project is a concentrated effort of the Township to increase the quality of storm water surface runoff that will be released to Barnegat Bay. The Township is concerned with the health of Barnegat Bay and is improving their approach to bettering Barnegat Bay for all residents.

Project Description

Construction of new water quality stormwater basins within Veterans Park.

Project Name, Number

Allentown Borough
S340567-05
Sewage Treatment Plant (STP) - Improvement/Upgrade

Priority List Rank

224

County

Monmouth

Existing Population

1,828

Service Area

The entire Borough of Allentown.

Need for Project

The existing Wastewater Treatment Plant (WWTP) is in a condition which requires either a replacement or elimination of the WWTP. NJDEP has cited that the existing trickling filter is not operating correctly and is undersized. The arm mechanism for the trickling filter is not operating correctly and requires replacement. Presently there is only one trickling filter, therefore inspection of the internal condition of the bottom filter plate and concrete structure has not been evaluated but it is expected that it requires extensive repair. The trickling filter is also undersized, so a second filter is needed. This would be difficult due to the confined site and wetlands constrictions. The WWTP often meets the discharge requirements of the NJPDES permit, but in the past 2 years has had multiple violations. The Borough realizes it needs to eliminate the violations at the WWTP and wants to decrease the cost of operation and maintenance.

Project Description

The Borough of Allentown owns and operates a Wastewater Treatment Plant (WWTP), which discharges effluent to Doctor's Creek. The WWTP presently requires improvements and repairs. The Borough is proposing to replace the existing WWTP with a more efficient integrated fixed-film activated sludge (IFAS) plant. The Borough will remove the existing sand filters, RBCs, trickling filter, and sludge holding tank. These components will be replaced with a new sludge tank with greater capacity and an integrated fixed-film activated sludge (IFAS) system. In addition, the electrical service will be upgraded, the primary and secondary clarifiers will be enlarged and raised above the flood elevation, a grinder will be installed within the influent PS wet well, and a mechanical bar screen will be installed. Additional pumping stations will also be provided. The proposed project will have no impact on the current or future WWTP design capacity, which will remain at 238,000 GPD, and will not increase the size of the Borough's sanitary sewer collection system service area.

Need for Project

PVSC accepts grease trap waste as part of the Liquid Waste Acceptance Program. The waste is currently dumped into the Head End Facility where it is eventually removed in our Primary Clarifiers, combined with our grit and screenings waste and disposed in a landfill. This project would redirect the grease trap waste into new equipment housed in an existing building where it would be processed into a brown grease material that would be sold so it can be converted into an advanced biofuel. Keeping this grease waste out of our wastewater treatment process and will help improve operations of the secondary treatment process.

Project Description

PVSC accepts grease trap waste as part of the Liquid Waste Acceptance Program. The waste is currently dumped into the Head End Facility where it is eventually removed in our Primary Clarifiers, combined with our grit and screenings waste and disposed in a landfill. This project would redirect the grease trap waste into new equipment housed in an existing building where it would be processed into a brown grease material that would be sold so it can be converted into an advanced biofuel. There will likely be two contracts. The first will be an equipment procurement project and the second will be for the installation of the equipment

Service Area

River Road Wastewater Treatment Plant began treating sewage in 1978. Wastewater flow to the River Road treatment plant is received from Princeton, a portion of South Brunswick Township and Plainsboro, and West Windsor Township.

Need for Project

The UV system will enable compliance with new NJPDES permit effluent limits for chlorodibromomethane (CDBM) and bromodichloromethane (BDCM). Replacement of aging deep bed dual-media effluent filters will ensure reliable performance of the effluent filtration process which is critical for water quality protection.

Project Description

The proposed project involves the replacement of our existing dual-media effluent filtration system and the replacement of the existing disinfection system with a UV system. Many components of the existing filtration system are 39 years old and in need of significant rehabilitation. This project replaces the existing filtration system with a new filtration facility utilizing disc-type effluent filters. The new facility will be in a new building constructed adjacent to the existing filter building. The existing chlorine-based disinfection system will be replaced with a new ultraviolet (UV) disinfection system to meet new, more stringent effluent limitations for Chlorodibromomethane (CDBM) and Bromodichloromethane (BDCM). Modifications to the existing chlorine contact tanks, de-chlorination tanks, and reaeration tanks will be completed to incorporate the new UV disinfection system within and on top of the existing tanks.

The project will service our member municipalities: Princeton, West Windsor Township, South Brunswick Township, Pennington Borough, Hopewell Borough, Hopewell Township

Need for Project

The project components (pumps) are used to convey dewatered sludge from our belt filter presses, sludge receiving bins and sludge storage hopper for incineration of SBRSA's sludge in addition to the sludge from approximately 30 small to midsize wastewater treatment plants.

Project Description

The project involves the replacement of seven existing dewatered sludge pumps with seven new dewatered sludge pumps and the replacement of the live bottom feed screws and drives for the sludge cake receiving bins. The pumps are essential for SBRSA to process/incinerate our sludge from our River Road, Hopewell and Pennington WWTPs as well as the liquid and cake sludge that SBRSA receives from approximately 30 small to midsize wastewater treatment plants.

Need for Project

The proposed project is needed to reduce the amount of electricity consumed at the plant. Continued operation using grid power would require a continued reliance on non-renewable energy sources. The project will reduce the production of greenhouse gases which are a by-product of burning fossil fuels. It will also reduce the cost of plant operation while providing a positive impact on our environment.

Project Description

The WMUA proposes installation of a new photovoltaic (PV) solar array system in two areas the north and south sections of the plant. The purpose of the project is to alleviate the electricity demand from the power plant during its operation. The PV array proposed in the south runs along the southern border of the site adjacent to Pine Brook and the area to the north is the existing site presently utilized by the WMUA for construction staging. The proposed solar array will cover approximately 146300 sq. ft. of land. As proposed the solar array will produce a total of 2 Mw of electricity and will offset approximately 13 to 12 of the current energy used by the plant.

Need for Project

The project will reduce the GTMUAs reliance on public electric supply and in turn fossil fuels. The solar array will supply power to the Authority facilities that handle the operations and maintenance for the MUA.

Project Description

The GTMUA Sewer System Rehabilitation Project consists of a single project as delineated in this planning document. All aspects of the components will be located within the boundary of GTMUAs current Gloucester Township service area and collection system. The project consists of the installation of a 175kW Solar Array to supply power to the MUA facilities. The project will include the necessary site work and installation of solar hardware to connect to the existing Authority buildings. The solar array will supply power to the Authority facilities that handle the operations and maintenance for the MUA. The proposed project objectives are to maintain permit compliance and increase operational efficiencies thereby enhancing the integrity of the overall wastewater collection system.

Need for Project

Stormwater runoff is the most common way that nonpoint source pollution reaches local rivers creeks and other water ways including Barnegat Bay. If the runoff is not absorbed by soil and vegetation or by other measures rainwater carries chemicals nutrients sediments and other forms of nonpoint source pollution into surface waters.

Project Description

The proposed project includes the retrofitting of four stormwater basins to subsurface gravel wetlands to improve their ability to remove nitrogen.

Need for Project

The existing tertiary filters were constructed in 1989 and are reaching the end of their useful life. The filters can get overwhelmed during periods of high flows and require increasing amounts of backwash water in order to maintain the required effluent quality. It is expected that the disc filters will reduce energy and backwash water requirements while improving effluent quality.

Project Description

Convert the existing mixed media, traveling bridge tertiary filters to rotating disc filters.

Service Area

The Long Hill Township WWTP is located on Block 10411, Lot 6 at the end of South Warren Avenue in Long Hill Township, Morris County, New Jersey. The existing sewer service area (SSA) of the WWTP is shown in Figure 1 of the planning documents and environmental assessment report, which is consistent with the SSA shown in the draft Morris County Wastewater Management Plan (WMP).

Need for Project

The proposed WWTP upgrades will enable compliance with the new effluent limit for Total Phosphorus, and the sewer rehabilitation will also benefit the Passaic River water quality by reducing peak flow rates of I&I thereby enhancing the reliability of plant performance and water quality protection.

Project Description

The project includes upgrades to the WWTP, pump stations, and sanitary sewer collection system. Several plant upgrades will occur to achieve the new effluent limit for Total Phosphorus and the permitted average flow capacity of 1.25 mgd. The upgrades will involve adding a chemical storage and feed system to precipitate Total Phosphorus, replacing the existing sand filters with new disc filters, replacing influent pumps 3 and 4 and the RAS pump. Additionally, the rehabilitation will be focused on areas suspect of contributing significant flow rates of infiltration and inflow, which will reduce peak flows to the WWTP thereby enhancing operation of the WWTP. The rehabilitation will also focus on the areas that are known to be deteriorating and located in flood-prone sections of the Township.

Service Area

Jefferson Township (Rockaway River Basin)

Need for Project

Some of the on-site systems that exist in the Rockaway River Basin of Jefferson Township have documented repeated failures. Most of the systems are failing due to shallow depth to bedrock high water tables and steep slopes. Rehabilitation has been attempted on some systems but the results have been generally unsuccessful. Trout fishing and primary contact recreation uses of Russia Brook (FW2-TM) are adversely impacted due to the unacceptable levels of nutrients and marginally acceptable levels of toxics and fecal coliform. These facilities may pose serious health hazards in the future for the township if not corrected.

Project Description

This project includes the design and construction of a local wastewater system for the Rockaway River Basin portion of Jefferson Township. The recommended wastewater management plan for this portion of Jefferson Township consists of two major parts 1) centralized sewer service for Cozy Lake Lake Swannanoa and White Pine Lake area in the Rockaway Basin and 2) Septic Management for the remaining portions.

Service Area

Complete replacement of the sanitary sewers, storm sewers and reconstruction of roadways within the following locations: 5th Ave (Beach Creek to Central Ave), including the street end bulkhead and boat ramp; 6th Ave (New Jersey Ave to Central Ave); 7th Ave (Central Ave to Surf Ave); 8th Ave (New Jersey Ave to Surf Ave); 9th Ave (Central Ave to Surf Ave); 14th Ave (Central Ave to Surf Ave); 15th Ave (Surf Ave to Ocean Ave); 16th Ave (Delaware Ave to New York Ave); 17th Ave (New York Ave to New Jersey Ave); 12th, 13th, 14th, & 15th Avenues (Hoffman Canal to Delaware Ave), including the street end bulkheads; Hoffman Alley (12th Ave to 15th Ave; Delaware Ave (12th Ave to 18th Ave); Central Ave (5th Ave to 6th Ave); New York Ave (5th Ave to 7th Ave); New York Ave (16th Ave to 17th Ave); the Boardwalk Storm Sewer System between 16th Ave and 26th Ave, including replacement of the Boardwalk between 22nd Ave and 26th Ave; and the Beach Outfall near 21st Avenue.

Need for Project

The project will dramatically improve resiliency in the existing sanitary sewer and storm sewer systems to mitigate flooding and system backup caused by failure of said systems. The project will minimize the potential for these systems to fail under both normal day to day operations as well as in storm events thereby preventing water quality impact to the open waters adjacent to the City on both the Ocean and Bay sides of the municipality.

Project Description

Complete replacement of the sanitary sewers and reconstruction of roadways within the following locations: 5th Ave (Beach Creek to Central Ave), including the street end bulkhead and boat ramp; 6th Ave (New Jersey Ave to Central Ave); 7th Ave (Central Ave to Surf Ave); 8th Ave (New Jersey Ave to Surf Ave); 9th Ave (Central Ave to Surf Ave); 14th Ave (Central Ave to Surf Ave); 15th Ave (Surf Ave to Ocean Ave); 16th Ave (Delaware Ave to New York Ave); 17th Ave (New York Ave to New Jersey Ave); 12th, 13th, 14th, & 15th Avenues (Hoffman Canal to Delaware Ave); Hoffman Alley (12th Ave to 15th Ave; Delaware Ave (12th Ave to 18th Ave); Central Ave (5th Ave to 6th Ave); New York Ave (5th Ave to 7th Ave); New York Ave (16th Ave to 17th Ave).

Service Area

The service area of this project encompasses the area east NJ State Highway 35 "Oceanside". And will consist of three parking lots with current methods to help alleviate contaminants in the storm runoff and decrease the carbon footprint of the entire site which serves as the main parking lot for the Townships which in the summer months is filled to capacity daily.

Need for Project

The newly constructed parking lot will utilize underground storage recharge structures which will help eliminate runoffs high in organic and inorganic compounds, thus helping to reduce addition of artificial or natural substances, such as nitrates and phosphates, through fertilizers or sewage, that flow into the Barnegat Bay Watershed which contributes to eutrofication. The newly constructed parking lot will utilize underground storage recharge structures which will help eliminate runoffs high in organic and inorganic compounds, thus helping to reduce the addition of artificial or natural substances, such as nitrates and phosphates, through fertilizers or sewage, which contributes to eutrofication. The lighting system will utilize highefficient, low energy lighting which will power LED lighting set on a timer to reduce the amount of electricity that is required to power these light structures.

Project Description

The work on this project consists of the installation an underground storm water recharge system capable of handling a two year storm (which will reduce the amount of discharge into the Barnegat Bay and Atlantic Ocean) high efficiency lighting system electric car charging stations and the repaving of the parking lots to still serve the original intended purpose of the proposed area and to promote better drainage of the site. All work will be designed and constructed to utilize the current green technologies to help eliminate the carbon footprint that tourist areas leave with the increase in population of the summer months. The area sees a tenfold increase in population in the summer months which is why this project is beneficial for the Borough and the environment.

Howell Township

Need for Project

The Freewood Acres section of Howell Township is currently relying on on-site septic disposal systems for the treatment of wastewater. Many of these existing systems provide inadequate treatment which has resulted in the degradation of Aldrich Lake. Aldrich Lake experiences high fecal coliform toxics and nutrients concentrations. Consequently trout fishing primary contact recreation and farming are impacted.

Project Description

Preliminary investigations indicate that a collection system will need to be constructed in the planning area. The collection system will be connected via an interceptor into the Manasquan River Regional Sewerage Authority conveyance system for treatment and disposal.

Need for Project

Stormwater runoff is the most common way that nonpoint source pollution reaches local rivers creeks and other water ways including Barnegat Bay. If the runoff is not absorbed by soil and vegetation or by other measures rainwater carries chemicals nutrients sediments and other forms of nonpoint source pollution into surface waters. Installation of pervious surface will allow all stormwater to enter the ground.

Project Description

The proposed project includes installation of approximately 20000sqft of permeable subsurface and pavers to an existing packed gravel parking lot.

This project will benefit all users of the recreation facilities at Boyer Avenue as well as the rate payers of the sanitary sewer system and wastewater treatment facility.

Need for Project

The Boyer Avenue site is currently approved to treat 1.6 MGD of treated wastewater effluent. The currently approved land application method is rapid infiltration utilizing the five existing on-site slit trenches. It is the Town's objective to maximize the on-site recharge and disposal of the treated effluent at this facility. Therefore, utilizing the recreation fields as means of infiltration will meet this objective.

Project Description

(Carryover SFY2015) - The Boyer Avenue facility is currently irrigated using potable quality water from the Town's water system resulting in substantial seasonal demands. Hammonton proposes to install overland effluent recharge and underground drip irrigation systems. This project will allow the Town to meet the requirements of the NJDEP Wastewater Discharge Permit and the Pinelands Commission directive to maximize on-site recharge. The project will also allow the Town to conserve potable water.

Service Area

The Sewer Service Area in the vicinity of the Sullivan Way Pump Station and its force mains includes a mixed use of residential and commercial establishments, a golf course and a NJ School for the Deaf. To the west of the sewer service area is the Delaware River.

Need for Project

The existing Sullivan Way Pump Station has reached the end of its useful life, and its dual force main has deteriorated, where both the replacement of the pump station and rehabilitation of the dual force main are required to maintain the sewer collection system in Ewing Township. NJDEP Central Enforcement has strongly suggested this as a priority project because of SSO history. A portion of the force main was permitted and replaced for \$1M in 2021 as a commitment to address the NJDEP concerns.

Project Description

The Authority (ELSA) is proposing to replace their existing Sullivan Way Pump Station, gravity sewer to the pump station and rehabilitate its existing dual eighteen-inch (18) diameter force mains. The existing and proposed force mains are located between the existing pump station on Sullivan Way and its discharge manhole on Parkway Avenue in Ewing Township, Mercer County, NJ. The repairs are needed to mitigate a history of pipe failures resulting in sewer system overflows and to improve the resiliency of sewer infrastructure. The existing pump station wet well is also undersized and subject to overflows since limit time between high water alarm and operator response. The new pump station system will also reduce the force main head pressure, utilize variable frequency drive motors and other energy efficiency improvements to reduce energy and operating costs.

Service Area

The LBSA service area covers approximately 5.36 square miles in central eastern Monmouth County, New Jersey. The area is bounded by the Ocean to the east; Monmouth Beach and Oceanport to the north; Oceanport, West Long Branch and Ocean Township to the west; and Ocean Township and Deal to the south. The land area breakdown contained in each of the municipalities included within the LBSA Wastewater Management Plan (WMP) area is as follows: the City of Long Branch (5.10 square miles), the Borough of West Long Branch (0.2565 square miles), and the Borough of Monmouth Beach (0.0011 square miles). The City of Long Branch is the only "participating" municipality. The small areas of the other two municipalities are "customers" of LBSA.

Need for Project

The purpose of the project is to improve effluent quality during peak flow periods, reduce the potential for sewage exfiltration and reduce maintenance and operating problems and costs. The project will also reduce inflow and infiltration and reduce the need for emergency repairs. In addition to addressing environmental issues, operating and maintenance should be improved. The I/I study and associated collection system improvements portion of the overall project will be LBSA's fifth Inflow and Infiltration (I/I) Remediation Project within the past 25 years. The Hoey Avenue pump station and force main improvements will improve reliability, efficiency and operations. Replacement of the force main will avoid the possibility of a failure of the existing pipe, which would be costly and create a major disruption of service.

Project Description

This loan application comprises three projects, including: 1) Inflow/Infiltration (I/I) Study and Rehabilitation Project: the evaluation of inflow and infiltration, flow metering, sewer cleaning, television inspection and collection system rehabilitation/replacement. A report will be prepared after completion of the system evaluation documenting findings and recommendations; 2) Hoey Avenue Pump Station Force Main Replacement Project: the replacement of the existing 3,850 LF of 14" force main. The main will be rerouted to stay within the public right-of-way. Upgrades of the pump station are also proposed; 3) Sanitary Sewer Railroad Crossing Investigation/Rehabilitation Project: the evaluation and possible rehabilitation of the railroad/sewer crossings. Design for rehabilitation of pipe at the crossings will be performed based upon the recommendations from the Inspection Reports generated by TV inspections.

Service Area

The BCUA's Service Area consists of forty-seven municipalities and a portion of five non-member municipalities. The thirty-eight municipalities entirely served by the BCUA WWTP include Bergenfield, Bogota, Carlstadt, Closter, Demarest, Dumont, Emerson, Edgewater, Englewood, Englewood Cliffs, Fairview, Harrington Park, Haworth, Hillsdale, Leonia, Little Ferry, Maywood, Montvale, Moonachie, New Milford, Northvale, Norwood, Old Tappan, Oradell, Palisades Park, Paramus, Park Ridge, Ridgefield, Ridgefield Park, River Edge, River Vale, Rochelle Park, Teaneck, Tenafly, Teterboro, Westwood, Woodcliff Lake and Wood-Ridge. The eight municipalities partially served by the BCUA WWTP include Cliffside Park, East Rutherford, Fort Lee, Hackensack, Hasbrouck Heights, Rutherford, South Hackensack and Washington Township. The five nonmember municipalities partially served by the BCUA WWTP include Alpine, Lodi, Lyndhurst, North Bergen, and Ridgewood. Portions of Cliffside Park, Fort Lee, Hackensack.

Need for Project

The BCUA evaluated its primary treatment facilities including the sixteen concrete tanks, the aforementioned equipment in the primary tanks, sludge pump stations, and the primary sludge degritting system and concluded that a comprehensive rehabilitation and upgrade is required to effectively meet the permit. Improvements to the primary treatment process tanks will include replacement of mechanical/process and electrical/instrumentation equipment, including inlet gates, sludge and scum collection equipment, and effluent weirs for the sixteen primary tanks. Concrete repairs to the interior of the tanks and tank decking are also required. Improvements to the primary sludge pump system will include pumps and replacement of associated pipes and valves for the four primary sludge pumps stations. This project will include improvements to the down-stream primary sludge degritting system. Associated electrical, instrumentation, controls and ancillary equipment will also be replaced.

Project Description

The Bergen County Utilities Authority (BCUA) Little Ferry Water Pollution Control Facility (WPCF) primary treatment facilities need numerous replacements, upgrades, and repairs. The mechanical/process and electrical/instrumentation equipment and structures for the four treatment trains (batteries) built 25+ years to 70+ years ago. The equipment has exceeded the expected useful life, and is important to the WPCFs ability to meet the permit limits.

Need for Project

The Jenbacher cogeneration (cogen) units #1 and #2 at the Bergen County Utility Authority's (BCUA) Little Ferry Water Pollution Control Facility (LFWPCF) are an essential source of power to the facility. The 60,000-hour maintenance is for the resilient operation of the facility. Close coordination is needed with the project tasks to ensure minimal downtime at the facility. The cogen maintenance and other resiliency-related projects will be completed within the existing facility, with no disturbance expected outside of the facility. These improvements will ensure the facility's resiliency and prevent downtime due to power failure.

Project Description

The Bergen County Utility Authority (BCUA) has two Jenbacher cogeneration (cogen) units (#1 and #2) have been operating since 2007/8 and are at or approaching the milestone of 60,000 operating hours. These units must undergo a major inspection and maintenance interval at this milestone, where they will either be rebuilt or reconditioned. There are also a number of other resiliency, State-of-Good Repair (SOGR) and compliance improvements related to the cogen units. The improvements include coordination with the ongoing Black Start Project, control system modifications, ancillary systems within the building, heat exchanger issues, emissions analysis, G1 and G2 60,000-hour overhaul/rebuild, the overhaul extra options, and other overall power resiliency issues.

Need for Project

The major parts of the sludge dryers reached the end of their useful life, and some had failed rendering dryers no longer operational and in need of rehabilitation. The sludge dryers are an integral part of operation within the CCMUA's water pollution control facility as well as its environmental effect on the surrounding communities. Without the sludge dryers in operation, sludge hauling is required at a great expense to the CCMUA and results in higher truck traffic through the environmental justice community potentially leading to higher risk of odors and air pollution.

Project Description

Contract 1 - Purchase of materials and equipment necessary to rehabilitate the existing sludge dryers at the CCMUA's water pollution control facility Contract 2 - Installation of pre purchased materials and equipment

Wastewater is primarily collected from the Joint Meeting's eleven member and four customer communities. Small portions of two neighboring communities (Berkeley Heights and Linden) are also served. Members (owner) communities include all or some parts of: East Orange, Hillside, Irvington, Maplewood, Millburn, Newark, Roselle Park, South Orange, Summit, Union and West Orange. The City of Elizabeth and portions of Livingston, Orange, Berkeley Heights, Linden and New Providence are currently served as customers by the Joint Meeting.

Need for Project

The purpose of the proposed project is to reduce the impact that natural disasters like Superstorm Sandy could have on the facility in the future and to avoid loss of wastewater service. The proposed project is needed to incorporate resiliency to minimize potential future facility failures, service interruptions and/or loss of service, and to minimize future damages to the critical facility's infrastructure. In addition, the proposed project will decrease the risk for release of untreated sewage into the environment, thereby protecting public health and natural resources.

Project Description

The project consists of construction of reinforced concrete flood protection walls around the Main Treatment Plant site, including installation of four (4) flood protection swing gates, demolition of the existing and construction of a new guard house, construction of five (5) storm sewer isolation chambers with sluice gates and electric actuators, realignment and repaving of various treatment plant roadways, construction of a new emergency access roadway, relocation and protection of existing utilities, and associated grading and site restoration.

County

Union

Existing Population

500,000

Service Area

Wastewater is primarily collected from the Joint Meeting's eleven member and four customer communities. Small portions of two neighboring communities (Berkeley Heights and Linden) are also served. Members (owner) communities include all or some parts of: East Orange, Hillside, Irvington, Maplewood, Millburn, Newark, Roselle Park, South Orange, Summit, Union and West Orange. The City of Elizabeth and portions of Livingston, Orange, Berkeley Heights, Linden and New Providence are currently served as customers by the Joint Meeting.

Need for Project

The purpose of the proposed project is to reduce the impact that natural disasters like Superstorm Sandy could have on the facility in the future and to avoid loss of wastewater service. The proposed project is needed to incorporate resiliency to minimize potential future facility failures, service interruptions and/or loss of service, and to minimize future damages to the critical facility's infrastructure. In addition, the proposed project will decrease the risk for release of untreated sewage into the environment, thereby protecting public health and natural resources.

Project Description

The project consists of construction of reinforced concrete flood protection walls around the Main Treatment Plant site, including installation of four (4) flood protection swing gates, demolition of the existing guard house and construction of a new guard house, construction of five (5) storm sewer isolation chambers with sluice gates and electric actuators, realignment and repaving of various treatment plant roadways, construction of a new emergency access roadway, relocation and protection of existing utilities, and associated grading and site restoration. Also included in the project are costs for engineering services related to surveying, NJIB Project Report & Permitting, NJDEP & ACOE permitting, and performance of test pits for determination of utility locations.

Existing Population

500,000

Service Area

Wastewater is primarily collected from the Joint Meeting's eleven member and four customer communities. Small portions of two neighboring communities (Berkeley Heights and Linden) are also served. Members (owner) communities include all or some parts of: East Orange, Hillside, Irvington, Maplewood, Millburn, Newark, Roselle Park, South Orange, Summit, Union and West Orange. The City of Elizabeth and portions of Livingston, Orange, Berkeley Heights, Linden and New Providence are currently served as customers by the Joint Meeting.

Need for Project

The purpose of the proposed project is to reduce the impact that natural disasters like Superstorm Sandy could have on the facility in the future and to avoid loss of wastewater service. The proposed project is needed to incorporate resiliency to minimize potential future facility failures, service interruptions and/or loss of service, and to minimize future damages to the critical facility's infrastructure. In addition, the proposed project will decrease the risk for release of untreated sewage into the environment, thereby protecting public health and natural resources.

Project Description

The project consists of construction of reinforced concrete flood protection walls around the Main Treatment Plant site, including installation of four (4) flood protection swing gates, demolition of the existing guard house and construction of a new guard house, construction of five (5) storm sewer isolation chambers with sluice gates and electric actuators, realignment and repaving of various treatment plant roadways, construction of a new emergency access roadway, relocation and protection of existing utilities, and associated grading and site restoration. Also included in the project are costs for engineering services related to surveying, NJIB Project Report & Permitting, NJDEP & ACOE permitting, and performance of test pits for determination of utility locations.

Service Area

The BCUA's Service Area consists of 47 municipalities and a portion of five non-member municipalities. The thirty-eight municipalities entirely served by the BCUA WWTP include Bergenfield, Bogota, Carlstadt, Closter, Demarest, Dumont, Emerson, Edgewater, Englewood, Englewood Cliffs, Fairview, Harrington Park, Haworth, Hillsdale, Leonia, Little Ferry, Maywood, Montvale, Moonachie, New Milford, Northvale, Norwood, Old Tappan, Oradell, Palisades Park, Paramus, Park Ridge, Ridgefield, Ridgefield Park, River Edge, River Vale, Rochelle Park, Teaneck, Tenafly, Teterboro, Westwood, Woodcliff Lake and Wood-Ridge. The eight municipalities partially served by the BCUA WWTP include Cliffside Park, East Rutherford, Fort Lee, Hackensack, Hasbrouck Heights, Rutherford, South Hackensack and Washington Township. The five nonmember municipalities partially served by the BCUA WWTP include Alpine, Lodi, Lyndhurst, North Bergen, and Ridgewood. Portions of Cliffside Park, Fort Lee, Hackensack, Ridgefield

Need for Project

Due to circumstances beyond its control, the BCUA is no longer capable of implementing its current compliance plan for copper, ammonia nitrogen and zinc by extending the existing Edgewater WPCF outfall to provide sufficient dilution on or before May 2015. The BCUA proposes to eliminate the existing surface water discharge including the bypass of secondary treatment in favor of a pump station and force main that diverts its service area to the Little Ferry WPCF for treatment offers the following advantages: resolution of the impediments to improving the quality of the discharge to the Hudson River from the Edgewater WPCF and reduction of the cost to the customers of the BCUA for wastewater treatment. Furthermore the diversion would reduce the diversion of fresh water from the Hackensack River; would further the state initiative of consolidation to reduce the cost of local government and would not harm the water quality in the Hackensack River.

Project Description

The proposed project includes consolidation of the Edgewater/Little Ferry service areas by converting the Edgewater WPCF to a pumping station and diverting its service area to the Little Ferry WPCF.

Need for Project

Improvements to the Edgewater Treatment Plant will allow remote monitoring and control from the BCUAs SCADA System provide cost savings in the operation of the plant increase reliability and operability of the system and provide necessary security improvements.

Project Description

The proposed project includes automation upgrades integration with the BCUA SCADA system replacement of manual bar screens with mechanical bar screens repair of UNOX reactors upgrades to the grit screenings compactor installation of a redundant disinfection system and installation of odor controls.

Service Area

The Joint Meeting's system serves an area of approximately 65 square miles. Wastewater is collected from the Joint Meeting's eleven members, one customer, and seven other communities. Member (owner) communities include all or portions of: East Orange, Hillside, Irvington, Maplewood, Millburn, Newark, Roselle Park, South Orange, Summit, Union and West Orange. The City of Elizabeth is served as a customer by the Joint Meeting. Joint Meeting's service and planning area's outer boundaries of its Wastewater Management Plan (WMP) are essentially the same, with the exception of the Borough of New Providence, the City of Summit and the Township of Berkeley Heights. New Providence owns and operates a wastewater treatment plant that receives all of the flow originating in New Providence and small sections of Summit and Berkeley Heights. The maximum allowable flow to be pumped from the New Providence plant to the Joint Meeting plant, via Summit's conveyance system, is 3.0 MGD.

Need for Project

The purpose of the proposed project is to reduce the impact that natural disasters like Hurricane Sandy could have on the facility in the future and to avoid loss of wastewater service. The proposed project is needed to incorporate resiliency to minimize potential future facility failures, service interruptions and/or loss of service, and to minimize future damages to the critical facility's infrastructure. In addition, the proposed project will decrease the risk for release of untreated sewage into the environment, thereby protecting public health and natural resources.

Project Description

Phase 1- Effluent Pumping Station: Joint Meeting of Essex and Union County (JMEUC) proposes to construct a new pumping station utilizing 5 effluent pumps and motors. Ancillary improvements include variable frequency drives, electrical upgrades including a SCADA system, various piping and valves including knife gates, and a HVAC system. Phase 2- Co-Generation Facility Upgrade: JMEUC proposes several upgrades to the existing Co-Generation Facility which include 2 new generator sets with ancillary heat exchanges, mechanical piping, electrical upgrades (including SCADA), and generator maintenance platforms. The generators will be used to supply emergency power to the effluent and storm water pumping stations and the Biosolids Facility.

The maximum allowable flow to be pumped from the New Providence plant to the Joint Meeting plant, via Summit's conveyance system, is 3.0 MGD.

Need for Project

The purpose of the proposed Waste Gas Burner Upgrades is to reduce maintenance and increase reliability of the waste gas burner system as well as to install new enclosed flares that meet current NJDEP air quality permitting requirements. The purpose of the proposed Miscellaneous Building Rehabilitation is to perform repairs on various structures throughout the plant to reduce the potential for structural and architectural failures which could pose safety hazards. The purpose of the proposed New Primary Tunnel Building Construction is to eliminate the permit required confined space and to replace severely corroded piping within the existing Primary Tunnel. The tunnel limits access to piping and equipment for maintenance or replacement and can become a safety hazard to plant personnel.

Project Description

Capital Improvement Projects 2019 consisting of the three following projects: Waste Gas Burner Upgrades - replacement of the existing waste gas burners at the Digester Building and Sludge Storage Tanks with state-of-the-art enclosed flares to meet current air emission permitting requirements. Miscellaneous Building Rehabilitation - Rehabilitation of various structures including concrete repairs and/or reconstruction in the Screen House, Old Chlorine Building, Chlorination Building, Aeration Gallery and Waste Gas Building; replacement of brick veneer panels and supporting walls on the Dewatering Building; replacement of the coping and brick facade on the Sludge Storage Tanks. New Primary Tunnel Building Construction - Construction of a new building adjacent to the existing Primary Tunnel at the influent end of the Primary Settling Tanks to eliminate the permit required confined space and replace severely corroded piping in the tunnel and installation of new primary sludge pumps.

The maximum allowable flow to be pumped from the New Providence plant to the Joint Meeting plant, via Summit's conveyance system, is 3.0 MGD.

Need for Project

The purpose of the proposed Waste Gas Burner Upgrades is to reduce maintenance and increase reliability of the waste gas burner system as well as to install new enclosed flares that meet current NJDEP air quality permitting requirements. The purpose of the proposed Miscellaneous Building Rehabilitation is to perform repairs on various structures throughout the plant to reduce the potential for structural and architectural failures which could pose safety hazards. The purpose of the proposed New Primary Tunnel Building Construction is to eliminate the permit required confined space and to replace severely corroded piping within the existing Primary Tunnel. The tunnel limits access to piping and equipment for maintenance or replacement and can become a safety hazard to plant personnel.

Project Description

Capital Improvement Projects 2019 consisting of the three following projects: Waste Gas Burner Upgrades - replacement of the existing waste gas burners at the Digester Building and Sludge Storage Tanks with state-of-the-art enclosed flares to meet current air emission permitting requirements. Miscellaneous Building Rehabilitation - Rehabilitation of various structures including concrete repairs and/or reconstruction in the Screen House, Old Chlorine Building, Chlorination Building, Aeration Gallery and Waste Gas Building; replacement of brick veneer panels and supporting walls on the Dewatering Building; replacement of the coping and brick facade on the Sludge Storage Tanks. New Primary Tunnel Building Construction - Construction of a new building adjacent to the existing Primary Tunnel at the influent end of the Primary Settling Tanks to eliminate the permit required confined space and replace severely corroded piping in the tunnel and installation of new primary sludge pumps.

450,000

Service Area

The Joint Meeting's system serves an area of approximately 65 square miles. Wastewater is collected from the Joint Meeting's eleven members, one customer, and seven other communities. Member (owner) communities include all or portions of: East Orange, Hillside, Irvington, Maplewood, Millburn, Newark, Roselle Park, South Orange, Summit, Union and West Orange. The City of Elizabeth is served as a customer by the Joint Meeting. Joint Meeting's service and planning area's outer boundaries of its Wastewater Management Plan (WMP) are essentially the same, with the exception of the Borough of New Providence, the City of Summit and the Township of Berkeley Heights. New Providence owns and operates a wastewater treatment plant that receives all of the flow originating in New Providence and small sections of Summit and Berkeley Heights. The maximum allowable flow to be pumped from the New Providence plant to the Joint Meeting plant, via Summit's conveyance system, is 3.0 MGD.

Need for Project

The purpose of the proposed Waste Gas Burner Upgrades is to reduce maintenance and increase reliability of the waste gas burner system as well as to install new enclosed flares that meet current NJDEP air quality permitting requirements. The purpose of the proposed Miscellaneous Building Rehabilitation is to perform repairs on various structures throughout the plant to reduce the potential for structural and architectural failures which could pose safety hazards. The purpose of the proposed New Primary Tunnel Building Construction is to eliminate the permit required confined space and to replace severely corroded piping within the existing Primary Tunnel. The tunnel limits access to piping and equipment for maintenance or replacement and can become a safety hazard to plant personnel.

Project Description

Capital Improvement Projects 2019 consisting of the three following projects: Waste Gas Burner Upgrades - replacement of the existing waste gas burners at the Digester Building and Sludge Storage Tanks with state-of-the-art enclosed flares to meet current air emission permitting requirements. Miscellaneous Building Rehabilitation - Rehabilitation of various structures including concrete repairs and/or reconstruction in the Screen House, Old Chlorine Building, Chlorination Building, Aeration Gallery and Waste Gas Building; replacement of brick veneer panels and supporting walls on the Dewatering Building; replacement of the coping and brick facade on the Sludge Storage Tanks. New Primary Tunnel Building Construction - Construction of a new building adjacent to the existing Primary Tunnel at the influent end of the Primary Settling Tanks to eliminate the permit required confined space and replace severely corroded piping in the tunnel and installation of new primary sludge pumps.

The maximum allowable flow to be pumped from the New Providence plant to the Joint Meeting plant, via Summit's conveyance system, is 3.0 MGD.

Need for Project

The purpose of the proposed project is to reduce the impact that natural disasters like Hurricane Sandy could have on the facility in the future and to avoid loss of wastewater service. The proposed project is needed to incorporate resiliency to minimize potential future facility failures, service interruptions and/or loss of service, and to minimize future damages to the critical facility's infrastructure. In addition, the proposed project will decrease the risk for release of untreated sewage into the environment, thereby protecting public health and natural resources.

Project Description

This work generally includes the construction of the concrete pumping station, installation of five (5) main effluent pumps and seventeen (17) flow diversion knife gates, modifications to the existing outfall structures, and associated electrical and instrumentation work. Also included are the engineering services for the Facility Flood Report, Stormwater Isolation analysis, Benefit Cost Analysis report, Environmental Assessment Preparation, NJDEP & ACOE permitting, Project Coordination, NJIB Project Report & Permitting, Preliminary Plans, Geotechnical Services, Surveying Services, all of which have been completed. Phase II – Co-Generation Upgrade The work generally includes installation of two (2) new generator sets in the existing Co-Generation Facility and associated electrical and instrumentation work.

Service Area

The Joint Meeting's system serves an area of approximately 65 square miles. Wastewater is collected from the Joint Meeting's eleven members, one customer, and seven other communities. Member (owner) communities include all or portions of: East Orange, Hillside, Irvington, Maplewood, Millburn, Newark, Roselle Park, South Orange, Summit, Union and West Orange. The City of Elizabeth is served as a customer by the Joint Meeting. Joint Meeting's service and planning area's outer boundaries of its Wastewater Management Plan (WMP) are essentially the same, with the exception of the Borough of New Providence, the City of Summit and the Township of Berkeley Heights. New Providence owns and operates a wastewater treatment plant that receives all of the flow originating in New Providence and small sections of Summit and Berkeley Heights. The maximum allowable flow to be pumped from the New Providence plant to the Joint Meeting plant, via Summit's conveyance system, is 3.0 MGD.

Need for Project

The purpose of the proposed project is to reduce the impact that natural disasters like Hurricane Sandy could have on the facility in the future and to avoid loss of wastewater service. The proposed project is needed to incorporate resiliency to minimize potential future facility failures, service interruptions and/or loss of service, and to minimize future damages to the critical facility's infrastructure. In addition, the proposed project will decrease the risk for release of untreated sewage into the environment, thereby protecting public health and natural resources.

Project Description

This work generally includes the construction of the concrete pumping station, installation of five (5) main effluent pumps and seventeen (17) flow diversion knife gates, modifications to the existing outfall structures, and associated electrical and instrumentation work. Also included are the engineering services for the Facility Flood Report, Stormwater Isolation analysis, Benefit Cost Analysis report, Environmental Assessment Preparation, NJDEP & ACOE permitting, Project Coordination, NJIB Project Report & Permitting, Preliminary Plans, Geotechnical Services, Surveying Services, all of which have been completed. Phase II – Co-Generation Upgrade The work generally includes installation of two (2) new generator sets in the existing Co-Generation Facility and associated electrical and instrumentation work.

Project Name, Number

Howell Township
S344040-02
Sanitary Sewer System - New

Priority List Rank

249

County

Monmouth

Existing Population

51,075

Service Area

The service area for the project is the Freewood Acres section in Howell Township. Howell Township is located in south central Monmouth County and with a land area of 62.10 square miles and a population of approximately 51,198. The project will serve all commercial and residential properties on Route 9 north and south between Georgia Tavern Road/Hulses Corner Road and White Street. Residential properties will include all portions of Freewood Acres on the east and west side of Route 9. The east side will include Wilentz Avenue, Windeler Road between Georgia Tavern Road and the Board of Education property, Georgia Tavern Road from just east of Helen Avenue to Route 9 and all interior portions of the Acres. The west side will include Hulses Corner Road from Route 9 to Smith Street and all interior portions of the Acres. Water bodies and streams within the project area include two streams that flow into Snipes Creek, which leads to Aldrich Lake, and the Metedeconk River watershed.

Need for Project

The project will rectify the issue of failing septic systems within the project area. There are two Category 1 streams in Freewood Acres that flow into Snipes Creek, which leads to Aldrich Lake. The lake currently has very low oxygen attributed directly to the failing septic systems. The Metedeconk River watershed, and subsequently the Barnegat Bay, is also directly impacted by the septic systems in Freewood Acres, which is documented in the Metedeconk River Watershed Protection and Watershed Restoration Plan.

Project Description

This is a project to extend sanitary sewer service to the Freewood Acres section of the Township of Howell and along US Hwy 9 (Route 9) corridor, north of Freewood Acres. Residents of this area currently rely on a combination of wells and septic systems. The project will address ongoing issues that involve failing septic systems and noxious odors in Freewood Acres. The project will also provide a public sanitary sewer system for the commercial properties along Route 9.

Need for Project

The Parsippany-Troy Hills wastewater treatment plant treats sanitary sewer discharges prior to surface water discharge. This proposed project is intended to reduce the Townships reliance on conventional electric power generation methods by substituting a sustainable alternative source of power for the treatment plant which will result in environmental benefits not only in improved water quality but also improving air quality and less reliance on natural resources.

Project Description

The proposed project includes design and construction of a photovoltaic power system to provide energy to the wastewater treatment plant.

Provides Electricity to the Busch and Livingston Campus along with High temperature Hot water to the Busch Campus for Heating. It serves over 8.5 million square feet of space. Spaces include classrooms, lecture halls, laboratories and research

Need for Project

The project will save 8 million gallons per year of potable water

Project Description

Replacement of the power generating turbines with increased capacity and other related equipment upgrades will cost \$30 M. As a result, a conservative estimate of energy cost savings will be \$1 M per year, and Market Participation credits will provide rebates of \$1.86 M, for an effective savings of \$2.86 M in 2016 dollars. New technology will result in a 50% decrease in emissions and elimination of water usage, saving 8 M gallons of water per year.

Need for Project

Reduce potable water usage by 8 million gallons

Project Description

The turbines in the plant are at the end of their useful life and use an antiquated water injection system to reduce NOX, which is disallowed under current DEP rules. The turbines have become unreliable and fail regularly, requiring excess maintenance and repairs. Replacement will be required in the near term to maintain a functioning plant. The proposed project consists of: - Replace the 3 existing turbines with three (3) Solar Mercury 50 Turbines with Duct fired slant tube Heat Recovery Steam Generators with an increased capacity of 2.8MW - New Gas Compressor - New Controls and Connections - Switchgear - Alterations to accommodate installation of the larger sized turbines

Project Name, Number

Northfield City
S340508-04
Sanitary Sewer System Rehabilitation

Priority List Rank

253

County

Atlantic

Existing Population

8,624

Service Area

The entire City population will be serviced by the Asset Management Plan, approximately 1,044 residential connections(2,825 residents), numerous commercial connections plus the City of Northfield Community School which serves over 900 students.

Need for Project

The pump station rehabilitation will ensure that all up-stream pump stations will function and no catastrophic system failure will occur. If this station is down temporarily, by-passing must be implemented using diesel powered pumps to ensure that no sanitary sewer will back up into residents' basements and homes. The new proposed pumps are more energy efficient, therefore the station will use less electricity. Additionally, the proposed permanent gas fired electrical generator will ensure that the pump station will function during any power outage.

Project Description

The City is in need for Sanitary Sewer Asset Management Plan (AMP) to provide an assessment of routine maintenance requirements, opinion of system conditions, staffing requirements and provide replacement cost for budgeting purposes. Also Zion Road pump station was constructed more than 42 years ago which needs rehabilitation, this station consists of wet well to collected the effluents and a deep dry well to house the pumps, valves , alarms and controls. This stations is not running close to its design capacity and in reality it is antiquated due to the setup and the age of this station. The Municipal Public Works Department needs to inspect this station almost on a daily basis, and two employees need to be on site because of the OSHA requirements which puts a strain on the small department. This station receives flows from three pump stations servicing 1,044 homes (30% of Northfield Households) and the Community School and numerous retail establishments and professional offices.

The drainage improvements proposed impact the Mystic Island section of the Township between Radio Road and the end of the cul-de-sac at Twin Lakes Boulevard.

Need for Project

The proposed work is necessary to improve the existing storm drainage infrastructure that is mostly comprised of corrugated metal pipe (CMP) approximately 40 to 50 years old that is deteriorating and undersized to handle the contributing drainage flow. Water quality will be impacted through the potential reduction of sediment and other particulates that would normally accumulate in area properties and roadways after storm events and then drain into the existing collection system, which would ultimately be discharged into uncoded tributaries that feed Big Creek, a Category 1 waterbody according to the NJDEP's Digital GeoWeb Data. Big Creek flows into the Great Bay, which is part of the Mullica Watershed Management Area, and is adjacent to the Barnegat Bay Watershed Management Area.

Project Description

The Township proposes to remove the existing stormwater drainage collection system, which consists of approximately 6,826 linear feet of drainage pipe, 83 inlets, 4 manholes, and 290 linear feet of bulkhead at 13 outfall locations. The Township will replace the above items with a new reconfigured stormwater drainage collection system, which will consist of 8,915 linear feet of new drainage pipe, 112 new inlets, 4 new manholes, 12 new inline check valves, 290 linear feet of new bulkhead at 13 outfall locations, and the restoration of paved and un-paved areas.

Need for Project

NJDEP has included a condition in the NJPDES permit requiring the AWWTP to monitor and record the levels of bromodichloromethane in its Discharge Monitoring Report (DMR). Though no violations are to be levied at this time, limits of bromodichloromethane were established. If these limits are exceeded, the Borough needs to provide a plan addressing the steps that need to be taken to meet the requirements in the next permit renewal. The major source of bromodichloromethane in wastewater is the addition of chlorine prior to discharge from the AWWTP. The Borough is considering replacing the current chlorine disinfection system with an ultra violet disinfection system to greatly reduce or possibly eliminate the potential production of bromodichloromethane.

Project Description

The existing chlorine contact chambers will be replaced by the UV disinfection system. Since there are two chambers the conversion will be completed in two phases. This will allow for continuing disinfection while the first chamber is modified to accept the UV unit. Once completed the second chlorine contact chamber will be modified to accept the second UV disinfection unit. When completed the AWWTP will not be utilizing chlorine for disinfection and the possibility of producing Bromodichloromethane will be eliminated.

Need for Project

The digester is used for holding, blending and digesting bio-solids. Currently, the digestion time is insufficient to meet the needs of the system. Construction of a second anaerobic digester will allow for longer detention time which will result in an increase of solids content and biogas creation and decrease in organic matter that will need to be processed. The second digester will decrease upkeep costs, increase system efficiency and allow continuous use of the system during maintenance and repairs.

Project Description

The Borough is proposing the construction of a second anaerobic digester. This will allow longer detention time for the solids sent to the digester thus allowing for extended digestion time and an increase of solids content. This will be a benefit to the Borough and their treatment and disposal of biosolids. This also provides for duplicity of treatment for the maintenance and upkeep of each digester. The Borough proposes to construct a second anaerobic digester on-site to provide not just duplicity but to allow for extended detention time for increased digestion and percent solids.

Need for Project

Stormwater runoff is the most common way that nonpoint source pollution reaches local rivers creeks and other water ways including Barnegat Bay. If the runoff is not absorbed by soil and vegetation or by other measures rainwater carries chemicals nutrients sediments and other forms of nonpoint source pollution into surface waters.

Project Description

The proposed project includes the purchase of a regenerative air sweeper.

Service Area

The service area consists of the drainage area that discharges to each individual outfall. The service area is mainly comprised of County roads and residential neighborhoods. The drainage area acreage has been provided in the Environmental Planning Document.

Need for Project

The water quality need for this project is to remove total suspended solids and float-able pollutants from the storm water system prior to discharging runoff into the Toms River in an effort to improve the water quality of Barnegat Bay.

Project Description

Manufactured Treatment Devices will be installed within existing storm water systems immediately upstream of various outfalls along the north side of the Toms River and along lagoons and tributaries to Barnegat Bay.

Need for Project

Barnegat Bay has been classified as highly eutrophic by both state and federal authorities. This eutrophication which continues to threaten ecological health of the Bay is particularly the result of excessive pollutant loading. Total suspended solids have been identified as one of the primary pollutants that can adversely affect the quality of water in the Bay. Reductions in the amount of total suspended solids floatables and other harmful pollutants delivered to the Bay by streams and waterways are primary objectives of both the Barnegat Bay Partnership and the New Jersey Department of Environmental Protections (NJDEP) Barnegat Bay Initiative. The need for the proposed project is evident in the fact that it is intended to reduce stormwater-borne total suspended solids and floatables from a highly developed drainage areas that discharge directly into the Barnegat Bays stream network.

Project Description

Construction of a regional automated truck wash for use by County Departments and municipalities. Currently there are no privately operated truck wash facilities in the County and only two public facilities which are both located in the northern part of the County. This facility would serve the needs of the southern part of the County. Recycling of the washwater will be incorporated into the design.

Need for Project

The project is needed to (1) enable compliance with the future stringent effluent limitation for total phosphorus and thereby improve water quality and (2) to enhance the reliability of performance and compliance and thereby protect water quality.

Project Description

This project consists of upgrades to enable compliance with a future more stringent effluent limitation for phosphorus by the addition of a chemical storage and feed system automate the biological nutrient removal process and thereby minimize chemical consumption implement additional SCADA improvement to enhance monitoring and control modify and improve return and waste sludge pumping systems implement oxidation ditch structural and mechanical improvements and add effluent filtration to enhance the overall reliability of compliance.

Service Area

The service area consists of the drainage area collected by the storm water pipe system that is being retrofitted and treated by the manufactured treatment device, although the population being served and benefiting from this project would be the people who live near and/or use Barnegat Bay.

Need for Project

Barnegat Bay has been classified as highly impaired by both state and federal authorities. The ecological health of the Bay continues to be threatened by excessive nutrient loading and non-point source pollution. Total suspended solids have been identified as one of the primary pollutants that can adversely affect the quality of water in the Bay. Reductions in the amount of total suspended solids, floatables, and other harmful pollutants delivered to the bay by streams and waterways are primary objectives of the New Jersey Department of Environmental Protection's (NJDEP) Barnegat Bay Initiative. The need for the proposed project is evident in the fact that it is intended to reduce stormwater-borne suspended solids and floatables from highly developed drainage areas that discharge directly into the Barnegat Bay's stream network.

Project Description

The proposed project involves retrofitting 5 existing storm water conveyance systems to include Manufactured Treatment Devices (MTD) for the purpose of removing total suspended solids and floatables from storm water runoff prior to entering Barnegat Bay.

County

Monmouth

Existing Population

65,923

Service Area

The WMUA provides sewage disposal services to the Townships of Manalapan and Marlboro, the Borough of Englishtown and a portion of the Township of Freehold.

Need for Project

The improvements proposed under WMUA's capital work program are largely necessitated to maintain continued operation of the existing treatment process and to minimize the possibility of potential failure of treatment plant components. Failure of treatment plant components would result in a violation of the WMUA's New Jersey Pollutant Discharge Elimination System (NJPDDES) permit and may also potentially result in sewage spills and/or surcharge of the system, causing a hazard to the adjacent Pine Brook.

Project Description

WMUA proposes various improvements to several treatment unit processes under the proposed Pine Brook Sewage Treatment Plant Improvements Project. These include improvements to its raw sewage pumping station; replacement of its existing plastic lined equalization basin with a new concrete tank; replacement of its six (6) pressure filter tank vessels; improvements to its existing digester building HVAC equipment; and replacement of its existing digester system piping and valving.

Service Area

City of Vineland part of Franklin Township and part of Pittsgrove Township

Need for Project

Facility was previously upgraded under a federal Construction Grant as Project No. C340461-02-2 and TWA SO-8-86-6073 without grit and scum removal. Under existing conditions the influent flow is pumped twice and this is inefficient. The project will result in one central pumping facility with gritscum removal which will improve the operational reliability of downstream treatment units.

Project Description

Construction of four (4) 60-inch diameter open flight screw pumps (archimedes screw) for a design flow of 12.2 MGD and peak of 24.3 MGD. Each screw capacity will be 8.1 MGD with one unit as standby. Due to the efficiency of the screw pump estimated power savings would be \$10000yr. Metering will be by two Parshall flumes chart recorded and mechanical barscreens. The gritgrease removal system will consist of a 3.2 x 36 meter grease removal channel and a 3.4 x 36 meter grit removal channel with the associated mechanical and aeration systems. A biofilter will be constructed to control odors from the proposed enclosed screw pumps as well as the headworks facility.

Existing Population

0

Service Area

The Cumberland County Utilities Authority (CCUA) service area includes a population of approximately 30,000 and wastewater flow from Bridgeton City, Deerfield Township, Fairfield Township, Hopewell Township, Shiloh Borough and Upper Deerfield Township.

Need for Project

The proposed improvements will extend the useful life of the critical treatment infrastructure and improve the efficiency and secondary treatment process. This work will ensure that the CCUA can continue to provide the critical treatment of wastewater flows generated throughout the service area.

Project Description

The work will include the rehabilitation of all concrete surfaces, interior and exterior, within the diversion chambers, equalization basin, primary clarifiers, aeration tanks, secondary clarifiers and chlorine contact tanks. This work will address structural deficiencies, concrete cracking, surface deterioration and exposed reinforcement to protect against additional corrosion and deterioration. In addition to the concrete rehabilitation, work will include the replacement of couplings and piping within the aeration tank to replace failed lengths of piping and the replacement of inefficient blowers. The CCUA also wishes to commence asset management planning efforts as well as feasibility evaluations for this and future Capital Improvements under this loan application.

Project Name, Number

Lacey Township
S344140-02
Stormwater Management - Gray Infrastructure

Priority List Rank

273

County

Ocean

Existing Population

28,273

Service Area

The population served by the project is the Township of Lacey, a 98.53 square mile coastal town in Ocean County, New Jersey. The southeasterly portion of the Township will benefit from the project, as measures will be implemented to replace aging infrastructure. The project is located on public property in a man-made lagoon. The project site is located between Yacht Basin Plaza North and Yacht Basin Plaza South and east of Lakeside Drive East, with the surrounding land uses being a mix of commercial and residential. The marina is located at the northern edge of a peninsula between the North Branch of the Forked River (north) and Middle Branch of the Forked River (south).

Need for Project

There are signs of erosion landward along the bulkhead, sinkholes form and cause safety hazards. The DPW routinely fills in the sinkholes to maintain public safety and structural integrity of the bulkhead and roadway. This erosion impacts the stability of the existing stormwater infrastructure and the surrounding area. Reconstruction of the bulkhead will rectify a safety and structural stability issue and eliminate the pollution and sedimentation caused by the breaches through the existing bulkhead. Elevation of the bulkhead will mitigate flooding in the project area. Due to local geography and proximity to the ocean, Lacey is susceptible to coastal flooding. The adjacent streets are some of the lowest road elevations in the Township. The project will tie into a similar bulkhead along Lakeside Drive East being replaced under a separate project. The project will also assist in reducing float-able pollutants, which is a result of bulkhead erosion, being discharged into the river.

Project Description

This is a Stormwater Management - Green Infrastructure project that impacts the Barnegat Bay Watershed. There is also a resiliency component to the project. The project includes bulkhead reconstruction and elevation, and stormwater conveyance improvements. The new bulkhead will be elevated from the existing conditions, providing a resiliency component to the project by reducing nuisance flooding of the marina area and adjacent residential neighborhoods. Stormwater conveyance infrastructure in the project area will be retrofitted and/or replaced to improve quality of runoff and reduce backflow from the lagoon. The plan also calls for elevation of the surrounding roads and utility infrastructure (power supply, potable water), further enhancing the resiliency aspect of the project. The Township is also considering improvements to the restroom building parking area across Yacht Basin Plaza South from the Marina.

Need for Project

This project is needed for water quality protection by ensuring the MWPCF's ability to continue providing reliable NJPDES Permit compliance into the future.

Project Description

This project consists of improvements to the Molitor Water Pollution Control Facility to replace or repair aging infrastructure which together with the installation of new effluent filtration facilities will enhance performance reliability, resiliency, and efficiency while also reducing the chemical cost of complying with the new effluent limit for phosphorus. This project will not increase the permitted capacity of the MWPCF

Need for Project

Stormwater runoff is the most common way that nonpoint source pollution reaches local rivers creeks and other water ways including Barnegat Bay. If the runoff is not absorbed by soil and vegetation or by other measures rainwater carries chemicals nutrients sediments and other forms of nonpoint source pollution into surface waters.

Project Description

The proposed project includes retrofitting storm drain inlet.

Stormwater Management - Gray Infrastructure

Priority List Rank

276

County

Ocean

Existing Population

11,045

Service Area

Borough of Beachwood

Need for Project

The Borough is located on the Toms River which discharges directly into the Barnegat Bay. The runoff from the Beachwood Beach outfall consists of storm water from the wooded and paved areas in the drainage area. The catch basins upstream of the outfall do not have the capability to reduce suspended solids. The hydrodynamic separator is the logical BMP at this location due to the close proximity of the drainage area to the river and the lack of space in this developed area to provide a storm water management basin or other facility to intercept and treat solids, sediments and other pollutants. Evidence of a water quality based need for measures to reduce non-point pollution in Beachwood Borough is provided by the results of testing for water quality at the Beachwood beaches. In many cases the water quality of many beaches is adversely impacted by contaminated storm water runoff. Information published by the National Resources Defense Council in Testing the Waters, 2010 listed the Beachwood Beach West in a list of 15 beaches in the nation with more than 25 samples exceeding the EPAs Single Sample Maximum Standards for designated beach areas each year, 2006- 2009. In 2009 alone, of 47 samples at the Beachwood Beach west, the EPA maximum standards were exceeded over 50% of the time. The outfall is located near the Borough beach and serves as the discharge point for the associated parking area . The drainage is 4.65 acres and includes paved areas.

Project Description

The proposed project includes relocating existing outfall pipe #1 and #2 and installing lift station (pump station) to accommodate the outfall relocation in order improve water quality and stormwater flooding.

Service Area

The service area that will be affected by Phases I, II, and III of this project is the North western portion of the City of Wildwood. This includes water service areas that are north of Park Boulevard and west of Cedar Avenue. Phases 1, 2, and 3 will collectively include the replacement of sanitary sewer main on the following streets: Cresse Avenue Hildreth Avenue Bennett Avenue Leaming Avenue Hand Avenue Taylor Avenue Andrews Avenue Burk Avenue Montgomery Avenue Baker Avenue Roberts Avenue Garfield Avenue Lincoln Avenue Mediteranean Avenue Susquehanna Avenue Hudson Avenue. They will also collectively include the replacement of storm water pipe on the following streets: Cresse Avenue Hildreth Avenue Bennett Avenue Leaming Avenue Hand Avenue Taylor Avenue Andrews Avenue Burk Avenue Lincoln Avenue Niagara Avenue Susquehanna Avenue Hudson Avenue. Additionally, the proposed storm water pump station (Phase 2) is located adjacent to Susquehanna Avenue and Taylor Avenue.

Need for Project

The purpose of this project is to replace the City's aged sanitary sewer main system in phases, as well as install storm water piping and pump stations. The sanitary sewer work will serve as a rehabilitation of the existing system by replacing sanitary main in the areas indicated in the service area description, so to properly maintain the City's existing system. The storm water work will serve as construction of new piping and pump stations which will serve the purpose of alleviating the severe flooding this portion of the island experiences, as well as being a measure to improve the infiltration due to flooding. Both purposes would greatly improve public safety.

Project Description

The City of Wildwood is proposing to replace the outdated sanitary sewer, water and storm drainage systems throughout the City in a seven (7) phase plan. The proposed sanitary sewer work will be primarily to update the currently outdated/failing system. The proposed water work will include the replacement of water main and services that are also currently outdated and failing. The proposed storm drainage work will include the installation of new storm water pipe throughout various areas of the City where it does not currently exist, as well as the construction of three (3) storm water pump stations. Each of the seven (7) phases will involve either milling and overlaying or full-depth reconstruction of the affected roadways as well. This application is being submitted to request a loan for the clean water-related (sanitary sewer and storm water) portion of Phases 1 - 3 of this seven (7) phase plan.

Little Silver Lake drains an approximate 250 acre watershed which include a state highway and several county roads. Improvement of the drainage will effect the area and the traveling public that utilizes the roadway network in the area.

Need for Project

Dredging the lake will remove the sediments that have accumulated for decades within the lake as well as decaying organic matter that might be present. The dredging will improve the depth at the inflow of the lake and improve circulation thereby benefiting water quality.

Project Description

Dredging of Little Silver Lake to remove accumulated sediments and storm sediments from the lake. In addition, reconstruct the existing failing bulkhead at the west end of the lake and replace the dilapidated weir structure that serves to regulate the lake water surface elevation. Finally provide for the installation of self regulating tide gates to provide resiliency and storm protection from higher tide events.

Roosevelt Borough
S340761-04
Sewage Treatment Plant (STP) - Improvement/Upgrade

Priority List Rank

285

County

Monmouth

Existing Population

882

Service Area

The entire Borough of Roosevelt.

Need for Project

The concrete structure for the trickling filters has deteriorated and is in a condition where they must be replaced. The mechanical equipment including nozzles and the plastic media are past their useful life and they must be replaced to operate the WWTP to meet permit conditions. It is in the best interest of the Borough to replace the trickling filters with either new units or utilize an alternate method of either an attached growth or suspended growth process. Due to limited space, the project will be phased to keep one trickling filter online while the second is taken offline and demolished. Once the first unit is replaced, the second unit will be taken offline and it will be replaced.

Project Description

The existing trickling filters at the Borough of Roosevelt's Wastewater Treatment Plant (WWTP) are at a point of requiring replacement. The concrete structures have developed structural cracks and the filter plate has deteriorated to the point that aggregate (stones) from the concrete are entering the recirculating pumps and causing damage to the impellers and clogging of the pumps. Due to the age and use of existing trickling filters, the plastic media is failing and the mechanical equipment is operating poorly and the nozzles are clogging. The trickling filters will be replaced with Rotating Biological Contractors (RBC) or other attached growth process to replace them. This will require a project performed in phases as only one trickling filter can be taken out of service and demolished at a time to allow for construction of the RBC. In addition, the recirculation pumps will be replaced, the pump chamber modified to allow for new pumps, and to replace outdated controls.

Sewage Treatment Plant (STP) - Improvement/Upgrade

Priority List Rank

285

County

Monmouth

Existing Population

882

Service Area

The Borough of Roosevelt.

Need for Project

The controls for the STP were installed in the early 1990's and utilize mercury switches and outdated level controls. The technology has changed and the existing equipment and controllers are difficult to replace and locate each time they need to be replaced. The replacement of the controls has become a necessity for the proper and efficient operation of the STP.

Project Description

The Borough STP control system utilizes mercury switches and mercury controls. Replacement of parts has become difficult and the components are in need of repairs and improvements. The Borough has decided to undertake the replacement of the STP controls with present technology and equipment.

Project Name, Number

Jersey City Municipal Utilities Authority
S340928-48
Sanitary Sewer System Rehabilitation

Priority List Rank

286

County

Hudson

Existing Population

247,597

Service Area

Jersey City is located in south central Hudson County and has a land area of 14.79 square miles. The rapidly growing population is estimated at 262,075. The city is bounded by the Hackensack River and Newark Bay to the west, the City of Bayonne to the south, the City of Hoboken to the north, and the Hudson River to the east. Land use within the project area is categorized as urban residential, high density or multiple dwelling, commercial/services, railroads, industrial, other urban or built-up land, and mixed urban or built-up land.

Need for Project

It is essential the aging infrastructure be replaced or rehabilitated. The selected sanitary sewers have significant damage and deterioration, as was determined through a televised inspection of the sewers. Without action, there is the potential for collapse of these existing sewer mains which would leave all the associated residents without sewer service. Additionally, infiltration of groundwater into the sewers reduces capacity of all downstream pipes, which may restrict or prohibit future development. The added flow caused by infiltration and inflow also causes a burden on the receiving treatment plant. Rehabilitation of these sewer mains, as opposed to replacing the mains outright, will mitigate inflow and infiltration while limiting negative impact to the community.

Project Description

This project consists of the rehabilitation of approximately 3,700 linear feet (L.F.) of existing sanitary sewer main at four (4) locations in Jersey City, Hudson County, New Jersey. 1. Tonnele Avenue; 2. Montgomery Street; 3. Manhattan Avenue; and 4. Kennedy Boulevard. The selected sections of sewer main have shown increased deterioration due to the close proximity to New Jersey Transit railways. Rehabilitation of the sewer mains will be performed utilizing trenchless technology.

Service Area

This project services the Ewing Township section of the Ewing Lawrence Sewerage Authority's Sanitary Sewer Collection System. The immediate area in the vicinity of the Fourth Street Pump Station services a combination of residential and commercial customers.

Need for Project

The existing Fourth Street Pump Station's equipment has reached its useful life and the existing dual force main has also deteriorated, therefore improvements to each part of the sewerage collection system is required to maintain the sewer service area.

Project Description

The purpose of the project is to rehabilitate an existing pump station and deteriorating force main piping in the stream corridor, resulting in improved water quality and public health and safety along the Shabakunk Creek.

County

Essex

Existing Population

1,535,586

Service Area

PVSC serves 48 municipalities in portions of Bergen, Essex, Hudson, Passaic and Union Counties.

Need for Project

The PVSC's cleaning, inspection and/or repair of its Main Interceptor Sewer, Branch Interceptor Sewers, Lateral Sewers, Local Sewer Connections, manholes, regulator chambers, and Venturi meters will ensure that PVSC continues to reliably convey wastewater efficiently and effectively via an upgraded conveyance system to minimize the potential for sewage leakage into the environment in accordance with NJDEP requirements. The proposed improvements will have no effect on wastewater management planning since there are no proposed changes to the NBTP flows as currently permitted. Water quality will be improved as a result of this program through the repairs to conveyance system components that are at or nearing the end of their useful life.

Project Description

This program involves rehabilitating existing sewage conveyance and related infrastructure that is in need of repair and due to capital construction costs will be divided into multiple contracts that will be bid at separate times, spread over a four (4) to five (5) year window.

County

Hunterdon

Existing Population

1,500,000

Service Area

The Round Valley Reservoir is part of Raritan Basin System, which provides the basic source of raw water supply to a number of public and private water utilities serving more than 1,500,000 people in central New Jersey. It is located in Clinton Township, Hunterdon County and is filled by pumping with water from the South Branch of the Raritan River via the Authority-owned South Branch Pumping Station. Water is released into the South Branch of the Rockaway Creek, a tributary to the main stem of the Raritan River or water is released to the South Branch of the Raritan River. The released water helps to maintain minimum passing flows in the South Branch and main stem Raritan River.

Need for Project

The integrity of the structures in the Spruce Run-Round Valley Reservoir system is integral to compliance with the requirement to maintain minimum passing flows in the Raritan River at 3 locations. Passing flows maintained by releases from the outlet structures at Round Valley and Spruce Run maintain ecological health of the river. Permitted discharges from downstream wastewater treatment plants also rely on these passing flows, therefore, the reservoir structures protect water quality. Catastrophic failure of these structures would result in the inundation of many downstream land uses including critical wastewater infrastructure. Refurbishing the structures now will provide long term risk reduction and increased resiliency for vital downstream infrastructure including water and wastewater treatment plants. Engineering design standards have advanced since the structures were designed and built.

Project Description

Decrease seepage by grouting at abutments; enhance, replace and/or install additional filters and drainage improvement features (chimney drain); install and improve instrumentation; flatten slopes to increase stability; remove and replace previous repairs to south structure; reestablish survey monumentation; install and improve security cameras; repair leak near the invert of the south tower; replace 10-inch pipe connecting force main and south valve vault; study, repair, replace and/or abandon low-level valve release; full inspection of all reservoir structures; rehabilitation of pumps #4, #5, #7, and #8 at South Branch Pumping Station; refill reservoir by pumping.

Need for Project

The CCMUAs Administration Building and Support Services Building houses their essential workers and provides a hub for communication, coordination and administration of services required to maintain compliance with all water quality rules and regulations.

Project Description

Fire safety, HVAC, roofing and interior renovations to both the Administration Building and the Support Services Building.

Existing Population

500,000

Service Area

Wastewater is primarily collected from the Joint Meeting's eleven member and four customer communities. Small portions of two neighboring communities (Berkeley Heights and Linden) are also served. Members (owned) communities include all or some parts of: East Orange, Hillside, Irvington, Maplewood, Millburn, Newark, Roselle Park, South Orange, Summit, Union and West Orange. The City of Elizabeth and portions of Livingston, Orange, Berkeley Heights, Linden, and New Providence are currently served as customers by the Joint Meeting.

Need for Project

The purpose of the proposed project is to reduce the impact that natural disasters like Superstorm Sandy could have on the facility in the future and to avoid loss of wastewater service. The proposed project is needed to incorporate resiliency to minimize potential future facility failures, service interruptions and/or loss of service, and to minimize future damages to the critical facility's infrastructure. In addition, the proposed project will decrease the risk of flooding which would otherwise cause a release of untreated sewage into the environment, thereby protecting public health and natural resources.

Project Description

The project generally consists of rehabilitation of the existing Army Corps of Engineers (ACOE) Stormwater Pumping Station including the removal of existing equipment, modifications to the existing pumping station structure, installation of three (3) new storm water pumps and discharge piping, replacement of two (2) existing sluice gates and installation of two (2) new sluice gates, modifications to the existing storm water piping influent to the pumping station, replacement of storm water inlet gratings, installation of a new seal water service to the pumping station, installation of new electrical power to the pumping station, and site restoration.

Service Area

Maplewood, Millburn, Newark, Roselle Park, South Orange, Summit, Union and West Orange. The City of Elizabeth and portions of Livingston, Orange, Berkeley Heights, Linden, and New Providence are currently served as customers by the Joint Meeting.

Need for Project

The purpose of the proposed project is to reduce the impact that natural disasters like Superstorm Sandy could have on the facility in the future and to avoid loss of wastewater service. The proposed project is needed to incorporate resiliency to minimize potential future facility failures, service interruptions and/or loss of service, and to minimize future damages to the critical facility's infrastructure. In addition, the proposed project will decrease the risk of flooding which would otherwise cause a release of untreated sewage into the environment, thereby protecting public health and natural resources.

Project Description

The project generally consists of rehabilitation of the existing Army Corps of Engineers (ACOE) Stormwater Pumping Station including the removal of existing equipment, modifications to the existing pumping station structure, installation of three (3) new storm water pumps and discharge piping, replacement of two (2) existing sluice gates and installation of two (2) new sluice gates, modifications to the existing storm water piping influent to the pumping station, replacement of storm water inlet gratings, installation of a new seal water service to the pumping station, installation of new electrical power to the pumping station, and site restoration.

Service Area

The municipalities of Absecon Brigantine Egg Harbor City Egg Harbor Township Galloway Hamilton Linwood Longport Margate Northfield Pleasantville Somers Point Ventnor Port Republic and Weymouth Township

Need for Project

The ACUAs regional collection system has 20 pumping stations throughout the county. These pump stations are often housed at the sites of former municipal treatment works facilities that were in operation prior to the regionalization of the county system in 1978. The ACUAs pump stations require significant amounts of energy to send the wastewater collected in the local municipal sewer systems throughout the eastern portion of Atlantic County to the ACUA treatment plant in Atlantic City. The ACUA believes that the installation of solar photovoltaic electric generation system (PV System) at these pump stations can provide a considerable benefit to the system ratepayers. By installing PV Systems at the pump stations the ACUA would see significant savings in its electricity bills at the pumping stations. These savings will ultimately be passed along to the systems ratepayers.

Project Description

The proposed project includes the installation of solar photovoltaic generation at 8 of ACUAs pump stations.

Atlantic

Existing Population

0

Service Area

The ACUA Wastewater Treatment Plant services 14 participating communities (Absecon - 9,137, Atlantic City - 38,497, Brigantine - 7,716, Egg Harbor City - 4,396, Egg Harbor Twp. - 47,842, Galloway Twp. - 37,813, Linwood - 6,971, Longport - 893, Margate - 5,317, Mays Landing (Hamilton Twp) - 5,603, Northfield - 8,434, Pleasantville - 20,629, Somers Point - 10,469, & Ventnor - 9,210) along with outside sludge customers that bring their sludge to ACUA's facility. Note: Population totals shown are from 2020 Census. The ACUA Pleasantville Pump Station services the following communities: Somers Point, Linwood, Northfield, Pleasantville, Absecon, Galloway, Egg Harbor City, and portions of Egg Harbor Township.

Need for Project

The Pleasantville Pump Station is the largest pump station in the ACUA's collection system, collecting pumping 11 MGD of raw sewage to ACUA's Wastewater Treatment Plant in Atlantic City. The pump station was constructed in the mid-1970s and is in need of upgrades. Upgraded equipment and systems will be more efficient and reliable, ensuring continued, service for ACUA's customers.

Project Description

The Pleasantville Pump Station is the largest pump station in the ACUA's collection system, collecting and pumping 11 MGD of raw sewage to ACUA's Wastewater Treatment Plant in Atlantic City. The Pleasantville Pump Station Upgrades project will include replacement of: (4) existing 200 HP pumps, variable frequency drives, electrical main distribution panel, motor control center panel, HVAC components, painting of all rooms, protective coatings for the wet wells, replacement of lighting fixtures with LED fixtures, and other miscellaneous items.

Service Area

The Authority's service area includes 11 municipalities including the Borough's of Allendale, Ho-Ho-Kus, Midland Park, Ramsey and Waldwick. Partially served are the municipalities of Mahwah, Wyckoff, Saddle River, Upper Saddle River, Franklin Lakes and Ridgewood.

Need for Project

The Security System Upgrades Project is a result of needs identified through a security audit performed to assess vulnerabilities at the Authority's sewage treatment plant and pump stations, all of which are located adjacent to various water bodies that could be impacted should failure occur.

Project Description

This project includes implementation of various safety and security measures at the Authority's sewage treatment plant and pump stations. Proposed improvements include the repair and/or replacement of fencing, installation of bollards around critical structures, enhancing the existing Intrusion Detection System, adding and/or relocating security cameras and installing new door hardware.

Service Area

The entire SMRSA service area will benefit from this project. Generally speaking the service area includes the south eastern section of Monmouth County, bounded by the Shark River to the North, The Manasquan River to the South, and State Highway Route 34 to the West.

Need for Project

The project is needed in order to continue to provide reliable "secondary" wastewater treatment service and maintain compliance with the SMRSA's existing NJPDES permit.

Project Description

SMRSA currently owns and operates two 184 ft. diameter trickling filters .Each of the filters are equipped with four hydraulically propelled distribution arms which span roughly 87 ft in length and are supported by five (5) 1 to 1.25 diameter guy rods. The rotary distribution arms are original equipment, were constructed of painted galvanized steel, and have been in operation since 1977. In accordance with the SMRSA's Asset Management goals and objectives and based upon condition assessments, SMRSA staff has prioritized the replacement of the Rotary Distribution Arms and guy rods on the two (2) existing trickling filters, as well as blasting/coating of the existing center column assemblies.

Service Area

The KMUA service area within the project limits includes the South Kearny section of Town. There are no residential connection to their system, KMUA serves 63 industrial/commercial customers. The project area begins with the Kearny Point Pumping Station which is located approximately 1,000 feet North of the confluence of the Passaic and Hackensack Rivers. The project area then continues North on Central Avenue and ends at Pennsylvania Avenue. The project area consists of land use associated with transportation and commercial/industrial uses and is currently fully developed. The project is necessary to provide adequate wastewater service in order to promote and achieve the objectives for redevelopment in accordance with State Smart Growth Initiatives.

Need for Project

For Central Ave & Pennsylvania Ave, - The seven leaking sanitary sewer defects are recommended for chemical grouting, sewer repair by chemical grout injection, replacement of app - The five identified manhole defects have been recommended for grouting and patching. It is also recommended to perform blockage removal of the forty-six sewers with a combined length of approximately 18,000 FT to remove the debris estimated within these sewers to achieve the design flow rates and velocities. For KMUA's Kearny Point Pumping Station, two chain and flight type grit collector mechanisms (one for each channel) will be installed in-kind as duplicates. The option of using corrosion resistant material for the new chain and flights will also be reviewed. The chain and flight equipment will consist of the following: Sprockets, Bearings, Scarfers, Drive Chain Guards, Hardware and Anchors, Shear Pin Limit Switch, Shafting, Drive Chain, Return tracks and track brackets, Proportional weirs

Project Description

The proposed project involves the rehabilitation of the Central Avenue and Pennsylvania Avenue Sewers in the City of Kearny, Hudson County. The Central Avenue Sanitary Sewer Inspection and Condition Assessment Study as well as separate CCTV inspections performed on Pennsylvania Avenue identified various sewers to be targeted for heavy blockage removal, additional CCTV inspection and pipe and joint sealing, as well as manhole and pipe repairs and the replacement of an ACP and VCP pipe section along Pennsylvania Avenue. At KMUA's Kearny Point Pump Station, the mechanical components of the existing grit collector system in the wet well are no longer operational due to corrosion. This portion of the project involves engineering design and construction phase services for the in-kind replacement of the chains and flights. With this project, KMUA will be reducing the I&I that enters the system and is conveyed to PVSC which is a CSO system.

Need for Project

While the CCMUAs Sicklerville sewage treatment plant does meet its NJPDES permit limits the permit limits exceed the normal standards required for discharges into the groundwater of the Pinelands National Reserve because the plant happens to be just outside the Pinelands area. Thus the plant is discharging compliant treated sewage into the groundwaters of the PNR at levels that are much higher than the normal Pinelands limits. This project will result in the elimination of the CCMUAs Sicklerville sewage treatment plant which currently discharges treated sewage into the groundwaters of the Great Egg Harbor River and the Pinelands National Reserve. This project will eliminate this discharge and convey the flow to the CCMUAs Delaware No.1 WPCF for treatment.

Project Description

The proposed project includes instalation of aproximately 7200 feet of 8 and 15 inch PVC sanitary sewer gravity pipe.

Service Area

The Service area for the WWTF is located in East Mendham and includes the Drakewick Condominium Association area of the Township. This association includes the Condominium buildings located off of Devonshire lane as well as the single family homes on Devonshire Lane, Walsingham Road, Trimmingham Court, Langford Drive, Wainwright Road, Pender Hill Road, Knapton Hill Road, Govenors Drive and Olmstead Lane. There are a total of 104 residential units connected to the facility.

Need for Project

Based upon a review of past historical DMR data for the facility, the existing wastewater treatment facility is very inefficient in how treatment is performed and therefore is proposed to be replaced. The break-point chlorination system is antiquated technology which is labor intensive to run and uses large volumes of corrosive and dangerous chemicals. Because of this, the treatment system does not always meet groundwater quality standards. Pollutant concentrations, which have adversely affected the condition of the effluent disposal system (it has already needed to be replaced) can also negatively impact groundwater quality. The new biological treatment system proposed is based on best available wastewater treatment technology and with proper operation will be capability of meeting NJ DEP discharge permit limits, thereby improving groundwater quality at the site and surround watershed area.

Project Description

The conversion of the existing break point chlorination STP to a more conventional biological treatment process would reduce total energy consumption at the STP in several ways. First, as the existing plant uses liquid chlorine to physically oxidize the raw waste, this process requires a lot of energy, has a very large carbon footprint and is very inefficient. In addition, all the pumps, blowers and motors at the facility are not premium efficiency rated as they were installed in 1987. The upgrade will reduce total energy consumption because large volumes of chlorine will no longer be needed in the treatment process (thereby saving almost 45,000 pounds per year of greenhouse gas emissions related to the chlorine generation alone). In addition all the new process motors will be premium efficiency motors, thereby reducing the electrical demand at the facility related to the pumps, air blowers and motors.

Service Area

The service area for this project is the Drakewick neighborhood, consisting of 104 households. Drakewick is located on the eastern side of Mendham Township.

Need for Project

The project is focused on repairing existing effluent disposal systems associated with a wastewater discharge. The project is needed to protect public health and the environment.

Project Description

Project consists of the "in-kind" replacement of the Mendham East Wastewater Treatment Facility's lower effluent disposal system. Existing lower effluent disposal systems are in a state of hydraulic failure and require complete replacement. Repair will be based on removing and legally disposing the existing effluent disposal system and replacing with an in-kind replacement with no expansion. This work will be performed under a change order to the Mendham East Wastewater Treatment Facility contract that received a CLP in the amount of \$2,295,125 under Project Number S340477-01 in April 2017. The project is focused on repairing existing effluent disposal systems associated with a wastewater discharge. The project is needed to protect public health and the environment.

Service Area

The LBSA service area covers approximately 5.36 square miles in central eastern Monmouth County, New Jersey. The area is bounded by the Ocean to the east; Monmouth Beach and Oceanport to the north; Oceanport, West Long Branch and Ocean Township to the west; and Ocean Township and Deal to the south. The land area breakdown contained in each of the municipalities included within the LBSA Wastewater Management Plan (WMP) area is as follows: the City of Long Branch (5.10 square miles), the Borough of West Long Branch (0.2565 square miles), and the Borough of Monmouth Beach (0.0011 square miles). The City of Long Branch is the only "participating" municipality. The small areas of the other two municipalities are "customers" of LBSA.

Need for Project

The project is needed in order to reduce inflow and infiltration, increase efficiency, reduce energy use, improve functionality and reliability, and replace/repair aging infrastructure. This will, in part, prevent the need for emergency repairs to the aging infrastructure.

Project Description

This project includes two projects. The first is Sanitary Sewer Main and Lateral Improvements and includes replacement of sanitary sewer mains and laterals to reduce inflow and infiltration resulting in pumping and treatment energy savings and prevention of potential emergency repairs to the aging infrastructure. The second project is Pump Station Mechanical & Control Improvements that include various pump station mechanical and control improvements to increase efficiency, reduce energy use, improve functionality and reliability, and replace/repair aging infrastructure. Pump station work includes the Beach Pump Station Check Valve Replacement, Hoey Avenue Pump Station Pumps, Pipe Gallery and Controls Replacement, McClellan Street Pump Station Improvements, Lincoln Gardens Pump Station Force Main Replacement, and Pump Station Trash Basket, Hoist and Grating Improvements.

Existing Population

0

Service Area

The Cumberland County Utilities Authority (CCUA) service area includes a population of approximately 30,000 and wastewater flow from Bridgeton City, Deerfield Township, Fairfield Township, Hopewell Township, Shiloh Borough and Upper Deerfield Township.

Need for Project

The new force main will provide the necessary capacity to ensure the service area located to the east of the Cohansey River will be serviced and replace existing cast iron force mains that have reduced capacity. This project will provide enhanced collection and distribution to ensure against future overflows of raw wastewater and provide an extended service life to the community.

Project Description

This project includes the upgrades and rehabilitation of the Glass Street Pump Station. Glass Street Pump Station (GSPS) is the Cumberland County Utilities Authority's largest collection pump station and has a capacity of up to 4,500 gallons per minute. GSPS is critical as it is the only means to convey wastewater from the east side of the Cohansey River to the treatment facility. Originally constructed in the 1930s the GSPS utilizes two (2) undersized cast iron force mains, 12-inches and 16-inches, to cross under the Cohansey River. These improvements would include addressing the capacity of the influent screen chamber and channel grinder to protect the recently upgraded dry pit submersible pumps, the installation of instrumentation and controls to monitor the performance of the station, facility upgrades and the installation of a new force main under the Cohansey River through a horizontal directional drill.

Service Area

The proposed projects are within the municipal boundaries of the existing Borough of Princeton and the Township of Princeton, Mercer County, New Jersey. On January 1, 2013, the Borough and Township will be consolidated into one new municipality. The sanitary sewer service area of the Princeton Sewer Operating Committee will remain the same.

Need for Project

Reduces the amount of infiltration and inflow (I/I) conveyed to the SBRSA River Road Treatment Plant. Improves the PSOC sanitary Sewer system infrastructure. Provides groundwater protection. Improves public health / provides pathogen reduction.

Project Description

(Carryover SFY2015) - The PSOC is currently designing and proposing the construction of the following sewer rehabilitation projects in 2013 - Improvements to Valley Road (Project 12 - 01) - Improvements to Forrester Drive Robert Road and Sturges Way (Project 12 - 02) - Brookstone Drive Fairway Drive Greenway Terrace and Winfield Road - Rehabilitation of Sanitary Sewer Mains and Laterals (Project 12 - 03) - Improvements to Bank Street (Project 12 - 06) This sanitary sewer rehabilitation work is a continuation of the PSOCs recent rehabilitation work.

Project Name, Number

Stafford Township
S340946-07
Sanitary Sewer System Rehabilitation

Priority List Rank

314

County

Ocean

Existing Population

26,535

Service Area

The portion of the sanitary sewer system that Stafford Township owns and operates is comparable to other towns in Ocean County. The owner of the sanitary sewer system is responsible for the conveyance of waste to a connection point with the Ocean County Utilities Authority (OCUA). The Township owner sanitary system consists of gravity lines and pump stations that ultimately feed into sanitary sewer mains owned and maintained by OCUA. The Township owns, operates and maintains a sanitary sewer collection system that presently has approximately 13,100 service connections

Need for Project

Stafford Township had multiple pipe collapses in the past 10 years, and emergency repairs were required to fix them. The material and age of the ACP pipes requires cautious working skill to avoid further damage when repairs are made. The collapse of the mains cause sewer blockages and backups of the main that could expose the resident to raw sewage. The area is in a flood zone and in close proximity to open waterways that feed the Manahawkin Bay. The water table is high in the project limits which makes the failing sanitary system more susceptible to water infiltration into the system.

Project Description

Beach Haven West Sanitary Rehabilitation will be a Phased Sanitary Sewer Replacement Project. The initial phase will consist of replacement in kind of failing ACP Sanitary Sewer System consisting of approximately 8,150 Linear Feet of 8" PVC Sanitary Sewer Main. The project will consist of the removal of approximately 8,150 Linear Feet of ACP Sanitary Sewer Main and will include the construction of 30 new sanitary sewer manholes, 8,150 linear feet of 8" PVC Sanitary Sewer Main and 242 new sewer laterals and cleanouts. Also included in this project will be the replacement of drainage catch basins, installation of new cross drains and repaving of the road from edge of pavement to edge of pavement. The project is located in a flood hazard area on a lagoon community which encounters high water tables and is subject to high levels of water infiltration. The sanitary sewer main has reached its useful life and has been repaired in several locations under emergency work.

Service Area

Beach Haven West Sanitary Sewer Service Area serving the Southeastern corridor of the Stafford Township Sanitary Sewer collection system.

Need for Project

This project proposes to replace ACP sanitary sewer main to repair leaks prevent seepage into the surrounding ground water and estuaries. Storm system improvements are also proposed as a means of mitigating excessive runoff and therefore improving water quality in the surrounding areas of Stafford Township.

Project Description

Project consists of the removal and replacement of approximately 8,159 LF of Asbestos Concrete Pipe (ACP) sanitary sewer main with 5,243 Linear Feet of 8" PVC SDR 35 and 2,916 linear feet of 10" PVC SDR-35 for Stafford Township. Work shall include removal of 31 manholes and installation of 31 new manholes, installation of 234 new sanitary sewer laterals, dewatering, temporary by-pass pumping systems, and all other work required for the removal and replacement of the sanitary sewer main. Work shall take place in the Beach Haven West section of Stafford Township on Jennifer Lane extending from the intersection of Morris Boulevard to the intersection of Jennie Drive, including the entire length of Joan drive, Robert Drive, Jeffrey Drive, Joshua Drive, Jennie Drive, and Morris Boulevard between Route 72 and Joan Drive.

Project Name, Number

Metuchen Borough
S340360-02
Sanitary Sewer System Rehabilitation

Priority List Rank

316

County

Middlesex

Existing Population

13,574

Service Area

The pump station serves the entire Borough of Metuchen as all flow generated within the Borough flows through the station. It also serves a small portion of adjoining Edison Township.

Need for Project

The pump station collects and pumps wastewater generated within the service area to an interceptor that carries the flow to the Middlesex County Utilities Authority in Sayreville for treatment. The station contains much of the original equipment and facilities from its construction in the mid-1950's and it is becoming more difficult to maintain and may experience a higher probability of failure. Failure of the station would result in the spilling of wastewater into the surrounding environment.

Project Description

There are presently two wastewater pump stations at the end of Jersey Avenue in Metuchen, one owned by Edison and the other owned by Metuchen, located approximately 500 feet apart. The Edison station pumps into the Metuchen station which pumps to an MCUA interceptor. Both stations are antiquated and require significant reconstruction. The municipalities have agreed to cost share for Metuchen to undertake the construction of a new pump station to replace the existing two stations. The work includes the extension of the existing force main and gravity sewers and the construction of a new pump station, including new sewage pumps and grinder, electrical supply and distribution systems and stand-by generator, pump control system, and a structure to house the electrical and control equipment. There will be fewer pumps than in the two existing stations, the double pumping will be eliminated and the new pumps will be selected to maximize their efficiency and be variable speed, decreasing electric consumption when compared to the existing 50 year old constant speed pumps and motors.

Service Area

The service area for the proposed repair and rehabilitation projects is coterminous with the Borough's boundary limits.

Need for Project

The existing sanitary sewer collection infrastructure is deteriorating and in need of repair and/or replacement where needed. If left untreated the infrastructure may fail resulting in adverse impacts to the surrounding environment and community.

Project Description

The Borough proposes two (2) separate contracts. The first contract is for the rehabilitation of up to 134 existing MHs located throughout the Borough. This work is required to address an Administrative Consent Order issued by the NJDEP. The second contract includes rehabilitation and/or repair of approximately 2,750 LF of its 27" interceptor sewer pipe that traverses through the center of the Borough.

Service Area

High School playing field on the border of residential zone

Need for Project

Stormwater quality measures for rubber turf infield as well as stormwater quantity measures resulting in reduced stormwater runoff volume.

Project Description

The proposed project is for improvements to the Manville High School Athletic Field stormwater management system. When the synthetic turf field was expanded in 2020, inadequate drainage was designed and constructed, resulting in additional flooding on the adjacent properties. A memorandum was issued by the Borough of Manville Engineer outlining a series of proposals to remediate the issue, which, in general, consists of full inspection of the local drainage system, increasing the sizing of the pipe network in the local streets, and finally the construction of a subsurface infiltration system on the school property to recharge, rather than discharge, the excess stormwater runoff. This proposal also includes a supplemental planning study to investigate the regional impact of the proposed stormwater improvement. The school has issued a letter of support for grant opportunities for this project.

Sanitary Sewer System - New

Priority List Rank

320

County

Sussex

Existing Population

0

Service Area

The Town operates a waste water collection system transporting raw sewage to the wastewater treatment plant. Newton's Sparta Avenue pump station handles sewage from approximately one half of the Town's collection system. The tributary drainage area to the Sparta Avenue is highlighted in red on the provided waste water system map that couldn't be attached.

Need for Project

The existing pumping station has reached the end of its service life, is in a state of significant structural and mechanical distress, and is in need of rehabilitation or replacement to provide reliable service in the future. Equipment service reports show significant effort to maintain the three pumps, with frequent problems associated with impeller wear and clogging. In addition, the building is showing significant signs of wear with visible deterioration of the concrete roof. The existing wet well provides insufficient operating volume, which results in frequent flooding of the lower level operating platform and excessive pump starting and stopping. Furthermore, the arrangement of the wet well flow channels and pump compartments is problematic hydraulically, with the formation of dead zones causing solids and rag deposition.

Project Description

The Sparta Avenue Pumping Station is a critical asset within Newtons wastewater collection system, given that it handles raw sewage from approximately one-half of the Towns collection system. The pumping station has reached the end of its service life and is in need of rehabilitation or replacement to provide reliable service in the future. The proposed project would entail the construction of an entirely new pump station facility sited adjacent to the existing pump station facility. The existing station would remain in operation while the new station is built, thereby minimizing the bypass pumping operations that would be required during construction. Upon completion of the new station and diversion of flows to the new station, the existing facility would be demolished by dismantling the equipment within the building, removing the structure to a certain depth below grade, and backfilling substructure with suitable material.

Need for Project

Contract 1 - work includes manhole patching and repairs and CIPP lining of aging infrastructure collection system lines.
Contract 2 - The Sussex Street pump station was constructed in 1960s and there are concerns with ongoing reliability. The Merriam Ave Pump Station is located in the same area. It is planned to combine the two pump stations with a new duplex submersible pumping station with approximately 650 linear feet of new sewer lines and three new manholes.

Project Description

Contract 1- Sewer Line Repairs - The sewer lining will reduce the infiltration in and out of the sewer system. This will increase the water efficiency of the sewer system. Contract 2- Pump Station Consolidation - consolidating 2 old pump stations into one (1) new pump station will reduce energy consumption

Need for Project

The existing collection system serving the City is very old and is subject to an extreme amount of II. Rehabilitation of the entire sanitary sewer system is necessary to prevent groundwater from seeping in and sewage from seeping into the groundwater.

Project Description

This proposed project will be for an II correction program to eliminate the portion of II that is excessive and detrimental to the existing collection system. In some cases minor replacement may be necessary.

Street & Utility Reconstruction as follows: Surf Ave. between 1st & 11th Aves.; Ocean Ave. between 2nd & 18th Aves.; Beachfront storm sewer between 4th & 15th Aves.; 7th, 8th, & 12th Aves. between Surf Ave. & JFK Blvd.; 4th Ave. between Ocean Ave. & JFK Blvd.

Need for Project

Aside from interruption in proper function and flow of the sanitary system, another potential problem associated with the damaged and deteriorated sewer mains is the potential for the contamination of surface waters. When blockage occurs from infiltration of sand and/or collapse of the system due to the damage of the pipe joints, sewer vents back up resulting in spillage through the sanitary cleanouts located behind the curb and also possibly the manholes in the street. This spillage could run into the storm sewer system which discharges into the coastal waters. It is also possible the sanitary sewage could exfiltrate from the sewer mains and, if in close proximity to a storm sewer, infiltrate into the storm sewer which again discharges into coastal waters.

Project Description

(Carryover SFY2015) - Street & Utility Reconstruction as follows Surf Avenue between 1st & 11th Avenues Ocean Avenue between 2 & 18th avenues Beachfront storm sewer between 4th & 15th Avenues 7th 8th & 12th Avenues between Surf Avenue and JFK Blvd. 4th Avenue between Ocean Avenue and JFK Blvd.

North Wildwood City

Need for Project

The sanitary sewer lines are over 60 years old. Many leaking joints have caused sinkhole problems accelerated street deterioration and results in excessive infiltration and inflow into the City's sewer system. The sewage has the potential to pollute surface water through exfiltration of the sanitary system combined with infiltration into the storm sewer system which discharges to the back bay.

Project Description

The proposed project involves reconstruction and replacement of sewer mains manholes and sewer laterals in a forty block area of the City.

Service Area

The Netcong Sewer Department provides sanitary sewer service in the Borough of Netcong. The customers are residential, municipal facilities, schools and small businesses. The sanitary sewer system serves the entire Borough.

Need for Project

Wastewater system Asset Management Plans are important for municipalities to drive the inspection, maintenance, repair of and renewal of their infrastructure consistent with regulatory standards. The Asset Management Plan will fully document the overall condition and operation of the wastewater system and identify the priority and budgetary costs of future capital investments. The Asset Management Plan will evaluate the physical, demographic, renewal (replacement or rehabilitation), regulatory, operational efficiency, safety, and security planning drivers to identify capital investment needs into the future (20 years).

Project Description

The Borough of Netcong wishes to create and implement a Sanitary Sewer System Asset Management Plan through funding available from the (CW) Asset Management Plan Development; for Small CW Systems; populations <10,000. The Borough of Netcong (the Borough) owns, operates, and maintains a sanitary sewerage distribution system which benefits approximately 3,232 residents. The Borough's sanitary sewer system consists of gravity transmission mains and lateral connections. The Borough wishes to report upon sound fundamentals in the planning, operation, maintenance, and reinvestment of its sanitary sewer system to assure a reliable sanitary sewer system to its customers, and potential customers. The Borough proposes to proceed with the following program of activities at this time: 1. Preparation of a Sanitary Sewer System Asset Management Plan 2. Geographic Information System (GIS) Update 3. Infiltration & Inflow (I/I) Investigation of Sanitary Sewer System

Service Area

System wide sanitary infrastructure condition assessment and I&I evaluations to identify project area and scope.

Need for Project

To significantly minimize and/or eliminate sources of I&I is an improvement to water quality and groundwater.

Project Description

The Borough is interested in rehabilitating existing aging infrastructure as well as finalizing Asset Management Planning efforts to prioritize future projects. In part of the planning efforts, the Borough would be interested in conducting Infiltration and Inflow (I&I) studies to identify vulnerable areas of the system and reduce I/I and resulting increase in treatment costs to Musconetcong Sewerage Authority. Following these planning efforts, the Borough will proceed with trenchless rehabilitation of sewer mains and manholes identified as source of I&I.

Existing Population

27,542

Service Area

Beach Haven West Sanitary Sewer Service Area serving the Southeastern corridor of the Stafford Township Sanitary Sewer collection system.

Need for Project

This project proposes to replace ACP sanitary sewer main to repair leaks prevent seepage into the surrounding ground water and estuaries. Storm system improvements are also proposed as a means of mitigating excessive runoff and therefore improving water quality in the surrounding areas of Stafford Township.

Project Description

Project consists of the removal and replacement of approximately 10,467 linear feet of Asbestos Concrete Pipe (ACP) sanitary sewer mains with 10,514 linear feet of SDR-35 PVC sanitary sewer mains. Work shall include removal and replacement of 33 sanitary sewer manholes and approximately 348 sanitary sewer laterals. The project shall require dewatering and bypass pumping during the course of construction. Work shall take place in the Beach Haven West section of Stafford Township on Jennifer Lane, Jonathan Drive, Linda Road, Phyllis lane, Glenn Drive, Walter Boulevard, Harry Drive, Virginia Drive, Joy Road, Mary Jeanne Lane, and Jack Lane.

Need for Project

Emergency Provisions to prevent the overflow of sewage due to a loss of power at the three (3) bayfront pump stations.

Project Description

The project includes installation of emergency generators for the three (3) existing sewage pump stations near the bayfront area to allow the pump stations to operate during a power outage raise the electrical power breakers and control panels at the same three pump stations to above the flood elevation. Due to the corrosive salt air environment it is anticipated the emergency generator for each pump station and the associated electrical controls will be installed in a small building - raised above the 100-year flood line - to protect against corrosion
